# Universal Clock Chip for VIA™ P4M/KT/KM400 DDR Systems

## Features

- Supports VIA™ P4M/KM/KT/266/333/400 chipsets
- Supports Pentium® 4, Athlon™ processors
- Supports two DDR DIMMS
- Supports three SDRAM DIMMS at 100 MHz
- Provides:
  - two different programmable CPU clock pairs
  - six differential SDRAM DDR pairs
  - three low-skew/-jitter AGP clocks
  - seven low-skew/-jitter PCI clocks
  - one 48M output for USB
  - one programmable 24M or 48M for SIO
- Dial-a-Frequency® and Dial-a-dB™ features
- Spread Spectrum for best electromagnetic interference (EMI) reduction
- Watchdog feature for system recovery
- SMBus-compatible for programmability
- 56-pin SSOP and TSSOP packages

Table 1. Frequency Selection Table

FS(3:0)	CPU	AGP	PCI
0000	66.80	66.80	33.40
0001	100.00	66.80	33.40
0010	120.00	60.00	30.00
0011	133.33	66.67	33.33
0100	72.00	72.00	36.00
0101	105.00	70.00	35.00
0110	160.00	64.00	32.00
0111	140.00	70.00	35.00
1000	77.00	77.00	38.50
1001	110.00	73.33	36.67
1010	180.00	60.00	30.00
1011	166.6	66.6	33.3
1100	90.00	60.00	30.00
1101	100.00	66.67	33.33
1110	200.00	66.67	33.33
1111	133.33	66.67	33.33

## Block Diagram

## Pin Configuration<sup>[1]</sup>

**Note:**

1. Pins marked with [\*] have internal pull-up resistors. Pins marked with [\*\*] have internal pull-down resistors.

**Pin Description<sup>[2]</sup>**

Pin Number	Pin Name	PWR	I/O	Pin Description
3	XIN		I	<b>Oscillator Buffer Input.</b> Connect to a crystal or to an external clock.
4	XOUT	VDD	O	<b>Oscillator Buffer Output.</b> Connect to a crystal. Do not connect when an external clock is applied at XIN.
1	FS0/REF0	VDDR	I/O PU	<b>Power-on Bidirectional Input/Output.</b> At power-up, FS0 is the input. When the power supply voltage crosses the input threshold voltage, FS0 state is latched and this pin becomes REF0, buffered copy of signal applied at XIN. (1-2 x strength, selectable by SMBus. Default value is 1 x strength.)
56	VTPWRGD#	VDDR	I	<b>If SELP4_K7 = 1, with a P4 processor set up as CPUT/C.</b> At power-up, VTT_PWRGD# is an input. When this input transitions to a logic low, the FS (3:0) and MULTSEL are latched and all output clocks are enabled. After the first high to low transition on VTT_PWRGD#, this pin is ignored and will not effect the behavior of the device thereafter. When the VTT_PWRGD# feature is not used, please connect this signal to ground through a 10KΩ resistor.
	REF1	VDDR	O	<b>If SELP4_K7 = 0, with an Athlon (K7) processor as CPU_OD(T:C).</b> VTT_PWRGD# function is disabled, and the feature is ignored. This pin becomes REF1 and is a buffered copy of the signal applied at XIN.
44,42,38, 36,32,30	DDRT (0:5)/SDRAM (0,2,4,6,8,10)	VDDD	O	<b>These pins are programmable through strapping pin11, SELSDR_DDR#.</b> If SELSDR_DDR# = 0, these pins are configured for DDR clock outputs. They are "True" copies of signal applied at Pin45, BUF_IN. In this mode, VDDD must be 2.5V. If SELSDR_DDR# = 1, these pins are configured for SDRAM(0,2,4,6,8,10) single ended clock outputs, copies of (and in phase with) signal applied at Pin45, BUF_IN. In this mode, VDDD must be 3.3V
43,41,37 35,31,29	DDRC (0:5)/SDRAM (1,3,5,7,9,11)	VDDD	O	<b>These pins are programmable through strapping pin11, SELSDR_DDR#.</b> If SELSDR_DDR# = 0, these pins are configured for DDR clock outputs. They are "Complementary" copies of signal applied at Pin45, BUF_IN. In this mode, VDDD must be 2.5V. If SELSDR_DDR# = 1, these pins are configured for SDRAM(1,3,5,7,9,11) single ended clock outputs, copies of (and in phase with) signal applied at Pin45, BUF_IN. In this mode, VDDD must be 3.3V.
7	SELP4_K7 / AGP1	VDDAGP	I/O PU	<b>Power-on Bidirectional Input/Output.</b> At power-up, SELP4_K7 is the input. When the power supply voltage crosses the input threshold voltage, SELP4_K7 state is latched and this pin becomes AGP1 clock output. SELP4_K7 = 1, P4 mode. SELP4_K7 = 0, K7 mode.
12	MULTSEL/PCI2	VDDPCI	I/O PU	<b>Power-on Bidirectional Input/Output.</b> At power-up, MULTSEL is the input. When the power supply voltage crosses the input threshold voltage, MULTSEL state is latched and this pin becomes PCI2 clock output. MULTSEL = 0, loh is 4 x IREF. MULTSEL = 1, loh is 6 x IREF
53	CPUT/CPUOD_T	VDDC	O	<b>3.3V CPU Clock Outputs.</b> This pin is programmable through strapping pin7, SELP4_K7. If SELP4_K7 = 1, this pin is configured as the CPUT Clock Output. If SELP4_K7 = 0, this pin is configured as the CPUOD_T Open Drain Clock Output. See <i>Table 1</i>
52	CPUC/CPUOD_C	VDDC	O	<b>3.3V CPU Clock Outputs.</b> This pin is programmable through strapping pin7, SELP4_K7. If SELP4_K7 = 1, this pin is configured as the CPUC Clock Output. If SELP4_K7 = 0, this pin is configured as the CPUOD_C Open Drain Clock Output. See <i>Table 1</i>
48,49	CPUCS_T/C	VDDI	O	<b>2.5V CPU Clock Outputs for Chipset.</b> See <i>Table 1</i> .
14,15,17,18	PCI (3:6)	VDDPCI	O	<b>PCI Clock Outputs.</b> Are synchronous to CPU clocks. See <i>Table 1</i>
10	FS1/PCI_F	VDDPCI	I/O PD	<b>Power-on Bidirectional Input/Output.</b> At power-up, FS0 is the input. When the power supply voltage crosses the input threshold voltage, FS1 state is latched and this pin becomes PCI_F clock output.
20	FS3/48M	VDD48M	I/O PD	<b>Power-on Bidirectional Input/Output.</b> At power-up, FS3 is the input. When the power supply voltage crosses the input threshold voltage, FS3 state is latched and this pin becomes 48M, a USB clock output.

**Note:**

2. PU = internal pull-up. PD = internal pull-down. Typically = 250 kΩ (range 200 kΩ to 500 kΩ).

**Pin Description<sup>[2]</sup>** (continued)

Pin Number	Pin Name	PWR	I/O	Pin Description
11	SELSDR_DDR#/PCI1	VDDPCI	I/O PD	<b>Power-on Bidirectional Input/Output.</b> At power-up, SELSDR_DDR is the input. When the power supply voltage crosses the input threshold voltage, SELSDR_DDR state is latched and this pin becomes PCI clock output. SelSDR_DDR#= 0, DDR Mode. SelSDR_DDR#= 1, SDR Mode.
21	FS2/24_48M	VDD48M	I/O PD	<b>Power-on Bidirectional Input/Output.</b> At power-up, FS2 is the input. When the power supply voltage crosses the input threshold voltage, FS2 state is latched and this pin becomes 24_48M, a SIO programmable clock output.
6	AGP0	VDDAGP	O	<b>AGP Clock Output.</b> Is synchronous to CPU clocks. See <i>Table 1</i>
8	AGP2	VDDAGP	O	<b>AGP Clock Output.</b> Is synchronous to CPU clocks. See <i>Table 1</i>
25	IREF		I	<b>Current reference programming input for CPU buffers.</b> A precise resistor is attached to this pin, which is connected to the internal current reference.
28	SDATA		I/O	<b>Serial Data Input.</b> Conforms to the Phillips I2C specification of a Slave Receive/Transmit device. It is an input when receiving data. It is an open drain output when acknowledging or transmitting data.
27	SCLK		I	<b>Serial Clock Input.</b> Conforms to the Philips I2C specification.
26	PD#/SRESET#		I/O PU	<b>Power-down Input/System Reset Control Output.</b> If Byte6 Bit7 = 0(default), this pin becomes a SRESET# open drain output. See system reset description. If Byte6Bit7 = 1, this pin becomes PD# input with an internal pull-up. When PD# is asserted low, the device enters power down mode. See power management function.
45	BUF_IN			<b>If SelSDR_DDR#= 0, 2.5V CMOS type input to the DDR differential buffers.</b> If SelSDR_DDR#= 1, 3.3V CMOS type input to the SDR buffer.
46	FBOUT			<b>If SelSDR_DDR#= 0, 2.5V single ended SDRAM buffered output of the signal applied at BUF_IN.</b> It is in phase with the DDRT(0:5) signals.If SelSDR_DDR#= 1, 3.3V single ended SDRAM buffered output of the signal applied at BUF_IN. It is in phase with the SDRAM(0:11) signals
5	VDDAGP			<b>3.3V power supply for AGP clocks</b>
51	VDDC			<b>3.3V power supply for CPUT/C clocks</b>
16	VDDPCI			<b>3.3V power supply for PCI clocks</b>
55	VDDR			<b>3.3V power supply for REF clock</b>
50	VDDI			<b>2.5V power supply for CPUCS_T/C clocks</b>
22	VDD_48M			<b>3.3V power supply for 48M</b>
23	VDD			<b>3.3V Common power supply</b>
34,40	VDDD			<b>If SelSDR_DDR#= 0, 2.5V power supply for DDR clocksIf SelSDR_DDR#= 1, 3.3V power supply for SDR clocks.</b>
9	VSSAGP			<b>Ground for AGP clocks</b>
13	VSSPCI			<b>Ground for PCI clocks</b>
54	VSSC			<b>Ground for CPUT/C clocks</b>
33,39	VSSD			<b>Ground for DDR clocks</b>
19	VSS_48M			<b>Ground for 48M clock</b>
47	VSSI			<b>Ground for ICPUCS_T/C clocks</b>
2	VSSR			<b>Ground for REF</b>
24	VSS			<b>Common Ground</b>

## Power Management Functions

All clocks can be individually enabled or stopped via the two-wire control interface. All clocks are stopped in the low state. All clocks maintain a valid high period on transitions from running to stop and on transitions from stopped to running when the chip was not powered down. On power up, the VCOs will stabilize to the correct pulse widths within about 0.5 ms.

### Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions such as individual clock output buffers, etc., can be individually enabled or disabled.

The registers associated with the Serial Data Interface initialize to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface can also be used during system operation for power management functions.

## Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operation from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individual indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 2*.

The block write and block read protocol is outlined in *Table 3* while *Table 4* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

**Table 2. Command Code Definition**

Bit	Description
7	0 = Block read or block write operation. 1 = Byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'

**Table 3. Block Read and Block Write Protocol**

Block Write Protocol		Block Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
2:8	Slave address – 7 bits	2:8	Slave address – 7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
11:18	Command Code – 8-bit '00000000' stands for block operation	11:18	Command Code – 8-bit '00000000' stands for block operation
19	Acknowledge from slave	19	Acknowledge from slave

## Serial Control Registers

### Byte 0: Frequency Select Register

Bit	@Pup	Pin#	Name	Description
7	0		Reserved	Reserved
6	H/W Setting	21	FS2	For Selecting Frequencies in <i>Frequency Selection Table</i> on page 1
5	H/W Setting	10	FS1	For Selecting Frequencies in <i>Frequency Selection Table</i> on page 1
4	H/W Setting	1	FS0	For Selecting Frequencies in <i>Frequency Selection Table</i> on page 1
3	0			If this bit is programmed to “1”, it enables WRITE to bits (6:4,1) for selecting the frequency via software (SMBus) If this bit is programmed to a “0” it enable only READ of bits (6:4,1), which reflect the hardware setting of FS(0:3).
2	H/W Setting	11	SELSDR_DDR	Only for reading the hardware setting of the SDRAM interface mode, status of SELSDR_DDR# strapping.
1	H/W Setting	20	FS3	For Selecting frequencies in <i>Frequency Selection Table</i> on page 1
0	H/W Setting	7	SELP4_K7	Only for reading the hardware setting of the CPU interface mode, status of SELP4_K7# strapping.

### Byte 1: CPU Clocks Register

Bit	@Pup	Pin#	Name	Description
7	0		MODE	0 = Down Spread. 1 = Center Spread. See <i>Table 9</i> on page 9
6	1		SSCG	1 = Enable (default). 0 = Disable
5	1		SST1	Select spread bandwidth. See <i>Table 9</i> on page 9
4	1		SST0	Select spread bandwidth. See <i>Table 9</i> on page 9
3	1	48,49	CPUCS_T, CPUCS_C	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
2	1	53,52	CPUT/CPUOD_T CPUC/CPUOD_C	1 = Output enabled (running). 0 = Output disable.
1	1	53,52	CPUT/C	In K7 mode, this bit is ignored. In P4 mode, 0 = when PD# asserted LOW, CPUT stops in a high state, CPUC stops in a low state. In P4 mode, 1 = when PD# asserted LOW, CPUT and CPUC stop in High-Z.
0	1	11	MULT0	Only for reading the hardware setting of the Pin11 MULT0 value.

**Byte 2: PCI Clock Register**

Bit	@Pup	Pin#	Name	Description
7	0		PCI_DRV	PCI clock output drive strength 0 = Low strength, 1 = High strength
6	1	10	PCI_F	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
5	1	18	PCI6	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
4	1	17	PCI5	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
3	1	15	PCI4	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
2	1	14	PCI3	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
1	1	12	PCI2	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
0	1	11	PCI1	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.

**Byte 3: AGP/Peripheral Clocks Register**

Bit	@Pup	Pin#	Name	Description
7	0	21	24_48M	0 = pin21 output is 24 MHz. Writing a '1' into this register asynchronously changes the frequency at pin21 to 48 MHz.
6	1	20	48MHz	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
5	1	21	24_48M	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
4	0	6,7,8	DASAG1	Programming these bits allow shifting skew of the AGP(0:2) signals relative to their default value. See <i>Table 5</i> .
3	0	6,7,8	DASAG0	
2	1	8	AGP2	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
1	1	7	AGP1	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
0	1	6	AGP0	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.

**Table 5. Dial-a-Skew™ AGP(0:2)**

DASAG (1:0)	AGP(0:2) Skew Shift
00	Default
01	-280 ps
10	+280 ps
11	+480 ps

**Byte 4: Peripheral Clocks Register**

Bit	@Pup	Pin#	Name	Description
7	1	20	48M	1 = Low strength, 0 = High strength 1 = strength x 1. 0 = strength x 2
6	1	21	24_48M	1 = Low strength, 0 = High strength 1 = strength x 1. 0 = strength x 2
5	0	6,7,8	DARAG1	Programming these bits allow modifying the frequency ratio of the AGP(2:0), PCI(6:1, F) clocks relative to the CPU clocks. See <i>Table 6</i> .
4	0	6,7,8	DARAG0	
3	1	1	REF0	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
2	1	56	REF1	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
1	1	1	REF0	1 = Low strength, 0 = High strength
0	1	56	REF1	1 = Low strength, 0 = High strength (K7 Mode only)

**Table 6. Dial-A-Ratio™ AGP(0:2)**

DARAG (1:0)	CU/AGP Ratio
00	Frequency Selection Default
01	2/1
10	2.5/1
11	3/1

**Byte 5: SDR/DDR Clock Register**

Bit	@Pup	Pin#	Name	Description
7	0	45	BUF_IN threshold voltage	DDR Mode, BUF_IN threshold setting. 0 = 1.15V, 1 = 1.05V SDR Mode, BUF_IN threshold setting. 0 = 1.35V, 1 = 1.25V
6	1	46	FBOUT	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
5	1	29,30	DDRT/C5/SDRAM(10,11)	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
4	1	31,32	DDRT/C4/SDRAM(8,9)	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
3	1	35,36	DDRT/C3/SDRAM(6,7)	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
2	1	37,38	DDRT/C2/SDRAM(4,5)	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
1	1	41,42	DDRT/C1/SDRAM(2,3)	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.
0	1	43,44	DDRT/C0/SDRAM(0,1)	1 = Output enabled (running). 0 = Output disabled asynchronously in a low state.

**Byte 6: Watchdog Register**

Bit	@Pup	Pin#	Name	Description
7	0	26	SRESET#	1 = Pin 26 is the input pin as PD# signal. 0 = Pin 26 is the output pin as SRESET# signal.
6	0		Frequency Revert	This bit allows setting the Revert Frequency once the system is rebooted due to Watchdog time out only. 0 = selects frequency of existing H/W setting 1 = selects frequency of the second to last S/W setting. (the software setting prior to the one that caused a system reboot).
5	0		WDTEST	For IMI Test - WD-Test, ALWAYS program to '0'
4	0		WD Alarm	This bit is set to "1" when the Watchdog times out. It is reset to "0" when the system clears the WD time stamps (WD3:0).
3	0		WD3	This bit allows the selection of the time stamp for the Watchdog timer. See <i>Table 7</i>
2	0		WD2	This bit allows the selection of the time stamp for the Watchdog timer. See <i>Table 7</i>
1	0		WD1	This bit allows the selection of the time stamp for the Watchdog timer. See <i>Table 7</i>
0	0		WD0	This bit allows the selection of the time stamp for the Watchdog timer. See <i>Table 7</i>

**Table 7. Watchdog Time Stamp**

WD3	WD2	WD1	WD0	FUNCTION
0	0	0	0	Off
0	0	0	1	1 second
0	0	1	0	2 seconds
0	0	1	1	3 seconds
0	1	0	0	4 seconds
0	1	0	1	5 seconds
0	1	1	0	6 seconds
0	1	1	1	7 seconds
1	0	0	0	8 seconds
1	0	0	1	9 seconds
1	0	1	0	10 seconds
1	0	1	1	11 seconds
1	1	0	0	12 seconds
1	1	0	1	13 seconds
1	1	1	0	14 seconds
1	1	1	1	15 seconds

**Byte 7: Dial-a-Frequency Control Register N**

Bit	@Pup	Pin#	Name	Description
-----	------	------	------	-------------

**Byte 7: Dial-a-Frequency Control Register N**

7	0		Reserved	Reserved for device function test.  These bits are for programming the PLL's internal N register. This access allows the user to modify the CPU frequency at very high resolution (accuracy). All other synchronous clocks (clocks that are generated from the same PLL, such as PCI) remain at their existing ratios relative to the CPU clock.
6	0		N6, MSB	
5	0		N5	
4	0		N4	
3	0		N3	
2	0		N2	
1	0		N3	
0	0		N0, LSB	

**Byte 8: Silicon Signature Register (all bits are read-only)**

Bit	@Pup	Pin#	Name	Description
7	0		Revision_ID3	Revision ID bit [3]
6	0		Revision_ID2	Revision ID bit [2]
5	0		Revision_ID1	Revision ID bit [1]
4	1		Revision_ID0	Revision ID bit [0]
3	1		Vendor_ID3	Cypress's Vendor ID bit [3].
2	0		Vendor_ID2	Cypress's Vendor ID bit [2].
1	0		Vendor_ID1	Cypress's Vendor ID bit [1].
0	0		Vendor_ID0	Cypress's Vendor ID bit [0].

**Byte9: Dial-A-Frequency Control Register R**

Bit	@Pup	Pin#	Name	Description
7	0			Reserved
6	0		R5, MSB	These bits are for programming the PLL's internal R register. This access allows the user to modify the CPU frequency at very high resolution (accuracy). All other synchronous clocks (clocks that are generated from the same PLL, such as PCI) remain at their existing ratios relative to the CPU clock.
5	0		R4	
4	0		R3	
3	0		R2	
2	0		R1	
1	0		R0	
0	0		DAF_ENB	R and N register mux selection. 0 = R and N values come from the ROM. 1 = data is load from DAF (SMBus) registers.

**Dial-a-Frequency Feature**

SMBus Dial-a-Frequency feature is available in this device via Byte7 and Byte9.

P is a PLL constant that depends on the frequency selection prior to accessing the Dial-a-Frequency feature.

**Table 8.**

FS(4:0)	P
XXXXX	96016000

## Spread Spectrum Clock Generation (SSCG)

Spread Spectrum is enabled/disabled via SMBus register Byte 1, Bit 7.

**Table 9. Spread Spectrum Table**

Mode	SST1	SST0	% Spread
0	0	0	+0.14, -1.23
0	0	1	+0, -1.00
0	1	0	+0, -0.60
0	1	1	+0, -0.52
1	0	0	+0.72, -0.71
1	0	1	+0.47, -0.49
1	1	0	+0.34, -0.33
1	1	1	+0.30, -0.28

## Swing Select Functions Through Hardware

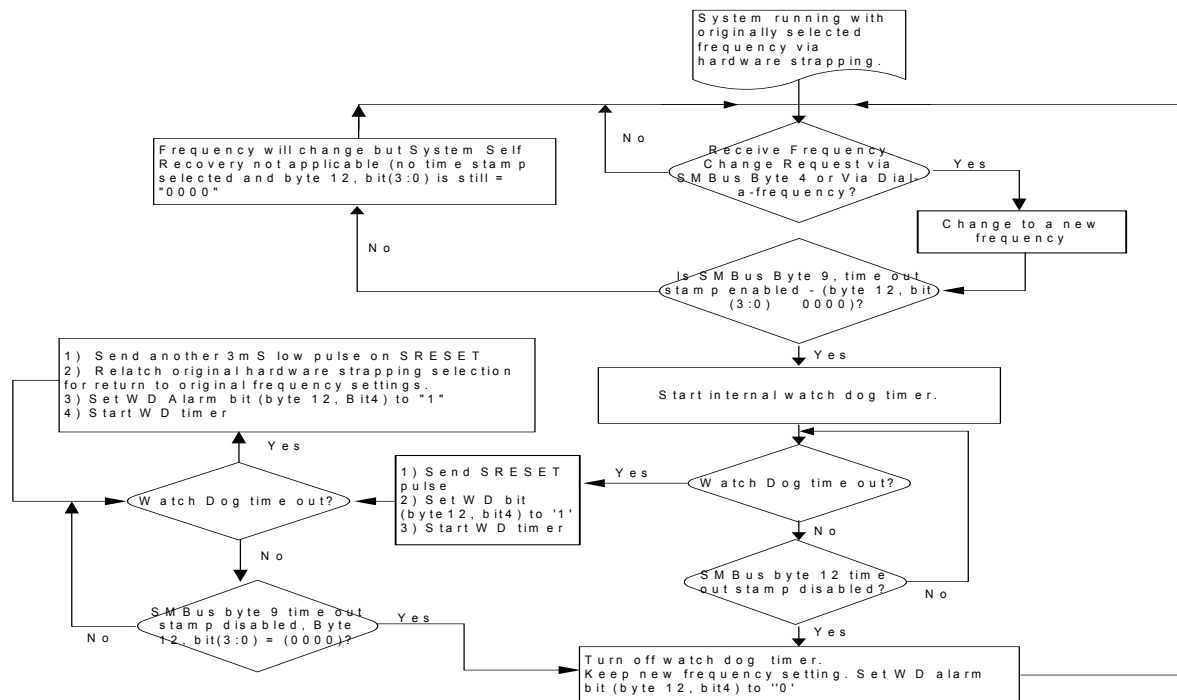

MULTSEL	Board Target Trace/Term Z	Reference R, IREF = VDD/(3*Rr)	Output Current	VOH@Z
0	50 Ohm	Rr = 221 1%, IREF = 5.00 mA	IOH = 4* Iref	1.0V@50
1	50 Ohm	Rr = 475 1%, IREF = 2.32 mA	IOH = 6* Iref	0.7V@50

## System Self Recovery Clock Management

This feature is designed to allow the system designer to change frequency while the system is running and reboot the operation of the system in case of a hang up due to the frequency change.

When the system sends an SMBus command requesting a frequency change through Byte 4 or through bytes 13 and 14, it must have previously sent a command to byte 12, for selecting which time out stamp the Watchdog must perform, otherwise the System Self Recovery feature will not be applicable. Consequently, this device will change frequency and then the Watchdog timer starts timing. Meanwhile, the system BIOS is running its operation with the new frequency. If this device receives a new SMBus command to clear the bits originally programmed in Byte 12, bits (3:0) (reprogram to 0000),

before the Watchdog times out, then this device will keep operating in its normal condition with the new selected frequency. If the Watchdog times out the first time before the new SMBus reprograms Byte 12, bits (3:0) to (0000), then this device will send a low system reset pulse, on SRESET# (see byte12, bit7), and changes WD alarm (Byte12, Bit4) status to "1" then restarts the Watchdog timer again. If the Watchdog times out a second time, then this device will send another low pulse on SRESET#, will relatch original hardware strapping frequency (or second to last software selected frequency, see byte12, bit6) selection, set WD alarm bit (Byte12, bit4) to '1,' then start WD timer again. The above-described sequence will keep repeating until the BIOS clears the SMBus byte12 bits (3:0). Once the BIOS sets Byte 12 bits (3:0) = 0000, then the Watchdog timer is turned off and the WD alarm bit (Byte 12, bit4) is reset to '0.'

**Figure 1. Watchdog Recovery Clock**

### P4 Processor **SELP4 K7# = 1**

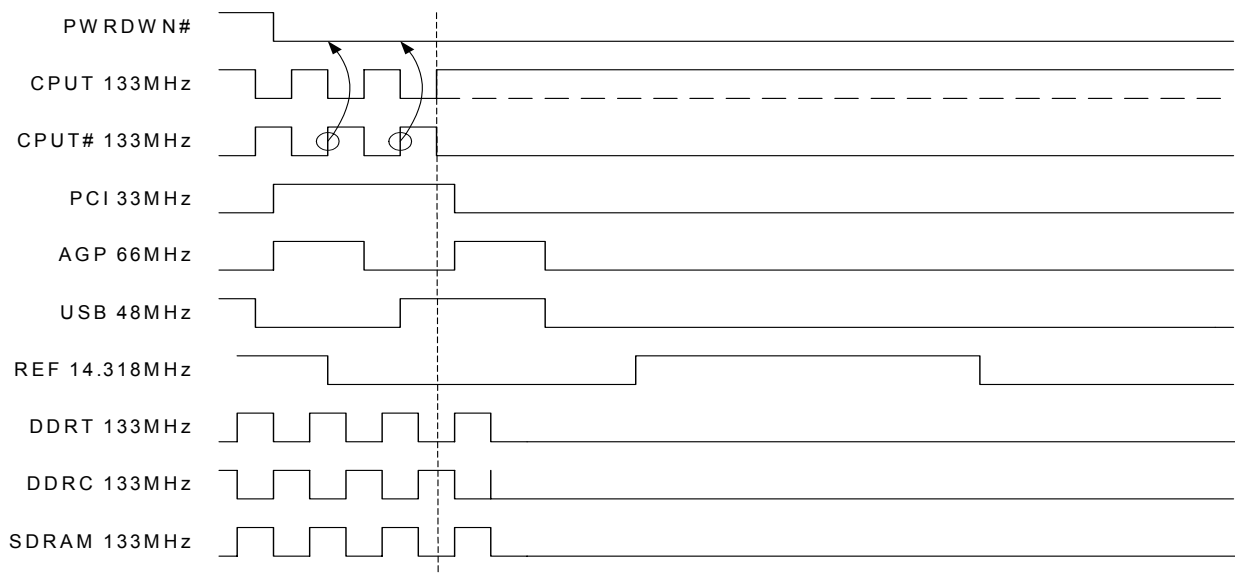

#### Power-down Assertion (P4 Mode)

When PD# is sampled low by two consecutive rising edges of CPU# clock then all clock outputs except CPU clocks must be held low on their next high to low transition. CPU clocks must be held with the CPU clock pin driven high with a value of 2 x Iref, and CPU# undriven. Note that *Figure 1* shows CPU =

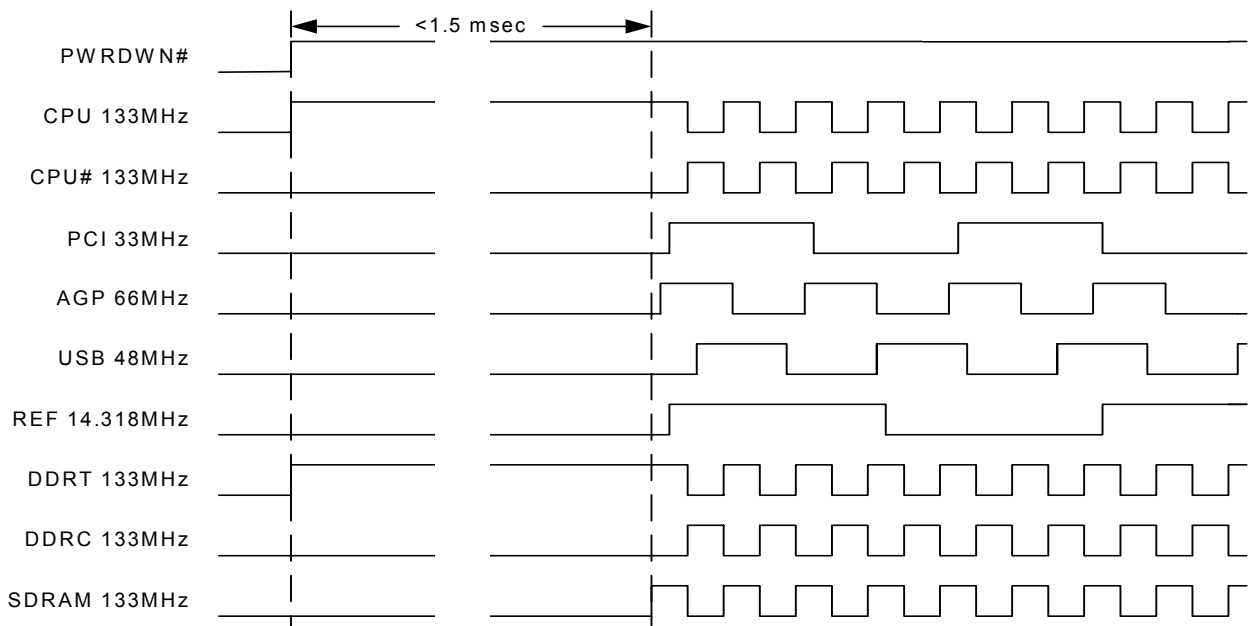

133 MHz. This diagram and description are applicable for all valid CPU frequencies 66, 100, 133, 200 MHz. Due to the state of internal logic, stopping and holding the REF clock outputs in the LOW state may require more than one clock cycle to complete.

#### Power-down Deassertion (P4 Mode)

The power-up latency needs to less than 3 ms.

**Figure 2. Power-down Assertion Timing Waveform (in P4 mode)**

**Figure 3. Power-down Deassertion Timing Waveform (in P4 mode)**

### AMD K7 processor SELP4 K7# = 0

#### Power-down Assertion (K7 Mode)

When the PD# signal is asserted LOW, all clocks are disabled to a low level in an orderly fashion prior to removing power from the part. When PD# is asserted (forced) LOW, the device transitions to a shutdown (power-down) mode and all power supplies may then be removed. When PD# is sampled LOW by two consecutive rising edges of CPU clock, then all affected

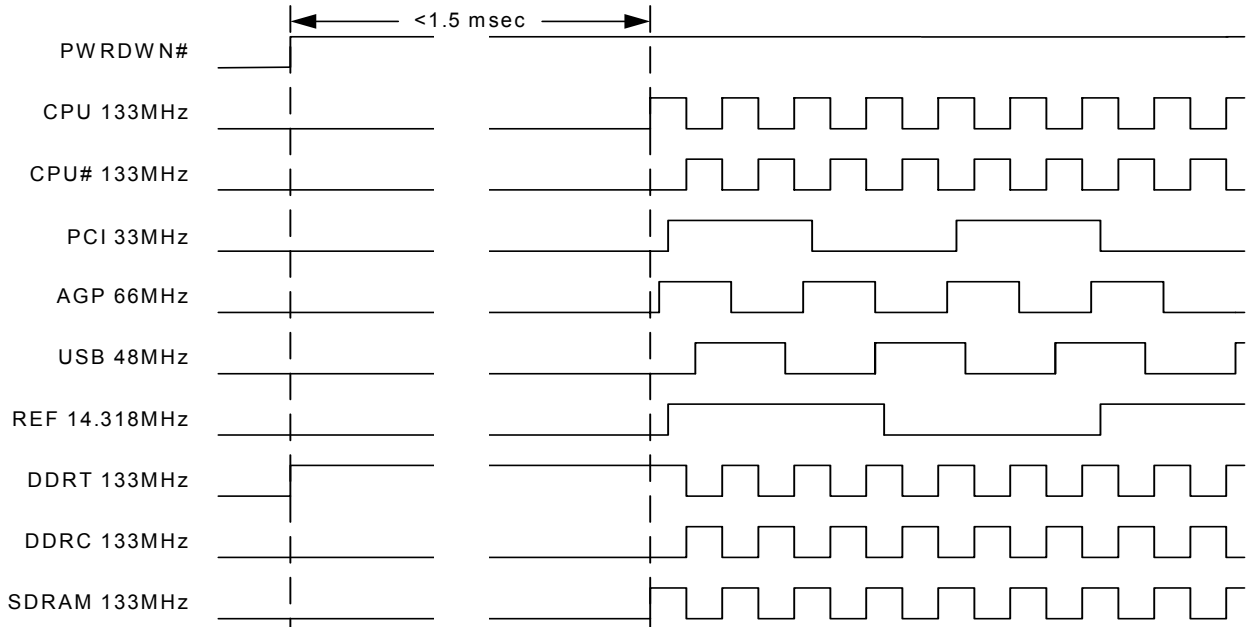

clocks are stopped in a LOW state as soon as possible. When in power-down (and before power is removed), all outputs are synchronously stopped in a LOW state (see *Figure 3* below), all PLL's are shut off, and the crystal oscillator is disabled. When the device is shut down, the I<sup>2</sup>C function is also disabled.

**Figure 4. Power-down Assertion Timing Waveform (in K7 mode)**

**Power-down Deassertion (K7 Mode)**

When deasserted PD# to HIGH level, all clocks are enabled and start running on the rising edge of the next full period in order to guarantee a glitch-free operation, no partial clock pulses.

**Figure 5. Power-down Deassertion Timing Waveform (in K7 Mode)**

**Figure 6. VTT\_PWGD# Timing Diagram (With Advanced PLL Processor SelP4\_K7 = 1)<sup>[3]</sup>**

**Note:**

3. This time diagram shows that VTT\_PWRGD# transits to a logic low in the first time at power-up. After the first high-to-low transition of VTT\_PWRGD#, device is not affected, VTT\_PWRGD# is ignored.

Figure 7. Clock Generator Power-up/Run State Diagram (with P4 processor **SELP4\_K7#=1**)

### Connection Circuit DDRT/C Signals

For open-drain CPU output signals (with K7 processor **SELP4\_K7#=0**)

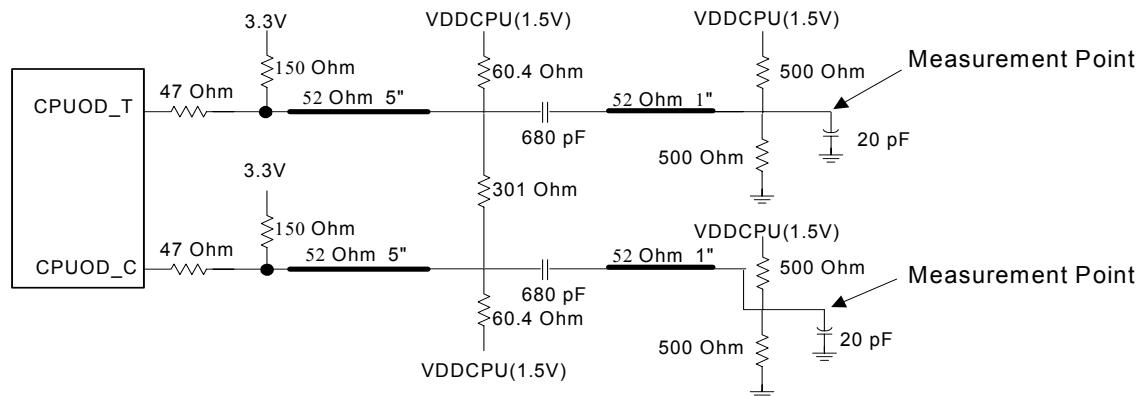

Figure 8. K7 Load Termination

Figure 9. CS Load Termination

Table 10. Signal Loading Table

Clock Name	Max Load (in pF)
REF (0:1), 48MHz (USB), 24_48MHz	20
AGP(0:2), SDRAM (0:11)	30
PCI_F(0:5)	30
DDRT/C (0:5), FBOU	
CPUT/C	See Figure 10
CPUOD_T/C	See Figure 8
CPUCS_T/C	See Figure 9

**For Differential CPU Output Signals (with P4 Processor **SELP4\_K7= 1**)**

The following diagram shows lumped test load configurations for the differential Host Clock outputs.

**Figure 10. P4 Load Termination**
**Table 11. Lumped Test Load Configuration**

Component	0.7V Amplitude Value	1.0V Amplitude Value
$R_{tA1}, R_{tA2}$	33Ω	0Ω
$R_{LA1}, R_{LA2}$	49.9Ω	∞
$T_{PCB}$	3" 50 ΩZ	3" 50 ΩZ
$R_{LB1}, R_{LB2}$	∞	63Ω
$R_D$	∞	470Ω
$R_{tB1}, R_{tB2}$	0Ω	33Ω
$C_{LA}, C_{LB}$	2 pF	2 pF
$R_{ref}$	475Ω w/mult0 = 1	221Ω w/mult0 = 0

**Group Timing Relationships and Tolerances<sup>[4]</sup>**

		Offset (ps)	Tolerance (ps)	Conditions
$t_{CSAGP}$	CPUCS to AGP	750	500	CPUCS Leads
$t_{AP}$	AGP to PCI	1,250	500	AGP Leads

0ns                      10ns                      20ns                      30ns

**Note:**

4. Ideally the probes should be placed on the pins. If there is a transmission line between the test point and the pin for one signal of the pair (e.g., CPU), the same length transmission line should be added to the other signal of the pair (e.g., AGP).

**Maximum Ratings<sup>[5]</sup>**

Input Voltage Relative to  $V_{SS}$ : .....  $V_{SS} - 0.3V$   
 Input Voltage Relative to  $V_{DDQ}$  or  $AV_{DD}$ : .....  $V_{DD} + 0.3V$   
 Storage Temperature: .....  $-65^{\circ}C$  to  $+150^{\circ}C$   
 Operating Temperature: .....  $0^{\circ}C$  to  $+70^{\circ}C$   
 Maximum ESD ..... 2000V  
 Maximum Power Supply: ..... 5.5V

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field. However, precautions should be take to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation,  $V_{IN}$  and  $V_{OUT}$  should be constrained to the range:

$$V_{SS} < (V_{IN} \text{ or } V_{OUT}) < V_{DD}$$

Unused inputs must always be tied to an appropriate logic voltage level (either  $V_{SS}$  or  $V_{DD}$ ).

**DC Parameters** ( $V_{DD} = V_{DDPCI} = V_{DDAGP} = V_{DDR} = V_{DD48M} = V_{DDC} = 3.3V \pm 5\%$ ,  $V_{DDI} = V_{DD} = 2.5 \pm 5\%$ ,  $T_A = 0^{\circ}C$  TO  $+70^{\circ}C$ )

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IL1}$	Input Low Voltage	Applicable to PD#, F S(0:4)			0.8	Vdc
$V_{IH1}$	Input High Voltage		2.0			Vdc

$T_{PERIOD}$	CPUT/C Period	9.85	10.2	7.35	7.65	4.85	5.1	ns	7,8,9,15,16

**Notes:**

- Multiple Supplies: The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.
- All outputs loaded as per maximum capacitive load table.
- This parameter is measured as an average over a 1-us duration, with a crystal center frequency of 14.31818 MHz.
- All outputs loaded as per loading specified in the *Table 11*.
- Probes are placed on the pins, and measurements are acquired at 1.5V for 3.3V signals and at 1.25V for 2.5V, and 50% point for differential signals.
- Probes are placed on the pins, and measurements are acquired at 0.4V.
- When Xin is driven from and external clock source (3.3V parameters apply).
- When crystal meets minimum 40-ohm device series resistance specification.
- Measured between  $0.2V_{DD}$  and  $.7V_{DD}$ .
- This is required for the duty cycle on the REF clock out to be as specified. The device will operate reliably with input duty cycles up to 30/70 but the REF clock duty cycle will not be within data sheet specifications.
- Measured at  $V_X$ , or where subtraction of CLK-CLK# crosses 0V.
- See *Figure 10* for 0.7V loading specification.

$T_R / T_F$	AGP(0:2) Rise and Fall Times	0.4	1.6	0.4	1.6	0.4	1.6	ns	8,13

**Notes:**

- Probes are placed on the pins, and measurements are acquired between 0.4V and 2.4V for 3.3V signals and between 0.4V and 2.0V for 2.5V signals, and between 20% and 80% for differential signals.
- This measurement is applicable with Spread ON or spread OFF.
- Probes are placed on the pins, and measurements are acquired at 2.4V for 3.3V signals and at 2.0V for 2.5V signals).
- Time specified is measured from when all VDDs reach their respective supply rail (3.3V and 2.5V) till frequency output is stable and operating within specs.
- The typical value of VX is expected to be  $0.5 \cdot V_{DD}$  (or  $0.5 \cdot V_{DDC}$  for CPUCS signals) and will track the variations in the DC level of the same.
- VD is the magnitude of the difference between the measured voltage level on a DDRT (and CPUCS\_T) clock and the measured voltage level on its complementary DDRC (and CPUCS\_C) one.
- Measured at VX between the rising edge and the following falling edge of the signal.
- Measured from  $V_{OL} = 0.175V$  to  $V_{OH} = 0.525V$ .
- Measurement taken from differential waveform, from -0.35V to +0.35V.
- Measurements taken from common mode waveforms, measure rise/fall time from 0.41V to 0.86V. Rise/fall time matching is defined as "the instantaneous difference between maximum clk rise (fall) and minimum clk# fall (rise) time, or minimum clk rise (fall) and maximum clk# fall (rise) time". This parameter is designed for waveform symmetry.
- Measured in absolute voltage, i.e., single-ended measurement.
