

# OMAP3525-HiRel and OMAP3530-HiRel Applications Processor

Check for Samples: [OMAP3525-HiRel](#), [OMAP3530-HiRel](#)

## 1 OMAP3525-HiRel and OMAP3530-HiRel Applications Processor

### 1.1 Features

- **OMAP325 and OMAP3530 Applications Processor:**
  - **OMAP™ 3 Architecture**
  - **MPU Subsystem**
    - Up to 600-MHz ARM Cortex™-A8 Core
    - NEON™ SIMD Coprocessor
  - **High Performance Image, Video, Audio (IVA2.2™) Accelerator Subsystem**
    - Up to 520-MHz TMS320C64x+™ DSP Core
    - Enhanced Direct Memory Access (EDMA) Controller (128 Independent Channels)
    - Video Hardware Accelerators
  - **POWERVR SGX™ Graphics Accelerator (OMAP3530 Device Only)**
    - Tile Based Architecture Delivering up to 10 MPoly/sec
    - Universal Scalable Shader Engine: Multi-threaded Engine Incorporating Pixel and Vertex Shader Functionality
    - Industry Standard API Support: OpenGL ES 1.1 and 2.0, OpenVG1.0
    - Fine Grained Task Switching, Load Balancing, and Power Management
    - Programmable High Quality Image Anti-Aliasing
  - **Fully Software-Compatible With C64x and ARM9™**
  - **Commercial and Extended Temperature Grades**
- **Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x+™ DSP Core**
  - **Eight Highly Independent Functional Units**
    - +Six ALUs (32-/40-Bit), Each Supports Single 32-Bit, Dual 16-Bit, or Quad 8-Bit Arithmetic per Clock Cycle
    - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
  - **Load-Store Architecture With Non-Aligned Support**
  - **64 32-Bit General-Purpose Registers**
- **Instruction Packing Reduces Code Size**
- **All Instructions Conditional**
- **Additional C64x+™ Enhancements**
  - Protected Mode Operation
  - Exceptions Support for Error Detection and Program Redirection
  - Hardware Support for Modulo Loop Operation
- **C64x+ L1/L2 Memory Architecture**
  - 32K-Byte L1P Program RAM/Cache (Direct Mapped)
  - 80K-Byte L1D Data RAM/Cache (2-Way Set-Associative)
  - 64K-Byte L2 Unified Mapped RAM/Cache (4-Way Set-Associative)
  - 32K-Byte L2 Shared SRAM and 16K-Byte L2 ROM
- **C64x+ Instruction Set Features**
  - Byte-Addressable (8-/16-/32-/64-Bit Data)
  - 8-Bit Overflow Protection
  - Bit-Field Extract, Set, Clear
  - Normalization, Saturation, Bit-Counting
  - Compact 16-Bit Instructions
  - Additional Instructions to Support Complex Multiplies
- **ARM Cortex™-A8 Core**
  - **ARMv7 Architecture**
    - Trust Zone®
    - Thumb®-2
    - MMU Enhancements
  - **In-Order, Dual-Issue, Superscalar Microprocessor Core**
  - **NEON™ Multimedia Architecture**
  - **Over 2x Performance of ARMv6 SIMD**
  - **Supports Both Integer and Floating Point SIMD**
  - **Jazelle® RCT Execution Environment Architecture**
  - **Dynamic Branch Prediction with Branch Target Address Cache, Global History Buffer, and 8-Entry Return Stack**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

- Embedded Trace Macrocell (ETM) Support for Non-Invasive Debug
- ARM Cortex™-A8 Memory Architecture:
  - 16 K-Byte Instruction Cache (4-Way Set-Associative)
  - 16 K-Byte Data Cache (4-Way Set-Associative)
  - 256 K-Byte L2 Cache
- 112K-Byte ROM
- 64K-Byte Shared SRAM
- Endianness:
  - ARM Instructions - Little Endian
  - ARM Data – Configurable
  - DSP Instruction/Data - Little Endian
- External Memory Interfaces:
  - SDRAM Controller (SDRC)
    - 16, 32-bit Memory Controller With 1G-Byte Total Address Space
    - Interfaces to Low-Power Double Data Rate (LPDDR) SDRAM
    - SDRAM Memory Scheduler (SMS) and Rotation Engine
  - General Purpose Memory Controller (GPMC)
    - 16-bit Wide Multiplexed Address/Data Bus
    - Up to 8 Chip Select Pins With 128M-Byte Address Space per Chip Select Pin
    - Glueless Interface to NOR Flash, NAND Flash (With ECC Hamming Code Calculation), SRAM and Pseudo-SRAM
    - Flexible Asynchronous Protocol Control for Interface to Custom Logic (FPGA, CPLD, ASICs, etc.)
    - Nonmultiplexed Address/Data Mode (Limited 2K-Byte Address Space)
- System Direct Memory Access (sDMA) Controller (32 Logical Channels With Configurable Priority)
- Camera Image Signal Processing (ISP)
  - CCD and CMOS Imager Interface
  - Memory Data Input
  - RAW Data Interface
  - BT.601/BT.656 Digital YCbCr 4:2:2 (8-/10-Bit) Interface
  - A-Law Compression and Decompression
  - Preview Engine for Real-Time Image Processing
  - Glueless Interface to Common Video Decoders
  - Histogram Module/Auto-Exposure, Auto-White Balance, and Auto-Focus Engine
  - Resize Engine
    - Resize Images From 1/4x to 4x
    - Separate Horizontal/Vertical Control
- Display Subsystem
  - Parallel Digital Output
    - Up to 24-Bit RGB
    - HD Maximum Resolution
    - Supports Up to 2 LCD Panels
    - Support for Remote Frame Buffer Interface (RFBI) LCD Panels
  - 2 10-Bit Digital-to-Analog Converters (DACs) Supporting:
    - Composite NTSC/PAL Video
    - Luma/Chroma Separate Video (S-Video)
  - Rotation 90-, 180-, and 270-degrees
  - Resize Images From 1/4x to 8x
  - Color Space Converter
  - 8-bit Alpha Blending
- Serial Communication
  - 5 Multichannel Buffered Serial Ports (McBSPs)
    - 512 Byte Transmit/Receive Buffer (McBSP1/3/4/5)
    - 5K-Byte Transmit/Receive Buffer (McBSP2)
    - SIDETONE Core Support (McBSP2 and 3 Only) For Filter, Gain, and Mix Operations
    - Direct Interface to I2S and PCM Device and TDM Buses
    - 128 Channel Transmit/Receive Mode
  - Four Master/Slave Multichannel Serial Port Interface (McSPI) Ports
  - High-Speed/Full-Speed/Low-Speed USB OTG Subsystem (12-/8-Pin ULPI Interface)
  - High-Speed/Full-Speed/Low-Speed Multiport USB Host Subsystem
    - 12-/8-Pin ULPI Interface or 6-/4-/3-Pin Serial Interface
    - Supports Transceiverless Link Logic (TLL)
  - One HDQ/1-Wire Interface
  - Three UARTs (One with Infrared Data Association [IrDA] and Consumer Infrared [CIR] Modes)
  - Three Master/Slave High-Speed Inter-Integrated Circuit (I2C) Controllers
- Removable Media Interfaces:
  - Three Multimedia Card (MMC)/ Secure Digital (SD) With Secure Data I/O (SDIO)
- Comprehensive Power, Reset, and Clock Management
  - SmartReflex™ Technology
  - Dynamic Voltage and Frequency Scaling (DVFS)
- Test Interfaces
  - IEEE-1149.1 (JTAG) Boundary-Scan Compatible
  - Embedded Trace Macro Interface (ETM)

- Serial Data Transport Interface (SDTI)
- 12 32-bit General Purpose Timers
- 2 32-bit Watchdog Timers
- 1 32-bit 32-kHz Sync Timer
- Up to 188 General-Purpose I/O (GPIO) Pins (Multiplexed With Other Device Functions)
- 6 5-nm CMOS Technology
- Package-On-Package (POP) Implementation for Memory Stacking (Not Available in CUS Package)
- Discrete Memory Interface (Not Available in CBC Package)
- Packages:
  - 515-pin s-PBGA package (CBB Suffix), .5mm Ball Pitch (Top), .4mm Ball Pitch (Bottom)
  - 515-pin s-PBGA package (CBC Suffix), .65mm Ball Pitch (Top), .5mm Ball Pitch (Bottom)
  - 423-pin s-PBGA package (CUS Suffix), .65mm Ball Pitch
- 1.8-V I/O and 3.0-V (MMC1 only), 0.985-V to 1.35-V Adaptive Processor Core Voltage
- 0.985-V to 1.35-V Adaptive Core Logic Voltage
- Note: These are default Operating Performance Point (OPP) voltages and could be optimized to lower values using SmartReflex™ AVS.
- Applications:
  - Portable Navigation Devices
  - Portable Media Player
  - Advanced Portable Consumer Electronics
  - Digital TV
  - Digital Video Camera
  - Portable Data Collection
  - Point-of-Sale Devices
  - Gaming
  - Web Tablet
  - Smart White Goods
  - Smart Home Controllers
  - Ultra Mobile Devices

## 1.2 Description

OMAP3525 and OMAP3530 high-performance, applications processors are based on the enhanced OMAP™ 3 architecture.

The OMAP™ 3 architecture is designed to provide best-in-class video, image, and graphics processing sufficient to support the following:

- Streaming video
- 3D mobile gaming
- Video conferencing
- High-resolution still image

The device supports high-level operating systems (OSs), such as:

- Linux
- Windows CE

This OMAP device includes state-of-the-art power-management techniques required for high-performance mobile products.

The following subsystems are part of the device:

- Microprocessor unit (MPU) subsystem based on the ARM Cortex™-A8 microprocessor
- IVA2.2 subsystem with a C64x+ digital signal processor (DSP) core
- POWERVR SGX™ subsystem for 3D graphics acceleration to support display and gaming effects (3530 only)
- Camera image signal processor (ISP) that supports multiple formats and interfacing options connected to a wide variety of image sensors
- Display subsystem with a wide variety of features for multiple concurrent image manipulation, and a programmable interface supporting a wide variety of displays. The display subsystem also supports NTSC/PAL video out.
- Level 3 (L3) and level 4 (L4) interconnects that provide high-bandwidth data transfers for multiple initiators to the internal and external memory controllers and to on-chip peripherals

The device also offers:

- A comprehensive power and clock-management scheme that enables high-performance, low-power operation, and ultralow-power standby features. The device also supports SmartReflex™ adaptive voltage control. This power management technique for automatic control of the operating voltage of a module reduces the active power consumption.
- Memory stacking feature using the package-on-package (POP) implementation (CBB and CBC packages only)

OMAP25 and OMAP3530 devices are available in a 515-pin s-PBGA package (CBB suffix), 515-pin s-PBGA package (CBC suffix), and a 423-pin s-PBGA package (CUS suffix). Some features of the CBB and CBC packages are not available in the CUS package.

[Table 1-1](#) lists the differences between the CBB, CBC, and CUS packages.

**Table 1-1. Differences Between CBB, CBC, and CUS Packages**

FEATURE	CBB PACKAGE	CBC PACKAGE	CUS PACKAGE
Pin Assignments	For CBB package pin assignments see, <i>Ball Characteristics (CBB Pkg.)</i>	For CBC package pin assignments see, <i>Ball Characteristics (CBC Pkg.)</i>	For CUS package pin assignments see, <i>Ball Characteristics (CUS Pkg.)</i>
Package-On-Package (POP) Interface	POP interface supported	POP interface supported	POP interface not available
Discrete Memory Interface	Discrete Memory Interface supported	Discrete Memory Interface not supported	Discrete Memory Interface supported
GPMC	Eight chip select pins available	Eight chip select pins available	Chip select pins gpmc_ncs1 and gpmc_ncs2 are not available
	Four wait pins available	Four wait pins available	Wait pins gpmc_wait1 and gpmc_wait2 are not available
UART1	CTS signal is available on 3 pins (triple muxed): uart1_cts (AG22 / W8 / T21), uart1_rts (AH22 / AA9), uart1_tx (F28 / Y8 / AE7), uart1_rx (E26 / AA8)	The following signals are either available on two (double muxed) or three pins (triple muxed): uart1_cts (AE21 / T19 / W2), uart1_rts (AE22 / R2), uart1_rx (H3 / H25 / AE4), uart1_tx (L4 / G26)	CTS signal is available on 3 pins (triple muxed): uart1_cts (AC19 / AC2 / AA18), uart1_rts (W6 / AB19), uart1_tx (E23 / V7 / AC3), uart1_rx (D24 / W7)
UART2	The following signals are available on two pins (double muxed): uart2_cts (AF6/AB26), uart2_rts (AE6/AB25), uart2_tx (AF5/AA25), uart2_rx (AE5/AD25)	The following signals are available on two pins (double muxed): uart2_cts (Y24/P3), uart2_rts (AA24/N3), uart2_tx (AD22/U3), uart2_rx (AD21/W3)	The following signals are available on one pin only: uart2_cts (V6), uart2_rts (V5), uart2_tx (W4), uart2_rx (V4)
McBSP3	The following signals are available on three pins (triple muxed): mcbbsp3_dx (AF6 / AB26 / V21), mcbbsp3_dr (AE6 / AB25 / U21), mcbbsp3_clkx (AF5 / AA25 / W21), and mcbbsp3_fsx (AE5 / AD25 / K26)	The following signals are available on two pins (triple muxed): mcbbsp3_dx (U17/ Y24/ P3), mcbbsp3_dr (T20/ AA24 / N3), mcbbsp3_clkx (T17/ AD22 / U3), mcbbsp3_fsx (P20/ AD21 / W3)	The following signals are available on two pins only (double muxed): mcbbsp3_dx (V6/W18), mcbbsp3_dr (V5/Y18), mcbbsp3_clkx (W4/V18), and mcbbsp3_fsx (V4/AA19)
GP Timer	The following signals are available on three pins (triple muxed): gpt8_pwm_evt (N8 / AD25 / V3), gpt9_pwm_evt (T8 / AB26 / Y2), gpt10_pwm_evt (R8 / AB25 / Y3), and gpt11_pwm_evt (P8 / AA25 / Y4)	The following signals are available on three pins (triple muxed): gpt8_pwm_evt (C5/AD21/V9), gpt9_pwm_evt (B4/W8/Y24), gpt10_pwm_evt(C4/U8/AA24), gpt11_pwm_evt(B5/V8/AD22)	The following signals are available on two pins only (double muxed): gpt8_pwm_evt (G4/M4), gpt9_pwm_evt (F4/N4), gpt10_pwm_evt (G5/N3), and gpt11_pwm_evt (F3/M5)
McBSP4	The following signals are available on two pins (double muxed): mcbbsp4_clkx (T8/AE1), mcbbsp4_dr (R8/AD1), mcbbsp4_dx (P8/AD2), mcbbsp4_fsx (N8/AC1)	The following signals are available on two pins(double muxed): mcbbsp4_clkx (B4 / V3), mcbbsp4_dr (C4 / U4), mcbbsp4_dx (B5 / R3), mcbbsp4_fsx (C5 / T3)	The following signals are available on one pin only: mcbbsp4_clkx (F4), mcbbsp4_dr (G5), mcbbsp4_dx (F3), mcbbsp4_fsx (G4)
HSUSB3_TLL	Supported	Supported	Not supported
MM_FSUSB3	Supported	Supported	Not supported
McSPI1	Four chip select pins are available	Four chip select pins are available	Chip select pins mcspi1_cs1 and mcspi_cs2 are not available
MMC3	The following signals are available on two pins (double muxed): mmc3_cmd (AC3 / AE10), and mmc3_clk (AB1 / AF10)	The following signals are available on two pins (double muxed): mmc3_cmd (R8 / AB3), mmc3_clk (R9 / AB2)	The following signals are available on one pin only: mmc3_cmd (AD3), and mmc3_clk (AC1)

**Table 1-1. Differences Between CBB, CBC, and CUS Packages (continued)**

FEATURE	CBB PACKAGE	CBC PACKAGE	CUS PACKAGE
GPIO	A maximum of 188 GPIO pins are supported.	A maximum of 188 GPIO pins are supported.	<p>A maximum of 170 GPIO pins are supported.</p> <p>The following GPIO pins are not available: gpio_112, gpio_113, gpio_114, gpio_115, gpio_52, gpio_53, gpio_63, gpio_64, gpio_144, gpio_145, gpio_146, gpio_147, gpio_152, gpio_153, gpio_154, gpio_155, gpio_175, and gpio_176.</p> <p>Pin muxing restricts the total number of GPIO pins available at one time. For more details, see , <i>Multiplexing Characteristics (CUS Pkg.)</i>.</p>

This OMAP3525 and OMAP3530 Applications Processor data manual presents the electrical and mechanical specifications for the OMAP3525 and OMAP3530 Applications Processor. The information contained in this data manual applies to both the commercial and extended temperature versions of the OMAP3525/30 Applications Processor unless otherwise indicated. It consists of the following sections:

- A description of the OMAP3525 and OMAP3530 terminals: assignment, electrical characteristics, multiplexing, and functional description ([Section 2](#))
- A presentation of the electrical characteristics requirements: power domains, operating conditions, power consumption, and dc characteristics ([Section 3](#))
- The clock specifications: input and output clocks, DPLL and DLL ([Section 4](#))
- The video DAC specification ([Section 5](#))
- The timing requirements and switching characteristics (ac timings) of the interfaces ([Section 6](#))
- A description of thermal characteristics, device nomenclature, and mechanical data about the available packaging ([Section 7](#))

### 1.3 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the OMAP3525 and OMAP3530 Applications Processor.

## 2 TERMINAL DESCRIPTION

### 2.1 Terminal Assignment

Figure 2-1 through Figure 2-5 show the ball locations for the 515- and 423- ball plastic ball grid array (s-PBGA) packages. through Table 2-25 indicate the signal names and ball grid numbers for both packages.

**Note:** There are no balls present on the top of the 423-ball s-PBGA package.

Figure 2-16. CUS Pin Map [Quadrant C - Top View]

## 2.3 Ball Characteristics

through describe the terminal characteristics and the signals multiplexed on each pin for the CBB, CBC, and CUS packages, respectively. The following list describes the table column headers.

1. **BALL BOTTOM:** Ball number(s) on the bottom side associated with each signal(s) on the bottom.
2. **BALL TOP:** Ball number(s) on the top side associated with each signal(s) on the top.
3. **PIN NAME:** Names of signals multiplexed on each ball (also notice that the name of the pin is the signal name in mode 0).

**Note:** through do not take into account subsystem pin multiplexing options. Subsystem pin multiplexing options are described in [Section 2.5, Signal Descriptions](#).

4. **MODE:** Multiplexing mode number.

(a) Mode 0 is the primary mode; this means that when mode 0 is set, the function mapped on the pin corresponds to the name of the pin. There is always a function mapped on the primary mode. Notice that primary mode is not necessarily the default mode.

**Note:** The default mode is the mode which is automatically configured on release of the internal GLOBAL\_PWRON reset; also see the RESET REL. MODE column.

(b) Modes 1 to 7 are possible modes for alternate functions. On each pin, some modes are effectively used for alternate functions, while some modes are not used and do not correspond to a functional configuration.

5. **TYPE:** Signal direction

- I = Input
- O = Output
- I/O = Input/Output
- D = Open drain
- DS = Differential
- A = Analog

**Note:** In the safe\_mode, the buffer is configured in high-impedance.

6. **BALL RESET STATE:** The state of the terminal at reset (power up).

- 0: The buffer drives  $V_{OL}$  (pulldown/pullup resistor not activated)  
0(PD): The buffer drives  $V_{OL}$  with an active pulldown resistor.
- 1: The buffer drives  $V_{OH}$  (pulldown/pullup resistor not activated)  
1(PU): The buffer drives  $V_{OH}$  with an active pullup resistor.
- Z: High-impedance
- L: High-impedance with an active pulldown resistor
- H : High-impedance with an active pullup resistor

7. **BALL RESET REL. STATE:** The state of the terminal at reset release.

- 0: The buffer drives  $V_{OL}$  (pulldown/pullup resistor not activated)  
0(PD): The buffer drives  $V_{OL}$  with an active pulldown resistor.
- 1: The buffer drives  $V_{OH}$  (pulldown/pullup resistor not activated)  
1(PU): The buffer drives  $V_{OH}$  with an active pullup resistor.
- Z: High-impedance
- L: High-impedance with an active pulldown resistor
- H : High-impedance with an active pullup resistor

8. **RESET REL. MODE:** This mode is automatically configured on release of the internal GLOBAL\_PWRON reset.

9. **POWER:** The voltage supply that powers the terminal's I/O buffers.

10. **HYS:** Indicates if the input buffer is with hysteresis.

11. **BUFFER STRENGTH:** Drive strength of the associated output buffer.

12. **PULL U/D - TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.

**Note:** The pullup/pulldown drive strength is equal to 100  $\mu$ A except for CBB balls P27, P26, R27, and R25 and CUS balls N22, N21, N20, and P24, which the pulldown drive strength is equal to 1.8 k $\Omega$ .

13. **IO CELL:** IO cell information.

**Note:** Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration.

## 2.4 Multiplexing Characteristics

Table 2-4 provides a description of the OMAP35 30/25 multiplexing on the CBB, CBC, and CUS packages, respectively.

**Note:** The following does not take into account subsystem pin multiplexing options. Subsystem pin multiplexing options are described in Section 2.5, *Signal Description*.

**Table 2-4. Multiplexing Characteristics**

## 2.5 Signal Description

Many signals are available on multiple pins according to the software configuration of the pin multiplexing options.

1. **SIGNAL NAME:** The signal name
2. **DESCRIPTION:** Description of the signal
3. **TYPE:** Type = Ball type for this specific function:
  - I = Input
  - O = Output
  - Z = High-impedance
  - D = Open Drain
  - DS = Differential
  - A = Analog
4. **BALL BOTTOM:** Associated ball(s) bottom
5. **BALL TOP:** Associated ball(s) top
6. **SUBSYSTEM PIN MULTIPLEXING:** Contains a list of the pin multiplexing options at the module/subsystem level. The pin function is selected at the module/system level.

**Note:** The Subsystem Multiplexing Signals are not described in the following tables.

### 2.5.1 External Memory Interfaces

**Table 2-5. External Memory Interfaces – GPMC Signals Description**

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBB Pkg.) [4]	BALL TOP (CBB Pkg.) [5]	BALL BOTTOM (CBC Pkg.) [4]	BALL TOP (CBC Pkg.) [5]	BALL BOTTOM (CUS Pkg.) [4]	SUBSYSTEM PIN MULTIPLEXING [6]
gpmc_a1	General-purpose memory address bit 1	O	N4 / K1	AC15 / M2	J2 / AA2	NA / U2	K4/ L2	/ gpmc_d0
gpmc_a2	General-purpose memory address bit 2	O	M4 / L1	AB15 / M1	H1 / AA1	NA / U1	K3/ M1	gpmc_a18/ gpmc_d1
gpmc_a3	General-purpose memory address bit 3	O	L4 / L2	AC16 / N2	H2 / AC2	NA / V2	K2/ M2	gpmc_a19/ gpmc_d2

## 2.5.4 Removable Media Interfaces

**Table 2-18. Removable Media Interfaces – MMC/SDIO Signals Description**

SIGNAL NAME	DESCRIPTION	TYPE <sup>(1)</sup>	BALL BOTTOM (CBB Pkg.)	BALL BOTTOM (CBC Pkg.)	BALL BOTTOM (CUS Pkg.)
<b>MULTIMEDIA MEMORY CARD (MMC1) / SECURE DIGITAL IO (SDIO1)</b>					
mmc1_clk	MMC/SD Output Clock	O	N28	N19	M23
mmc1_cmd	MMC/SD command signal	IO	M27	L18	L23
mmc1_dat0	MMC/SD Card Data bit 0 / SPI Serial Input	IO	N27	M19	M22
mmc1_dat1	MMC/SD Card Data bit 1	IO	N26	M18	M21
mmc1_dat2	MMC/SD Card Data bit 2	IO	N25	K18	M20
mmc1_dat3	MMC/SD Card Data bit 3	IO	P28	N20	N23
mmc1_dat4	MMC/SD Card Data bit 4	IO	P27	M20	N22
mmc1_dat5	MMC/SD Card Data bit 5	IO	P26	P17	N21
mmc1_dat6	MMC/SD Card Data bit 6	IO	R27	P18	N20
mmc1_dat7	MMC/SD Card Data bit 7	IO	R25	P19	P24
<b>MULTIMEDIA MEMORY CARD (MMC2) / SECURE DIGITAL IO (SDIO2)</b>					
mmc2_clk	MMC/SD Output Clock	O	AE2	W10	Y1
mmc2_dir_dat0	Direction control for DAT0 signal case an external transceiver used	O	AE4	V10	AB2
mmc2_dir_dat1	Direction control for DAT1 and DAT3 signals case an external transceiver used	O	AH3	M3	AA2
mmc2_dir_dat2	Direction control for DAT2 signal case an external transceiver used	O	AF19	E4	AC17
mmc2_dir_dat3	Direction control for DAT4, DAT5, DAT6, and DAT7 signals case an external transceiver used	O	AE21	G3	AB16
mmc2_clkin	MMC/SD input Clock	I	AE3	K3	AA1
mmc2_dat0	MMC/SD Card Data bit 0	IO	AH5	T10	AB3
mmc2_dat1	MMC/SD Card Data bit 1	IO	AH4	T9	Y3
mmc2_dat2	MMC/SD Card Data bit 2	IO	AG4	U10	W3
mmc2_dat3	MMC/SD Card Data bit 3	IO	AF4	U9	V3
mmc2_dat4	MMC/SD Card Data bit 4	IO	AE4 / AB3	P9 / V10	AB2 / T5
mmc2_dat5	MMC/SD Card Data bit 5	IO	AH3 / AB4	M3/P8	AA2 / R4
mmc2_dat6	MMC/SD Card Data bit 6	IO	AF3 / AA4	L3/P7	Y2 / T4
mmc2_dat7	MMC/SD Card Data bit 7	IO	AE3 / AC2	K3/R7	AA1 / T6
mmc2_dir_cmd	Direction control for CMD signal case an external transceiver is used	O	AF3	L3	Y2
mmc2_cmd	MMC/SD command signal	IO	AG5	R10	AB5
<b>MULTIMEDIA MEMORY CARD (MMC3) / SECURE DIGITAL IO (SDIO3)</b>					
mmc3_clk	MMC/SD Output Clock	O	AB1 / AF10	R9 / AB2	AC1
mmc3_cmd	MMC/SD command signal	IO	AC3 / AE10	R8 / AB3	AD3
mmc3_dat0	MMC/SD Card Data bit 0 / SPI Serial Input	IO	AE4 / AE11	V10 / Y3	AB2 / AC5
mmc3_dat1	MMC/SD Card Data bit 1	IO	AH3 / AH9	M3/AB1	AA2 / AD2
mmc3_dat2	MMC/SD Card Data bit 2	IO	AF3 / AF13	L3/AE3	Y2 / AC8
mmc3_dat3	MMC/SD Card Data bit 3	IO	AE3 / AE13	K3/AA3	AA1 / AD8
mmc3_dat4	MMC/SD Card Data bit 4	IO	AF11	AC3	AD6
mmc3_dat5	MMC/SD Card Data bit 5	IO	AG9	V2	AD5
mmc3_dat6	MMC/SD Card Data bit 6	IO	AF9	AA4	AC4
mmc3_dat7	MMC/SD Card Data bit 7	IO	AH14	AD2	AD9

(1) Type = Ball type for this specific function (I = Input, O = Output, Z = high-impedance, D = Open Drain, DS = Differential, A = Analog)

## 2.5.5 Test Interfaces

**Table 2-19. Test Interfaces – ETK Signals Description**

SIGNAL NAME	DESCRIPTION	TYPE <sup>(1)</sup>	BALL BOTTOM (CBB Pkg.)	BALL BOTTOM (CBC Pkg.)	BALL BOTTOM (CUS Pkg.)
etk_ctl	ETK trace ctl	O	AE10	AB2	AD3
etk_clk	ETK trace clock	O	AF10	AB3	AC1
etk_d0	ETK data 0	O	AF11	AC3	AD6
etk_d1	ETK data 1	O	AG12	AD4	AC6
etk_d2	ETK data 2	O	AH12	AD3	AC7
etk_d3	ETK data 3	O	AE13	AA3	AD8
etk_d4	ETK data 4	O	AE11	Y3	AC5
etk_d5	ETK data 5	O	AH9	AB1	AD2
etk_d6	ETK data 6	O	AF13	AE3	AC8
etk_d7	ETK data 7	O	AH14	AD2	AD9
etk_d8	ETK data 8	O	AF9	AA4	AC4
etk_d9	ETK data 9	O	AG9	V2	AD5
etk_d10	ETK data 10	O	AE7	AE4	AC3
etk_d11	ETK data 11	O	AF7	AF6	AC9
etk_d12	ETK data 12	O	AG7	AE6	AC10
etk_d13	ETK data 13	O	AH7	AF7	AD11
etk_d14	ETK data 14	O	AG8	AF9	AC11
etk_d15	ETK data 15	O	AH8	AE9	AD12

(1) Type = Ball type for this specific function (I = Input, O = Output, Z = high-impedance, D = Open Drain, DS = Differential, A = Analog)

**Table 2-20. Test Interfaces – JTAG Signals Description**

SIGNAL NAME	DESCRIPTION	TYPE <sup>(1)</sup>	BALL BOTTOM (CBB Pkg.)	BALL BOTTOM (CBC Pkg.)	BALL BOTTOM (CUS Pkg.)
jtag_nrst	Test Reset	I	AA17	U15	AB7
jtag_tck	Test Clock	I	AA13	V14	AB6
jtag_rtck	ARM Clock Emulation	O	AA12	W13	AA7
jtag_tms_tmisc	Test Mode Select	IO	AA18	V15	AA9
jtag_tdi	Test Data Input	I	AA20	U16	AB10
jtag_tdo	Test Data Output	O	AA19	Y13	AB9
jtag_emu0	Test emulation 0	IO	AA11	Y15	AC24
jtag_emu1	Test emulation 1	IO	AA10	Y14	AD24

(1) Type = Ball type for this specific function (I = Input, O = Output, Z = high-impedance, D = Open Drain, DS = Differential, A = Analog)

**Table 2-21. Test Interfaces – SDTI Signals Description**

SIGNAL NAME	DESCRIPTION	TYPE <sup>(1)</sup>	BALL BOTTOM (CBB Pkg.)	BALL BOTTOM (CBC Pkg.)	BALL BOTTOM (CUS Pkg.)	SUBSYSTEM SIGNAL MULTIPLEXING <sup>(2)</sup>
sdti_clk	Serial clock dual edge	O	AF7 / AA11 / AG8	AF6 / Y15 / AF9	AC9 / AC24 / AC11	etk_d11 / jtag_emu0 / etk_d14
sdti_txd0	Serial data out (System Trace messages)	O	AG7 / AA10 / AA11	AE6 / Y14 / Y15	AC10 / AD24 / AC24	etk_d12 / jtag_emu1 / jtag_emu0

sys_boot6	Boot configuration mode bit 6	I	AF21	NA	D4	NA	AA15
sys_nrespwrn	Power On Reset	I	AH25	NA	V13	NA	AA10
sys_nreswarm	Warm Boot Reset (open drain output)	IOD	AF24	NA	AD7	NA	Y10
sys_nirq	External FIQ input	I	AF26	NA	V16	NA	W16
sys_nvmode1	Indicates the voltage mode	O	AD26	NA	AD15	NA	Y16
sys_nvmode2	Indicates the voltage mode	O	AE26	NA	W16	NA	Y15
sys_off_mode	Indicates the voltage mode	O	AF22	NA	V12	NA	AD23
sys_ndmareq0	External DMA request 0 (system expansion). Level (active low) or edge (falling) selectable.	I	U8	NA	B6	NA	D2
sys_ndmareq1	External DMA request 1 (system expansion). Level (active low) or edge (falling) selectable.	I	T8 / J8	NA	B4 / C6	NA	F4 / C2
sys_ndmareq2	External DMA request 2 (system expansion). Level (active low) or edge (falling) selectable.	I	L3 / R8	NA	D1 / C4	NA	H2 / G5
sys_ndmareq3	External DMA request 3 (system expansion). Level (active low) or edge (falling) selectable.	I	K3 / P8	NA	D2 / B5	NA	G2 / F3
sys_secure_indicator	MSECURE transactions indicator	O	AG9	NA	V2	NA	AD5
sys_drm_msecure	MSECURE output	O	AF9	NA	AA4	NA	AC4

(1) Type = Ball type for this specific function (I = Input, O = Output, Z = high-impedance, D = Open Drain, DS = Differential, A = Analog)

## 2.5.10 Feed-Through Balls (CBC and CBB Packages)

Feed-through pins represent a wire. That is, they do not connect to the silicon die, but rather just connect from the bottom ball to the top ball. The purpose of these balls is to allow for different PoP packages. [Table 2-27](#) and [Table 2-28](#) list the feed-through balls on the OMAP35x CBC and CBB packages, respectively.

**Table 2-27. CBC Package Feed-Through Balls**

JEDEC 14x14mm, 152ball	JEDEC DESCRIPTION <sup>(1)</sup>	BALL TOP	BALL BOTTOM	FEED-THROUGH BALL NAME

## 3 ELECTRICAL CHARACTERISTICS

### 3.1 Power Domains

The OMAP35 30/25 device integrates enhanced features that dynamically adapt energy consumption according to application needs and performance requirements.

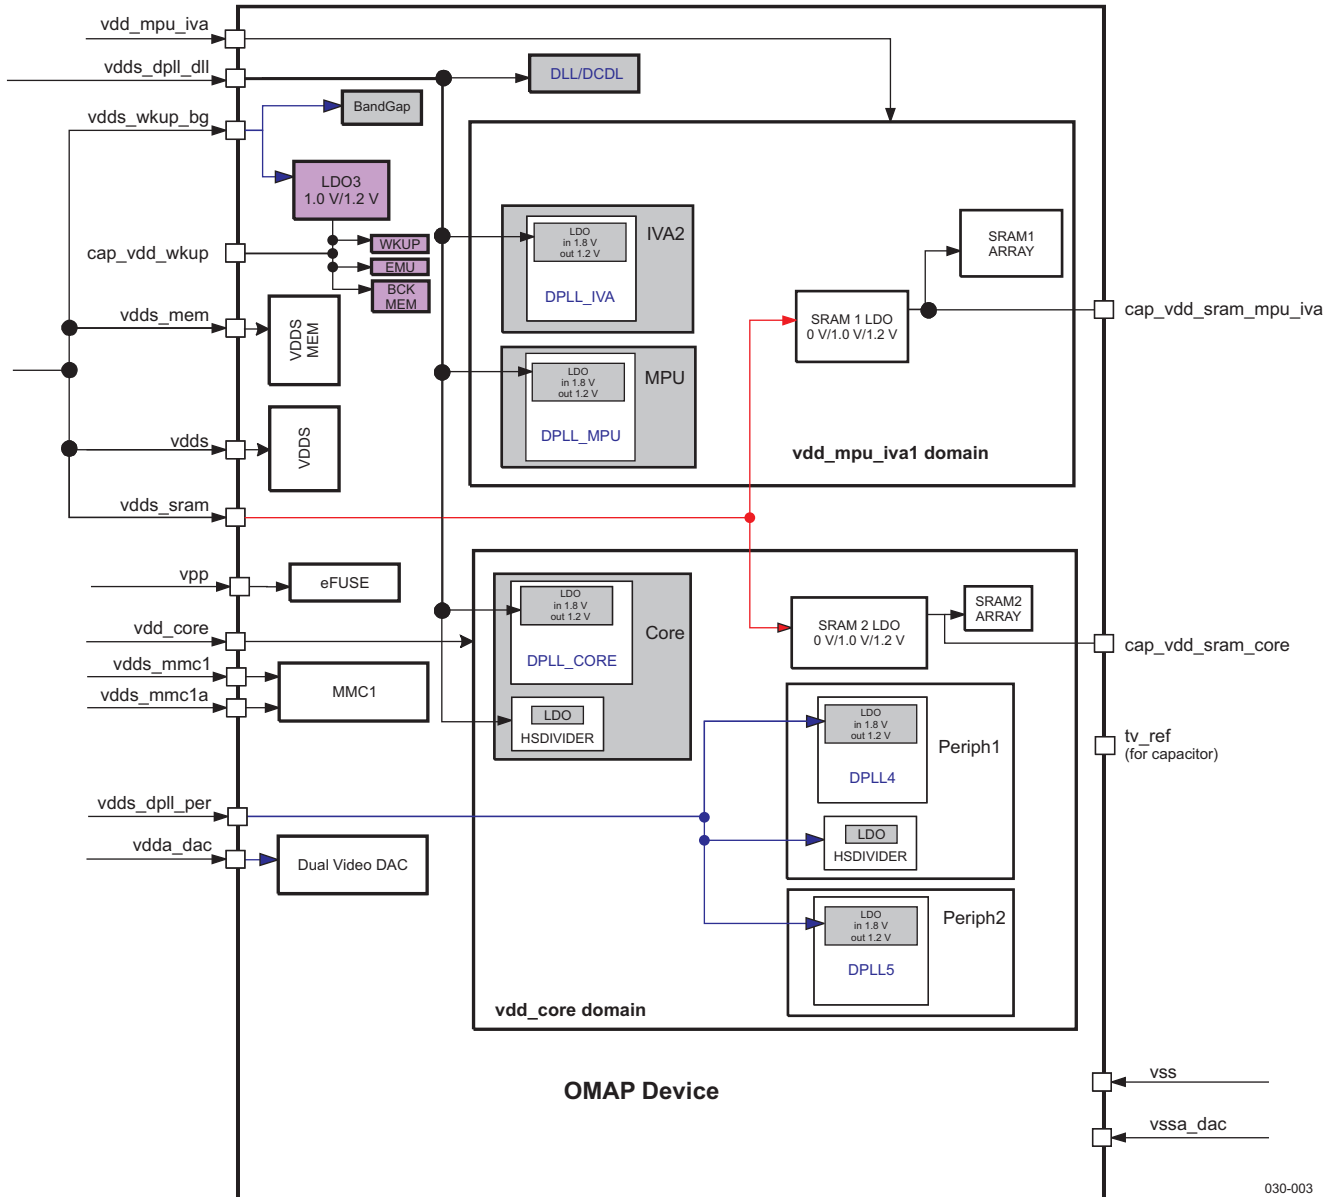

The OMAP35 30/25 device includes an enhanced power-management scheme based on:

- Nine independent functional voltage domains on chip partitioning
- Multiple voltage domains
- Voltage scaling support
- Enhanced memory retention support
- Optimized device off mode
- Centralized management of power, reset, and clock

The external power supplies of OMAP35 30/25 are:

- vdd\_mpu\_iva for the ARM and IVA2.2 processors
- vdd\_core for macros
- vdds for IO macros
- vdds\_mem for memory macros
- vdds\_sram for SRAM LDOs
- vdds\_dppll\_dll for DLL IO
- vdds\_dppll\_per for peripheral DPLLs
- vdds\_wkup\_bg for wakeup LDO and VDDA (2 LDOs: SRAM and BandGap)
- vdda\_dac for video DAC
- vdds\_mmc1 and vdds\_mmc1a for MMC IO
- The supply voltages are detailed in [Table 3-3](#).

[Figure 3-1](#) illustrates the power domains:

030-003

Figure 3-1. OMAP3525 and OMAP3530 Power Domains

This power domain segmentation switches off (or places in retention state) domains that are unused while keeping others active. This implementation is based on internal switches that independently control each power domain.

A power domain regular logic is attached to one of the device  $V_{DD}$  supplies through a primary domain switch. When the primary switch is open, most of the logic supply is off, resulting in a low-leakage state of the domain. Embedded switches are implemented for all power domains except the wake-up domain. This allows the domain to be powered off, if not being used, to give maximum power savings. For more information, see the PRCM chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUFA5](#)].

All domain output signals at the interface between power domains are connected through isolation latch cells. These cells ensure a proper electrical isolation between the domains and an appropriate interface state at the domain boundaries.

### 3.2 Absolute Maximum Ratings

The following table specifies the absolute maximum ratings over the operating junction temperature range of OMAP commercial and extended temperature devices. Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

**Notes:**

- Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.
- The OMAP35 30/25 device adheres to EIA/JESD22–A114, Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM). Minimum pass level for HBM is ±1 kV.

**Table 3-1. Absolute Maximum Ratings Over Operating Junction Temperature Range**

PARAMETER		MIN	MAX	UNIT		
vdd_mpu_iva vdd_core	Supply voltage range for core macros		-0.5	1.6	V	
vdds vdds_mem	Second supply voltage range for 1.8-V I/O macros		-0.5	2.25	V	
vdds_mmc1	Supply voltage range for MMC1 CMD, CLK and DAT[3:0] and for memory stick I/Os	1.8-V mode	-0.5	2.45	V	
		3.0-V mode	-0.5	3.50		
vdds_ vdds_mmc1a	Second supply voltage range for MMC1 DAT[7:4]	1.8-V mode	-0.5	2.45	V

			Other pins		1000	
		CDM (charged device model) <sup>(7)</sup>	MMC1 signals (CBB pkg only) <sup>(6)</sup>		300	
			Other pins		500	
I <sub>IOI</sub>	Current-pulse injection on each I/O pin <sup>(8)</sup>			200	mA	
I <sub>clamp</sub>	Clamp current for an input or output		-20	20	mA	
T <sub>stg</sub>	Storage temperature range <sup>(9)</sup>		-65	150	°C	

(1) For a maximum time of 30% time period.  
 (2) For a maximum time of 15% time period.  
 (3) Depending on ball, vddsx can be vdds\_mem or vdds.  
 (4) Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.  
 (5) JEDEC JESD22–A114F  
 (6) Corresponding signals: mmc1\_dat0, mmc1\_dat1, mmc1\_dat2, mmc1\_dat3, mmc1\_dat4, mmc1\_dat5, mmc1\_dat6, mmc1\_dat7, mmc1\_clk, mmc1\_cmd and vdds\_mmc1 (CBB pkg only).  
 (7) JEDEC JESD22–C101D  
 (8) Each device is tested with I/O pin injection of 200 mA with a stress voltage of 1.5 times maximum vdd at room temperature.  
 (9) These temperatures extreme do not simulate actual operating conditions but exaggerate any faults that might exist.

This section includes the maximum power consumption for each power domain (core, IVA2, etc.). [Table 3-2](#) summarizes the power consumption at the ball level.

**Table 3-2. Estimated Maximum Power Consumption At Ball Level**

PARAMETER		MAX ( T = 90°C)	MAX ( T = 105°C)	UNIT	
Signal	Description				
vdd_mpu_iva	Processors <sup>(1)</sup>	OMAP35 30/25 (SmartReflex™ Enabled - OPP5)	994	1051	mA
		OMAP35 30/25 (SmartReflex™ Disabled - OPP5)	1236	1317	mA
		OMAP3530 (SmartReflex™ Enabled - OPP6)	1177	1233	mA
		OMAP3530 (SmartReflex™ Disabled - OPP6)	1457	1538	mA
vdd_core	Core <sup>(1)</sup>	OMAP3530 (SmartReflex™ Enabled - OPP5/6)	439	489	mA
		OMAP3530 (SmartReflex™ Disabled - OPP5/6)	539	609	mA
		OMAP3525 (SmartReflex™ Enabled - OPP5)	353	403	mA
		OMAP3525(SmartReflex™ Disabled - OPP5)	438	507	mA
vdda_dac	Video DAC	65	65	mA	
vdss_dppll_dll	DLL + DPLL MPU, DSP, and core	25	25	mA	
vdss_dppll_per	DPLL peripheral 1 and peripheral 2	15	15	mA	
vdss_sram	Processors and core LDO (LDO1 and LDO2)	41	41	mA	
vdss_wkup_bg	Bandgap, wakeup + LDO, EMU off	6	6	mA	
vdss_mem	Standard I/Os (SDRC+GPMC)	37	37	mA	
vdss	Standard I/Os (all excluding SDRC and GPMC)	63	63	mA	
vdss_mmc1	MMC I/O <sup>(2)</sup>	20	20	mA	
vdss_mmc1a	Power supply for MMC IO [DAT4 – DAT7]	2	2	mA	
vpp	eFuse	50	50	mA	

(1) OPP6 is not currently supported in HiRel device.

(2) MMC card and I/O card are not included.

### 3.3 Recommended Operating Conditions

All OMAP3530/25 modules are used under the operating conditions contained in [Table 3-3](#).

**Note:**

To avoid significant device degradation for commercial temperature OMAP3530/OMAP3525 devices ( $0^{\circ}\text{C} \leq T_j \leq 90^{\circ}\text{C}$ ), the device power-on hours (POH) must be limited to one of the following:

- 100K total POH when operating across all OPPs and keeping the time spent at OPP5 to less than 23K POH.
- 50K total POH when operating at OPP5.
- 44K total POH with *no restrictions* to the proportion of these POH at operating points OPP1 - OPP5.

To avoid significant device degradation for extended temperature OMAP3530A/OMAP3525A devices ( $-40^{\circ}\text{C} \leq T_j \leq 105^{\circ}\text{C}$ ), the following restrictions apply:

- The total device POH must be limited to less than 50K.
- 50K total POH when operating OPP1-4.
- 50K total POH when operating across all OPPs and keeping the time spent at OPP5 to less than 10K POH. Total FIT Rate increases from design goal of 50FIT to 70FIT under these accelerated conditions.
- 20K total POH when operating exclusively at OPP5. Total FIT Rate increases from design goal of 50FIT to 70FIT under these accelerated conditions.

If an extended temperature device is operated such that  $T_j$  never exceeds  $90^{\circ}\text{C}$  ( $-40^{\circ}\text{C} \leq T_j \leq 90^{\circ}\text{C}$ ) then the OPP POH limits for commercial devices indicated above apply.

**Note:** Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

**Table 3-3. Recommended Operating Conditions**

### 3.5 Core Voltage Decoupling

For module performance, decoupling capacitors are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage. A decoupling capacitor is most effective when it is close to the device because this minimizes the inductance of the circuit board wiring and interconnects.

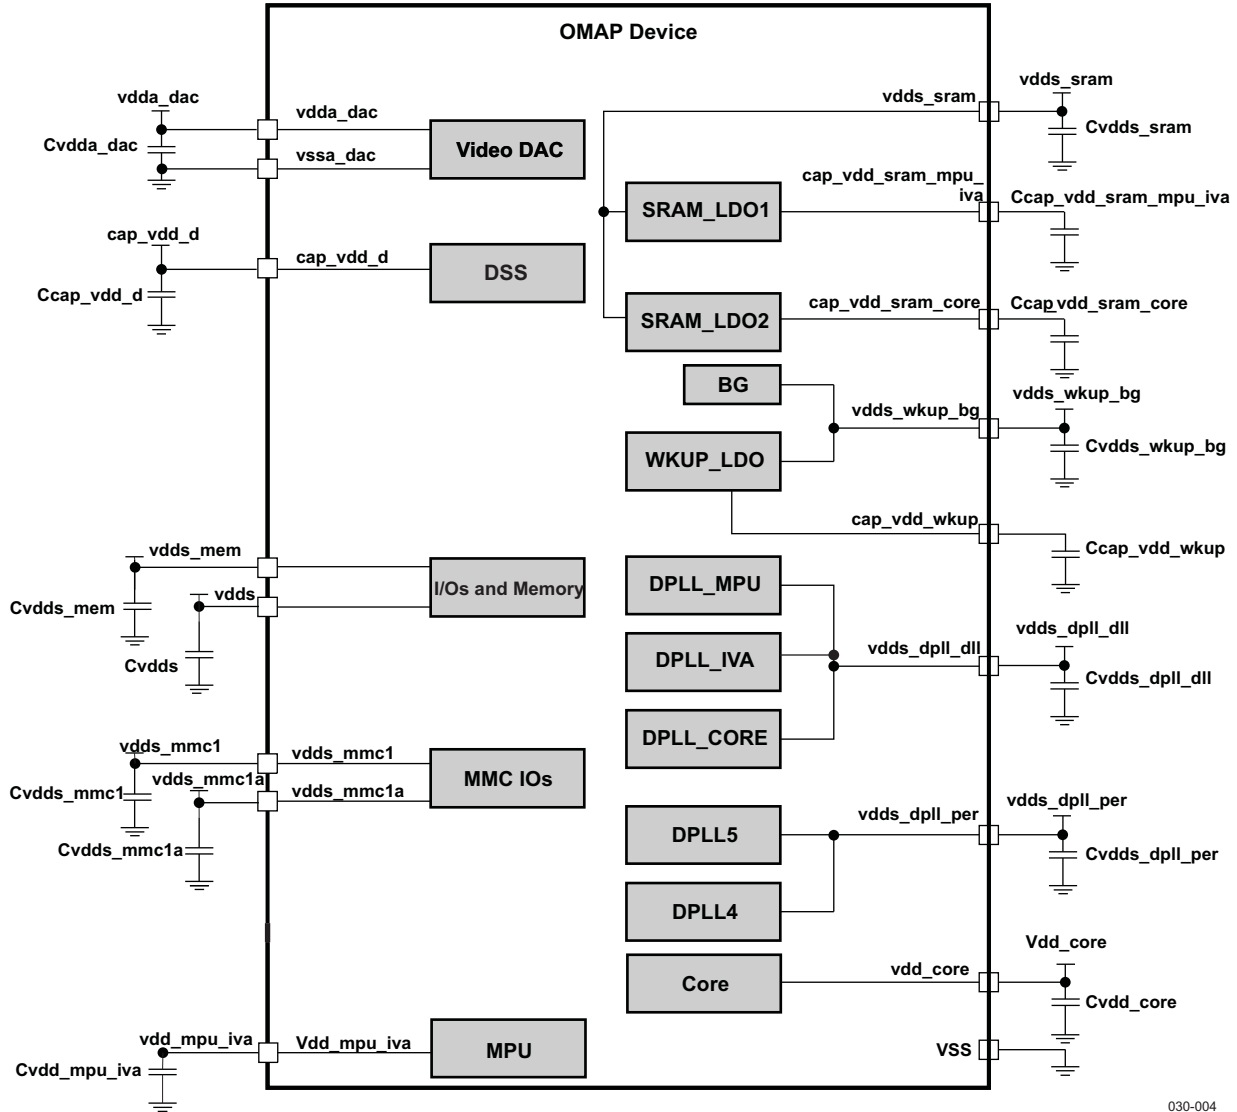

Table 3-5 summarizes the power supplies decoupling characteristics.

**Table 3-5. Core Voltage Decoupling Characteristics**

PARAMETER	MIN	TYP	MAX	UNIT
Cvdd_mpu_iva <sup>(1)</sup>	50	100	120	nF

(1) 1 capacitor per 2 to 4 balls

illustrates an example of power supply decoupling.

030-004

- A. Signals "vdds" and "vdds\_mem" are combined with "vdds" on the CBC package.
- B. Signals "vdds" and "vdds\_mem" are separate on the CBB and CUS packages.

**Figure 3-2. Power Supply Decoupling**

## 3.6 Power-up and Power-down

This section provides the timing requirements for the OMAP3525 and OMAP3530 hardware signals.

### 3.6.1 Power-up Sequence

The following steps give an example of power-up sequence supported by the OMAP3525 and OMAP3530 device.

1. vdds and vdds\_mem are ramped ensuring a level on the IO domain and sys\_nrespwron must be low. At the same time, vdds\_sram and vdds\_wkup\_bg can also be ramped.
2. Once vdds\_wkup\_bg rail is stabilized, vdd\_core can be ramped.
3. Once vdd\_core is stabilized, then vdd\_mpu\_iva can be ramped.
4. vdds\_dpll\_dll and vdds\_dpll\_per rails can be ramped at any time during the above sequence.
5. sys\_nrespwron can be released as soon as the vdds\_pll\_dll rail is stabilized, and sys\_xtalin and sys\_32k clocks are stabilized.
6. During the whole sequence above, sys\_nreswarm is held low by OMAP3525 and OMAP3530 . sys\_nreswarm is released after the eFuse check has been performed; that is, after sys\_nrespwron is released.
7. The other power supplies can then be turned on upon software request.

shows the power-up sequence.

#### Notes:

- If an external square clock is provided, it could be started after sys\_nrespwron release provided it is clean: no glitch, stable frequency, and duty cycle.
- Higher voltage can be used. OPP voltage values may change following the silicon characterization result.

030-005

Figure 3-3. Power-up Sequence

### 3.6.2 Power-down Sequence

The following steps give an example of the power-down sequence supported by the OMAP3525 and OMAP3530 device.

1. Reset OMAP3525 and OMAP3530 device.
2. Stop all signals driven to OMAP3525 and OMAP3530 balls.
3. Option 1: Power down all domains simultaneously.
4. Option 2: If all domains cannot be powered down simultaneously, follow the below sequence:
  - (a) Power off all complex I/O domains (vdds\_mmc1, vdds\_mmc1a, vdda\_dac)
  - (b) Power off all core domains (vdd\_core, vdd\_mpu\_iva)
  - (c) Power off all PLL domains (vdds\_dpll\_dll, vdds\_dpll\_per)
  - (d) Power off all SRAM LDOs (vdds\_sram)
  - (e) Power off all reference domains (vdds\_wkup\_bg)
  - (f) Power off all standard I/O domains (vdds, vdds\_mem)

The OMAP3525 and OMAP3530 device proceeds with the power-down sequence shown in .

**Note:** Another possible power-down sequence:

- vdd\_mpu\_iva shuts down before vdd\_core.
- vdds\_sram, vdds\_wkup\_bg, vdds, and vdds\_mem shut down simultaneously.
- vdds\_dpll\_dll and vdds\_dpll\_per shut down anytime between all complex IO domains shut down and vdds\_sram shuts down.

034-009

Figure 3-4. Power-down Sequence

## 4 CLOCK SPECIFICATIONS

The OMAP3525 and OMAP3530 device has three external input clocks, a low frequency (sys\_32k), a high frequency (sys\_xtalin), and an optional (sys\_altclk). The OMAP3525 and OMAP3530 device has two configurable output clocks, sys\_clkout1 and sys\_clkout2.

Figure 4-1 shows the interface to the external clock sources and clock outputs.

Figure 4-1. Clock Interface

The OMAP3525 and OMAP3530 device operation requires the following three input clocks:

- The 32-kHz frequency is used for low frequency operation. It supplies the wake-up domain for operation in lowest power mode (off mode). This clock is provided through the sys\_32k pin.
- The system alternative clock can be used (through the sys\_altclk pin) to provide alternative 48 or 54 MHz or other clock source (up to 59 MHz).
- The system clock input (12, 13, 16.8, 19.2, 26, or 38.4 MHz) is used to generate the main source clock of the OMAP3525 and OMAP3530 device. It supplies the DPLLs as well as several OMAP modules. The system clock input can be connected to either:
  - A crystal oscillator clock managed by sys\_xtalin and sys\_xtalout. In this case, the sys\_clkreq is used as an input (GPIN).
  - A CMOS digital clock through the sys\_xtalin pin. In this case, the sys\_clkreq is used as an output to request the external system clock.

The OMAP3525 and OMAP3530 outputs externally two clocks:

- sys\_clkout1 can output the oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz) at any time. It can be controlled by software or externally using sys\_clkreq control. When the device is in the off state, the sys\_clkreq can be asserted to enable the oscillator and activate the sys\_clkout1 without waking up the device. The off state polarity of sys\_clkout1 is programmable.

- sys\_clkout2 can output the oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz), core\_clk (core DPLL output), 96 MHz or 54 MHz. It can be divided by 2, 4, 8, or 16 and its off state polarity is programmable. This output is active only when the core power domain is active.

For more information on the OMAP3525 and OMAP3530 Applications Processor clocking structure, see the Power, Reset, and Clock management (PRCM) chapter of the *OMAP35x Applications Processor TRM* (literature number [SPRUFA5](#)).

### 4.1 Input Clock Specifications

The clock system accepts three input clock sources:

- 32-kHz digital CMOS clock
- Crystal oscillator clock or CMOS digital clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz)
- Alternate clock (48 or 54 MHz, or other up to 59 MHz)

#### 4.1.1 Clock Source Requirements

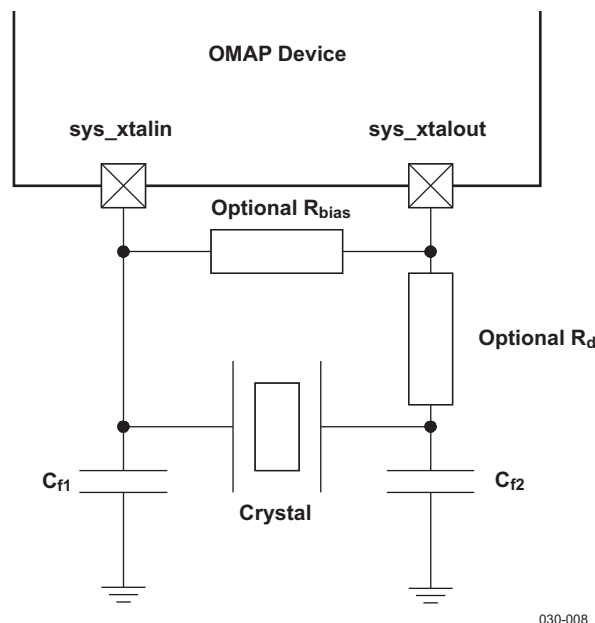

Table 4-1 illustrates the requirements to supply a clock to the OMAP3525 and OMAP3530 device.

**Table 4-1. Clock Source Requirements**

PAD	CLOCK FREQUENCY		STABILITY	DUTY CYCLE	JITTER	TRANSITION
sys_xtalout	12, 13, 16.8, or 19.2 MHz	Crystal	± 25 ppm	na	na	na
sys_xtalin	12, 13, 16.8, 19.2, 26, or 38.4 MHz	Square	± 50 ppm	45% to 55%	< 1%	< 3.6 ns
sys_altclk	48,54 or up to 59 MHz		± 50 ppm	40% to 60%	< 1%	< 5 ns

#### 4.1.2 External Crystal Description

To supply a 12-, 13-, 16.8-, or 19.2-MHz clock to the OMAP3525 and OMAP3530, an external crystal can be connected to the sys\_xtalin and sys\_xtalout pins. Figure 4-2 describes the crystal implementation.

**Figure 4-2. Crystal Implementation(1) (2) (3) (4)**

- (1) On the PCB, the oscillator components (crystal, foot capacitors, optional R<sub>bias</sub> and R<sub>d</sub>) must be located close to the package. All these components must be routed first with the lowest possible number of board vias.
- (2) An optional resistor R<sub>d</sub> can be added in series with the crystal to debug or filter the harmonics; a footprint must be reserved on the PCB for use with 10-MHz crystals and feature low-drive levels.
- (3) A 120-kΩ internal bias resistor R<sub>bias</sub> is used. The feedback resistor R<sub>bias</sub> provides negative feedback to the oscillator to put it in the

linear operating region; thus oscillation begins when power is applied.

- (4)  $C_{f1}$  and  $C_{f2}$  represent the total capacitance of the PCB and components excluding the power IC and crystal. Their values in fact depend on the crystal datasheet. In the datasheet of the crystal, the frequency is specified at a specific load capacitor value which is the equivalent capacitor of the two capacitors  $C_{f1}$  and  $C_{f2}$  connected to sys\_xtalin and sys\_xtalout. The frequency of the oscillations depends on the value of the capacitors (10 pF corresponds to a load capacitor of 5 pF for the crystal).

The crystal must be in the fundamental mode of operation and parallel resonant. [Table 4-2](#) summarizes the required electrical constraints.

**Table 4-2. Crystal Electrical Characteristics**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$f_p$	Parallel resonance crystal frequency <sup>(1)</sup>	12, 13, 16.8, or 19.2			MHz
$C_L$	Load capacitance for crystal parallel resonance	5		20	pF
ESR12&13	Crystal ESR (12 and 13 MHz) <sup>(1)</sup>			80	$\Omega$
ESR16.8&19.2	Crystal ESR (16.8 and 19.2 MHz) <sup>(2)</sup>			50	$\Omega$
$C_o$	Crystal shunt capacitance	1		7	pF
$L_m$	Crystal motional inductance for $f_p = 12$ MHz			35	mH
$C_m$	Crystal motional capacitance	5		100	fF
DL	Crystal drive level			0.5	mW
$R_{bias}$	Internal bias resistor	30	120	300	k $\Omega$

- (1) Measured with the load capacitance specified by the crystal manufacturer. This load is defined by the foot capacitances tied in series. If  $C_L = 20$  pF, then both foot capacitors will be  $C_{f1} = C_{f2} = 40$  pF. Parasitic capacitance from package and board must also be taken in account.
- (2) Measured with the load capacitance specified by the crystal manufacturer. This load is defined by the foot capacitances tied in series. If  $C_L = 20$  pF, then both foot capacitors will be  $C_{f1} = C_{f2} = 40$  pF. Parasitic capacitance from package and board must also be taken in account.

$$ESR = R_m \left( 1 + \frac{C_o}{C_L} \right)^2$$

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system. [Table 4-3](#) details the switching characteristics of the oscillator and the input requirements of the 12-, 13-, 16.8-, or 19.2-MHz input clock.

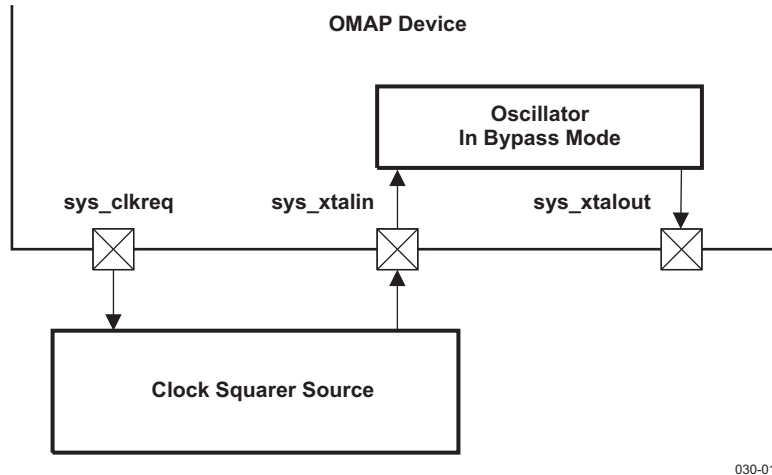

**Table 4-3. Base Oscillator Switching Characteristics**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
$f_p$	Oscillation frequency	12, 13, 16.8, or 19.2			MHz
$t_{sX}$	Start-up time <sup>(1) (2)</sup>	8			ms

- (1) Start-up time defined as time interval between oscillator control signal release and sys\_xtalin amplitude at 50% of its final value (vdd and vdds supplies ramped and stable). The start-up time can be performed in function of the crystal characteristics. 8-ms minimum only when using the internal oscillator; it is programmable after reset for wake-up. At power-on reset, the time is adjustable using the pin itself. The reset must be released when the oscillator or clock source is stable. Before the processor boots up and the oscillator is set to bypass mode, there is a start-up time when the internal oscillator is in application mode and receives a square wave. The start-up time in this case is about 100  $\mu$ s.
- (2) For  $f_p = 12$  or 13 MHz:  $C_L = 13.5$  pF and  $L_m = 35$  mH  
For  $f_p = 16.8$  or 19.2 MHz:  $C_L = 9$  pF and  $L_m = 15$  mH

### 4.1.3 Clock Squarer Input Description

A 1.8-V CMOS clock squarer is another source that can supply a 12-, 13-, 16.8-, 19.2-, 26-, or 38.4-MHz clock to the OMAP3525 and OMAP3530. An analog clock squarer function converts a low-amplitude sinusoidal clock into a low-jitter digital signal. It can be connected to input pin sys\_xtalin (sys\_xtalout unconnected). [Figure 4-3](#) illustrates the effective connections.

030-010

**Figure 4-3. Clock Squarer Source Connection**

To connect a digital clock source, the oscillator is configured in bypass mode. The `sys_clkreq` pin is an OMAP3525 and OMAP3530 output which can be used to switch the clock source on or off.

1. Pin `sys_xtalout` is not used in this mode. It must be left unconnected.
2. Once the system is powered up, the clock squarer source or crystal oscillator source can be applied; however, this affects the performance. The input source must be configured after power up to attain the desired system requirements.

Table 4-4 summarizes the electrical constraints required by the clock squarer used in the fundamental mode of operation.

**Note:** There is an internal pulldown resistor of 5k Ω (max.) on `sys_xtalin` when the oscillator is disabled.

**Table 4-4. Base Oscillator Electrical Characteristics (in Bypass Mode)**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency <sup>(1)</sup>	12, 13, 16.8, 19.2, 26, or 38.4			MHz
t <sub>sx</sub>	Start-up time	(2)			ms
I <sub>DDQ</sub>	Current consumption on VDD5 when <code>sys_xtalin</code> = 0 and in power-down mode			1	μA

(1) Measured with the load capacitance specified by the manufacturer. Parasitic capacitance from package and board must also be taken in account.

(2) Before the processor boots up and the oscillator is set to bypass mode, there is a start-up time when the internal oscillator is in application mode and receives a square wave. The start-up time in this case is about 100 μs.

Table 4-5 details the input requirements of the 12-, 13-, 16.8-, 19.2-, 26-, or 38.4-MHz input clock.

**Table 4-5. 12-, 13-, 16.8-, 19.2-, 26-, or 38.4-MHz Input Clock Squarer Timing Requirements**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
OCS0	1 / t <sub>c(xtalin)</sub>	Frequency, <code>sys_xtalin</code>	12, 13, 16.8, 19.2, 26, or 38.4			MHz
OCS1	t <sub>w(xtalin)</sub>	Pulse duration, <code>sys_xtalin</code> low or high	0.45 * t <sub>c(xtalin)</sub>		0.55 * t <sub>c(xtalin)</sub>	ns
OCS2	t <sub>J(xtalin)</sub>	Peak-to-peak jitter <sup>(1)</sup> , <code>sys_xtalin</code>	-1%		1%	
OCS3	t <sub>R(xtalin)</sub>	Rise time, <code>sys_xtalin</code>			3.6	ns
OCS4	t <sub>F(xtalin)</sub>	Fall time, <code>sys_xtalin</code>			3.6	ns
OCS5	t <sub>J(xtalin)</sub>	Frequency stability, <code>sys_xtalin</code>			±25	ppm

(1) Peak-to-peak jitter is defined as the difference between the maximum and the minimum output periods on a statistical population of 300 period samples. The sinusoidal noise is added on top of the vdds supply voltage.

030-011

Figure 4-4. Crystal Oscillator in Bypass Mode

#### 4.1.4 External 32-kHz CMOS Input Clock

A 32.768-kHz clock signal (often abbreviated to 32-kHz) can be supplied by an external 1.8-V CMOS signal on pin sys\_32k.

Table 4-6 summarizes the electrical constraints imposed to the clock source.

Table 4-6. 32-kHz Input Clock Source Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency	32.768			kHz
C <sub>I</sub>	Input capacitance		0.44		pF
R <sub>I</sub>	Input resistance	0.25		10 <sup>6</sup>	GΩ

Table 4-7 details the input requirements of the 32-kHz input clock.

Table 4-7. 32-kHz Input Clock Source Timing Requirements<sup>(1)</sup>

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
CK0	1 / t <sub>c(32k)</sub>	Frequency, sys_32k		32.768		kHz
CK3	t <sub>R(32k)</sub>	Rise time, sys_32k			20	ns
CK4	t <sub>F(32k)</sub>	Fall time, sys_32k			20	ns
CK5	t <sub>J(32k)</sub>	Frequency stability, sys_32k			±200	ppm

(1) See Table 3-4, *Electrical Characteristics*, Standard LVC MOS IOs part for sys\_32k V<sub>IH</sub>/V<sub>IL</sub> parameters.

030-012

Figure 4-5. 32-kHz CMOS Clock

#### 4.1.5 External sys\_altclk CMOS Input Clock

A 48-, 54-, or up to 59- MHz clock signal can be supplied by an external 1.8-V CMOS signal on pin sys\_altclk.

Table 4-8 summarizes the electrical constraints imposed by the clock source.

Table 4-8. 48-, 54-, or up to 59- MHz Input Clock Source Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, sys_altclk	48-, 54-, or up to 59- MHz			MHz
C <sub>I</sub>	Input capacitance		0.74		pF
R <sub>I</sub>	Input resistance	0.25		10 <sup>6</sup>	GΩ

Table 4-9 details the input requirements of the input clock.

**Table 4-9. 48- or 54-MHz Input Clock Source Timing Requirements<sup>(1) (2)</sup>**

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
ALT0	$1 / t_{c(altclk)}$ Frequency, sys_altclk	48-, 54-, or up to 59- MHz			MHz
ALT1	$t_{w(altclk)}$ Pulse duration, sys_altclk low or high	$0.40 * t_{c(altclk)}$		$0.60 * t_{c(altclk)}$	ns
ALT2	$t_{j(altclk)}$ Peak-to-peak jitter <sup>(1)</sup> , sys_altclk	-1%		1%	
ALT3	$t_{r(altclk)}$ Rise time, sys_altclk			10	ns
ALT4	$t_{f(altclk)}$ Fall time, sys_altclk			10	ns
ALT5	$t_{j(altclk)}$ Frequency stability, sys_altclk			$\pm 50$	ppm

- (1) Peak-to-peak jitter is defined as the difference between the maximum and the minimum output periods on a statistical population of 300 period samples. The sinusoidal noise is added on top of the vdds supply voltage.
- (2) See Table 3-4, *Electrical Characteristics*, for sys\_altclk  $V_{IH}/V_{IL}$  parameters.

030-013

**Figure 4-6. Alternate CMOS Clock**

## 4.2 Output Clock Specifications

Two output clocks (pin sys\_clkout1 and pin sys\_clkout2) are available:

- sys\_clkout1 can output the oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz) at any time. It can be controlled by software or externally using sys\_clkreq control. When the device is in the off state, the sys\_clkreq can be asserted to enable the oscillator and activate the sys\_clkout1 without waking up the device. The off state polarity of sys\_clkout1 is programmable.
- sys\_clkout2 can output sys\_clk (12, 13, 16.8, 19.2, 26, or 38.4 MHz), CORE\_CLK (core DPLL output, 332 MHz maximum), APLL-96 MHz, or APLL-54 MHz. It can be divided by 2, 4, 8, or 16 and its off state polarity is programmable. This output is active only when the core domain is active.

Table 4-10 summarizes the sys\_clkout1 output clock electrical characteristics.

**Table 4-10. sys\_clkout1 Output Clock Electrical Characteristics**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
f	Frequency		12, 13, 16.8, 19.2, 26, or 38.4			MHz
C <sub>1</sub>	Load capacitance <sup>(1)</sup>	f(max) = 38.4 MHz		37		pF
		f(max) = 26 MHz		50		

(1) The load capacitance is adapted to a frequency.

Table 4-11 details the sys\_clkout1 output clock timing characteristics.

**Table 4-11. sys\_clkout1 Output Clock Switching Characteristics**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
f	1 / CO0	Frequency	12, 13, 16.8, 19.2, 26, or 38.4			MHz
CO1	t <sub>w</sub> (CLKOUT1)	Pulse duration, sys_clkout1 low or high	0.40 *		0.60 *	ns
			t <sub>c</sub> (CLKOUT1)		t <sub>c</sub> (CLKOUT1)	
CO2	t <sub>R</sub> (CLKOUT1)	Rise time, sys_clkout1 <sup>(1)</sup>			5.5	ns
CO3	t <sub>F</sub> (CLKOUT1)	Fall time, sys_clkout1 <sup>(1)</sup>			5.5	ns

(1) With a load capacitance of 50 pF.

030-014

**Figure 4-7. sys\_clkout1 System Output Clock**

Table 4-12 summarizes the sys\_clkout2 output clock electrical characteristics.

**Table 4-12. sys\_clkout2 Output Clock Electrical Characteristics**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
f	Frequency, sys_clkout2				322	MHz
C <sub>L</sub>	Load capacitance <sup>(1)</sup>	f(max) = 166 MHz	2	8	12	pF

(1) The load capacitance is adapted to a frequency.

Table 4-13 details the sys\_clkout2 output clock timing characteristics.

**Table 4-13. sys\_clkout2 Output Clock Switching Characteristics**

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
f	1 / CO0	Frequency			322	MHz
CO1	$t_{w}(\text{CLKOUT2})$	Pulse duration, sys_clkout2 low or high	$0.40 * t_c(\text{CLKOUT2})$		$0.60 * t_c(\text{CLKOUT2})$	ns
CO2	$t_{R}(\text{CLKOUT2})$	Rise time, sys_clkout2 <sup>(1)</sup>			3.7	ns
CO3	$t_{F}(\text{CLKOUT2})$	Fall time, sys_clkout2 <sup>(1)</sup>			4.3	ns

(1) With a load capacitance of 12 pF.

030-015

### 4.3 DPLL and DLL Specifications

The OMAP3525 and OMAP3530 integrates seven DPLLs and a DLL. The PRM and CM drive five of them, while the sixth ( not supported ) and the seventh (not supported ) are controlled by the display subsystem.

The five main DPLLs are:

- DPLL1 (MPU)
- DPLL2 ( IVA2 )
- DPLL3 (Core)
- DPLL4 (Peripherals)
- DPLL5 (Second Peripherals DPLL)

Figure 4-9 illustrates the DLL and DPLL implementation.

(1) Figure 4-9. DPLL and DLL Implementation

For more information on the OMAP3525 and OMAP3530 Applications Processor DPLLs and clocking structure, see the Power, Reset, and Clock management (PRCM) chapter of the *OMAP35x Applications Processor TRM* (literature number [SPRUFA5](#)).

#### 4.3.1 Digital Phase-Locked Loop (DPLL)

The DPLL provides all interface clocks and some functional clocks (such as the processor clocks) of the OMAP3525 and OMAP3530 device.

DPLL1 and DPLL2 get an always-on clock used to produce the synthesized clock. They get a high-speed bypass clock used to switch the DPLL output clock on this high-speed clock during bypass mode.

The high-speed bypass clock is an L3 divided clock (programmable by 1 or 2) that saves DPLL processor power consumption when the processor does not need to run faster than the L3 clock speed, or optimizes performance during frequency scaling.

Each DPLL synthesized frequency is set by programming M (multiplier) and N (divider) factors. In addition, all DPLL outputs can be controlled by an independent divider (M2 to M6).

The clock generating DPLLs of the OMAP3525 and OMAP3530 device have following features:

- Independent power domain per DPLL
- Controlled by clock-manager (CM)

- Fed with always-on system clock with independent gating control per DPLL
- Analog part supplied through dedicated power supply (1.8 V) and an embedded LDO to get rid of 1-MHz noise
- Up to five independent output dividers for simultaneous generation of multiple clock frequencies

#### 4.3.1.1 DPLL1 (MPU)

DPLL1 is located in the MPU subsystem and supplies all clocks of the subsystem. All MPU subsystem clocks are internally generated in the subsystem. When the core domain is on, it can use the DPLL3 (CORE DPLL) output as a high-frequency bypass input clock.

#### 4.3.1.2 DPLL2 (IVA2)

DPLL2 is located in the IVA subsystem and supplies all clocks of the subsystem. All IVA subsystem clocks are internally generated in the subsystem. When the core domain is on, it can use the DPLL3 (CORE DPLL) output as a high-frequency bypass input clock.

#### 4.3.1.3 DPLL3 (CORE)

DPLL3 supplies all interface clocks and also a few module functional clocks. It can be also source of the emulation trace clock. It is located in the core domain area. All interface clocks and a few module functional clocks are generated in the CM. When the core domain is on, it can be used as a bypass input to DPLL1 and DPLL2.

#### 4.3.1.4 DPLL4 (Peripherals)

DPLL4 generates clocks for the peripherals. It supplies five clock sources: 96-MHz functional clocks to subsystems and peripherals, 54 MHz to TV DAC, display functional clock, camera sensor clock, and emulation trace clock. It is located in the core domain area. All interface clocks and few module functional clocks are generated in the CM. Its outputs to the DSS, PER, and EMU domains are propagated with always-on clock trees.

#### 4.3.1.5 DPLL5 (Second peripherals DPLL)

DPLL5 supplies the 120-MHz functional clock to the CM.

### 4.3.2 Delay-Locked Loops (DLL)

The SDRC includes analog-controlled delay technology for interfacing high-speed mobile DDR memory components. For more information, see the SDRC-GPMC chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)]. A DLL is a calibration module used on dynamic track of voltage and temperature variations, as well as to compensate the silicon process dispersion.

The SDRC DLL has four modes of operation:

1. APPLICATION MODE 0: used to generate 72° delay
2. APPLICATION MODE 1: used to generate 90° delay
3. MODEMAXDELAY: used for low frequency operation where we do not have the requirement of accurate 72° or 90° phase shift
4. IDLE MODE: a low-power state that allows the DLL to gain lock quickly on exit from this mode

### 4.3.3 DPLLs and DLL Characteristics

Several specifications characterize the seven DPLLs.

Table 4-14 summarizes the DPLL characteristics and assumes testing over recommended operating conditions.

**Table 4-14. DPLL Characteristics**

NAME	PARAMETER	MIN	TYP	MAX	UNIT	COMMENTS <sup>(1)</sup>
vdds_dppll_per		1.71	1.8	1.89	V	At ball level (+5%, +10%)
vdds_dppll_dll		1.71	1.8	1.89	V	
T <sub>J</sub>	Junction temperature	–40	25	105	°C	Will not unlock after lock over this range for slow temperature drifts
f <sub>input</sub>	Input reference frequency <sup>(2)</sup>	0.75		65	MHz	FINP
f <sub>internal</sub>	Internal reference frequency	0.75		2.1	MHz	FREQSEL3 = 0; FINT = FINP/(N+1)
		7.5		21	MHz	FREQSEL3 = 1; FINT = FINP/(N+1)
f <sub>output</sub>	CLKOUT output frequency	25		900	MHz	
f <sub>output*2</sub>	CLKOUTx2 output frequency	50		1800	MHz	
t <sub>lock</sub>	Frequency lock time <sup>(3)</sup>	71.4		200	μs	150 FINT cycles; FREQSEL3 = 0
		37.1		104	μs	780 FINT cycles; FREQSEL3 = 1
ρ <sub>lock</sub>	Phase lock time	166.7		466.7	μs	350 FINT cycles; FREQSEL3 = 0
		46.7		130.7	μs	980 FINT cycles; FREQSEL3 = 1
t <sub>relock</sub>	Relock time – frequency lock <sup>(4)</sup>	4.8		13.3	μs	10 FINT cycles Lowcurrstby = 0; FREQSEL3 = 0
		4.8		13.3	μs	100 FINT cycles Lowcurrstby = 0; FREQSEL3 = 1
		19		53.3	μs	40 FINT cycles Lowcurrstby = 1; FREQSEL3 = 0
		19		53.3	μs	400 FINT cycles Lowcurrstby = 1; FREQSEL3 = 1
		71.4		200	μs	150 FINT cycles Lowcurrstby = 0; FREQSEL3 = 0
		11.9		33.3	μs	250 FINT cycles Lowcurrstby = 0; FREQSEL3 = 1
ρ <sub>relock</sub>	Relock time – Phase lock <sup>(4)</sup>	95.2		266.7	μs	200 FINT cycles Lowcurrstby = 1; FREQSEL3 = 0
		26.7		74.7	μs	560 FINT cycles Lowcurrstby = 1; FREQSEL3 = 1

(1) f<sub>reqsel</sub> needs to be programmed accordingly to reference clock and DPLL divider (register setting), Lowcurrstby depends on the targeted DPLL power state (dynamic).

Lowcurrstby = 0 then DPLL is in normal mode

Lowcurrstby = 1 then DPLL is in low-power mode

(2) Input frequencies below 0.75 MHz are possible with performance penalty.

(3) Maximum frequency for nominal conditions. Speed binning possible above f<sub>max</sub>.

(4) Relock time assumes typical operating conditions, 4°C maximum temperature drift (see the Functional Specification for more detailed information).

and [Table 4-16](#) show the DPLL1 and DPLL2 clock frequency ranges.

**Note:** The DPLL1 and DPLL2 clock frequency ranges depend on the  $V_{DD1}$  (vdd\_mpu\_iva) operating point.

**Table 4-15. DPLL1 Clock Frequency Ranges**

Clock Signal	Description		Max	Unit
ARM_CLK	DPLL1 output clock.	OPP6 <sup>(1)</sup>	720	MHz
		OPP5	600	MHz
		OPP4	550	MHz
		OPP3	500	MHz
		OPP2	250	MHz
		OPP1 <sup>(2)</sup>	125	MHz

- (1) OPP6 frequency range is not currently supported in HiRel device.
- (2) Cannot boot in OPP1. If OPP1 is desired, boot in higher OPP then switch to OPP1.

**Table 4-16. DPLL2 Clock Frequency Ranges**

Clock Signal	Description		Max	Unit
IVA2_CLK	Generated from DPLL2 output clock.	OPP6 <sup>(1)</sup>	520	MHz
		OPP5	430	MHz
		OPP4	400	MHz
		OPP3	360	MHz
		OPP2	180	MHz
		OPP1 <sup>(2)</sup>	90	MHz

- (1) OPP6 frequency range is not currently supported in HiRel device.
- (2) Cannot boot in OPP1. If OPP1 is desired, boot in higher OPP then switch to OPP1.

[Table 4-17](#) through [Table 4-19](#) show the DPLL3 clock frequency ranges.

**Note:** The DPLL3 clock frequency ranges depend on the  $V_{DD2}$  (vdd\_core) operating point and the L3 clock speed configuration.

**Table 4-17. DPLL3 Clock Frequency Ranges, VDD2 OPP3**

Clock Signal	Description	Config 1 (166 MHz)		Config 2 (133 MHz)		Unit
		Min	Max	Min	Max	
CM: CORE_CLK	Output of clock manager (CM), generated directly from DPLL3.	-	332	-	266	MHz
CM: L3_ICLK	Output of clock manager (CM), generated using DPLL3.	-	166	-	133	MHz
CM: L4_ICLK	Output of clock manager (CM), generated using CM L3_ICLK and divider.	-	83	-	66.5	MHz
SGX	SGX input clock, taken from CM CORE_CLK.	-	110.67	-	88.67	MHz
SDRC	SDRC input clock, taken from CM L3_ICLK.	-	166	-	133	MHz
GPMC	GPMC input clock, taken from CM L3_ICLK.	-	83	-	66.5	MHz

**Table 4-18. DPLL3 Clock Frequency Ranges, VDD2 OPP2**

Clock Signal	Description	Config 1 (83 MHz)		Config 2 (100 MHz)		Unit
		Min	Max	Min	Max	
CM: CORE_CLK	Output of clock manager (CM), generated directly from DPLL3.	-	166	-	200	MHz
CM: L3_ICLK	Output of clock manager (CM), generated using DPLL3.	-	83	-	100	MHz

**Table 4-18. DPLL3 Clock Frequency Ranges, VDD2 OPP2 (continued)**

Clock Signal	Description	Config 1 (83 MHz)		Config 2 (100 MHz)		Unit
		Min	Max	Min	Max	
CM: L4_ICLK	Output of clock manager (CM), generated using CM L3_ICLK and divider.	-	41.5	-	50	MHz
SGX	SGX input clock, taken from CM CORE_CLK.	-	55.53	-	66.67	MHz
SDRC	SDRC input clock, taken from CM L3_ICLK.	-	83	-	100	MHz
GPMC	GPMC input clock, taken from CM L3_ICLK.	-	41.5	-	50	MHz

**Table 4-19. DPLL3 Clock Frequency Ranges, VDD2 OPP1<sup>(1)</sup>**

Clock Signal	Description	Config 1 (40 MHz)		Config 2 (50 MHz)		Unit
		Min	Max	Min	Max	
CM: CORE_CLK	Output of clock manager (CM), generated directly from DPLL3.	-	83	-	100	MHz

(1) Cannot boot in OPP1. If OPP1 is desired, boot in higher OPP then switch to OPP1.

Table 4-20 summarizes the DLL characteristics.

**Table 4-20. DLL Characteristics**

PARAMETER	MIN	NOM	MAX	UNIT	COMMENTS
Supply voltage vdds_dp11_dll	1.71	1.8	1.89	V	
Junction operating temperature	-40	25	105	°C	
Input clock frequency	66	120	133	MHz	APPLICATION MODE 0
	83	120	166		APPLICATION MODE 1
Input load <sup>(1)</sup>			15	fF	
Lock time <sup>(2)</sup>			500	Clocks	
Relock time (Mode transitions through idle mode)			500	ns	IDLE to MODEMAXDELAY
		150	372	Clocks	IDLE to APPLICATION MODE 1 or 0
		1	2	µs	IDLE to APPLICATION MODE @133 MHz
		1	1.5	µs	IDLE to APPLICATION MODE @166 MHz

(1) This parameter is design goal and is not tested on silicon.

(2) Lock signal would go high from power down within 500 clocks. Lock signal switches to low state when the input clock is switched off after 3 µs.

### 4.3.4 DPLL and DLL Noise Isolation

The DPLL and DLL require dedicated power supply pins to isolate the core analog circuit from the switching noise generated by the core logic that can cause jitter on the clock output signal. Guard rings are added to the cell to isolate it from substrate noise injection.

The vdd supplies are the most sensitive to noise; decoupling capacitance is recommended below the supply rails. The maximum input noise level allowed is 30 mV<sub>pp</sub> for frequencies below 1 MHz.

Figure 4-10 illustrates an example of a noise filter.

030-017

Figure 4-10. DPLL and DLL Noise Filter

Table 4-21 specifies the noise filter requirements.

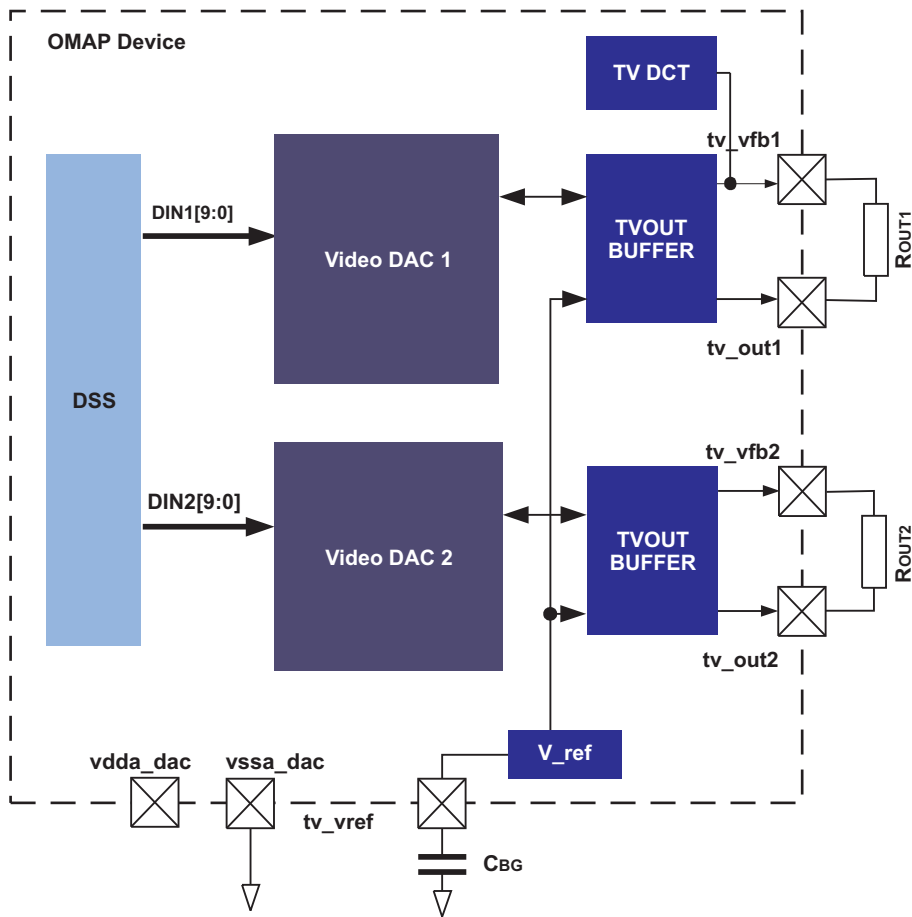

Table 4-21. DPLL and DLL Noise Filter Requirements

NAME	MIN	TYP	MAX	UNIT
Filtering capacitor		100		nF

- (1) The capacitors must be inserted between power and ground as close as possible.
- (2) This circuit is provided only as an example.
- (3) The filter must be located as close as possible to the device.
- (4) No filtering required if noise is below 10 mV<sub>pp</sub>.

## 5 VIDEO DAC SPECIFICATIONS

A dual-display interface equips the OMAP3525 and OMAP3530 processor. This display subsystem provides the necessary control signals to interface the memory frame buffer directly to the external displays (TV-set). Two (one per channel) 10-bit current steering DACs are inserted between the DSS and the TV set to generate the video analog signal. One of the video DACs also includes TV detection and power-down mode. Figure 5-1 illustrates the OMAP3525 and OMAP3530 DAC architecture. For more information, see the DSS chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

030-018

Figure 5-1. Video DAC Architecture

The following paragraphs detail the 10-bit DAC interface pinout, static and dynamic specifications, and noise requirements. The operating conditions and absolute maximum ratings are detailed in [Table 5-2](#) and [Table 5-4](#).

### 5.1 Interface Description

[Table 5-1](#) summarizes the external pins of the video DAC.

Table 5-1. External Pins of 10-bit Video DAC

PIN NAME	I/O	DESCRIPTION	
tv_out1	O	TV analog output composite	DAC1 video output. An external resistor is connected between this node and tv_vfb1. The nominal value of ROUT1 is 1650 Ω. Finally, note that this is the output node that drives the load (75 Ω).

**Table 5-1. External Pins of 10-bit Video DAC (continued)**

PIN NAME	I/O	DESCRIPTION	
tv_out2	O	TV analog output S-VIDEO	DAC2 video output. An external resistor is connected between this node and tv_vfb2. The nominal value of ROUT2 is 1650 $\Omega$ . Finally, note that this is the output node that drives the load (75 $\Omega$ ).
tv_vref	I	Reference output voltage from internal bandgap	A decoupling capacitor (CBG) needs to be connected for optimum performance.
tv_vfb1	O	Amplifier feedback node	Amplifier feedback node. An external resistor is connected between this node and tv_out1. The nominal value of ROUT1 is 1650 $\Omega$ (1%).
tv_vfb2	O	Amplifier feedback node	Amplifier feedback node. An external resistor is connected between this node and tv_out2. The nominal value of ROUT2 is 1650 $\Omega$ (1%).

## 5.2 Electrical Specifications Over Recommended Operating Conditions

( $T_{MIN}$  to  $T_{MAX}$ ,  $v_{dda\_dac} = 1.8\text{ V}$ ,  $R_{OUT1/2} = 1650\ \Omega$ ,  $R_{LOAD} = 75\ \Omega$ , unless otherwise noted)

**Table 5-2. DAC – Static Electrical Specification**

PARAMETER		CONDITIONS/ASSUMPTIONS	MIN	TYP	MAX	UNIT
R	Resolution			10		Bits
<b>DC ACCURACY</b>						
INL <sup>(1)</sup>	Integral nonlinearity		–1		1	LSB
DNL <sup>(2)</sup>	Differential nonlinearity		–1		1	LSB
<b>ANALOG OUTPUT</b>						
-	Full-scale output voltage	$R_{LOAD} = 75\ \Omega$	0.7	0.88	1	V
-	Output offset voltage			50		mV
-	Output offset voltage drift			20		mV/°C
-	Gain error		–17		19	% FS
$R_{VOUT}$	Output impedance		67.5	75	82.5	$\Omega$
<b>REFERENCE</b>						
$V_{REF}$	Reference voltage range		0.525	0.55	0.575	V
-	Reference noise density	100-kHz reference noise bandwidth		129		
$R_{SET}$	Full-scale current adjust resistor		3700	4000	4200	$\Omega$
$P_{SRR}$	Reference PSRR <sup>(3)</sup> (Up to 6 MHz)			40		dB
<b>POWER CONSUMPTION</b>						
$I_{vdda-up}$	Analog Supply Current <sup>(4)</sup>	2 channels, no load		8		mA
-	Analog supply driving a 75- $\Omega$ load (RMS)	2 channels		50		mA
$I_{vdda-up}$ (peak)	Peak analog supply current:	Lasts less than 1 ns		60		mA
$I_{vdd-up}$	Digital supply current <sup>(5)</sup>	Measured at $f_{CLK} = 54\text{ MHz}$ , $f_{OUT} = 2\text{ MHz}$ sine wave, $v_{dd} = 1.3\text{ V}$		2		mA
$I_{vdd-up}$ (peak)	Peak digital supply current <sup>(6)</sup>	Lasts less than 1 ns		2.5		mA
$I_{vdda-down}$	Analog power at power-down	$T = 30^\circ\text{C}$ , $v_{dda} = 1.8\text{ V}$		1.5		mA
$I_{vdd-down}$	Digital power at power-down	$T = 30^\circ\text{C}$ , $v_{dd} = 1.3\text{ V}$		1		mA

(1) The INL is measured at the output of the DAC (accessible at an external pin during bypass mode).

(2) The DNL is measured at the output of the DAC (accessible at an external pin during bypass mode).

(3) Assuming a capacitor of 0.1  $\mu\text{F}$  at the  $tv\_ref$  node.

(4) The analog supply current  $I_{vdda}$  is directly proportional to the full-scale output current IFS and is insensitive to  $f_{CLK}$ .

(5) The digital supply current  $I_{VDD}$  is dependent on the digital input waveform, the DAC update rate  $f_{CLK}$ , and the digital supply VDD.

(6) The peak digital supply current occurs at full-scale transition for duration less than 1 ns.

( $T_{MIN}$  to  $T_{MAX}$ ,  $v_{dda\_dac} = 1.8\text{ V}$ ,  $R_{OUT1/2} = 1650\ \Omega$ ,  $R_{LOAD} = 75\ \Omega$ , unless otherwise noted)

**Table 5-3. Video DAC – Dynamic Electrical Specification**

	PARAMETER	CONDITIONS/ASSUMPTIONS	MIN	TYP	MAX	UNIT
$f_{CLK}^{(1)}$	Output update rate	Equal to input clock frequency		54		MHz
	Clock jitter	rms clock jitter required in order to assure 10-bit accuracy			40	ps
	Attenuation at 5.1 MHz	Corner frequency for signal	0.1	0.5	1.5	dB
	Attenuation at 54 MHz <sup>(1)</sup>	Image frequency	25	30	33	dB
$t_{ST}$	Output settling time	Time from the start of the output transition to output within $\pm 1$ LSB of final value.		85		ns
$t_{Rout}$	Output rise time	Measured from 10% to 90% of full-scale transition		25		ns
$t_{Fout}$	Output fall time	Measured from 10% to 90% of full-scale transition		25		ns
BW	Signal bandwidth			6		MHz
	Differential gain <sup>(2)</sup>			1.5%		
	Differential phase <sup>(2)</sup>			1		deg.
SFDR	Within bandwidth	$f_{CLK} = 54\text{ MHz}$ , $f_{OUT} = 1\text{ MHz}$		45		dB
SNR	Signal-to-noise ratio 1 kHz to 6 MHz bandwidth	$f_{CLK} = 54\text{ MHz}$ , $f_{OUT} = 1\text{ MHz}$		55 <sup>(3)</sup>		dB
PSRR	Power supply rejection ratio	Up to 6 MHz		20 <sup>(4)</sup>		dB
Crosstalk	Between the two video channels			-50	-40	dB

- (1) For internal input clock information, For more information, see the DSS chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUJ98](#)].
- (2) The differential gain and phase value is for dc coupling. Note that there is degradation for the ac coupling.
- (3) The SNR value is for dc coupling. Note that there is a 6-dB degradation for ac coupling.
- (4) The PSSR value is for dc coupling. Note that there is a 10-dB degradation for ac coupling.

### 5.3 Analog Supply (vdda\_dac) Noise Requirements

In order to assure 10-bit accuracy of the DAC analog output, the analog supply vdda\_dac has to meet the noise requirements stated in this section.

The DAC Power Supply Rejection Ratio is defined as the relative variation of the full-scale output current divided by the supply variation. Thus, it is expressed in percentage of Full-Scale Range (FSR) per volt of

$$PSRR_{DAC} = \frac{100 \cdot \frac{\Delta I_{OUT}}{I_{OUTFS}}}{V_{AC}} \quad \left[ \% \text{ FSR} / V \right]$$

supply variation as shown in the following equation:

Depending on frequency, the PSRR is defined in [Table 5-4](#).

**Table 5-4. Video DAC – Power Supply Rejection Ratio**

Supply Noise Frequency	PSRR % FSR/V
0 to 100 kHz	1
> 100 kHz	The rejection decreases 20 dB/dec. Example: at 1 MHz the PSRR is 10% of FSR/V

A graphic representation is shown in [Figure 5-2](#).

**Figure 5-2. Video DAC – Power Supply Rejection Ratio**

To ensure that the DAC SFDR specification is met, the PSRR values and the clock jitter requirements translate to the following limits on vdda\_dac (for the Video DAC).

The maximum peak-to-peak noise on vdda (ripple) is defined in [Table 5-5](#):

**Table 5-5. Video DAC – Maximum Peak-to-Peak Noise on vdda\_dac**

Tone Frequency	Maximum Peak-to-Peak Noise on vdda_dac
0 to 100 kHz	< 30 mVpp
> 100 kHz	Decreases 20 dB/dec. Example: at 1 MHz the maximum is 3 mVpp

The maximum noise spectral density (white noise) is defined in [Table 5-6](#):

**Table 5-6. Video DAC – Maximum Noise Spectral Density**

Supply Noise Bandwidth	Maximum Supply Noise Density
0 to 100 kHz	< 20 $\mu\text{V} / \sqrt{\text{Hz}}$
> 100 kHz	Decreases 20 dB/dec. Example: at 1 MHz the maximum noise density is 2 $\mu\text{V} / \sqrt{\text{Hz}}$

Because the DAC PSRR deteriorates at a rate of 20 dB/dec after 100 kHz, it is highly recommended to have vdda\_dac low pass filtered (proper decoupling) (see the illustrated application: [Section 5.4, External Component Value Choice](#)).

## 5.4 External Component Value Choice

The full-scale output voltage  $V_{OUTMAX}$  is regulated by the reference amplifier, and is set by an internal resistor  $R_{SET}$ .  $I_{OUTMAX}$  can be expressed as:

$$I_{OUTMAX} = I_{REF} / 8 * (63 + 15/16) \quad (1)$$

Where:

$$V_{REF} = 0.55V \quad (2)$$

$$I_{REF} = V_{REF} / (2 * R_{SET}) \quad (3)$$

The output current  $I_{OUT}$  appearing at DAC output is a function of both the input code and  $I_{OUTMAX}$  and can be expressed as:

$$I_{OUT} = (DAC\_CODE/1023) * I_{OUTMAX} \quad (4)$$

Where:

$$DAC\_CODE = 0 \text{ to } 1023 \text{ is the DAC input code in decimal.} \quad (5)$$

The output voltage is:

$$V_{OUT} = I_{OUT} * N * R_{CABLE} \quad (6)$$

Where:

$$(N = \text{amplifier gain} = 21) \quad (7)$$

$$R_{CABLE} = 75 \Omega \text{ (cable typical impedance)} \quad (8)$$

The TV-out buffer requires a per channel external resistors:  $R_{OUT1/2}$ . The equation below can be used to select different resistor values (if necessary):

$$R_{OUT} = (N+1) R_{CABLE} = 1650 \Omega \quad (9)$$

Recommended parameter values are:

**Table 5-7. Video DAC – Recommended External Components Values**

	Recommended Value	UNIT
$C_{BG}$	100	nF
$R_{OUT1/2}$	1650	$\Omega$

In order to limit the reference noise bandwidth and to suppress transients on  $V_{REF}$ , it is necessary to connect a large decoupling capacitor ( $C_{BG}$ ) between the tv\_vref and vssa\_dac pins.

## 6 TIMING REQUIREMENTS AND SWITCHING CHARACTERISTICS

### 6.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions of [Table 3-3](#), unless otherwise specified.

### 6.2 Interface Clock Specifications

#### 6.2.1 Interface Clock Terminology

The Interface clock is used at the system level to sequence the data and/or control transfers accordingly with the interface protocol.

#### 6.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the OMAP3525 and OMAP3530 IC and doesn't take into account any system consideration (PCB, peripherals).

The system designer will have to consider these system considerations and OMAP3525 and OMAP3530 IC timings characteristics as well, to define properly the maximum operating frequency, which corresponds to the maximum frequency supported to transfer the data on this interface.

#### 6.2.3 Clock Jitter Specifications

Jitter is a phase noise, which may alter different characteristics of a clock signal. The jitter specified in this document is the time difference between the typical cycle period and the actual cycle period affected by noise sources on the clock. The cycle (or period) jitter terminology identifies this type of jitter.

$$\text{Max. Cycle Jitter} = \text{Max} (T_i)$$

$$\text{Min. Cycle Jitter} = \text{Min} (T_i)$$

$$\text{Jitter Standard Deviation (or rms Jitter)} = \text{Standard Deviation} (T_i)$$

030-020

Figure 6-1. Cycle (or Period) Jitter

#### 6.2.4 Clock Duty Cycle Error

The duty cycle error is the ratio between either the high-level pulse duration or the low-level pulse duration and the cycle time of a clock signal.

### 6.3 Timing Parameters

The timing parameter symbols used in the timing requirement and switching characteristic tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some pin names and other related terminologies have been abbreviated as follows:

**Table 6-1. Timing Parameters**

LOWERCASE SUBSCRIPTS	
Symbols	Parameter
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
H	High
L	Low
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

## 6.4 External Memory Interfaces

The OMAP3525 and OMAP3530 processor includes the following external memory interfaces:

- General-purpose memory controller (GPMC)
- SDRAM controller (SDRC)

### 6.4.1 General-Purpose Memory Controller (GPMC)

The GPMC is the OMAP3525 and OMAP3530 unified memory controller used to interface external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

#### 6.4.1.1 GPMC/NOR Flash Interface Synchronous Timing

Table 6-3 and Table 6-4 assume testing over the recommended operating conditions (see Figure 6-2 through Figure 6-5) and electrical characteristic conditions.

**Table 6-2. GPMC/NOR Flash Synchronous Mode Timing Conditions**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	1.8	ns
$t_F$	Input signal fall time	1.8	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	15.94	pF

**Table 6-3. GPMC/NOR Flash Interface Timing Requirements – Synchronous Mode<sup>(1)</sup>**

NO.	PARAMETER		OPP3		OPP2		OPP1 <sup>(2)</sup>		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	
F12	$t_{su(DV-CLKH)}$	Setup time, read gpmc_d[15:0] valid before gpmc_clk high	1.9		1.9		3.2		ns
F13	$t_h(CLKH-DV)$	Hold time, read gpmc_d[15:0] valid after gpmc_clk high	1.9		1.9		1.9		ns
F21	$t_{su(WAITV-CLKH)}$	Setup time, gpmc_waitx <sup>(3)</sup> valid before gpmc_clk high	1.9		1.9		3.2		ns
F22	$t_h(CLKH-WAITV)$	Hold Time, gpmc_waitx <sup>(3)</sup> valid after gpmc_clk high	2.5		2.5		2.5		ns

(1) For VDD2 (vdd\_core) OPP voltages, see Table 3-3, Recommended Operating Conditions.

(2) Cannot boot in OPP1. If OPP1 is desired, boot in higher OPP then switch to OPP1.

(3) Wait monitoring support is limited to a WaitMonitoringTime value > 0. For a full description of wait monitoring feature, see the OMAP35x Technical Reference Manual (literature number [SPRUF988](#)).

**Table 6-4. GPMC/NOR Flash Interface Switching Characteristics – Synchronous Mode**

(1) **For single read:**  $A = (CSRdOffTime - CSOnTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$  period  
**For burst read:**  $A = (CSRdOffTime - CSOnTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$  period  
**For burst write:**  $A = (CSWrOffTime - CSOnTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$  period  
with n being the page burst access number.

(2)  $B = ClkActivationTime * GPMC\_FCLK$

(3) **For single read:**  $C = RdCycleTime * (TimeParaGranularity + 1) * GPMC\_FCLK$

**For burst read:**  $C = (RdCycleTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

**For burst write:**  $C = (WrCycleTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$  with n being the page burst access number.

(4) **For single read:**  $D = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

**For burst read:**  $D = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

**For burst write:**  $D = (WrCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

(5) **For single read:**  $E = (CSRdOffTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

**For burst read:**  $E = (CSRdOffTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

**For burst write:**  $E = (CSWrOffTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

(6) **For nCS falling edge (CS activated):**

– **Case GpmcFCLKDivider = 0:**

–  $F = 0.5 * CSEExtraDelay * GPMC\_FCLK$

– **Case GpmcFCLKDivider = 1:**

–  $F = 0.5 * CSEExtraDelay * GPMC\_FCLK$  if (ClkActivationTime and CSOnTime are odd) or (ClkActivationTime and CSOnTime are even)

–  $F = (1 + 0.5 * CSEExtraDelay) * GPMC\_FCLK$  otherwise

– **Case GpmcFCLKDivider = 2:**

–  $F = 0.5 * CSEExtraDelay * GPMC\_FCLK$  if ((CSOnTime – ClkActivationTime) is a multiple of 3)

–  $F = (1 + 0.5 * CSEExtraDelay) * GPMC\_FCLK$  if ((CSOnTime – ClkActivationTime – 1) is a multiple of 3)

–  $F = (2 + 0.5 * CSEExtraDelay) * GPMC\_FCLK$  if ((CSOnTime – ClkActivationTime – 2) is a multiple of 3)

(7) **For ADV falling edge (ADV activated):**

– **Case GpmcFCLKDivider = 0:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$

– **Case GpmcFCLKDivider = 1:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$  if (ClkActivationTime and ADVOnTime are odd) or (ClkActivationTime and ADVOnTime are even)

–  $G = (1 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  otherwise

– **Case GpmcFCLKDivider = 2:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$  if ((ADVOnTime – ClkActivationTime) is a multiple of 3)

–  $G = (1 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  if ((ADVOnTime – ClkActivationTime – 1) is a multiple of 3)

–  $G = (2 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  if ((ADVOnTime – ClkActivationTime – 2) is a multiple of 3)

**For ADV rising edge (ADV deactivated) in Reading mode:**

– **Case GpmcFCLKDivider = 0:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$

– **Case GpmcFCLKDivider = 1:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$  if (ClkActivationTime and ADVrOffTime are odd) or (ClkActivationTime and ADVrOffTime are even)

–  $G = (1 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  otherwise

– **Case GpmcFCLKDivider = 2:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$  if ((ADVrOffTime – ClkActivationTime) is a multiple of 3)

–  $G = (1 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  if ((ADVrOffTime – ClkActivationTime – 1) is a multiple of 3)

–  $G = (2 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  if ((ADVrOffTime – ClkActivationTime – 2) is a multiple of 3)

**For ADV rising edge (ADV deactivated) in Writing mode:**

– **Case GpmcFCLKDivider = 0:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$

– **Case GpmcFCLKDivider = 1:**

–  $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$  if (ClkActivationTime and ADVWrOffTime are odd) or (ClkActivationTime and ADVWrOffTime are even)

–  $G = (1 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  otherwise

– **Case GpmcFCLKDivider = 2:**

- $G = 0.5 * ADVExtraDelay * GPMC\_FCLK$  if  $((ADVWrOffTime - ClkActivationTime)$  is a multiple of 3)
- $G = (1 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  if  $((ADVWrOffTime - ClkActivationTime - 1)$  is a multiple of 3)
- $G = (2 + 0.5 * ADVExtraDelay) * GPMC\_FCLK$  if  $((ADVWrOffTime - ClkActivationTime - 2)$  is a multiple of 3)

**(8) For OE falling edge (OE activated) / IO DIR rising edge (Data Bus input direction):**

- **Case GpmcFCLKDivider = 0:**
  - $H = 0.5 * OEEExtraDelay * GPMC\_FCLK$
- **Case GpmcFCLKDivider = 1:**
  - $H = 0.5 * OEEExtraDelay * GPMC\_FCLK$  if  $(ClkActivationTime$  and  $OEOntime$  are odd) or  $(ClkActivationTime$  and  $OEOntime$  are even)
  - $H = (1 + 0.5 * OEEExtraDelay) * GPMC\_FCLK$  otherwise
- **Case GpmcFCLKDivider = 2:**
  - $H = 0.5 * OEEExtraDelay * GPMC\_FCLK$  if  $((OEOntime - ClkActivationTime)$  is a multiple of 3)
  - $H = (1 + 0.5 * OEEExtraDelay) * GPMC\_FCLK$  if  $((OEOntime - ClkActivationTime - 1)$  is a multiple of 3)
  - $H = (2 + 0.5 * OEEExtraDelay) * GPMC\_FCLK$  if  $((OEOntime - ClkActivationTime - 2)$  is a multiple of 3)

**For OE rising edge (OE deactivated):**

- **GpmcFCLKDivider = 0:**
  - $H = 0.5 * OEEExtraDelay * GPMC\_FCLK$
- **Case GpmcFCLKDivider = 1:**
  - $H = 0.5 * OEEExtraDelay * GPMC\_FC$  if  $(ClkActivationTime$  and  $OEOffTime$  are odd) or  $(ClkActivationTime$  and  $OEOffTime$  are even)
  - $H = (1 + 0.5 * OEEExtraDelay) * GPMC\_FCLK$  otherwise
- **Case GpmcFCLKDivider = 2:**
  - $H = 0.5 * OEEExtraDelay * GPMC\_FCLK$  if  $((OEOffTime - ClkActivationTime)$  is a multiple of 3)
  - $H = (1 + 0.5 * OEEExtraDelay) * GPMC\_FCLK$  if  $((OEOffTime - ClkActivationTime - 1)$  is a multiple of 3)
  - $H = (2 + 0.5 * OEEExtraDelay) * GPMC\_FCLK$  if  $((OEOffTime - ClkActivationTime - 2)$  is a multiple of 3)

**(9) For WE falling edge (WE activated):**

- **Case GpmcFCLKDivider = 0:**
  - $I = 0.5 * WEExtraDelay * GPMC\_FCLK$
- **Case GpmcFCLKDivider = 1:**
  - $I = 0.5 * WEExtraDelay * GPMC\_FCLK$  if  $(ClkActivationTime$  and  $WEOnTime$  are odd) or  $(ClkActivationTime$  and  $WEOnTime$  are even)
  - $I = (1 + 0.5 * WEExtraDelay) * GPMC\_FCLK$  otherwise
- **Case GpmcFCLKDivider = 2:**
  - $I = 0.5 * WEExtraDelay * GPMC\_FCLK$  if  $((WEOnTime - ClkActivationTime)$  is a multiple of 3)
  - $I = (1 + 0.5 * WEExtraDelay) * GPMC\_FCLK$  if  $((WEOnTime - ClkActivationTime - 1)$  is a multiple of 3)
  - $I = (2 + 0.5 * WEExtraDelay) * GPMC\_FCLK$  if  $((WEOnTime - ClkActivationTime - 2)$  is a multiple of 3)

**For WE rising edge (WE deactivated):**

- **Case GpmcFCLKDivider = 0:**
  - $I = 0.5 * WEExtraDelay * GPMC\_FCLK$
- **Case GpmcFCLKDivider = 1:**
  - $I = 0.5 * WEExtraDelay * GPMC\_FCLK$  if  $(ClkActivationTime$  and  $WEOffTime$  are odd) or  $(ClkActivationTime$  and  $WEOffTime$  are even)
  - $I = (1 + 0.5 * WEExtraDelay) * GPMC\_FCLK$  otherwise
- **Case GpmcFCLKDivider = 2:**
  - $I = 0.5 * WEExtraDelay * GPMC\_FCLK$  if  $((WEOffTime - ClkActivationTime)$  is a multiple of 3)
  - $I = (1 + 0.5 * WEExtraDelay) * GPMC\_FCLK$  if  $((WEOffTime - ClkActivationTime - 1)$  is a multiple of 3)
  - $I = (2 + 0.5 * WEExtraDelay) * GPMC\_FCLK$  if  $((WEOffTime - ClkActivationTime - 2)$  is a multiple of 3)

(10)  $J = GPMC\_FCLK$  period

(11) In  $gpmc\_ncsx$ ,  $x$  is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In  $gpmc\_waitx$ ,  $x$  is equal to 0, 1, 2, or 3.

(12)  $P = gpmc\_clk$  period

(13) **For read:**  $K = (ADVrdOffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$   
**For write:**  $K = (ADVWrOffTime - ADVOnTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

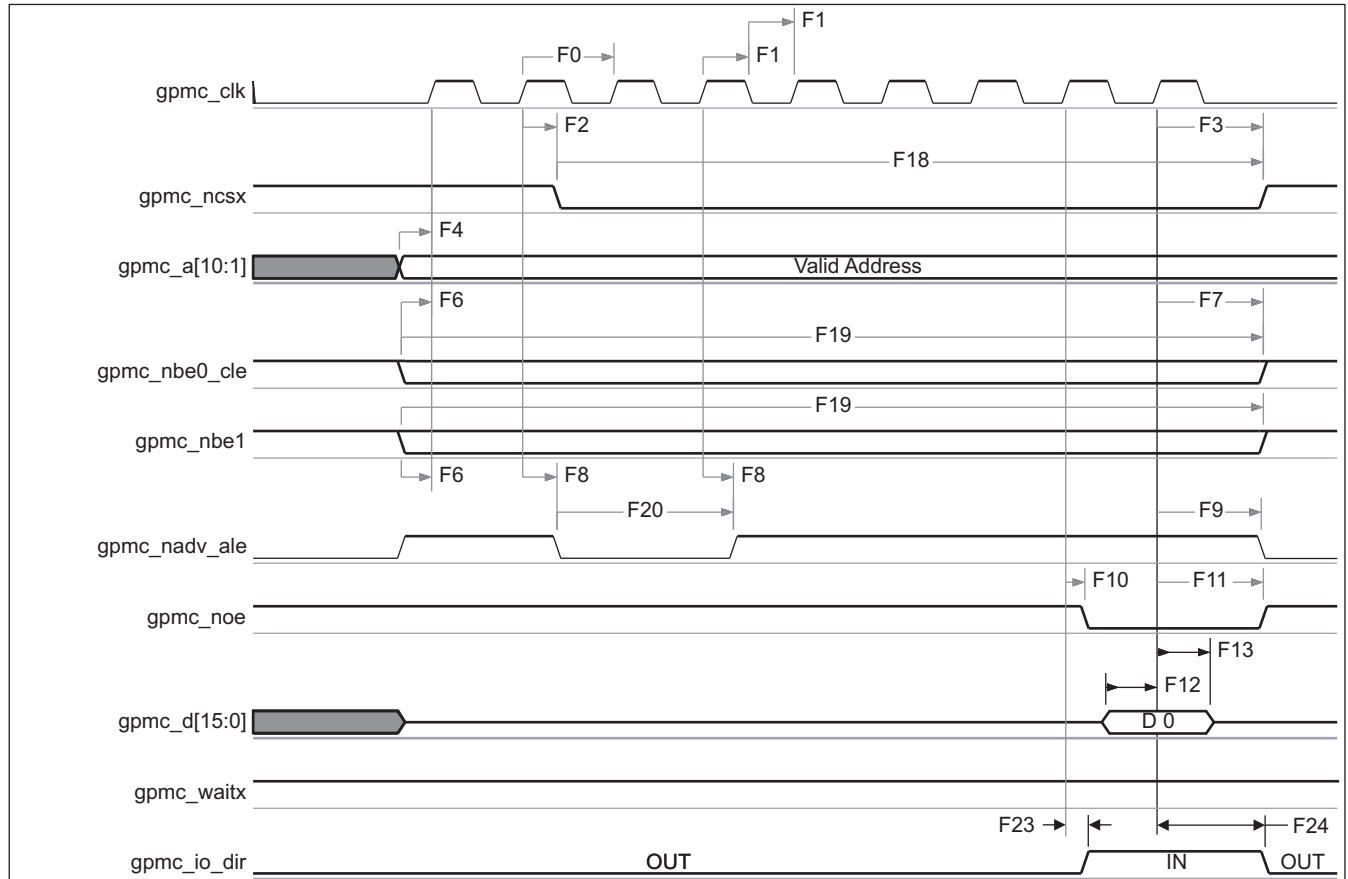

(14)  $GPMC\_FCLK$  is General-Purpose Memory Controller internal functional clock.

(15) Related to the  $gpmc\_clk$  output clock maximum and minimum frequencies programmable in the I/F module by setting the  $GPMC\_CONFIG1\_CSx$  configuration register bit field  $GpmcFCLKDivider$ .

(16) The jitter probability density can be approximated by a Gaussian function.

(17)  $M = (RdCycleTime - AccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

Above  $M$  parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both  $RdCycleTime$  and  $BusTurnAround$  completion. Behavior of IO direction signal does depend on kind of successive Read/Write accesses performed to Memory and multiplexed or non-multiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behavior is automatically handled by GPMC controller. For a full description of the  $gpmc\_io\_dir$  feature, see the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

030-021

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

**Figure 6-2. GPMC/NOR Flash – Synchronous Single Read – (GpmcFCLKDivider = 0)**

030-022

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

**Figure 6-3. GPMC/NOR Flash – Synchronous Burst Read – 4x16-bit (GpmcFCLKDivider = 0)**

030-023

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

**Figure 6-4. GPMC/NOR Flash – Synchronous Burst Write – (GpmcFCLKDivider = 0)**

030-024

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

**Figure 6-5. GPMC/Multiplexed NOR Flash – Synchronous Burst Read**

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

### 6.4.1.2 GPMC/NOR Flash Interface Asynchronous Timing

Table 6-7 and Table 6-8 assume testing over the recommended operating conditions (see Figure 6-7 through Figure 6-12) and electrical characteristic conditions.

Table 6-5. GPMC/NOR Flash Asynchronous Mode Timing Conditions

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	1.8	ns
$t_F$	Input signal fall time	1.8	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	15.94	pF

Table 6-6. GPMC/NOR Flash Interface Asynchronous Timing – Internal Parameters<sup>(1) (2)</sup>

NO.	PARAMETER	1.15 V		1.0 V		0.9 V		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
F11	Maximum output data generation delay from internal functional clock		6.5		9.1		13.7	ns
F12	Maximum input data capture delay by internal functional clock		4		5.6		8.1	ns
F13	Maximum device select generation delay from internal functional clock		6.5		9.1		13.7	ns
F14	Maximum address generation delay from internal functional clock		6.5		9.1		13.7	ns

(1) The internal parameters table must be used to calculate Data Access Time stored in the corresponding CS register bit field.

(2) Internal parameters are referred to the GPMC functional internal clock which is not provided externally.

**Table 6-6. GPMC/NOR Flash Interface Asynchronous Timing – Internal Parameters (continued)**

NO.	PARAMETER	1.15 V		1.0 V		0.9 V		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
FI5	Maximum address valid generation delay from internal functional clock		6.5		9.1		13.7	ns
FI6	Maximum byte enable generation delay from internal functional clock		6.5		9.1		13.7	ns
FI7	Maximum output enable generation delay from internal functional clock		6.5		9.1		13.7	ns
FI8	Maximum write enable generation delay from internal functional clock		6.5		9.1		13.7	ns
FI9	Maximum functional clock skew		100		170		200	ps

**Table 6-7. GPMC/NOR Flash Interface Timing Requirements – Asynchronous Mode**

NO.	PARAMETER		1.15 V		1.0 V		0.9 V		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	
FA5 <sup>(1)</sup>	t <sub>acc(DAT)</sub>	Data maximum access time		H <sup>(2)</sup>		H <sup>(2)</sup>		H <sup>(2)</sup>	GPMC_FCLK cycles
FA20 <sup>(3)</sup>	t <sub>acc1-pgmode(DAT)</sub>	Page mode successive data maximum access time		P <sup>(4)</sup>		P <sup>(4)</sup>		P <sup>(4)</sup>	GPMC_FCLK cycles
FA21 <sup>(5)</sup>	t <sub>acc2-pgmode(DAT)</sub>	Page mode first data maximum access time		H <sup>(2)</sup>		H <sup>(2)</sup>		H <sup>(2)</sup>	GPMC_FCLK cycles

- (1) The FA5 parameter illustrates the amount of time required to internally sample input Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input Data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.
- (2) H = AccessTime \* (TimeParaGranularity + 1)
- (3) The FA20 parameter illustrates amount of time required to internally sample successive input Page Data. It is expressed in number of GPMC functional clock cycles. After each access to input Page Data, next input Page Data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.
- (4) P = PageBurstAccessTime \* (TimeParaGranularity + 1)
- (5) The FA21 parameter illustrates amount of time required to internally sample first input Page Data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, First input Page Data is internally sampled by active functional clock edge. FA21 value must be stored inside the AccessTime register bit field.

**For burst read:**  $N = (RdCycleTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$   
**For burst write:**  $N = (WrCycleTime + (n - 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$
- (13) In `gpmc_ncsx`, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.
- (14)  $M = ((RdCycleTime - CSOnTime) * (TimeParaGranularity + 1) - 0.5 * CSEExtraDelay) * GPMC\_FCLK$   
 Above M parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both `RdCycleTime` and `BusTurnAround` completion. Behavior of IO direction signal does depend on kind of successive Read/Write accesses performed to Memory and multiplexed or non-multiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behavior is automatically handled by GPMC controller. For a full description of the `gpmc_io_dir` feature, see the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

030-026

**Figure 6-7. GPMC/NOR Flash – Asynchronous Read – Single Word Timing(1) (2) (3)**

- (1) In `gpmc_ncsx`, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In `gpmc_waitx`, x is equal to 0, 1, 2, or 3.
- (2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside `AccessTime` register bit field.
- (3) `GPMC_FCLK` is an internal clock (GPMC functional clock) not provided externally.

030-027

**Figure 6-8. GPMC/NOR Flash – Asynchronous Read – 32-bit Timing(1) (2) (3)**

- (1) In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.
- (2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bit field.
- (3) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally.

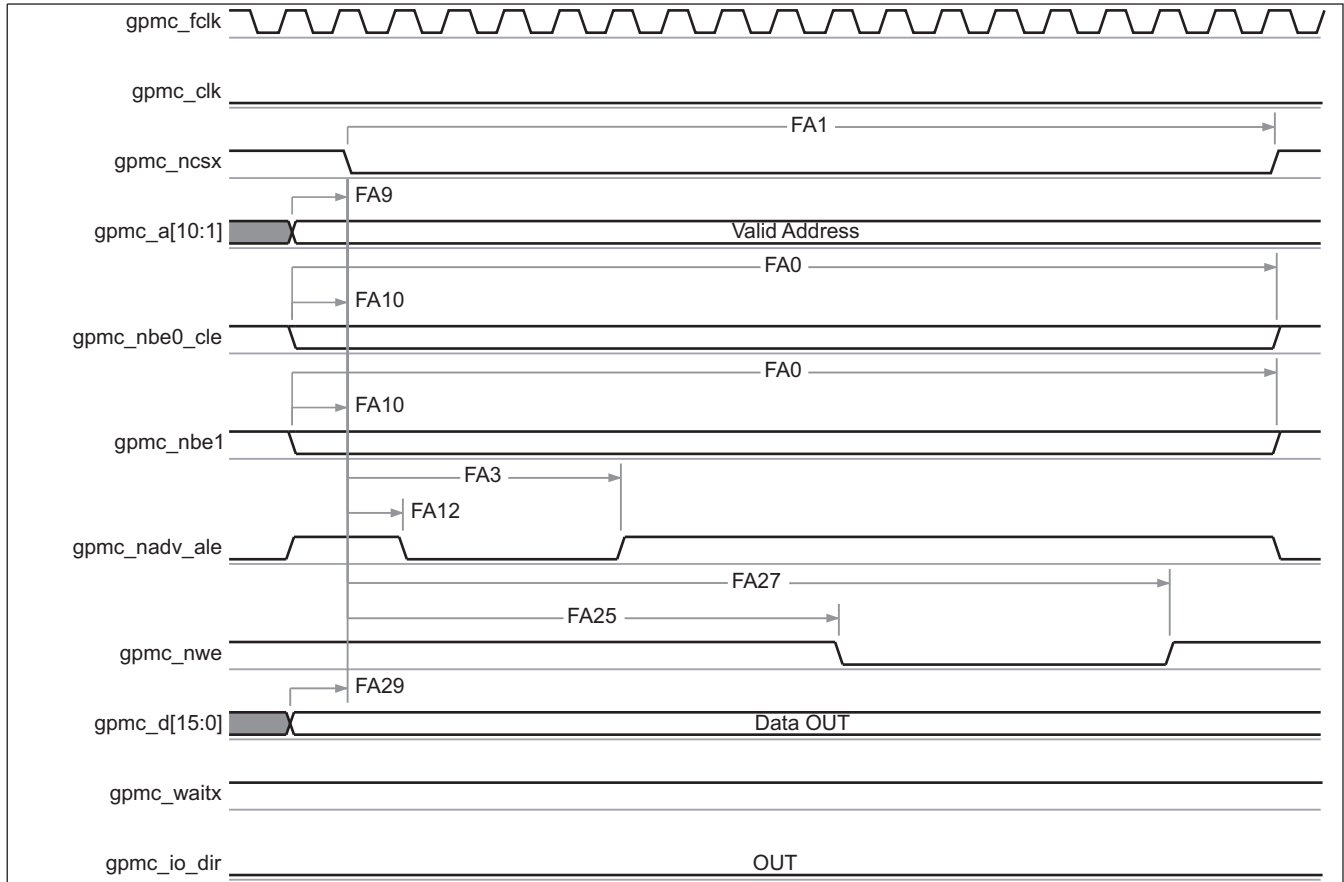

030-028

**Figure 6-9. GPMC/NOR Flash – Asynchronous Read – Page Mode 4x16-bit Timing(1) (2) (3) (4)**

- (1) In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.
- (2) FA21 parameter illustrates amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data is internally sampled by active functional clock edge. FA21 value must be stored inside AccessTime register bit field.
- (3) FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 is also the duration of address phases for successive input page data (excluding first input page data). FA20 value must be stored in PageBurstAccessTime register bit field.
- (4) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally.

030-029

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

**Figure 6-10. GPMC/NOR Flash – Asynchronous Write – Single Word Timing**

030-030

### 6.4.1.3 GPMC/NAND Flash Interface Timing

Table 6-10 through Table 6-12 assume testing over the recommended operating conditions (see Figure 6-13 through Figure 6-16) and electrical characteristic conditions.

**Table 6-9. GPMC/NAND Flash Asynchronous Mode Timing Conditions**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	1.8	ns
$t_F$	Input signal fall time	1.8	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	15.94	pF

**Table 6-10. GPMC/NAND Flash Interface Asynchronous Timing – Internal Parameters<sup>(1) (2)</sup>**

NO.	PARAMETER	1.15 V		1.0 V		0.9 V		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
GNFI1	Maximum output data generation delay from internal functional clock		6.5		9.1		13.7	ns
GNFI2	Maximum input data capture delay by internal functional clock		4		5.6		8.1	ns

(1) Internal parameters table must be used to calculate data access time stored in the corresponding CS register bit field.

(2) Internal parameters are referred to the GPMC functional internal clock which is not provided externally.

**Table 6-10. GPMC/NAND Flash Interface Asynchronous Timing – Internal Parameters (continued)**

NO.	PARAMETER	1.15 V		1.0 V		0.9 V		UNIT
		MIN	MAX	MIN	MAX	MIN	MAX	
GNFI3	Maximum device select generation delay from internal functional clock		6.5		9.1		13.7	ns
GNFI4	Maximum address latch enable generation delay from internal functional clock		6.5		9.1		13.7	ns
GNFI5	Maximum command latch enable generation delay from internal functional clock		6.5		9.1		13.7	ns
GNFI6	Maximum output enable generation delay from internal functional clock		6.5		9.1		13.7	ns
GNFI7	Maximum write enable generation delay from internal functional clock		6.5		9.1		13.7	ns
GNFI8	Maximum functional clock skew		100		170		200	ps

**Table 6-11. GPMC/NAND Flash Interface Timing Requirements**

NO.	PARAMETER		1.15 V		1.0 V		0.9 V		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	
GNF12 <sup>(1)</sup>	t <sub>acc(DAT)</sub>	Data maximum access time		J <sup>(2)</sup>		J <sup>(2)</sup>		J <sup>(2)</sup>	GPMC_FCLK cycles

- (1) The GNF12 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of the read cycle and after GNF12 functional clock cycles, input data is internally sampled by the active functional clock edge. The GNF12 value must be stored inside AccessTime register bit field.
- (2)  $J = \text{AccessTime} * (\text{TimeParaGranularity} + 1)$

**Table 6-12. GPMC/NAND Flash Interface Switching Characteristics**

NO.	PARAMETER		1.15 V		1.0 V		0.9 V		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX

(1)  $A = (WEOffTime - WEOnTime) * (TimeParaGranularity + 1) * GPMC\_FCLK$

(2)  $B = ((WEOnTime - CSONTime) * (TimeParaGranularity + 1) + 0.5 * (WEEExtraDelay - CSEExtraDelay)) * GPMC\_FCLK$

(3)  $C = ((WEOnTime - ADVOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEEExtraDelay - ADVExtraDelay)) * GPMC\_FCLK$

(4)  $D = (WEOnTime * (TimeParaGranularity + 1) + 0.5 * WEEExtraDelay) * GPMC\_FCLK$

(5)  $E = ((WrCycleTime - WEOffTime) * (TimeParaGranularity + 1) - 0.5 * WEEExtraDelay) * GPMC\_FCLK$

(6)  $F = ((ADVWrOffTime - WEOffTime) * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay - WEEExtraDelay)) * GPMC\_FCLK$

(7)  $G = ((CSWrOffTime - WEOffTime) * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - WEEExtraDelay)) * GPMC\_FCLK$

(8)  $H = WrCycleTime * (1 + TimeParaGranularity) * GPMC\_FCLK$

(9)  $I = ((OEOnTime - CSONTime) * (TimeParaGranularity + 1) + 0.5 * (OEEExtraDelay - CSEExtraDelay)) * GPMC\_FCLK$

(10)  $K = (OEOffTime - OEOnTime) * (1 + TimeParaGranularity) * GPMC\_FCLK$

(11)  $L = RdCycleTime * (1 + TimeParaGranularity) * GPMC\_FCLK$

(12)  $M = ((CSRdOffTime - OEOffTime) * (TimeParaGranularity + 1) + 0.5 * (CSEExtraDelay - OEEExtraDelay)) * GPMC\_FCLK$

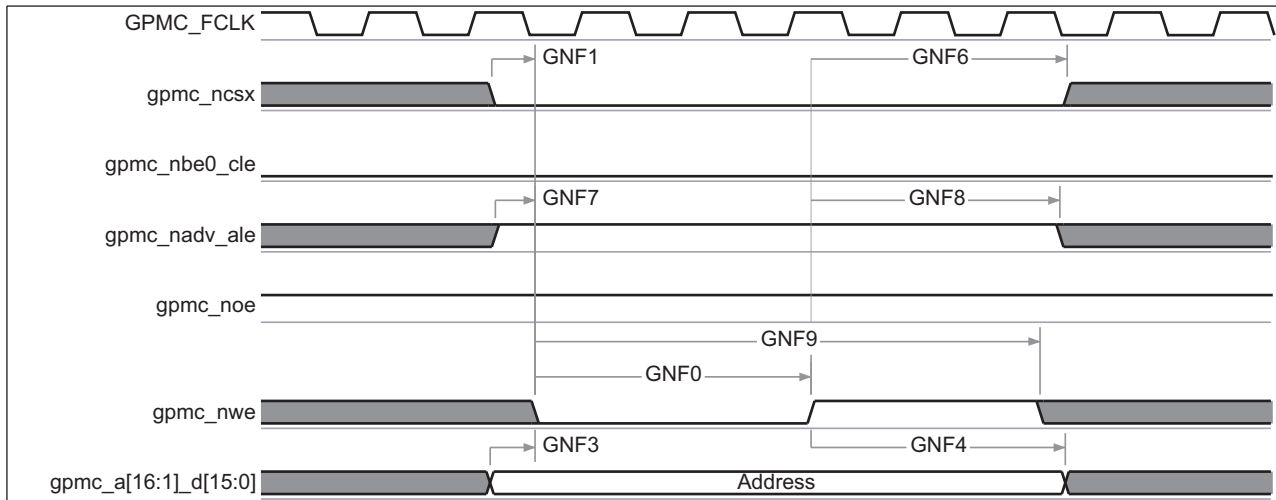

(13) In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

030-032

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

**Figure 6-13. GPMC/NAND Flash – Command Latch Cycle Timing**

030-033

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

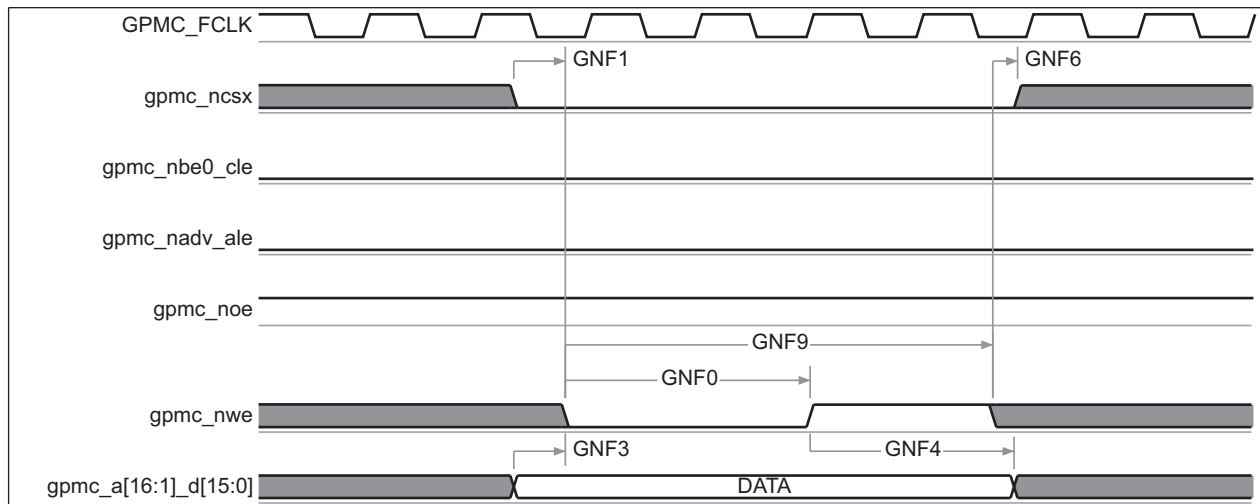

**Figure 6-14. GPMC/NAND Flash – Address Latch Cycle Timing**

030-034

**Figure 6-15. GPMC/NAND Flash – Data Read Cycle Timing(1) (2) (3)**

- (1) The GNF12 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after GNF12 functional clock cycles, input data is internally sampled by active functional clock edge. The GNF12 value must be stored inside AccessTime register bit field.
- (2) GPMC\_FCLK is an internal clock (GPMC functional clock) not provided externally.
- (3) In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0, 1, 2, or 3.

030-035

In gpmc\_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc\_waitx, x is equal to 0 or 1.

**Figure 6-16. GPMC/NAND Flash – Data Write Cycle Timing**

## 6.4.2 SDRAM Controller Subsystem (SDRC)

The SDRAM controller subsystem (SDRC) module provides connectivity between the OMAP35x Applications Processor and external DRAM memory components. The SDRC module only supports low-power double-data-rate (LPDDR) SDRAM devices. Memory devices can be interfaced to the SDRC using a stacked-memory approach or through the printed circuit board (PCB). The stacked-memory approach uses the package on package interface pins (available on CBB & CBC package).

### 6.4.2.1 SDRAM Controller Subsystem Device-Specific Information

The approach to specifying interface timing for the SDRC memory bus is different than on other interfaces such as the general-purpose memory controller (GPMC) and the multi-channel buffered serial ports (McBSPs). For these other interfaces the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models.

For the SDRC memory bus, the approach is to specify compatible memory devices and provide the printed circuit board (PCB) solution and guidelines directly to the user. Texas Instruments (TI) has performed the simulation and system characterization to ensure all interface timings in this solution are met.

### 6.4.2.2 LPDDR Interface

The LPDDR interface is balled out on the bottom side of all OMAP35x packages and on the top side of OMAP35x POP packages. The LPDDR interface on the top of the POP package has been designed for compatibility any POP LPDDR device with a matching footprint and compliance with the JEDEC LPDDR-266 specification.

This section provides the timing specification for the bottom-side LPDDR interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable LPDDR memory system without the need for a complex timing closure process. For more information regarding guidelines for using this LPDDR specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* Application Report (literature number [SPRAAV0](#)).

#### 6.4.2.2.1 LPDDR Interface Schematic

[Figure 6-17](#) and [Figure 6-18](#) show the LPDDR interface schematics for a LPDDR memory system. The 1 x16 LPDDR system schematic is identical to [Figure 6-17](#) except that the high word LPDDR device is deleted.

Figure 6-17. OMAP35x LPDDR High Level Schematic (x16 memories)

Figure 6-18. OMAP35x LPDDR High Level Schematic (x32 memory)

6.4.2.2.2 Compatible JEDEC LPDDR Devices

Table 6-13 shows the parameters of the JEDEC LPDDR devices that are compatible with this interface. Generally, the LPDDR interface is compatible with x16 and x32 LPDDR266 and LPDDR333 speed grade LPDDR devices.

Table 6-13. Compatible JEDEC LPDDR Devices

NO.	PARAMETER	MIN	MAX	UNIT	NOTES
1	JEDEC LPDDR Device Speed Grade	LPDDR-266			See Note (1)
2	JEDEC LPDDR Device Bit Width	16	32	Bits	
3	JEDEC LPDDR Device Count	1	2	Devices	See Note (2)
4	JEDEC LPDDR Device Ball Count	60	90	Balls	

(1) Higher LPDDR speed grades are supported due to inherent JEDEC LPDDR backwards compatibility.  
 (2) 1 x16 LPDDR device is used for 16 bit LPDDR memory system. 1x32 or 2x16 LPDDR devices are used for a 32-bit LPDDR memory system.

### 6.4.2.2.3 PCB Stackup

The minimum stackup required for routing the OMAP35x is a six layer stack as shown in [Table 6-14](#). Additional layers may be added to the PCB stack up to accommodate other circuitry or to reduce the size of the PCB footprint.

**Table 6-14. OMAP35x Minimum PCB Stack Up**

LAYER	TYPE	DESCRIPTION
1	Signal	Top Routing Mostly Horizontal
2	Plane	Ground
3	Plane	Power
4	Signal	Internal Routing
5	Plane	Ground
6	Signal	Bottom Routing Mostly Vertical

**Table 6-15. PCB Stack Up Specifications**

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
1	PCB Routing/Plane Layers	6				
2	Signal Routing Layers	3				
3	Full ground layers under LPDDR routing region	2				
4	Number of ground plane cuts allowed within LPDDR routing region			0		
5	Number of ground reference planes required for each LPDDR routing 1 layer	1				
6	Number of layers between LPDDR routing layer and reference ground 0 plane			0		
7	PCB Routing Feature Size		4		Mils	
8	PCB Trace Width w		4		Mils	
9	PCB BGA escape via pad size		18		Mils	
10	PCB BGA escape via hole size		8		Mils	
11	Device BGA Pad Size					See Note <sup>(1)</sup>
12	LPDDR Device BGA Pad Size					See Note <sup>(2)</sup>
13	Single Ended Impedance, ZO	50		75	Ω	
14	Impedance Control	Z-5	Z	Z + 5	Ω	See Note <sup>(3)</sup>

(1) Please see the *Flip Chip Ball Grid Array Package Reference Guide* (literature number [SPRU811](#)) for device BGA pad size.

(2) Please see the LPDDR device manufacturer documentation for the LPDDR device BGA pad size.

(3) Z is the nominal singled ended impedance selected for the PCB specified by item 12.

### 6.4.2.3 Placement

[Figure 6-19](#) shows the required placement for the OMAP35x device as well as the LPDDR devices. The dimensions for [Figure 6-19](#) are defined in [Table 6-16](#). The placement does not restrict the side of the PCB that the devices are mounted on. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For 1x16 and 1x32 LPDDR memory systems, the second LPDDR device is omitted from the placement.

Figure 6-19. OMAP35x and LPDDR Device Placement

Table 6-16. Placement Specifications

NO.	PARAMETER	MIN	MAX	UNIT	NOTES
1	X		1440	Mils	See Notes <sup>(1)</sup> , <sup>(2)</sup>
2	Y		1030	Mils	See Notes <sup>(1)</sup> , <sup>(2)</sup>
3	Y Offset		525	Mils	See Notes <sup>(1)</sup> , <sup>(2)</sup> , <sup>(3)</sup>
4	LPDDR Keepout Region				See Note <sup>(4)</sup>
5	Clearance from non-LPDDR signal to LPDDR Keepout Region	4		w	See Note <sup>(5)</sup>

- (1) See [Figure 6-17](#) for dimension definitions.
- (2) Measurements from center of device to center of LPDDR device.
- (3) For 16 bit memory systems it is recommended that Y Offset be as small as possible.
- (4) LPDDR keepout region to encompass entire LPDDR routing area.
- (5) Non-LPDDR signals allowed within LPDDR keepout region provided they are separated from LPDDR routing layers by a ground plane.

#### 6.4.2.4 LPDDR Keep Out Region

The region of the PCB used for the LPDDR circuitry must be isolated from other signals. The LPDDR keep out region is defined for this purpose and is shown in [Figure 6-20](#). The size of this region varies with the placement and LPDDR routing. Additional clearances required for the keep out region are shown in [Table 6-16](#).

Region should encompass all LPDDR circuitry and varies depending on placement. Non-LPDDR signals should not be routed on the LPDDR signal layers within the LPDDR keep out region. Non-LPDDR signals may be routed in the region provided they are routed on layers separated from LPDDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.8 V power plane should cover the entire keep out region.

Figure 6-20. LPDDR Keepout Region

#### 6.4.2.5 Net Classes

Table 6-17 lists the clock net classes for the LPDDR interface. Table 6-18 lists the signal net classes, and associated clock net classes, for the signals in the LPDDR interface. These net classes are used for the termination and routing rules that follow.

Table 6-17. Clock Net Class Definitions

CLOCK NET CLASS	OMAP PIN NAMES
CK	sdrc_clk/sdrc_nclk
DQS0	sdrc_dqs0
DQS1	sdrc_dqs1
DQS2	sdrc_dqs2
DQS3	sdrc_dqs3

Table 6-18. Signal Net Class Definitions

CLOCK NET CLASS	ASSOCIATED CLOCK NET CLASS	OMAP PIN NAMES
ADDR_CTRL	CK	sdrc_ba, sdrc_a, sdrc_ncs0, sdrc_ncas, sdrc_nras, sdrc_nwe, sdrc_cke0
DQ0	DQS0	sdrc_d, sdrc_dm0
DQ1	DQS1	sdrc_d, sdrc_dm1
DQ2	DQS2	sdrc_d, sdrc_dm2
DQ3	DQS3	sdrc_d, sdrc_dm3

#### 6.4.2.6 LPDDR Signal Termination

No terminations of any kind are required in order to meet signal integrity and overshoot requirements. Serial terminators are permitted, if desired, to reduce EMI risk; however, serial terminations are the only type permitted. Table 6-19 shows the specifications for the series terminators.

**Table 6-19. LPDDR Signal Terminations**

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
1	CK Net Class	0		10	$\Omega$	See Note <sup>(1)</sup>
2	ADDR_CTRL Net Class	0	22	Zo	$\Omega$	See Notes <sup>(1), (2), (3)</sup>
3	Data Byte Net Classes (DQS0-DQS3, DQ0-DQ3)	0	22	Zo	$\Omega$	See Notes <sup>(1), (2), (3)</sup>

- (1) Only series termination is permitted, parallel or SST specifically disallowed.
- (2) Terminator values larger than typical only recommended to address EMI issues.
- (3) Termination value should be uniform across net class.

**6.4.2.7 LPDDR CK and ADDR\_CTRL Routing**

Figure 6-21 shows the topology of the routing for the CK and ADDR\_CTRL net classes. The route is a balanced T as it is intended that the length of segments B and C be equal. In addition, the length of A should be maximized.

**Figure 6-21. CK and ADDR\_CTRL Routing and Topology**

**Table 6-20. CK and ADDR\_CTRL Routing Specification**

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
1	Center to Center CK-CK spacing			2w		
2	CK A to B/A to C Skew Length Mismatch			25	Mils	See Note <sup>(1)</sup>
3	CK B to C Skew Length Mismatch			25	Mils	
4	Center to Center CK to other LPDDR trace spacing	4w				See Note <sup>(2)</sup>
5	CK/ADDR_CTRL nominal trace length	CACLM-50	CACLM	CACLM+50	Mils	See Note <sup>(3)</sup>
6	ADDR_CTRL to CK Skew Length Mismatch			100	Mils	
7	ADDR_CTRL to ADDR_CTRL Skew Length Mismatch			100	Mils	
8	Center to Center ADDR_CTRL to other LPDDR trace 4w spacing	4w				See Note <sup>(2)</sup>
9	Center to Center ADDR_CTRL to other ADDR_CTRL 3w trace spacing	3w				See Note <sup>(2)</sup>
10	ADDR_CTRL A to B/A to C Skew Length Mismatch			100	Mils	See Note <sup>(1)</sup>
11	ADDR_CTRL B to C Skew Length Mismatch			100	Mils	

- (1) Series terminator, if used, should be located closest to device.
- (2) Center to center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (3) CACLM is the longest Manhattan distance of the CK and ADDR\_CTRL net classes.

Figure 6-22 shows the topology and routing for the DQS and DQ net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

Figure 6-22. DQS and DQ Routing and Topology

Table 6-21. DQS and DQ Routing Specification<sup>(1)</sup>

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
2	DQS E Skew Length Mismatch			25	Mils	
3	Center to Center DQS to other LPDDR trace spacing	4w				See Note <sup>(2)</sup>
4	DQS/DQ nominal trace length	DQLM - 50	DQLM	DQLM + 50	Mils	See Note <sup>(3)</sup>
5	DQ to DQS Skew Length Mismatch			100	Mils	
6	DQ to DQ Skew Length Mismatch			100	Mils	
7	Center to Center DQ to other LPDDR trace spacing	4w				See Note <sup>(2)</sup>
8	Center to Center DQ to other DQ trace spacing	3w				See Note <sup>(2), (4)</sup>
9	DQ E Skew Length Mismatch			100	Mils	

- (1) Series terminator, if used, should be located closest to LPDDR.
- (2) Center to center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (3) Center to center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (4) DQLM is the longest Manhattan distance of the DQS and DQ net classes.

## 6.5 Video Interfaces

### 6.5.1 Camera Interface

The camera subsystem provides the system interfaces and the processing capability to connect raw, YUV, or JPEG image sensor modules to the OMAP3525 and OMAP3530 device for video-preview, video-record, and still-image-capture applications. The camera subsystem supports up to two simultaneous pixel flows but only one of them can use the video processing hardware:

- PARALLEL: the parallel interface data must go through the video processing hardware.

#### 6.5.1.1 Parallel Camera Interface Timing

The parallel camera interface is a 12-bit interface which can be used in two modes:

1. SYNC mode: progressive and interlaced image sensor modules for 8-, 10-, 11-, and 12-bit data. The pixel clock can be up to 75 MHz in 12-bit mode. The pixel clock can be up to 130 MHz in 8-bit packed mode.
2. ITU mode provides an ITU-R BT 656 compatible data stream with progressive image sensor modules only in 8- and 10-bit configurations. The pixel clock can be up to 75 MHz.

##### 6.5.1.1.1 SYNC Normal Mode

##### 6.5.1.1.1.1 12-Bit SYNC Normal – Progressive Mode

Table 6-23 and Table 6-24 assume testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-23).

**Table 6-22. ISP Timing Conditions – 12-Bit SYNC Normal – Progressive Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	2.7	ns
$t_F$	Input signal fall time	2.7	ns
<b>Output Condition</b>			
$C_{LOAD}$	Output load capacitance	8.6	pF

**Table 6-23. ISP Timing Requirements – 12-Bit SYNC Normal – Progressive Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
ISP17	$t_{c(pclk)}$	Cycle time <sup>(2)</sup> , cam_pclk period	13.3		22.2		ns
ISP18	$t_{W(pclkH)}$	Typical pulse duration, cam_pclk high	0.5*P <sup>(3)</sup>		0.5*P <sup>(3)</sup>		ns
ISP18	$t_{W(pclkL)}$	Typical pulse duration, cam_pclk low	0.5*P <sup>(3)</sup>		0.5*P <sup>(3)</sup>		ns
	$t_{dc(pclk)}$	Duty cycle error, cam_pclk		667		1111	ps
	$t_{j(pclk)}$	Cycle jitter <sup>(4)</sup> , cam_pclk		133		200	ps
ISP19	$t_{su(dV-pclkH)}$	Setup time, cam_d[11:0] valid before cam_pclk rising edge	1.82		3.25		ns
ISP20	$t_{h(pclkH-dV)}$	Hold time, cam_d[11:0] valid after cam_pclk rising edge	1.82		3.25		ns
ISP21	$t_{su(dV-vsH)}$	Setup time, cam_vs valid before cam_pclk rising edge	1.82		3.25		ns
ISP22	$t_{h(pclkH-vsV)}$	Hold time, cam_vs valid after cam_pclk rising edge	1.82		3.25		ns

(1) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.

(2) Related with the input maximum frequency supported by the ISP module.

(3) P = cam\_pclk period in ns

(4) Maximum cycle jitter supported by cam\_pclk input clock.

**Table 6-23. ISP Timing Requirements – 12-Bit SYNC Normal – Progressive Mode (continued)**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
ISP23	$t_{su(dV-hsH)}$	Setup time, cam_hs valid before cam_pclk rising edge	1.82		3.25		ns
ISP24	$t_{h(pclkH-hsV)}$	Hold time, cam_hs valid after cam_pclk rising edge	1.82		3.25		ns
ISP25	$t_{su(dV-hsH)}$	Setup time, cam_wen valid before cam_pclk rising edge	1.82		3.25		ns
ISP26	$t_{h(pclkH-hsV)}$	Hold time, cam_wen valid after cam_pclk rising edge	1.82		3.25		ns

**Table 6-24. ISP Switching Characteristics – 12-Bit SYNC Normal – Progressive Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
ISP15	$t_{c(xclk)}$	Cycle time <sup>(1)</sup> , cam_xclk period	4.6		4.6		ns
ISP16	$t_{W(xclkH)}$	Typical pulse duration, cam_xclk high	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
ISP16	$t_{W(xclkL)}$	Typical pulse duration, cam_xclk low	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
	$t_{dc(xclk)}$	Duty cycle error, cam_xclk		231		231	ps
	$t_{j(xclk)}$	Jitter standard deviation <sup>(3)</sup> , cam_xclk		33		33	ps
	$t_{R(xclk)}$	Rise time, cam_xclk		0.93		0.93	ns
	$t_{F(xclk)}$	Fall time, cam_xclk		0.93		0.93	ns

(1) Related with the cam\_xclk maximum and minimum frequencies programmable in the ISP module.

**Warning:** The camera sensor or the camera module must be disabled to change the frequency configuration. For more information, see the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#) ]

(2) PO = cam\_xclk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

030-056

**Figure 6-23. ISP – 12-Bit SYNC Normal – Progressive Mode(1) (2) (3) (4) (5) (6) (7) (8)**

- (1) The polarity of cam\_pclk, cam\_fld, cam\_vs, and cam\_hs are configurable. If the cam\_hs, cam\_vs, and cam\_fld signals are output, the signal length can be set.
- (2) The parallel camera in SYNC mode supports progressive image sensor modules and 8-, 10-, 11-, or 12-bit data.
- (3) When the image sensor has fewer than 12 data lines, it must be connected to the lower data lines and the unused lines must be grounded.
- (4) However, it is possible to shift the data to 0, 2, or 4 data internal lanes.
- (5) The bit configurations are: cam\_d[11:4] or cam\_d[7:0] in 8-bit mode, cam\_d[11:2] or cam\_d[9:0] in 10-bit mode, cam\_d[10:0] in 11-bit mode, and cam\_d[11:0] in 12-bit mode.
- (6) Optionally, the data write to memory can be qualified by the external cam\_wen signal.
- (7) The cam\_wen signal can be used as a external memory write-enable signal. The data is stored to memory only if cam\_hs, cam\_vs, and cam\_wen signals are asserted.
- (8) In cam\_xclki; I is equal to a or b.

**6.5.1.1.2 8-bit Packed SYNC – Progressive Mode**

Table 6-26 and Table 6-27 assume testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-24).

**Table 6-25. ISP Timing Conditions – 8-bit Packed SYNC – Progressive Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
t <sub>R</sub>	Input signal rise time	2.5	ns
t <sub>F</sub>	Input signal fall time	2.5	ns

**Table 6-25. ISP Timing Conditions – 8-bit Packed SYNC – Progressive Mode (continued)**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	8.6	pF

**Table 6-26. ISP Timing Requirements – 8-bit Packed SYNC – Progressive Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT

	$t_j(pclk)$	Cycle jitter <sup>(4)</sup> , cam_pclk		133		200	ps
ISP23	$t_{su(dV-pclkH)}$	Setup time, cam_d[9:0] valid before cam_pclk rising edge	1.82		3.25		ns
ISP24	$t_h(pclkH-dV)$	Hold time, cam_d[9:0] valid after cam_pclk rising edge	1.82		3.25		ns

(1) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.

(2) Related with the input maximum frequency supported by the ISP module.

(3) P = cam\_lclk period in ns.

(4) Maximum cycle jitter supported by cam\_lclk input clock.

**Table 6-36. ISP Switching Characteristics – ITU Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
ISP15	$t_{c(xclk)}$	Cycle time <sup>(1)</sup> , cam_xclk period	4.6		4.6		ns
ISP16	$t_{W(xclkH)}$	Typical pulse duration, cam_xclk high	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
ISP16	$t_{W(xclkL)}$	Typical pulse duration, cam_xclk low	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
	$t_{dc(xclk)}$	Duty cycle error, cam_xclk		231		231	ps
	$t_j(xclk)$	Jitter standard deviation <sup>(3)</sup> , cam_xclk		33		33	ps
	$t_R(xclk)$	Rise time, cam_xclk		0.93		0.93	ns
	$t_F(xclk)$	Fall time, cam_xclk		0.93		0.93	ns

(1) Related with the cam\_xclk maximum and minimum frequencies programmable in the ISP module.

**Warning:** The camera sensor or the camera module must be disabled to change the frequency configuration. For more information, see the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)]

(2) PO = cam\_xclk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

030-058

**Figure 6-27. ISP – ITU Mode(1) (2)**

- (1) The unused lines must be grounded and the data bus must be connected to the lower data lines. It is possible to shift the data to 0, 2, or 4 data internal lanes. The different configurations are: `cam_d[11:4]` or `cam_d[7:0]` in 8-bit mode and `cam_d[11:2]` or `cam_d[9:0]` in 10-bit mode.
- (2) The parallel camera in ITU mode supports progressive camera modules.

## 6.5.2 Display Subsystem (DSS)

The display subsystem (DSS) provides the logic to display the video frame from external (SDRAM) or internal (SRAM) memory on an LCD panel or a TV set. The DSS integrates a display controller, a remote frame buffer module (RFBI), and a TV-out module. It can be used in two configurations:

- LCD display in:
  - Bypass mode (RFBI module bypassed)
  - RFBI mode (through RFBI module)
- TV display (not discussed in this document because of its analog IO signals)

The two displays can be active at the same time.

### NOTE

For more information, see Display Subsystem / Display Subsystem Functional Description section of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

### 6.5.2.1 LCD Display in Bypass Mode

Two types of LCD panel are supported:

- Thin film transistor (TFT) or active matrix technology
- Supertwisted nematic (STN) or passive matrix technology

Both configurations are discussed in the following paragraphs.

#### 6.5.2.1.1 LCD Display in TFT Mode

##### 6.5.2.1.1.1 LCD Display in TFT Mode – HDTV Application

[Table 6-37](#) assumes testing over the recommended operating conditions (see [Figure 6-28](#)).

**Table 6-37. LCD Display Switching Characteristics in TFT Mode – HDTV Application<sup>(3) (4)</sup>**

NO.	PARAMETER		OPP3		OPP2		UNIT
			MIN	MAX	MIN	MAX	
DL0	$t_{d(PCLKA-HSYNCT)}$	Delay time, dss_pclk active edge to dss_hsync transition	–4.2	4.2	–4.7	4.7	ns
DL1	$t_{d(PCLKA-VSYNCT)}$	Delay time, dss_pclk active edge to dss_vsync transition	–4.2	4.2	–4.7	4.7	ns
DL2	$t_{d(PCLKA-ACBIASA)}$	Delay time, dss_pclk active edge to dss_acbias active level	–4.2	4.2	–4.7	4.7	ns
DL3	$t_{d(PCLKA-DATAV)}$	Delay time, dss_pclk active edge to dss_data bus valid	–4.2	4.2	–4.7	4.7	ns
DL4	$t_{c(PCLK)}$	Cycle time <sup>(2)</sup> , dss_pclk	13.468		15.152		ns
DL5	$t_{w(PCLK)}$	Pulse duration, dss_pclk low or high	$0.45 \cdot P^{(1)}$	$0.55 \cdot P^{(1)}$	$0.45 \cdot P^{(1)}$	$0.55 \cdot P^{(1)}$	ns

(1) P = dss\_pclk period.

(2) The pixel clock frequency is software programmable via the pixel clock divider configuration from 1 to 255 division range in the DISPC\_DIVISOR register.

(3) The capacitive load is equivalent to 25 pF at 1.15 V and 30 pF at 1.0 V.

(4) For more information, see the DSS chapter in the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

030-061

**Figure 6-28. LCD Display in TFT Mode – HDTV Application<sup>(1) (2) (3) (4)</sup>**

- (1) The pixel data bus depends on the use of 8-, 9-, 12-, 16-, 18-, or 24-bit per pixel data output pins.
- (2) The pixel clock frequency is programmable.
- (3) All timings not illustrated in the waveform are programmable by software, control signal polarity, and driven edge of dss\_pclk.
- (4) For more information, see the DSS chapter in the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

**6.5.2.1.2 LCD Display in STN Mode**

Table 6-38 assumes testing over the recommended operating conditions (see Figure 6-29).

**Table 6-38. LCD Display Switching Characteristics in STN Mode<sup>(3) (4) (5)</sup>**

NO.	PARAMETER		OPP3		OPP2		UNIT
			MIN	MAX	MIN	MAX	
DL3	$t_{d(PCLKA-DATAV)}$	Delay time, dss_pclk active edge to dss_data bus valid	-6.9	6.9	-6.9	6.9	ns
DL4	$t_{c(PCLK)}$	Cycle time <sup>(2)</sup> , dss_pclk	22.727		22.727		ns
DL5	$t_{w(PCLK)}$	Pulse duration, dss_pclk low or high	$0.45 \cdot P^{(1)}$	$0.55 \cdot P^{(1)}$	$0.45 \cdot P^{(1)}$	$0.55 \cdot P^{(1)}$	ns

- (1) P = dss\_pclk period.
- (2) The pixel clock frequency is software programmable via the pixel clock divider configuration from 1 to 255 division range in the DISPC\_DIVISOR register.
- (3) The DSS in STN mode is used with 4 or 8 pins only; unused pixel data bits always remain low.
- (4) The capacitive load is equivalent to 40 pF.
- (5) For more information, see the DSS chapter in the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

030-062

**Figure 6-29. LCD Display in STN Mode(1) (2) (3) (4) (5)**

- (1) The pixel data bus depends on the use 4-, 8-, 12-, 16-, 18-, or 24-bit per pixel data output pins.
- (2) All timings not illustrated in the waveform are programmable by software, control signal polarity, and driven edge of dss\_pclk.
- (3) dss\_vsync width must be programmed to be as small as possible.
- (4) The pixel clock frequency is programmable.
- (5) For more information, see the DSS chapter in the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

### 6.5.2.2 LCD Display in RFBI Mode

Table 6-40 and Table 6-41 assume testing over the recommended operating conditions (see Figure 6-30 through Figure 6-32).

**Table 6-39. LCD Timing Conditions – RFBI Mode**

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
<b>Input Conditions</b>				
$t_R$	Input signal rise time		15	ns
$t_F$	Input signal fall time		15	ns
<b>Output Conditions</b>				
$C_{LOAD}$	Output load capacitance		30	pF

**Table 6-40. LCD Display Timing Requirements in RFBI Mode**

NO.	PARAMETER		OPP3		OPP2		OPP1 <sup>(1)</sup>		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	
DR0	$t_{su(DAV-RDH)}$	Setup time, rfb_da[15:0] valid to rfb_rd high	7.0		9.0				ns
DR1	$t_{h(RDH-DAIV)}$	Hold time, rfb_rd high to rfb_da[15:0] invalid	5.0		5.0				ns
	$t_d(\text{Data sampled})$	rfb_da[15:0] are sampled at the end off the access time	N <sup>(2)</sup>		N <sup>(2)</sup>				ns

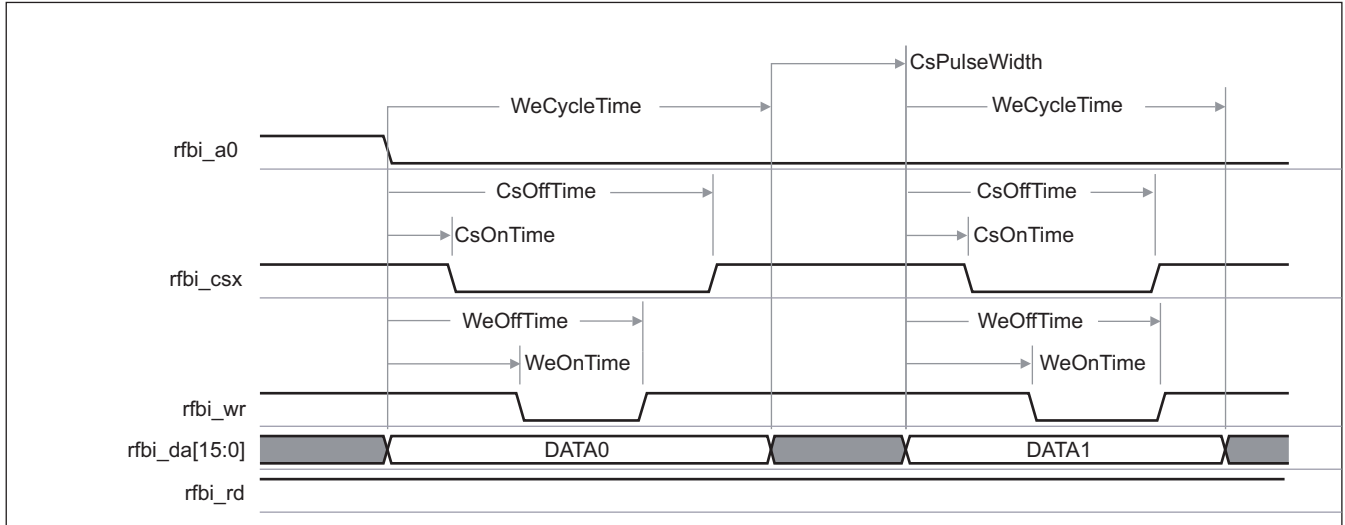

(1) Cannot boot in OPP1. If OPP1 is desired, boot in higher OPP then switch to OPP1.

(2)  $N = (\text{AccessTime}) * (\text{TimeParaGranularity} + 1) * L4CLK$

**Table 6-41. LCD Display Switching Characteristics in RFBI Mode**

## 6.6 Serial Communications Interfaces

### 6.6.1 Multichannel Buffered Serial Port (McBSP) Timing

There are five McBSP modules called McBSP1 through McBSP5. McBSP provides a full-duplex, direct serial interface between the OMAP3525 and OMAP3530 device and other devices in a system such as other application devices or codecs. It can accommodate a wide range of peripherals and clocked frame-oriented protocols (I2S, PCM, and TDM) due to its high level of versatility.

The McBSP1-5 modules may support two types of data transfer at the system level:

- The full-cycle mode, for which one clock period is used to transfer the data, generated on one edge and captured on the same edge (one clock period later).
- The half-cycle mode, for which one half clock period is used to transfer the data, generated on one edge and captured on the opposite edge (one half clock period later). Note that a new data is generated only every clock period, which secures the required hold time.

The interface clock (CLKX/CLKR) activation edge (data/frame sync capture and generation) has to be configured accordingly with the external peripheral (activation edge capability) and the type of data transfer required at the system level.

The OMAP3525 and OMAP3530 McBSP1-5 timing characteristics are described for both rising and falling activation edges. McBSP1 supports:

- 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins.
- 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back via software configuration, respectively, to the clkr and fsr internal signals for data receive.

McBSP2, 3, 4, and 5 support only the 4-pin mode.

The following sections describe the timing characteristics for applications in normal mode (that is, OMAP3525 and OMAP3530 McBSPx connected to one peripheral) and TDM applications in multipoint mode.

#### 6.6.1.1 McBSP in Normal Mode

**Table 6-42. McBSP Timing Conditions—Normal Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	2	ns
$t_F$	Input signal fall time	2	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	10	pF

**Table 6-43. McBSP Output Clock Pulse Duration**

NO.	PARAMETER		OPP3		OPP2		UNIT
			MIN	MAX	MIN	MAX	
<b>Inputs and Outputs</b>							
McBSP1	$t_{c(CLK)}$	Cycle time, mcbbsp1_clkx / mcbbsp1_clkr (multiplexing mode 0)	20.83		41.67		ns
McBSP2	$t_{c(CLK)}$	Cycle time, mcbbsp2_clkx (multiplexing mode 0)	20.83		41.67		ns
McBSP3	$t_{c(CLK)}$	Cycle time, mcbbsp3_clkx	IO set 1 (multiplexing mode 0)	31.25		62.50	ns
			IO set 2 (multiplexing mode 1)	20.83		41.67	
			IO set 3 (multiplexing mode 2)	20.83		41.67	
McBSP4	$t_{c(CLK)}$	Cycle time, mcbbsp4_clkx	IO set 1 (multiplexing mode 0)	20.83		41.67	ns
			IO set 2 (multiplexing mode 2)	31.25		62.50	

**Table 6-43. McBSP Output Clock Pulse Duration (continued)**

NO.	PARAMETER		OPP3		OPP2		UNIT
			MIN	MAX	MIN	MAX	
McBSP5	$t_{c(CLK)}$	Cycle time, mcbbsp5_clkx (multiplexing mode 1)	31.25		62.50		ns
<b>Outputs</b>							
	$t_w(CLKH)$	Typical pulse duration, mcbbsp1_clk / mcbbsp_x_clkx high <sup>(2)</sup>	0.5*P <sup>(1)</sup>		0.5*P <sup>(1)</sup>		ns
	$t_w(CLKL)$	Typical pulse duration, mcbbsp1_clk / mcbbsp_x_clkx low <sup>(2)</sup>	0.5*P <sup>(1)</sup>		0.5*P <sup>(1)</sup>		ns
	$t_{dc(CLK)}$	Duty cycle error, mcbbsp1_clk / mcbbsp_x_clkx <sup>(2)</sup>	-0.75	0.75	-0.75	0.75	ns

(1) P = mcbbsp1\_clk / mcbbsp\_x\_clkx clock period.

(2) In mcbbsp\_x, x identifies the McBSP number: 1, 2, 3, 4, or 5.

**6.6.1.1.1 Receive Timing with Rising Edge as Activation Edge**

Table 6-44 through Table 6-49 assume testing over the recommended operating conditions (see Figure 6-33 through Figure 6-34).

**Table 6-44. McBSP1, 2, and 3 (Sets #2 and #3) Timing Requirements – Rising Edge and Receive Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B3	$t_{su(DRV-CLKAE)}$	Setup time, mcbbsp_x_dr valid before mcbbsp1_clk / mcbbsp_x_clkx active edge	Master	3.5		7.7	ns
			Slave	3.7		7.9	ns
B4	$t_h(CLKAE-DRV)$	Hold time, mcbbsp_x_dr valid after mcbbsp1_clk / mcbbsp_x_clkx active edge	Master	1		1	ns
			Slave	0.4		0.4	ns
B5	$t_{su(FSV-CLKAE)}$	Setup time, mcbbsp1_fsr / mcbbsp_x_fsx valid before mcbbsp1_clk / mcbbsp_x_clkx active edge	3.7		7.9		ns
B6	$t_h(CLKAE-FSV)$	Hold time, mcbbsp1_fsr / mcbbsp_x_fsx valid after mcbbsp1_clk / mcbbsp_x_clkx active edge	0.5		0.5		ns

(1) In mcbbsp\_x, x identifies the McBSP number: 1, 2, or 3. Note that for the McBSP3, these timings concern only Set #2 (multiplexing mode on UART pins) and Set #3 (multiplexing mode on McBSP1 pins).

**Table 6-45. McBSP1, 2, and 3 (Sets #2 and #3) Switching Characteristics – Rising Edge and Receive Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B2	$t_d(CLKAE-FSV)$	Delay time, mcbbsp1_clk / mcbbsp_x_clkx active edge to mcbbsp1_fsr / mcbbsp_x_fsx valid	0.7	14.8	0.7	29.6	ns

(1) In mcbbsp\_x, x identifies the McBSP number: 1, 2, or 3. Note that for the McBSP3, these timings concern only Set #2 (multiplexing mode on UART pins) and Set #3 (multiplexing mode on McBSP1 pins).

**Table 6-46. McBSP4 (Set #1) Timing Requirements – Rising Edge and Receive Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B3	$t_{su(DRV-CLKXAE)}$	Setup time, mcbbsp_x_dr valid before mcbbsp_x_clkx active edge	Master	2.7		7.7	ns

B6	$t_h(CLKXAE-FSXV)$	Hold time, mcbsp <sub>x</sub> _fsx valid after mcbsp <sub>x</sub> _clkx active edge	0.5		0.5		ns

(1) In mcbsp<sub>x</sub>, x identifies the McBSP number: 3, 4, or 5. Note that for the McBSP3, these timings concern only Set #1: multiplexing mode by default. The McBSP3 is also multiplexed on UART pins (Set #2) and on McBSP1 pins (Set #3): the corresponding timings are specified in [Table 6-46](#) and [Table 6-47](#).  
For the McBSP4, these timings concern only Set #2 (multiplexing mode on GPMC pins).

**Table 6-49. McBSP3 (Set #1), 4 (Set #2), and 5 Switching Requirements – Rising Edge and Receive Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B2	$t_{d(CLKXAE-FSXV)}$	Delay time, mcbsp <sub>x</sub> _clkx active edge to mcbsp <sub>x</sub> _fsx valid	0.7	22.2	0.7	44.4	ns

(1) In mcbsp<sub>x</sub>, x identifies the McBSP number: 3, 4, or 5. Note that for the McBSP3, these timings concern only Set #1: multiplexing mode by default. The McBSP3 is also multiplexed on UART pins (Set #2) and on McBSP1 pins (Set #3): the corresponding timings are specified in [Table 6-46](#) and [Table 6-47](#).  
For the McBSP4, these timings concern only Set #2 (multiplexing mode on GPMC pins).

**Figure 6-33. McBSP Rising Edge Receive Timing in Master Mode**

**Figure 6-34. McBSP Rising Edge Receive Timing in Slave Mode**

**6.6.1.1.2 Transmit Timing with Rising Edge as Activation Edge**

[Table 6-50](#) through [Table 6-55](#) assume testing over the recommended operating conditions (see [Figure 6-35](#) and [Figure 6-36](#)).

**Table 6-50. McBSP1, 2, and 3 (Sets #2 and #3) Timing Requirements – Rising Edge and Transmit Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B5	$t_{su}(FSXV-CLKXAE)$	Setup time, mcbsp <sub>x</sub> _fsx valid before mcbsp <sub>x</sub> _clkx active edge	3.7		7.9		ns
B6	$t_h(CLKXAE-FSXV)$	Hold time, mcbsp <sub>x</sub> _fsx valid after mcbsp <sub>x</sub> _clkx active edge	0.5		0.5		ns

(1) In mcbsp<sub>x</sub>, x identifies the McBSP number: 1, 2, or 3. Note that for the McBSP3, these timings concern only Set #2 (multiplexing mode on UART pins) and Set #3 (multiplexing mode on McBSP1 pins).

**Table 6-51. McBSP1, 2, and 3 (Sets #2 and #3) Switching Characteristics – Rising Edge and Transmit Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT	
			MIN	MAX	MIN	MAX		
B2	$t_d(CLKXAE-FSXV)$	Delay time, mcbsp <sub>x</sub> _clkx active edge to mcbsp <sub>x</sub> _fsx valid	0.7	14.8	0.7	29.6	ns	
B8	$t_d(CLKXAE-DXV)$	Delay time, mcbsp <sub>x</sub> _clkx active edge to mcbsp <sub>x</sub> _dx valid	Master	0.6	14.8	0.6	29.6	ns
			Slave	0.6	14.8	0.6	29.6	ns

(1) In mcbsp<sub>x</sub>, x identifies the McBSP number: 1, 2, or 3. Note that for the McBSP3, these timings concern only Set #2 (multiplexing mode on UART pins) and Set #3 (multiplexing mode on McBSP1 pins).

**Table 6-52. McBSP4 (Set #1) Timing Requirements – Rising Edge and Transmit Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B5	$t_{su}(FSXV-CLKXAE)$	Setup time, mcbsp <sub>x</sub> _fsx valid before mcbsp <sub>x</sub> _clkx active edge	3.7		7.9		ns
B6	$t_h(CLKXAE-FSXV)$	Hold time, mcbsp <sub>x</sub> _fsx valid after mcbsp <sub>x</sub> _clkx active edge	0.5		0.5		ns

(1) n mcbsp<sub>x</sub>, x identifies the McBSP number: 4. Note that for the McBSP4, these timings concern only Set #1: multiplexing mode by default. The McBSP4 is also multiplexed on GPMC pins (Set #2): the corresponding timings are specified in [Table 6-54](#).

**Table 6-53. McBSP4 (Set #1) Switching Characteristics – Rising Edge and Transmit Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT	
			MIN	MAX	MIN	MAX		
B2	$t_d(CLKXAE-FSXV)$	Delay time, mcbsp <sub>x</sub> _clkx active edge to mcbsp <sub>x</sub> _fsx valid	0.7	16.6	0.7	33.1	ns	
B8	$t_d(CLKXAE-DXV)$	Delay time, mcbsp <sub>x</sub> _clkx active edge to mcbsp <sub>x</sub> _dx valid	Master	0.6	16.6	0.6	33.1	ns
			Slave	0.6	17.3	0.6	33.1	ns

(1) In mcbsp<sub>x</sub>, x identifies the McBSP number: 4. Note that for the McBSP4, these timings concern only Set #1: multiplexing mode by default. The McBSP4 is also multiplexed on GPMC pins (Set #2): the corresponding timings are specified in [Table 6-54](#).

Figure 6-40. McBSP Falling Edge Transmit Timing in Slave Mode

030-075

### 6.6.1.2 McBSP in TDM—Multipoint Mode (McBSP3)

For TDM application in multipoint mode, OMAP3525 and OMAP3530 is considered as a slave. Table 6-69 and Table 6-70 assume testing over the operating conditions and electrical characteristic conditions described below.

Table 6-68. McBSP3 Timing Conditions—TDM in Multipoint Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
<b>Input Conditions</b>				
$t_R$	Input signal rising time	1.0	8.5	ns
$t_F$	Input signal falling time	1.0	8.5	ns
<b>Output Conditions</b>				
$C_{LOAD}$	Output Load Capacitance		40	pF

Table 6-69. McBSP3 Timing Requirements—TDM in Multipoint Mode<sup>(1)</sup>

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
	$t_{W(CLKH)}$	Cycle Time, mcbssp3_clkx	162.8		162.8		ns
	$t_{W(CLKH)}$	Typical Pulse duration, mcbssp3_clkx high	0.5*P <sup>(2)</sup>		0.5*P <sup>(2)</sup>		ns
	$t_{W(CLKL)}$	Typical Pulse duration, mcbssp3_clkx low	0.5*P <sup>(2)</sup>		0.5*P <sup>(2)</sup>		ns
	$t_{dc(CLK)}$	Duty cycle error, mcbssp3_clkx	-8.14	8.14	-8.14	8.14	ns
B3 <sup>(3)</sup>	$t_{su(DRV-CLKAE)}$	Setup time, mcbssp3_dr valid before mcbssp3_clkx active edge	9		9		ns
B4 <sup>(3)</sup>	$t_h(CLKAE-DRV)$	Hold time, mcbssp3_dr valid after mcbssp3_clkx active edge	2.4		2.4		ns
B5 <sup>(3)</sup>	$t_{su(FSV-CLKAE)}$	Setup time, mcbssp3_fsv valid before mcbssp3_clkx active edge	9		9		ns
B6 <sup>(3)</sup>	$t_h(CLKAE-FSV)$	Hold time, mcbssp3_fsv valid after mcbssp3_clkx active edge	2.4		2.4		ns

(1) For McBSP3, these timings concern only Set #3 (multiplexing mode in McBSP1 pins).

(2) P = mcbssp3\_clkx period in ns

(3) See Section 6.6.1.1, *McBSP in Normal Mode* for corresponding figures.

Table 6-70. McBSP3 Switching Characteristics—TDM in Multipoint Mode<sup>(1)</sup>

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
B8 <sup>(2)</sup>	$t_{d(CLKXAE-DXV)}$	Delay time, mcbssp3_clkx active edge to mcbssp3_dx valid	0.6	16.8	0.6	29.6	ns

(1) For McBSP3, these timings concern only Set #3 (multiplexing mode in McBSP1 pins).

(2) See Section 6.6.1.1, *McBSP in Normal Mode* for corresponding figures.

### 6.6.2 Multichannel Serial Port Interface (McSPI) Timing

The multichannel SPI is a master/slave synchronous serial bus. The McSPI1 module supports up to four peripherals and the others (McSPI2, McSPI3, and McSPI4) support up to two peripherals. The following timings are applicable to the different configurations of McSPI in master/slave mode for any McSPI and any channel (n).

#### 6.6.2.1 McSPI in Slave Mode

Table 6-71 and Table 6-72 assume testing over the recommended operating conditions (see Figure 6-41).

**Table 6-71. McSPI Interface Timing Requirements – Slave Mode<sup>(1) (2)</sup>**

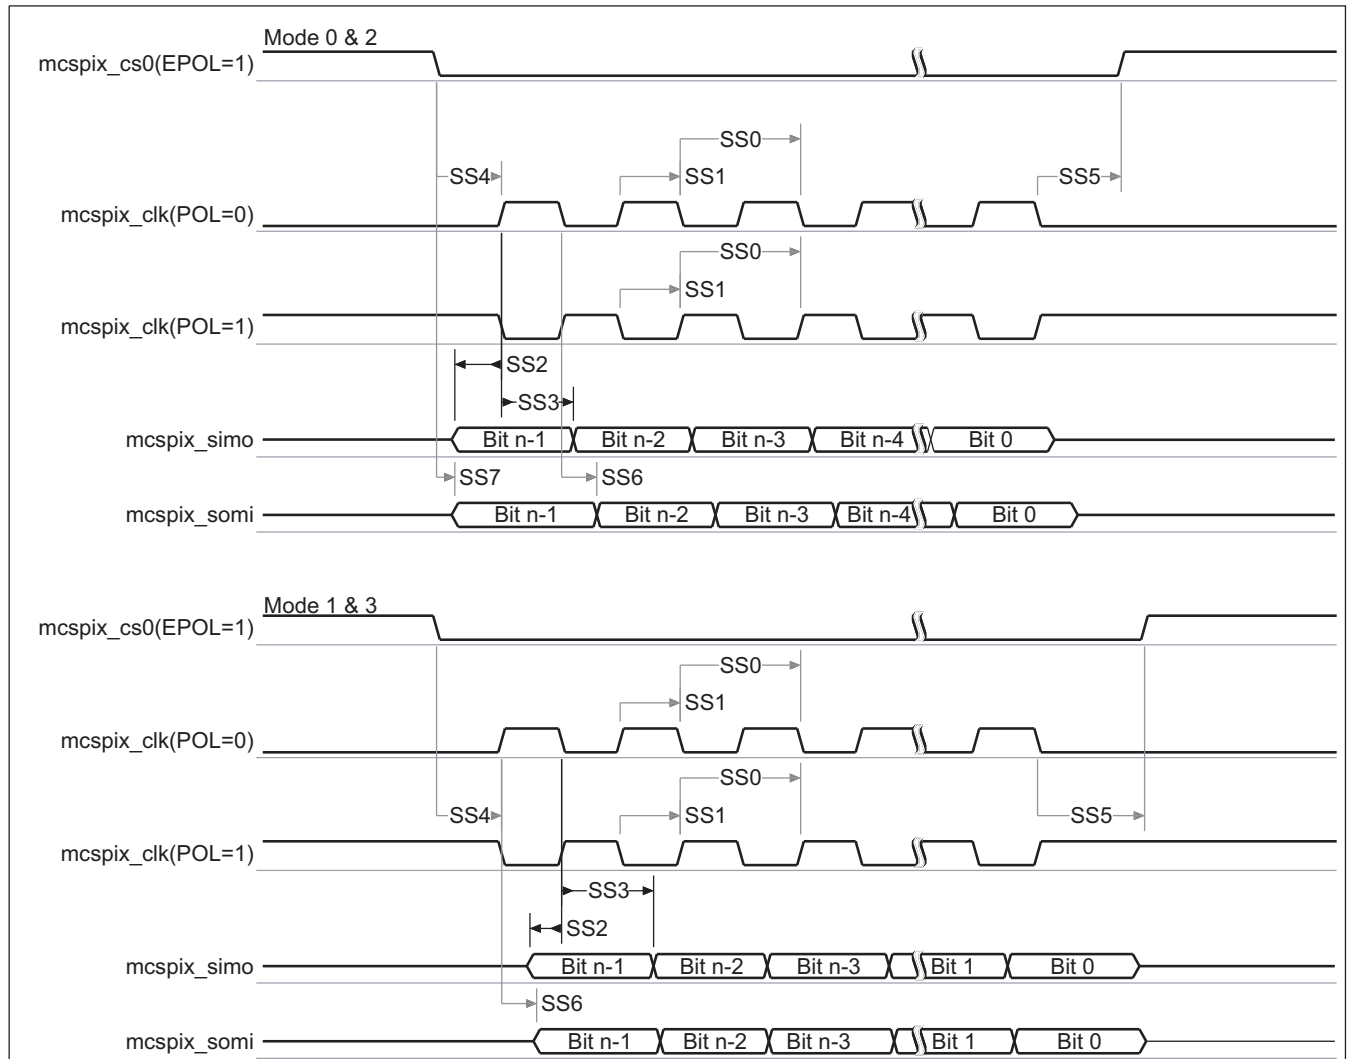

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
1/SS0	$t_{c(CLK)}$	Frequency, mcspx_clk		24		12	MHz
	$t_{j(CLK)}$	Cycle jitter <sup>(3)</sup> , mcspx_clk	-200	200	-200	200	ps
SS1	$t_{w(CLK)}$	Pulse duration, mcspx_clk high or low	$0.45 \cdot P^{(4)}$	$0.55 \cdot P^{(5)}$	$0.45 \cdot P^{(5)}$	$0.55 \cdot P^{(5)}$	ns
SS2	$t_{su(SIMOV-CLKAE)}$	Setup time, mcspx_simo valid before mcspx_clk active edge	4.2		9.5		ns
SS3	$t_{h(SIMOV-CLKAE)}$	Hold time, mcspx_simo valid after mcspx_clk active edge	4.6		9.9		ns
SS4	$t_{su(CS0V-CLKFE)}$	Setup time, mcspx_cs0 valid before mcspx_clk first edge	13.8		28.6		ns
SS5	$t_{h(CS0I-CLKLE)}$	Hold time, mcspx_cs0 invalid after mcspx_clk last edge	13.8		28.6		ns

- (1) The input timing requirements are given by considering a rise time and a fall time of 4 ns.
- (2) In mcspx, x is equal to 1, 2, 3, or 4.
- (3) Maximum cycle jitter supported by mcspx\_clk input clock.
- (4) P = mcspx\_clk clock period
- (5) P = mcspx\_clk clock period

**Table 6-72. McSPI Interface Switching Requirements<sup>(1) (2) (3) (4)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
SS6	$t_{d(CLKAE-SOMIV)}$	Delay time, mcspx_clk active edge to mcspx_somi shifted	1.8	15.9	3.2	31.7	ns
SS7	$t_{d(CS0AE-SOMIV)}$	Delay time, mcspx_cs0 active edge to mcspx_somi shifted		15.9		31.7	ns

- (1) The capacitive load is equivalent to 20 pF.
- (2) In mcspx, x is equal to 1, 2, 3, or 4.
- (3) The polarity of mcspx\_clk and the active edge (rising or falling) on which mcspx\_simo is driven and mcspx\_somi is latched is all software configurable.
- (4) This timing applies to all configurations regardless of mcspx\_clk polarity and which clock edges are used to drive output data and capture input data.

030-076

**Figure 6-41. McSPI Interface – Transmit and Receive in Slave Mode(1) (2)**

- (1) The active clock edge (rising or falling) on which mcspi\_somi is driven and mcspi\_simo data is latched is software configurable with the bit MSPI\_CHCONFx[0] = PHA and the bit MSPI\_CHCONFx[1] = POL.
- (2) The polarity of mcspix\_csi is software configurable with the bit MSPI\_CHCONFx[6] = EPOL In mcspix, x is equal to 1, 2, 3, or 4.

**6.6.2.2 McSPI in Master Mode**

Table 6-73 and Table 6-74 assume testing over the recommended operating conditions (see Figure 6-42).

**Table 6-73. McSPI1, 2, and 4 Interface Timing Requirements – Master Mode(1) (2)**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
SM2	$t_{su}(SOMIV-CLKAE)$	Setup time, mcspix_somi valid before mcspix_clk active edge	1.1		1.5		ns
SM3	$t_h(SOMIV-CLKAE)$	Hold time, mcspix_somi valid after mcspix_clk active edge	1.9		2.8		ns

- (1) The input timing requirements are given by considering a rise time and a fall time of 4 ns.
- (2) In mcspix, x is equal to 1, 2, or 4. In mcspix\_csn, n is equal to 0, 1, 2, or 3 for x equal to 1, n is equal to 0 or 1 for x equal to 2 and 4.

**Table 6-74. McSPI1, 2, and 4 Interface Switching Characteristics – Master Mode<sup>(1) (2) (3)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
1/SM0	$1/t_{c(CLK)}$	Frequency, mcspix_clk		48		24	MHz
	$t_{j(CLK)}$	Cycle jitter <sup>(4)</sup> , mcspix_clk	-200	200	-200	200	ps
SM1	$t_{w(CLK)}$	Pulse duration, mcspix_clk high or low	$0.45 \cdot P^{(5)}$	$0.55 \cdot P^{(5)}$	$0.45 \cdot P^{(5)}$	$0.55 \cdot P^{(5)}$	ns
SM4	$t_{d(CLKAE-SIMOV)}$	Delay time, mcspix_clk active edge to mcspix_simo shifted	-2.1	5	-2.1	11.3	ns
SM5	$t_{d(CSnA-CLKFE)}$	Delay time, mcspix_csi active to mcspix_clk first edge	Modes 1 and 3	$A^{(6)} - 3.1$		$A^{(6)} - 4.4$	ns
			Modes 0 and 2	$B^{(7)} - 3.1$		$B^{(7)} - 4.4$	ns
SM6	$t_{d(CLKLE-CSnI)}$	Delay time, mcspix_clk last edge to mcspix_csi inactive	Modes 1 and 3	$B^{(7)} - 3.1$		$B^{(7)} - 4.4$	ns
			Modes 0 and 2	$A^{(6)} - 3.1$		$A^{(6)} - 4.4$	ns
SM7	$t_{d(CSnAE-SIMOV)}$	Delay time, mcspix_csi active edge to mcspix_simo shifted		5.0		11.3	ns

- (1) Timings are given for a maximum load capacitance of 20 pF for spix\_csn signals, 30 pF for spix\_clk and spix\_simo signals with x = 1 or 2, and 20 pF for spi4\_clk and spi4\_simo signals.
- (2) In mcspix, x is equal to 1, 2, or 4. In mcspix\_csn, n is equal to 0, 1, 2, or 3 for x equal to 1, n is equal to 0 or 1 for x equal to 2 and 4.
- (3) The polarity of mcspix\_clk and the active edge (rising or falling) on which mcspix\_simo is driven and mcspix\_somi is latched is all software configurable.
- (4) Maximum cycle jitter supported by mcspix\_clk input clock.
- (5) P = mcspix\_clk clock period
- (6) Case P = 20.8 ns, A = (TCS+0.5)\*P (TCS is a bit field of MSPI\_CHCONFx[26:25] register). Case P > 20.8 ns, A = TCS\*P (TCS is a bitfield of MSPI\_CHCONFx[26:25] register). For more information, see the McSPI chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].
- (7) B = TCS\*P (TCS is a bit field of MSPI\_CHCONFx[26:25] register). For more information, see the McSPI chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

Table 6-75 and Table 6-76 assume testing over the recommended operating conditions (see Figure 6-42).

**Table 6-75. McSPI 3 Interface Timing Requirements – Master Mode<sup>(1) (2)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
SM2	$t_{su(SOMIV-CLKAE)}$	Setup time, mcspi3_somi valid before mcspi3_clk active edge	1.5		4.3		ns
SM3	$t_h(SOMIV-CLKAE)}$	Hold time, mcspi3_somi valid after mcspi3_clk active edge	2.8		5.9		ns

- (1) The input timing requirements are given by considering a rise time and a fall time of 4 ns.
- (2) In mcspi3\_csn, n is equal to 0 or 1. The polarity of mcspi3\_clk and the active edge (rising or falling) on which mcspi3\_simo is driven and mcspi3\_somi is latched is all software configurable.

**Table 6-76. McSPI3 Interface Switching Requirements – Master Mode<sup>(1) (2) (3)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
1/SM0	$1/t_{c(CLK)}$	Frequency, mcspix_clk		24		12	MHz
	$t_{j(CLK)}$	Cycle jitter <sup>(4)</sup> , mcspix_clk	-200	200	-200	200	ps
SM1	$t_{w(CLK)}$	Pulse duration, mcspix_clk high or low	$0.45 \cdot P^{(5)}$	$0.55 \cdot P^{(5)}$	$0.45 \cdot P^{(5)}$	$0.55 \cdot P^{(5)}$	ns

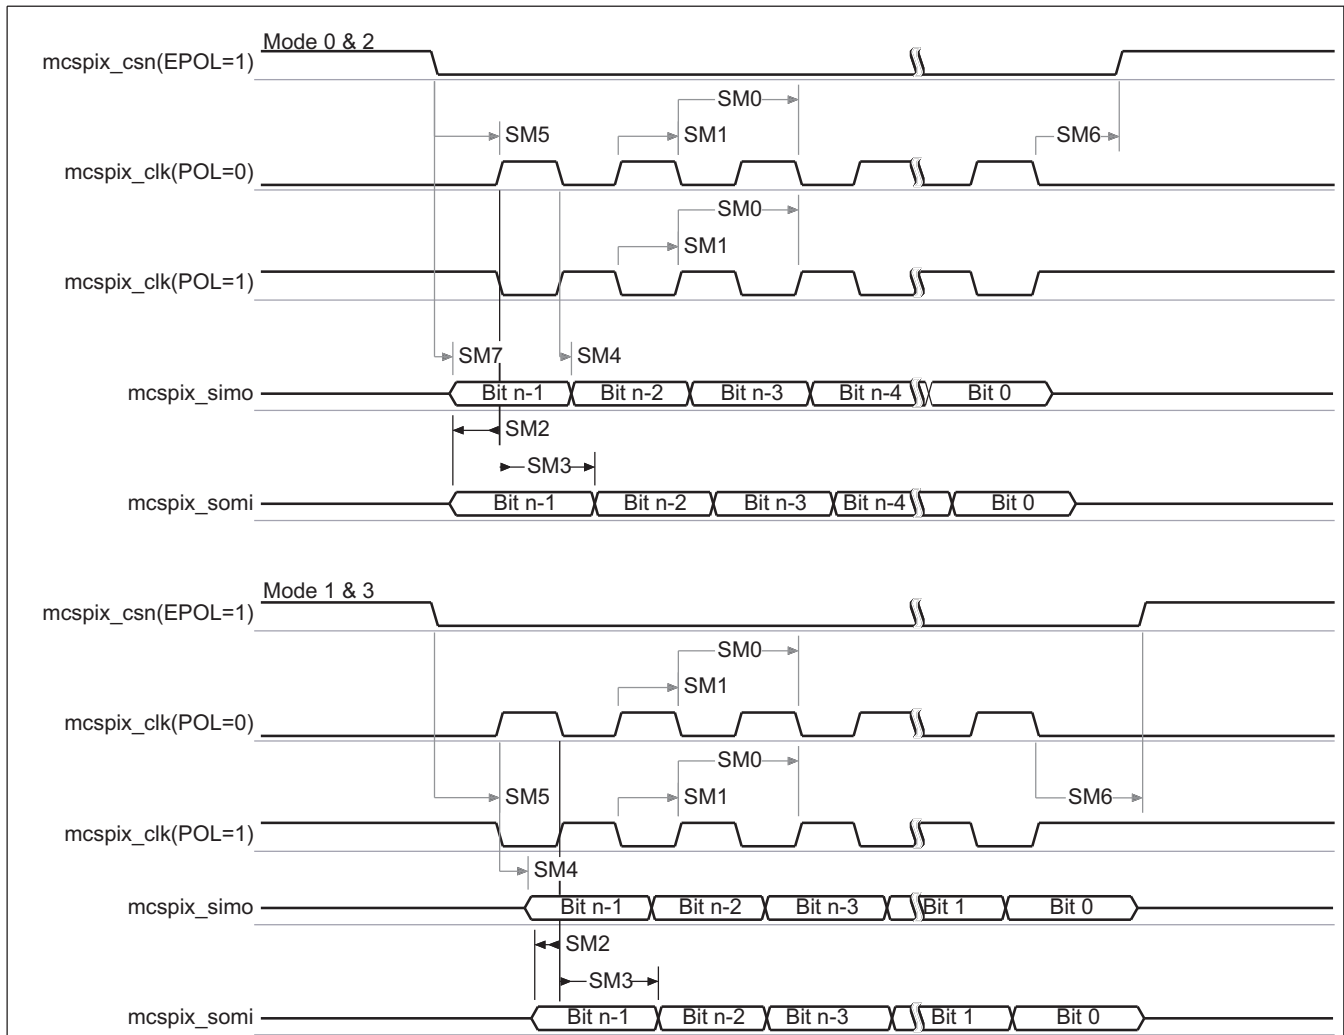

- (1) The capacitive load is equivalent to 20 pF.
- (2) In mcspi3\_csn, n is equal to 0 or 1. The polarity of mcspi3\_clk and the active edge (rising or falling) on which mcspi3\_simo is driven and mcspi3\_somi is latched is all software configurable.
- (3) This timing applies to all configurations regardless of McSPI3\_CLK polarity and which clock edges are used to drive output data and capture input data.
- (4) Maximum cycle jitter supported by mcspix\_clk input clock.
- (5) P = mcspi3\_clk clock period

**Table 6-76. McSPI3 Interface Switching Requirements – Master Mode (continued)**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
SM4	$t_{d(\text{CLKAE-SIMOV})}$	Delay time, mcspix_clk active edge to mcspix_simo shifted	-2.1	11.3	-5.3	23.6	ns
SM5	$t_{d(\text{CSnA-CLKFE})}$	Delay time, mcspix_csi active to mcspix_clk first edge	Modes 1 and 3	$-4.4 + A^{(6)}$		$-10.1 + A^{(6)}$	ns
			Modes 0 and 2	$-4.4 + B^{(7)}$		$-10.1 + B^{(7)}$	ns
SM6	$t_{d(\text{CLK-CSn})}$	Delay time, mcspix_clk last edge to mcspix_csi inactive	Modes 1 and 3	$B - 4.4^{(7)}$		$B - 10.1^{(7)}$	ns
			Modes 0 and 2	$A^{(6)} - 4.4$		$A^{(6)} - 10.1$	ns
SM7	$t_{d(\text{CSnAE-SIMOV})}$	Delay time, mcspix_csi active edge to mcspix_simo shifted		11.3		23.6	ns

(6) Case P = 20.8 ns,  $A = (\text{TCS} + 0.5) * P$  (TCS is a bit field of MSP1\_CHCONFx[26:25] register). Case P > 20.8 ns,  $A = \text{TCS} * P$  (TCS is a bit field of MSP1\_CHCONFx[26:25] register). For more information, see the McSPI chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

(7)  $B = \text{TCS} * P$  (TCS is a bit field of MSP1\_CHCONFx[26:25] register). For more information, see the McSPI chapter of the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

030-077

**Figure 6-42. McSPI Interface – Transmit and Receive in Master Mode(1) (2) (3)**

- (1) The active clock edge (rising or falling) on which mcspx\_simo is driven and mcspx\_somi data is latched is software configurable with the bit MSP1\_CHCONFx[0] = PHA and the bit MSP1\_CHCONFx[1] = POL.
- (2) The polarity of mcspx\_csi is software configurable with the bit MSP1\_CHCONFx[6] = EPOL.
- (3) In mcspx, x is equal to 1. In mcspx\_csn, n is equal to 0, 1, 2, or 3.

### 6.6.3 Multiport Full-Speed Universal Serial Bus (USB) Interface

The OMAP3525 and OMAP3530 processor provides three USB ports working in full- and low-speed data transactions (up to 12Mbit/s).

Connected to either a serial link controller (TLL modes) or a serial PHY (PHY interface modes) it supports:

- 6-pin (Tx: Dat/Se0 or Tx: Dp/Dm) unidirectional mode
- 4-pin bidirectional mode
- 3-pin bidirectional mode

#### 6.6.3.1 Multiport Full-Speed Universal Serial Bus (USB) – Unidirectional Standard 6-pin Mode

Table 6-78 and Table 6-79 assume testing over the recommended operating conditions (see Figure 6-43).

**Table 6-77. Low-/Full-Speed USB Timing Conditions – Unidirectional Standard 6-pin Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	2.0	ns
$t_F$	Input signal fall time	2.0	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	15.0	pF

**Table 6-78. Low-/Full-Speed USB Timing Requirements – Unidirectional Standard 6-pin Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
FSU1	$t_d(Vp,Vm)$	Time duration, mmx_rxdp and mmx_rxdm low together during transition		14.0		14.0	ns
FSU2	$t_d(Vp,Vm)$	Time duration, mmx_rxdp and mmx_rxdm high together during transition		8.0		8.0	ns
FSU3	$t_d(RCVU0)$	Time duration, mmx_rrxcv undefine during a single end 0 (mmx_rxdp and mmx_rxdm low together)		14.0		14.0	ns
FSU4	$t_d(RCVU1)$	Time duration, mmx_rxcv undefine during a single end 1 (mmx_rxdp and mmx_rxdm high together)		8.0		8.0	ns

**Table 6-79. Low-/Full-Speed USB Switching Characteristics – Unidirectional Standard 6-pin Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX

**Figure 6-48. Low-/Full-Speed USB – Bidirectional TLL 3-pin Mode**

### 6.6.4 Multiport High-Speed Universal Serial Bus (USB) Timing

In addition to the full-speed USB controller, a high-speed (HS) USB OTG controller is instantiated inside OMAP3525 and OMAP3530 . It allows high-speed transactions (up to 480 Mbit/s) on the USB ports 0, 1, 2, and 3.

- Port 0:
  - 12-bit slave mode (SDR)
- Port 1 and port 2:
  - 12-bit master mode (SDR)
  - 12-bit TLL master mode (SDR)

- 8-bit TLL master mode (DDR)
- Port 3:
  - 12-bit TLL master mode (SDR)
  - 8-bit TLL master mode (DDR)

**6.6.4.1 High-Speed Universal Serial Bus (USB) on Port 0 – 12-bit Slave Mode**

Table 6-96 and Table 6-97 assume testing over the recommended operating conditions (see Figure 6-49).

**Table 6-95. High-Speed USB Timing Conditions – 12-bit Slave Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_r$	Input Signal Rising Time	2.00	ns
$t_f$	Input Signal Falling Time	2.00	ns
<b>Output Conditions</b>			
$C_{load}$	Output Load Capacitance	3.50	pF

- (1) In hsusbx, x is equal to 1, 2, or 3.
- (2) The jitter probability density can be approximated by a Gaussian function.

In hsusbx, x is equal to 1, 2, or 3.

**Figure 6-52. High-Speed USB – 8-bit TLL Master Mode**

### 6.6.5 I<sup>2</sup>C Interface

The multimaster I<sup>2</sup>C peripheral provides an interface between two or more devices via an I<sup>2</sup>C serial bus. The I<sup>2</sup>C controller supports the multimaster mode which allows more than one device capable of controlling the bus to be connected to it. Each I<sup>2</sup>C device is recognized by a unique address and can operate as either transmitter or receiver, according to the function of the device. In addition to being a transmitter or receiver, a device connected to the I<sup>2</sup>C bus can also be considered as master or slave when performing data transfers. This data transfer is carried out via two serial bidirectional wires:

- An SDA data line
- An SCL clock line

The following sections illustrate the data transfer is in master or slave configuration with 7-bit addressing format. The I<sup>2</sup>C interface is compliant with Philips I<sup>2</sup>C specification version 2.1. It supports standard mode (up to 100K bits/s), fast mode (up to 400K bits/s) and high-speed mode (up to 3.4Mb/s).

#### 6.6.5.1 I<sup>2</sup>C Standard/Fast-Speed Mode

**Table 6-107. I<sup>2</sup>C Standard/Fast-Speed Mode Timings**

NO.	PARAMETER <sup>(1)</sup>		Standard Mode		Fast Mode		UNIT
			MIN	MAX	MIN	MAX	
	f <sub>SCL</sub>	Clock Frequency, i2cX_scl		100		400	kHz
I1	t <sub>w(SCLH)</sub>	Pulse Duration, i2cX_scl high	4		0.6		μs
I2	t <sub>w(SCLL)</sub>	Pulse Duration, i2cX_scl low	4.7		1.3		μs
I3	t <sub>su(SDAV-SCLH)</sub>	Setup time, i2cX_sda valid before i2cX_scl active level	250		100 <sup>(2)</sup>		ns
I4	t <sub>h(SCLH-SDAV)</sub>	Hold time, i2cX_sda valid after i2cX_scl active level	0 <sup>(3)</sup>	3.45 <sup>(4)</sup>	0 <sup>(3)</sup>	0.9 <sup>(4)</sup>	μs
I5	t <sub>su(SDAL-SCLH)</sub>	Setup time, i2cX_scl high after i2cX_sda low (for a START <sup>(5)</sup> condition or a repeated START condition)	4.7		0.6		μs
I6	t <sub>h(SCLH-SDAH)</sub>	Hold time, i2cX_sda low level after i2cX_scl high level (STOP condition)	4		0.6		μs
I7	t <sub>h(SCLH-RSTART)</sub>	Hold time, i2cX_sda low level after i2cX_scl high level (for a repeated START condition)	4		0.6		μs
I8	t <sub>w(SDAH)</sub>	Pulse duration, i2cX_sda high between STOP and START conditions	4.7		1.3		μs
	t <sub>R(SCL)</sub>	Rise time, i2cX_scl		1000		300	ns
	t <sub>F(SCL)</sub>	Fall time, i2cX_scl		300		300	ns
	t <sub>R(SDA)</sub>	Rise time, i2cX_sda		1000		300	ns
	t <sub>F(SDA)</sub>	Fall time, i2cX_sda		300		300	ns
	CB	Capacitive load for each bus line		60 <sup>(6)</sup>		60 <sup>(6)</sup>	pF

(1) In i2cX, X is equal to 1, 2, 3, or 4. Note that I2C4 is master transmitter only.

(2) A fast-mode I<sup>2</sup>C-bus device can be used in a standard-mode I<sup>2</sup>C-bus system, but the requirement t<sub>su(SDAV-SCLH)</sub> ≥ 250 ns must then be met. This is automatically the case if the device does not stretch the low period of the i2cx\_scl. If such a device does stretch the low period of the i2cx\_scl, it must output the next data bit to the i2cx\_sda line t<sub>r(SDA)</sub> max + t<sub>su(SDAV-SCLH)</sub> = 1000 + 250 = 1250 ns (according to the standard-mode I<sup>2</sup>C-bus specification) before the i2cx\_scl line is released.

(3) The device provides (via the I<sup>2</sup>C bus) a hold time of at least 300 ns for the i2cx\_sda signal (refer to the fall and rise time of i2cx\_scl) to bridge the undefined region of the falling edge of i2cx\_scl.

(4) The maximum t<sub>h(SCLH-SDA)</sub> has only to be met if the device does not stretch the low period of the i2cx\_scl signal.

(5) After this time, the first clock is generated.

(6) Maximum reference load for i2c4\_scl and i2c4\_sda is CB = 15 pF.

Figure 6-53. I<sup>2</sup>C – Standard/Fast Mode

6.6.5.2 I<sup>2</sup>C High-Speed Mode

NO.	PARAMETER	CB = 100 pF MAX		CB = 400 pF MAX		UNIT
		MIN	MAX	MIN	MAX	
	f <sub>SCL</sub>	Clock frequency, i2cX_scl		3.4		MHz
I1	t <sub>w(SCLH)</sub>	Pulse duration, i2cX_scl high		60 <sup>(3)</sup>	120 <sup>(3)</sup>	μs
I2	t <sub>w(SCLL)</sub>	Pulse duration, i2cX_scl low		160 <sup>(3)</sup>	320 <sup>(3)</sup>	μs
I3	t <sub>su(SDAV-SCLH)</sub>	Setup time, i2cX_sda valid before i2cX_scl active level		10	10	ns
I4	t <sub>h(SCLH-SDAV)</sub>	Hold time, i2cX_sda valid after i2cX_scl active level		0 <sup>(2)</sup>	150	μs
I5	t <sub>su(SDAL-SCLH)</sub>	Setup time, i2cX_scl high after i2cX_sda low (for a START <sup>(4)</sup> condition or a repeated START condition)		160	160	μs
I6	t <sub>h(SCLH-SDAH)</sub>	Hold time, i2cX_sda low level after i2cX_scl high level (STOP condition)		160	160	μs
I7	t <sub>h(SCLH-RSTART)</sub>	Hold time, i2cX_sda low level after i2cX_scl high level (for a repeated START condition)		160	160	ns
	t <sub>R(SCL)</sub>	Rise time, i2cX_scl		40	80	ns
	t <sub>R(SCL)</sub>	Rise time, i2cX_scl after a repeated START condition and after a bit acknowledge		80	160	ns
	t <sub>F(SCL)</sub>	Fall time, i2cX_scl		40	80	ns
	t <sub>R(SDA)</sub>	Rise time, i2cX_sda		80	160	ns
	t <sub>F(SDA)</sub>	Fall time, i2cX_sda		80	160	ns
	C <sub>B</sub>	Capacitive load for each bus line		60 <sup>(5)</sup>	pF	

- (1) In i2cX, X is equal to 1, 2, 3, or 4. Note that I2C4 is master transmitter only.
- (2) The device provides (via the I<sup>2</sup>C bus) a hold time of at least 300 ns for the i2cx\_sda signal (refer to the fall and rise time of i2cx\_scl) to bridge the undefined region of the falling edge of i2cx\_scl.
- (3) HS-mode master devices generate a serial clock signal with a high to low ratio of 1 to 2. t<sub>w(SCLL)</sub> > 2 × t<sub>w(SCLH)</sub>.
- (4) After this time, the first clock is generated.
- (5) Maximum reference load for i2c4\_scl and i2c4\_sda is C<sub>B</sub> = 15 pF.

030-094

Figure 6-54. I<sup>2</sup>C – High-Speed Mode<sup>(1) (2) (3)</sup>

- (1) HS-mode master devices generate a serial clock signal with a high-to-low ratio of 1 to 2. t<sub>w(SCLL)</sub> > 2 × t<sub>w(SCLH)</sub>.
- (2) In i2cX, X is equal to 1, 2, 3, or 4. Note that I2C4 is master transmitter only.
- (3) After this time, the first clock is generated.

**6.6.6 HDQ / 1-Wire Interfaces**

This module is intended to work with both the HDQ and the 1-Wire protocols. The protocols use a single wire to communicate between the master and the slave. The protocols employ an asynchronous return to 1 mechanism where, after any command, the line is pulled high.

**6.6.6.1 HDQ Protocol**

Table 6-110 and Table 6-111 assume testing over the recommended operating conditions (see Figure 6-55 through Figure 6-58).

**Table 6-110. HDQ Timing Requirements**

6.6.7 UART IrDA Interface

The IrDA module can operate in three different modes:

- Slow infrared (SIR) ( $\leq 115.2$  Kbits/s)
- Medium infrared (MIR) (0.576 Mbits/s and 1.152 Mbits/s)
- Fast infrared (FIR) (4 Mbits/s)

For more information about this interface, see the UART/IrDA chapter in the *OMAP35x Technical Reference Manual (TRM)* [literature number [SPRUF98](#)].

## 6.7 Removable Media Interfaces

### 6.7.1 High-Speed Multimedia Memory Card (MMC) and Secure Digital IO Card (SDIO) Timing

The MMC/SDIO host controller provides an interface to high-speed and standard MMC, SD memory cards, or SDIO cards. The application interface is responsible for managing transaction semantics. The MMC/SDIO host controller deals with MMC/SDIO protocol at transmission level, packing data, adding CRC, start/end bit, and checking for syntactical correctness.

There are three MMC interfaces on the OMAP3525 and OMAP3530 :

- MMC/SD/SDIO Interface 1:
  - 1.8 V/3 V support
  - 8 bits
- MMC/SD/SDIO Interface 2:
  - 1.8 V support
  - 8 bits
  - 4 bits with external transceiver allowing to support 3 V peripherals. Transceiver direction control signals are multiplexed with the upper four data bits.
- MMC/SD/SDIO Interface 3:
  - 1.8 V support
  - 8 bits

#### 6.7.1.1 MMC/SD/SDIO in SD Identification Mode

Table 6-118 and Table 6-119 assume testing over the recommended operating conditions and electrical characteristic conditions.

**Table 6-117. MMC/SD/SDIO Timing Conditions – SD Identification Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>SD Identification Mode</b>			
<b>Input Conditions</b>			
$t_R$	Input signal rise time	10	ns
$t_F$	Input signal fall time	10	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	40	pF

**Table 6-118. MMC/SD/SDIO Timing Requirements – SD Identification Mode<sup>(1) (2) (3)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
<b>SD Identification Mode</b>							
<b>MMC/SD/SDIO Interface 1 (1.8 V IO)</b>							
HSSD3/SD3	$t_{su}(CMDV-CLKIH)$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	1198.4		1198.4		ns
HSSD4/SD4	$t_{su}(CLKIH-CMDIV)$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	1249.2		1249.2		ns
<b>MMC/SD/SDIO Interface 1 (3.0 V IO)</b>							
HSSD3/SD3	$t_{su}(CMDV-CLKIH)$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	1198.4		1198.4		ns
HSSD4/SD4	$t_{su}(CLKIH-CMDIV)$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	1249.2		1249.2		ns
<b>MMC/SD/SDIO Interface 2</b>							

(1) Timing parameters are referred to output clock specified in Table 6-119.

(2) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified in Table 6-119.

(3) Corresponding figures showing timing parameters are common with other interface modes. (See SD and HS SD modes).

**Table 6-118. MMC/SD/SDIO Timing Requirements – SD Identification Mode (continued)**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX

	$t_{W}(clkL)$	Rise time, output data		10		10	ns
	$t_{dc}(clk)$	Fall time, output data		10		10	ns
HSSD5/SD5	$t_{d}(CLKOH-CMD)$	Delay time, mmc2_clk rising clock edge to mmc2_cmd transition	6.3	2492.7	6.3	2492.7	ns
<b>MMC/SD/SDIO Interface 3</b>							
	$t_{c}(clk)$	Rise time, output clk		10		10	ns

(1) Corresponding figures showing timing parameters are common with other interface modes (see SD and HS SD modes).

(2) Related with the output clk maximum and minimum frequencies programmable in I/F module.

(3) In mmc\_x\_clk, 'x' is equal to 1, 2, or 3.

(4) The X parameter is defined as shown in Table 6-120.

(5) PO = output clk period in ns.

(6) The Y parameter is defined as shown in Table 6-121.

(7) The jitter probability density can be approximated by a Gaussian function.

**Table 6-119. MMC/SD/SDIO Switching Characteristics – SD Identification Mode (continued)**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
	$t_{W(\text{clkH})}$	Fall time, output clk		10		10	ns

In mmc\_x, x is equal to 1, 2, or 3.

Figure 6-68. MMC/SD/SDIO – Standard SD Mode – Data/Command Transmit

## 6.8 Test Interfaces

The emulation and trace interfaces allow tracing activities of the following CPUs:

- ARM1136JF-STM through an Embedded Trace Macro-cell (ETM11) dedicated to enable real-time trace of the ARM subsystem operations and a Serial Debug Trace Interface (SDTI)
- IVA2 DSP through a high-speed real-time data exchange (HS-RTDX) controller

All processors can be emulated via JTAG ports.

### 6.8.1 Embedded Trace Macro Interface (ETM)

Table 6-142 assumes testing over the recommended operating conditions (see Figure 6-69).

Table 6-142. Embedded Trace Macro Interface Switching Characteristics<sup>(1)</sup>

NO.	PARAMETER		1.15 V		UNIT
			MIN	MAX	
f	$1/t_{c(\text{CLK})}$	Frequency, etk_clk		166	MHz
ETM0	$t_{c(\text{CLK})}$	Cycle time <sup>(2)</sup> , etk_clk	6		ns
ETM1	$t_{W(\text{CLK})}$	Clock pulse width, etk_clk	2.7		ns
ETM2	$t_{d(\text{CLK-CTL})}$	Delay time, etk_clk clock edge to etk_ctl transition	-0.5	0.5	ns
ETM3	$t_{d(\text{CLK-D})}$	Delay time, etk_clk clock high to etk_d[15:0] transition	-0.5	0.5	ns

(1) The capacitive load is equivalent to 25 pF.

(2) Cycle time is given by considering a jitter of 5%.

030-110

Figure 6-69. Embedded Trace Macro Interface

### 6.8.2 System Debug Trace Interface (SDTI)

The system debug trace interface (SDTI) module provides real-time software tracing functionality to the OMAP3525 and OMAP3530 device.

The trace interface has four trace data pins and a trace clock pin.

This interface is a dual-edge interface: the data are available on rising and falling edges of sdti\_clk but can be also configured in single edge mode where data are available on falling edge of sdti\_clk.

Serial interface operates in clock stop regime: serial clock is not free running, when there is no trace data there is no trace clock.

#### 6.8.2.1 System Debug Trace Interface in Dual-Edge Mode

Table 6-144 assumes testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-70).

**Table 6-143. System Debug Trace Interface Timing Conditions – Dual-Edge Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Output Conditions</b>			
C <sub>LOAD</sub>	Output load capacitance	25	pF

**Table 6-144. System Debug Trace Interface Switching Characteristics – Dual-Edge Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
SD1	t <sub>c</sub> (CLK)	Cycle time, sdti_clk period	29		29		ns
SD2	t <sub>w</sub> (CLK)	Typical pulse duration, sdti_clk high or low	0.5*P <sup>(1)</sup>		0.5*P <sup>(1)</sup>		ns
	t <sub>dc</sub> (CLK)	Duty cycle error, sdti_clk	-1.2	1.2	-1.2	1.2	ns
	t <sub>R</sub> (CLK)	Rise time, sdti_clk		5		5	ns
	t <sub>F</sub> (CLK)	Fall time, sdti_clk		5		5	ns
SD3	t <sub>d</sub> (CLK-TxD)	Multiplexing mode on etk pins	2.3	10.9	2.3	10.9	ns
		Multiplexing mode on jtag_emu pins	2.3	13.9	2.3	13.9	
	t <sub>R</sub> (CLK)	Rise time, sdti_txd[3:0]		5		5	ns
	t <sub>F</sub> (CLK)	Fall time, sdti_txd[3:0]		5		5	ns

(1) P = sdti\_clk clock period

030-111

**Figure 6-70. System Debug Trace Interface – Dual-Edge Mode**

**6.8.2.2 System Debug Trace Interface in Single-Edge Mode**

Table 6-146 assumes testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-71).

**Table 6-145. System Debug Trace Interface Timing Conditions – Single-Edge Mode**

### 6.8.3 JTAG Interfaces

OMAP3525 and OMAP3530 JTAG TAP controller handles standard IEEE JTAG interfaces. The following sections define the timing requirements for several tools used to test the OMAP3525 and OMAP3530 processors as:

- Free running clock tool, like XDS560 and XDS510 tools
- Adaptive clock tool, like RealView® ICE tool and Lauterbach™ tool

#### 6.8.3.1 JTAG – Free Running Clock Mode

Table 6-148 and Table 6-149 assume testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-72).

**Table 6-147. JTAG Timing Conditions – Free Running Clock Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	5	ns
$t_F$	Input signal fall time	5	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	30	pF

**Table 6-148. JTAG Timing Requirements – Free Running Clock Mode<sup>(1)</sup>**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
JT4	$t_c(tck)$	Cycle time <sup>(2)</sup> , jtag_tck period	25		33		ns
JT5	$t_w(tckL)$	Typical pulse duration, jtag_tck low	0.5*P <sup>(3)</sup>		0.5*P <sup>(3)</sup>		ns
JT6	$t_w(tckH)$	Typical pulse duration, jtag_tck high	0.5*P <sup>(3)</sup>		0.5*P <sup>(3)</sup>		ns
	$t_{dc}(tck)$	Duty cycle error, jtag_tck	-1250	1250	-1667	1667	ps
	$t_j(tck)$	Cycle jitter <sup>(4)</sup> , jtag_tck	-1250	1250	-1667	1667	ps
JT7	$t_{su}(tdiV-rtckH)$	Setup time, jtag_tdi valid before jtag_rtck high	1.8		1.8		ns
JT8	$t_h(tdiV-rtckH)$	Hold time, jtag_tdi valid after jtag_rtck high	0.7		1		ns
JT9	$t_{su}(tmsV-rtckH)$	Setup time, jtag_tms valid before jtag_rtck high	1.8		1.8		ns
JT10	$t_h(tmsV-rtckH)$	Hold time, jtag_tms valid after jtag_rtck high	0.7		1		ns
JT12	$t_{su}(emuxV-rtckH)$	Setup time, jtag_emux <sup>(5)</sup> valid before jtag_rtck high	14.6		19.8		ns

- (1) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
- (2) Related with the input maximum frequency supported by the JTAG module.
- (3) P = jtag\_tck period in ns.
- (4) Maximum cycle jitter supported by jtag\_tck input clock.
- (5) x = 0 to 1

**Table 6-148. JTAG Timing Requirements – Free Running Clock Mode (continued)**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
JT13	$t_{h(emuxV-rtckH)}$	Hold time, jtag_emux <sup>(5)</sup> valid after jtag_rtck high	2		2.7		ns

**Table 6-149. JTAG Switching Characteristics – Free Running Clock Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
JT1	$t_{c(rtck)}$	Cycle time <sup>(1)</sup> , jtag_rtck period	25		33		ns
JT2	$t_w(rtckL)$	Typical pulse duration, jtag_rtck low	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
JT3	$t_w(rtckH)$	Typical pulse duration, jtag_rtck high	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
	$t_{dc(rtck)}$	Duty cycle error, jtag_rtck	-1250	1250	-1667	1667	ps
	$t_j(rtck)$	Jitter standard deviation <sup>(3)</sup> , jtag_rtck		33.3		33.3	ps
	$t_R(rtck)$	Rise time, jtag_rtck		4		4	ns
	$t_F(rtck)$	Fall time, jtag_rtck		4		4	ns
JT11	$t_d(rtckL-tdoV)$	Delay time, jtag_rtck low to jtag_tdo valid	-5.8	5.8	-7.9	7.9	ns
	$t_R(tdo)$	Rise time, jtag_tdo		4		4	ns
	$t_F(tdo)$	Fall time, jtag_tdo		4		4	ns
JT14	$t_d(rtckH-emuxV)$	Delay time, jtag_rtck high to jtag_emux <sup>(4)</sup> valid	2.7	15.1	2.7	20.4	ns
	$t_R(emux)$	Rise time, jtag_emux <sup>(4)</sup>		6		6	ns
	$t_F(emux)$	Fall time, jtag_emux <sup>(4)</sup>		6		6	ns

- (1) Related with the jtag\_rtck maximum frequency.
- (2) PO = jtag\_rtck period in ns.
- (3) The jitter probability density can be approximated by a Gaussian function.
- (4) x = 0 to 1

In jtag\_emux, x is equal to 0 to 1.

**Figure 6-72. JTAG Interface Timing – Free Running Clock Mode**

### 6.8.3.2 JTAG – Adaptive Clock Mode

Table 6-151 and Table 6-152 assume testing over the recommended operating conditions and electrical characteristic conditions (see Figure 6-73):

**Table 6-150. JTAG Timing Conditions – Adaptive Clock Mode**

TIMING CONDITION PARAMETER		VALUE	UNIT
<b>Input Conditions</b>			
$t_R$	Input signal rise time	5	ns
$t_F$	Input signal fall time	5	ns
<b>Output Conditions</b>			
$C_{LOAD}$	Output load capacitance	30	pF

**Table 6-151. JTAG Timing Requirements – Adaptive Clock Mode<sup>(1)</sup>**

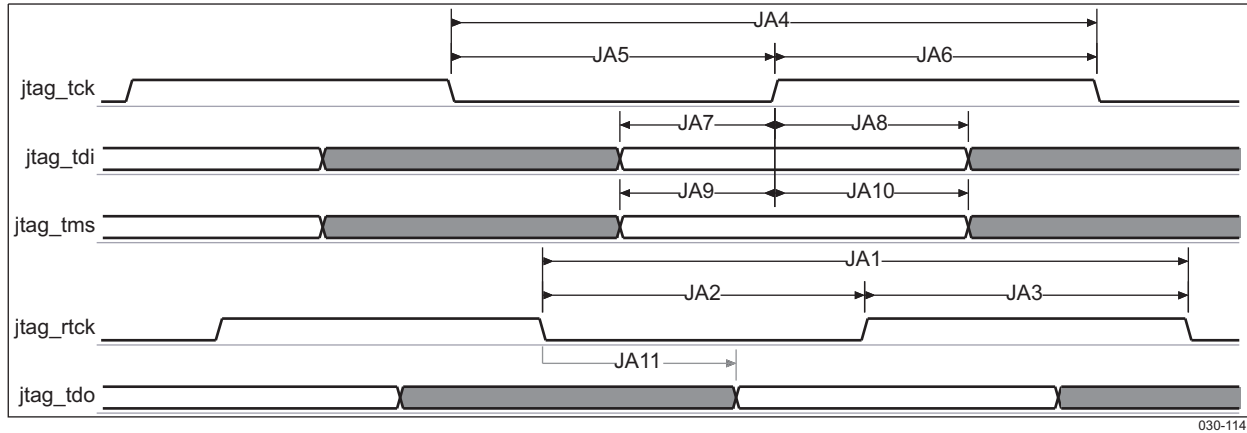

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
JA4	$t_{c(tck)}$	Cycle time <sup>(2)</sup> , jtag_tck period	50		50		ns
JA5	$t_{w(tckL)}$	Typical pulse duration, jtag_tck low	0.5*P <sup>(3)</sup>		0.5*P <sup>(3)</sup>		ns
JA6	$t_{w(tckH)}$	Typical pulse duration, jtag_tck high	0.5*P <sup>(3)</sup>		0.5*P <sup>(3)</sup>		ns
	$t_{dc(lclk)}$	Duty cycle error, jtag_tck	-2500	2500	-2500	2500	ps
	$t_{j(lclk)}$	Cycle jitter <sup>(4)</sup> , jtag_tck	-1500	1500	-1500	1500	ps
JA7	$t_{su(tdiV-tckH)}$	Setup time, jtag_tdi valid before jtag_tck high	13.8		13.8		ns
JA8	$t_{h(tdiV-tckH)}$	Hold time, jtag_tdi valid after jtag_tck high	13.8		13.8		ns
JA9	$t_{su(tmsV-tckH)}$	Setup time, jtag_tms valid before jtag_tck high	13.8		13.8		ns
JA10	$t_{h(tmsV-tckH)}$	Hold time, jtag_tms valid after jtag_tck high	13.8		13.8		ns

- (1) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.  
(2) Related with the input maximum frequency supported by the JTAG module.  
(3) P = jtag\_tck period in ns.  
(4) Maximum cycle jitter supported by jtag\_tck input clock.

**Table 6-152. JTAG Switching Characteristics – Adaptive Clock Mode**

NO.	PARAMETER		1.15 V		1.0 V		UNIT
			MIN	MAX	MIN	MAX	
JA1	$t_{c(rtck)}$	Cycle time <sup>(1)</sup> , jtag_rtck period	50		50		ns
JA2	$t_{w(rtckL)}$	Typical pulse duration, jtag_rtck low	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
JA3	$t_{w(rtckH)}$	Typical pulse duration, jtag_rtck high	0.5*PO <sup>(2)</sup>		0.5*PO <sup>(2)</sup>		ns
	$t_{dc(rtck)}$	Duty cycle error, jtag_rtck	-2500	2500	-2500	2500	ps
	$t_{j(rtck)}$	Jitter standard deviation <sup>(3)</sup> , jtag_rtck		33.3		33.3	ps
	$t_R(rtck)$	Rise time, jtag_rtck		4		4	ns
	$t_F(rtck)$	Fall time, jtag_rtck		4		4	ns
JA11	$t_{d(rtckL-tdoV)}$	Delay time, jtag_rtck low to jtag_tdo valid	-14.6	14.6	-14.6	14.6	ns
	$t_R(tdo)$	Rise time, jtag_tdo,		4		4	ns
	$t_F(tdo)$	Fall time, jtag_tdo		4		4	ns

- (1) Related with the jtag\_rtck maximum frequency programmable.  
(2) PO = jtag\_rtck period in ns.  
(3) The jitter probability density can be approximated by a Gaussian function.

030-114

## 7 PACKAGE CHARACTERISTICS

### 7.1 Package Thermal Resistance

Table 7-1 provides the thermal resistance characteristics for the recommended package types used on the OMAP3525 and OMAP3530 Applications Processor.

**Table 7-1. OMAP3525 and OMAP3530 Thermal Resistance Characteristics<sup>(1) (2)</sup>**

Package	Power (W) <sup>(3)</sup>	R <sub>θJA</sub> (°C/W)	R <sub>θJB</sub> (°C/W)	R <sub>θJC</sub> (°C/W) <sup>(4)</sup>	Board Type
OMAP3525/30 (CBB Pkg.)	0.92871	24.46	10.94		<sup>(5)</sup> 2S2P <sup>(6)</sup>
OMAP3525/30 (CBC Pkg.)	0.92871	21.89	6.23	<sup>(5)</sup>	2S2P <sup>(6)</sup>
OMAP3525/30 (CUS Pkg.)	0.92871	23.69	8.1	2.31	2S2P <sup>(6)</sup>

- (1) R<sub>θJA</sub> (Theta-JA) = Thermal Resistance Junction-to-Ambient, °C/W
- (2) This table provides simulation data and may not represent actual use-case values.  
R<sub>θJB</sub> (Theta-JB) = Thermal Resistance Junction-to-Board, °C/W  
R<sub>θJC</sub> (Theta-JC) = Thermal Resistance Junction-to-Case, °C/W
- (3) These numbers are based on simulation results and don't necessarily represent the wattage that the part will take in actual use.
- (4) It is recommended to dissipate the heat to the board instead of attempting to remove it from the top of the chip; therefore, top-side heat sinks should not be used for package.
- (5) Not applicable if the POP package has a memory package on top; no heat sink can be used.
- (6) The board types are defined by JEDEC (reference JEDEC standard JESD51-9, Test Board for Area Array Surface Mount Package Thermal Measurements).

### 7.2 Device Support

#### 7.2.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all OMAP processors and support tools. Each OMAP device has one of three prefixes: X, P, or null (no prefix). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices/tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow. (TMX definition)
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications. (TMP definition)
- null** Production version of the silicon die that is fully qualified. (TMS definition)

Support tool development evolutionary flow:

- TMDX** Development support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

“Developmental product is intended for internal evaluation purposes.”

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P), have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For additional description of the device nomenclature markings, see the *OMAP35x Applications Processor Silicon Errata* (literature number [SPRZ278](#)).

- A. For more information on the silicon revision, please see the *OMAP3530/25/15/03 Applications Processor Silicon Errata* (literature number [SPRZ278](#)).

Figure 7-1. Device Nomenclature

## 7.2.2 Documentation Support

### 7.2.2.1 Related Documentation from Texas Instruments

The following documents describe the OMAP3525 and OMAP3530 Applications Processor. Copies of these documents are available on the Internet at [www.ti.com](http://www.ti.com). Tip: Enter the literature number in the search box provided at [www.ti.com](http://www.ti.com).

The current documentation that describes the OMAP3525 and OMAP3530 Applications Processor, related peripherals, and other technical collateral, is available in the product folder at: [www.ti.com](http://www.ti.com).

**[SPRUF98](#) *OMAP35x Technical Reference Manual.*** Collection of documents providing detailed information on the OMAP3 architecture including power, reset, and clock control, interrupts, memory map, and switch fabric interconnect. Detailed information on the microprocessor unit (MPU) subsystem, the image, video, and audio (IVA2.2) subsystem, as well a functional description of the peripherals supported on OMAP35x devices is also included.

**[SPRU732](#) *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.*** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

**[SPRU871](#) *TMS320C64x+ DSP Megamodule Reference Guide.*** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

**[SPRU889](#) *High-Speed DSP Systems Design Reference Guide.*** Provides recommendations for meeting the many challenges of high-speed DSP system design. These recommendations include information about DSP audio, video, and communications systems for the C5000 and C6000 DSP platforms.

### 7.2.2.2 Related Documentation from Other Sources

The following documents are related to the OMAP3525 and OMAP3530 Applications Processor. Copies of these documents can be obtained directly from the internet or from your Texas Instruments representative.

**Cortex™-A8 Technical Reference Manual.** This is the technical reference manual for the Cortex-A8 processor. A copy of this document can be obtained via the internet at <http://infocenter.arm.com>. Please see the *OMAP35x Applications Processor Silicon Errata* (literature number [SPRZ278](#) ) to determine the revision of the Cortex-A8 core used on your device.

**ARM Core Cortex™-A8 (AT400/AT401) Errata Notice.** Provides a list of advisories for the different revisions of the Cortex-A8 processor. Contact your TI representative for a copy of this document. Please see the *OMAP35x Applications Processor Silicon Errata* (literature number [SPRZ278](#) ) to determine the revision of the Cortex-A8 core used on your device.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
OMAP3525EZCBC	ACTIVE	POP-FCBGA	CBC	515	119	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	-40 to 90	3525EZCBC	<a href="#">Samples</a>
OMAP3525EZCBCA	ACTIVE	POP-FCBGA	CBC	515	119	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	-40 to 105	3525EZCBCA	<a href="#">Samples</a>

OMAP3530EZCBBA	ACTIVE	POP-FCBGA	CBB	515	119	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	-40 to 105	3530EZCBB A	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
