Table continues on the next page...

**Table 13-31. Protocol-to-Phy Interface Signal List (continued)**

Signal	I/O	Description
RX_BYTE_CLK_HS0	I	Byte Clock
RX_VALID_HS%	I	Received Data is valid.
RX_DATA_HS%[7:0]	I	Data bus for HS transfer
STOP_STATE %	I	Stop state indicator (active high)
ULPS_DAT%	I	ULPS state indicator (active low)
ERR_SOT_HS%	I	Error flag of Start of transmission in HS mode.
ENABLE_D%	O	Data lane enabler
<b>D-Sphy test</b>		
I_DPHY_TESTMODE	I	D-phy test mode
I_DTLPCLK	I	D-phy Test clock
TXESCCLK%	O	Escape mode clock for D-phy test
<b>D-phy config</b>		
O_HS_SETTLE[7:0]	O	Configuration for tuning HS settle time
O_S_CLKSETTLECTRL[1:0]	O	Configuration for D-phy control
O_B_DPHYCTRL[63:0]	O	Configuration for D-phy ac characteristics
O_S_DPHYCTRL[63:0]	O	Configuration for D-phy ac characteristics
O_S_DPDN_SWAP_CLK	O	Swapping Dp and Dn channel of clock lane in D-phy.
O_S_DPDN_SWAP_DAT	O	Swapping Dp and Dn channel of data lanes in D-phy.

### 13.5.3.11.3 AMBA signal

**Table 13-32. APB slave Interface signal list**

Signal	I/O	Description
<b>APB Slave</b>		
I_PCLK	I	Main system clock
I_PRESETn	I	Main system reset
I_PADDR[31:0]	I	System address
I_PSEL	I	Module select strobe
I_PWRITE	I	Write strobe
I_PENABLE	I	Enable strobe
I_PWDATA[31:0]	I	Write data to slave module
O_PREADY	O	Slave module is ready (but tied high: always ready).
O_PSLVERR	O	Slave module with error
O_PRDATA[31:0]	O	Read data from slave module

### 13.5.3.11.4 Image signal

Image output signals are duplicated for output channel 1 to 3.

**Table 13-33. Image Output Interface Signal List**

Signal	I/O	Description
<b>ISP or CAM I/F</b>		
O_PIX_CLK[0]	O	Pixel clock for ISP or CAM I/F This is pixel clock for transferring image data to ISP or CAM I/F. The default clock of this is PCLK. If user wants to assign another clock, Set the WCLK_SRC of CSIS_CNFG register. The relationship of bandwidth between input and output is that output bandwidth should be faster than input bandwidth. The frequency of this clock is determined as following equation. $(\# \text{ of data lane}) * (\text{frequency of RX\_BYTE\_CLK\_HS}) \leq (\text{bitwidths of image format}) * (\text{frequency of PIXCLK}).$ O_PIX_CLK[0] are worked when the corresponding channels are used
O_VVALID [0]	O	Vertical sync (level) O_VVALID[0] is worked when the corresponding channels are used.
O_HVALID [0]	O	Horizontal sync (level) O_HVALID[0] is worked when the corresponding channels are used.
O_DVALID [0]	O	Data valid O_DVALID[0] is worked when the corresponding channels are used.
O_BVALID[1:0]	O	Byte valid O_BVALID[1:0] is worked when the corresponding channels are used.
O_DATA[31:0]	O	Pixel data O_DATA[31:0] is worked when the corresponding channels are used.

### 13.5.3.11.5 Sideband signal

**Table 13-34. Image Sideband signal list**

Signal	I/O	Description
<b>Interrupt</b>		
O_INT_CSIS	O	Interrupt request signal
I_INTGEN_SEL	I	Interrupt type selection signal: <ul style="list-style-type: none"> <li>0: Pulse interrupt generation</li> <li>1: Level interrupt generation</li> </ul>
<b>External clock source</b>		
I_WRAPPER_CLK	I	External clock input for wrapper

### 13.5.3.11.6 Memory I/F

**Table 13-35. Memory I/F**

Signal	I/O	Description
<b>Memory for Generic data</b>		

*Table continues on the next page...*

**Table 13-35. Memory I/F (continued)**

Signal	I/O	Description
O_GEN_MEM_WCLK	O	Write clock (ByteClk)
O_GEN_MEM_WEN	O	Generic data Write enable strobe
O_GEN_MEM_WADDR[10:0]	O	Generic data Write Address
O_GEN_MEM_WDATA[31:0]	O	Generic data Write Data bus
O_GEN_MEM_RCLK	O	Read clock (PCLK)
O_GEN_MEM_RADDR[10:0]	O	Generic data Read Address
O_GEN_MEM_REN	O	Generic data Read enable strobe
I_GEN_MEM_RDATA[31:0]	I	Generic data Read Data bus
<b>Memory for Image data</b>		
O_IMG_MEM_WCLK	O	Write clock (ByteClk)
O_IMG_MEM_WEN	O	Image data Write enable strobe
O_IMG_MEM_WADDR[7:0]	O	Image data Write Address
O_IMG_MEM_WDATA[32:0]	O	Image data Write Data bus
O_IMG_MEM_RCLK	O	Read clock (PIXCLK)
O_IMG_MEM_RADDR[7:0]	O	Image data Read Address
O_IMG_MEM_REN	O	Image data Read enable strobe
I_IMG_MEM_RDATA[32:0]	I	Image data Read Data bus

**13.5.3.11.7 Test signal**

**Table 13-36. Test Related Signal List**

Signal	I/O	Description
I_STMODE	I	Scan Test mode
I_TCLK_WRAP	I	Scan Test Clock for WRAP clock domain This port is used for testing SCAN at the speed of WRAP clock. If user uses only 1 SCAN test net, this port should be connected to TCLK which is SCAN test clock.
I_TCLK_WRAP_HALF	I	Scan Test Clock for WRAP / 2 clock domain This port is used for testing SCAN at the half speed of WRAP clock. If user uses only 1 SCAN test net, this port should be connected to TCLK which is SCAN test clock.
I_TCLK_BYTE	I	Scan Test Clock for BYTE clock domain This port is used for testing SCAN at the speed of BYTE clock. If user uses only 1 SCAN test net, this port should be connected to TCLK which is SCAN test clock.

## 13.5.3.12 Application Scenario

### 13.5.3.12.1 Programming model

**Table 13-37. Behavior Programming in Each Case**

No.	Pseudo Code	Description
Initialize		
1	APB_WRITE(CSIS_INT R_ MSK, - )	Set Interrupt Mask
2	APB_WRITE(DPHY _B CTRL_ L , - )	Set DPHYBCTRL LSB
3	APB_WRITE(DPHY _B CTRL_ H , - )	Set DPHYBCTRL MSB
4	APB_WRITE(DPHY _CMN_ CTRL, 0x11 )	Set DPHY HSSETTLE
5	APB_WRITE( ISP _ CONFIG_ CH0 , - )	Set ISP_ CH0 configuration
6	APB_WRITE( ISP_ RESOL_ CH0 , - )	Set ISP_ CH0 resolution
7	APB_WRITE( ISP _ SYNC_ CH0 , - )	Set ISP_ CH0 sync
8	APB_WRITE( ISP_ CONFIG_ CH1, - )	Set ISP_ CH1 configuration
9	APB_WRITE( ISP_ RESOL_ CH1, - )	Set ISP_ CH1 resolution
10	APB_WRITE( ISP_ SYNC_ CH 1 , - )	Set ISP_ CH1 sync
11	APB_WRITE(CSIS_ CLK_ CTRL, - )	Set CSIS clock control
12	APB_WRITE(CSIS_ CMN_ CTRL, - )	Set CSIS common control (enable CSI)
Run in Data transfer		

### 13.5.3.12.2 Enable decompressor

**Table 13-38. Config CH0 with RAW10 Decomp-en (10 - 14 Decompressor)**

No.	Pseudo Code	Description
Initialize		
1	APB_WRITE (ISP_ RESOL_ CH0, 0x0280_01E0)	Set CH0 Resol (640x480)
2	APB_WRITE (ISP_ CONFIG_ CH0, 0x0800_03AC)	Set CH0 Config (RAW10, VC:0, Fullgap:8, advanced predict decomp enabled)
3	APB_WRITE (CSIS_ CMN_ CTRL, 0x0001_0F01)	Set CSIS CMN CTRL ( enable system, 4lane, VCI and DT interleave, ISP0 update)
Run in Data transfer		

## 13.5.4 Register

MIPI\_CSI2 memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
3075_0004	CSIS Common Control (MIPI_CSI2_CSIS_CMN_CTRL)	32	R/W	0000_0000h	<a href="#">13.5.4.1/3847</a>
3075_0008	CSIS Clock gate Control (MIPI_CSI2_CSIS_CLK_CTRL)	32	R/W	0000_00F0h	<a href="#">13.5.4.2/3849</a>
3075_0010	CSIS Interrupt Mask (MIPI_CSI2_CSIS_INT_MSK)	32	R/W	0000_0000h	<a href="#">13.5.4.3/3850</a>
3075_0014	CSIS Interrupt Source (MIPI_CSI2_CSIS_INT_SRC)	32	R/W	0000_0000h	<a href="#">13.5.4.4/3852</a>
3075_0020	D-PHY Status (MIPI_CSI2_DPHY_STATUS)	32	R/W	0000_00F1h	<a href="#">13.5.4.5/3854</a>
3075_0024	D-PHY Common Control (MIPI_CSI2_DPHY_CMN_CTRL)	32	R/W	0000_0000h	<a href="#">13.5.4.6/3856</a>
3075_0030	D-PHY Master and Slave Control register low (MIPI_CSI2_DPHY_BCTRL_L)	32	R/W	0000_0000h	<a href="#">13.5.4.7/3857</a>
3075_0034	D-PHY Master and Slave Control register high (MIPI_CSI2_DPHY_BCTRL_H)	32	R/W	0000_0000h	<a href="#">13.5.4.8/3857</a>
3075_0038	D-PHY Slave Control register low (MIPI_CSI2_DPHY_SCTRL_L)	32	R/W	0000_0000h	<a href="#">13.5.4.9/3858</a>
3075_003C	D-PHY Slave Control register high (MIPI_CSI2_DPHY_SCTRL_H)	32	R/W	0000_0000h	<a href="#">13.5.4.10/3858</a>
3075_0040	ISP Configuration register of CH0 (MIPI_CSI2_ISP_CONFIG_CH0)	32	R/W	0800_08FCh	<a href="#">13.5.4.11/3859</a>
3075_0044	ISP Image Resolution register of CH0 (MIPI_CSI2_ISP_RESOL_CH0)	32	R/W	8000_8000h	<a href="#">13.5.4.12/3861</a>
3075_0048	ISP SYNC register of CH0 (MIPI_CSI2_ISP_SYNC_CH0)	32	R/W	0000_0000h	<a href="#">13.5.4.13/3862</a>
3075_0080	Shadow Configuration register of CH0 (MIPI_CSI2_SDW_CONFIG_CH0)	32	R	0800_08FCh	<a href="#">13.5.4.14/3863</a>
3075_0084	Shadow Resolution register of CH0 (MIPI_CSI2_SDW_RESOL_CH0)	32	R	0800_0800h	<a href="#">13.5.4.15/3865</a>
3075_0088	Shadow SYNC register of CH0 (MIPI_CSI2_SDW_SYNC_CH0)	32	R/W	0000_0000h	<a href="#">13.5.4.16/3865</a>
3075_00C0	Debug Control register (MIPI_CSI2_DBG_CTRL)	32	R/W	0000_0F00h	<a href="#">13.5.4.17/3866</a>
3075_00C4	Debug Interrupt Mask (MIPI_CSI2_DBG_INTR_MSK)	32	R/W	0000_0000h	<a href="#">13.5.4.18/3867</a>
3075_00C8	Debug Interrupt Mask (MIPI_CSI2_DBG_INTR_SRC)	32	R/W	0000_0000h	<a href="#">13.5.4.19/3869</a>
3075_2000	Non Image Data (MIPI_CSI2_NON_IMG_DATA)	32	R/W	Undefined	<a href="#">13.5.4.20/3870</a>

### 13.5.4.1 CSIS Common Control (MIPI\_CSI2\_CSIS\_CMN\_CTRL)

Address: 3075\_0000h base + 4h offset = 3075\_0004h

**MIPI\_CSI2\_CSIS\_CMN\_CTRL field descriptions**

Field	Description
31–20 RSVD1	Reserved Read as zero, do not modify.
19–16 UPDATE_SHADOW	Strobe of updating shadow registers After configuration, user has to set this bit for updating shadow registers. This bit is cleared automatically after updating shadow registers. Bit 19, 18, 17 is reserved. Bit 16 set for CH0. 0 Default 1 Update the shadow registers

Table continues on the next page...

**MIPI\_CSI2\_CSIS\_CMN\_CTRL field descriptions (continued)**

Field	Description
15–12 RSVD2	Reserved  Read as zero, do not modify.
11–10 INTERLEAVE_ MODE	Select Interleave mode, VC (Virtual channel) and DT (Data type)  11 VC and DT 10 VC only 01 DT only 00 CH0 only, no data interleave
9–8 LANE_NUMBER	Number of data lane  00 1 data lane 01 2 data lane 10 Reserved 11 Reserved
7–3 RSVD3	Reserved  Read as zero, do not modify.
2 UPDATE_ SHADOW_CTRL	Update Shadow Control  Enable this reg is recommended when interleave_mode is 2 or 3.  0 Disable (default) 1 Enable
1 SW_REST	Software Reset  All writable registers in CSI2 go back to initial state. After this bit is active for three cycles, this bit will be deasserted automatically.  <b>NOTE:</b> Almost MIPI CSI2 block uses “ByteClk” from D-phy. This “ByteClk” is not continuous clock. User has to assert software reset when Camera module is turned off.  0 Ready 1 Reset
0 CSI_EN	MIPI CSI2 system enable  0 Disable 1 Enable

### 13.5.4.2 CSIS Clock gate Control (MIPI\_CSI2\_CSIS\_CLK\_CTRL)

Address: 3075\_0000h base + 8h offset = 3075\_0008h

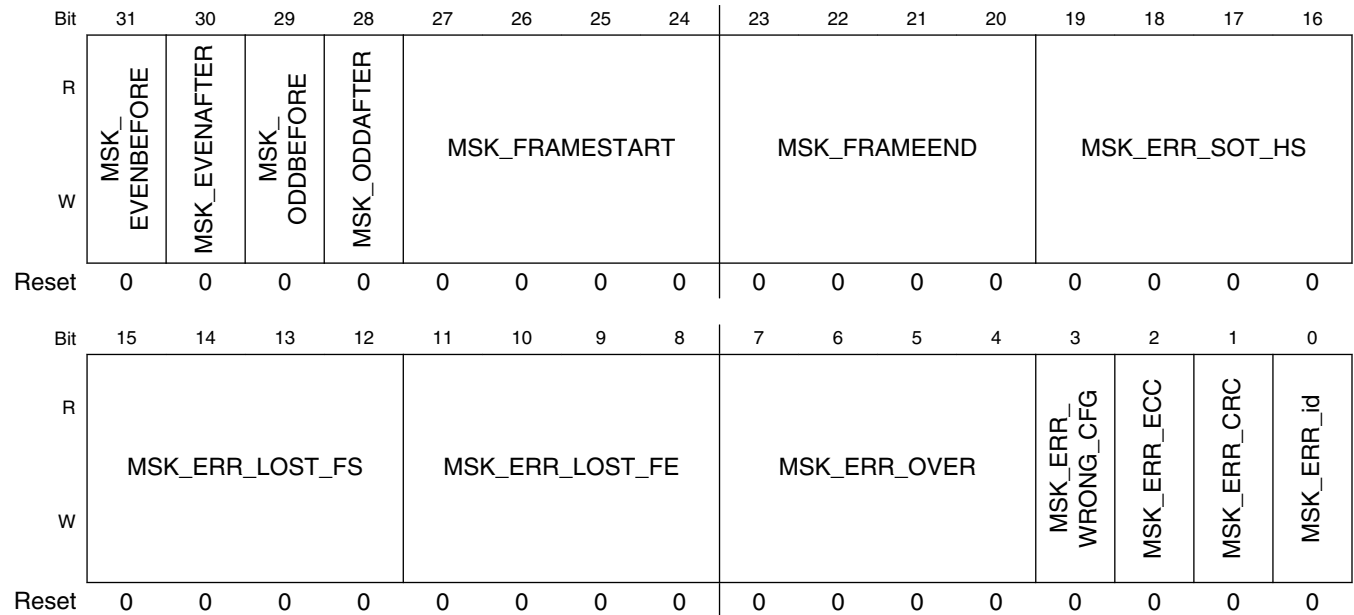

#### MIPI\_CSI2\_CSIS\_CLK\_CTRL field descriptions

Field	Description
31–16 CLKGATE_ TRAIL	0 ~ 15 (1~16 Trailing clocks) [31:28], [27:24], [23:20] Reserved; [19:16] CH0. Trailing clocks are used for popping the F/F of ISP or CAM.
15–8 RSVD4	Reserved Read as zero, do not modify.
7–4 CLKGATE_EN	Bit 7, 6, 5 is reserved, bit 4 set for CH0. 0 Pixel clock is always alive. 1 Pixel clock is alive during the interval of frame.
WCLK_SRC	Pixel Clock Source This bit determines source of Pixel clock, which is clock of transferring image data to ISP or CAM I/F. Bit3, 2, 1 is reserved, bit0 set for CH0. 0 PCLK 1 EXTCLK (WRAP_CLK)

### 13.5.4.3 CSIS Interrupt Mask (MIPI\_CSI2\_CSIS\_INT\_MSK)

Address: 3075\_0000h base + 10h offset = 3075\_0010h

#### MIPI\_CSI2\_CSIS\_INT\_MSK field descriptions

Field	Description
31 MSK_EVENBEFORE	Non Image data are received at Even frame and Before Image. 0 Disable (masked) 1 Enable (unmasked)
30 MSK_EVENAFTER	Non Image data are received at Even frame and After Image. 0 Disable (masked) 1 Enable (unmasked)
29 MSK_ODDBEFORE	Non Image data are received at Odd frame and Before Image. 0 Disable (masked) 1 Enable (unmasked)
28 MSK_ODDAFTER	Non Image data are received at Odd frame and After Image. 0 Disable (masked) 1 Enable (unmasked)
27-24 MSK_FRAMESTART	FS packet is received, [CH3,CH2,CH1,CH0] 0 Disable (masked) 1 Enable (unmasked)

Table continues on the next page...

## MIPI\_CSI2\_CSIS\_INT\_MSK field descriptions (continued)

Field	Description
23–20 MSK_ FRAMEEND	FE packet is received, [CH3,CH2,CH1,CH0] 0 Disable (masked) 1 Enable (unmasked)
19–16 MSK_ERR_ SOT_HS	Start of transmission error [reserved, reserved, Lane1, Lane0] 0 Disable (masked) 1 Enable (unmasked)
15–12 MSK_ERR_ LOST_FS	Lost of Frame Start packet, [CH3,CH2,CH1,CH0] 0 Disable (masked) 1 Enable (unmasked)
11–8 MSK_ERR_ LOST_FE	Lost of Frame End packet, [CH3,CH2,CH1,CH0] 0 Disable (masked) 1 Enable (unmasked)
7–4 MSK_ERR_ OVER	Image FIFO overflow interrupt, [CH3,CH2,CH1,CH0] 0 Disable (masked) 1 Enable (unmasked)
3 MSK_ERR_ WRONG_CFG	Wrong configuration 0 Disable (masked) 1 Enable (unmasked)
2 MSK_ERR_ECC	ECC Error 0 Disable (masked) 1 Enable (unmasked)
1 MSK_ERR_CRC	CRC Error 0 Disable (masked) 1 Enable (unmasked)
0 MSK_ERR_id	Unknown ID Error 0 Disable (masked) 1 Enable (unmasked)

### 13.5.4.4 CSIS Interrupt Source (MIPI\_CSI2\_CSIS\_INT\_SRC)

Address: 3075\_0000h base + 14h offset = 3075\_0014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	EVENBEFORE	EVENAFTER	ODDBEFORE	ODDAFTER	FRAMESTART				FRAMEEND				ERR_SOT_HS			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ERR_LOST_FS				ERR_LOST_FE				ERR_OVER				ERR_WRONG_CFG	ERR_ECC	ERR_CRC	ERR_ID
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**MIPI\_CSI2\_CSIS\_INT\_SRC field descriptions**

Field	Description
31 EVENBEFORE	Non Image data are received at Even frame and Before Image.
30 EVENAFTER	Non Image data are received at Even frame and After Image.
29 ODDBEFORE	Non Image data are received at Odd frame and Before Image.
28 ODDAFTER	Non Image data are received at Odd frame and After Image.
27-24 FRAMESTART	FS packet is received, [CH3,CH2,CH1,CH0]
23-20 FRAMEEND	FE packet is received, [CH3,CH2,CH1,CH0]
19-16 ERR_SOT_HS	Start of transmission error, [reserved, reserved, Lane1 , Lane0]
15-12 ERR_LOST_FS	Indication of lost of Frame Start packet, [CH3,CH2,CH1,CH0]
11-8 ERR_LOST_FE	Indication of lost of Frame End packet, [CH3,CH2,CH1,CH0]
7-4 ERR_OVER	<p>Overflow is caused in image FIFO, [CH3,CH2,CH1,CH0]                      Outer bandwidth has to be faster than imputer bandwidth.                      But image FIFO can be overflow because of user's fault.                      There are two ways for preventing overflow.</p> <ol style="list-style-type: none"> <li>1. Tune output pixel clock faster than current</li> </ol>

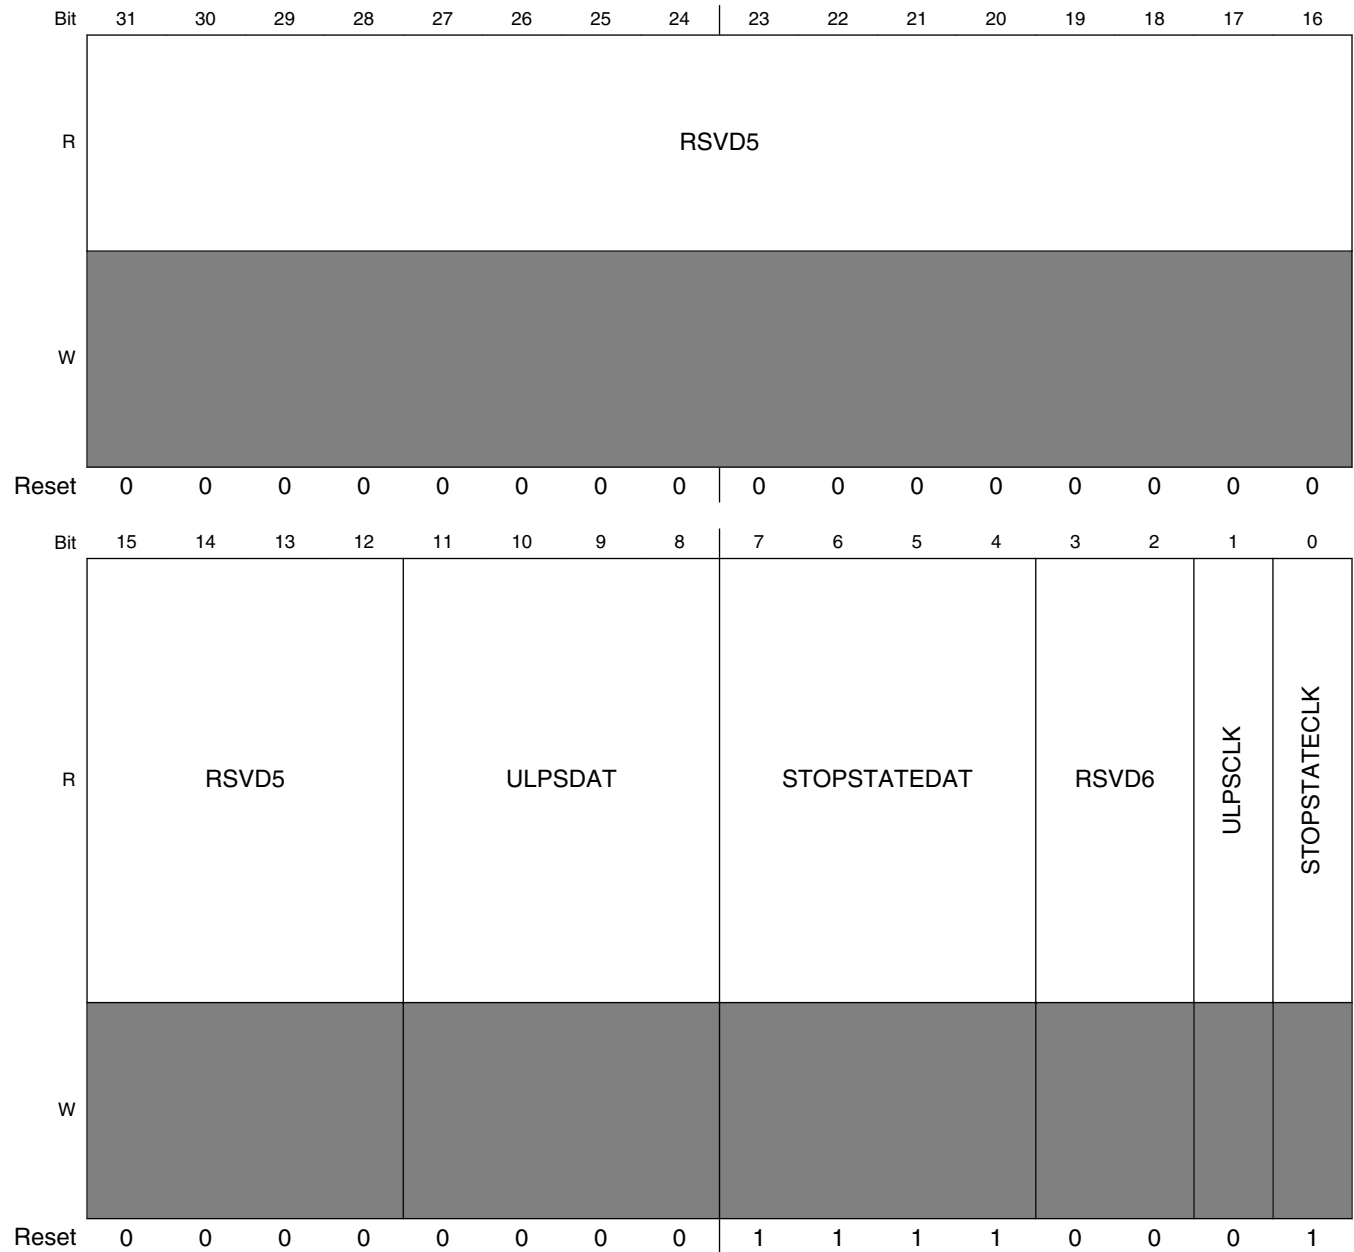

Table continues on the next page...

**MIPI\_CSI2\_CSIS\_INT\_SRC field descriptions (continued)**

Field	Description
	<p>2. Tune input byte clock slower than current</p> <p>First case: WCLK_SRC in CSIS_CTRL register can be set 1, and then assign faster clock</p> <p>Second case: user can set register in camera module through I<sup>2</sup>C channel.</p> <p>When this interrupt is generated,</p> <ol style="list-style-type: none"> <li>1. Turn camera off</li> <li>2. Assert software reset, if you didn't assert software reset, MIPI CSIS could not receive any more data.</li> <li>3. Tune the clock frequency and re-configure all related registers</li> </ol> <p>MIPI CSIS module is ready for operating.</p>
<p>3 ERR_WRONG_CFG</p>	<p>Wrong Configuration</p> <p>The received packet is not decoded at any channels of ISP (due to wrong data type or virtual channel ID)</p>
<p>2 ERR_ECC</p>	<p>ECC Error</p>
<p>1 ERR_CRC</p>	<p>CRC Error</p>
<p>0 ERR_ID</p>	<p>Unknown ID Error</p>

### 13.5.4.5 D-PHY Status (MIPI\_CSI2\_DPHY\_STATUS)

Address: 3075\_0000h base + 20h offset = 3075\_0020h

**MIPI\_CSI2\_DPHY\_STATUS field descriptions**

Field	Description
31–12 RSVD5	Reserved Read as zero, do not modify.
11–8 ULPSDAT	Data lane [3:0] is in ULPS.

Table continues on the next page...

## MIPI\_CSI2\_DPHY\_STATUS field descriptions (continued)

Field	Description
	[11]: Reserved [10]: Reserved [9]: Data lane 1 [8]: Data lane 0 0 Not ULPS 1 ULPS —
7–4 STOPSTATEDAT	Data lane [3:0] is in Stop State. [7]: Reserved [6]: Reserved [5]: Data lane 1 [4]: Data lane 0 0 Not Stop state 1 Stop state
3–2 RSVD6	Reserved Read as zero, do not modify.
1 ULPCLK	Clock lane is in ULPS. 0 Not ULPS 1 ULPS
0 STOPSTATECLK	Clock lane is in Stop state. 0 Not Stop state 1 Stop state

### 13.5.4.6 D-PHY Common Control (MIPI\_CSI2\_DPHY\_CMN\_CTRL)

Address: 3075\_0000h base + 24h offset = 3075\_0024h

**MIPI\_CSI2\_DPHY\_CMN\_CTRL field descriptions**

Field	Description
31–24 HSSETTLE	HS-RX settle time control register
23–22 S_ CLKSETTLECTL	D-PHY control register is for standard spec v0.9 of MIPI CSI2.
21–7 RSVD7	Reserved Read as zero, do not modify.
6 S_DPDN_ SWAP_CLK	Swapping Dp and Dn channel of clock lane. 0 Default 1 Swapped

Table continues on the next page...

### MIPI\_CSI2\_DPHY\_CMN\_CTRL field descriptions (continued)

Field	Description
5 S_DPDN_ SWAP_DAT	Swapping Dp and Dn channel of data lanes. 0 Default 1 Swapped
4-1 ENABLE_DAT	D-PHY enable [3]: Reserved [2]: Reserved [1]: Data lane 1 [0]: Data lane 0 0 Disable 1 Enable
0 ENABLE_CLK	D-PHY clock lane enable 0 Disable 1 Enable

#### 13.5.4.7 D-PHY Master and Slave Control register low (MIPI\_CSI2\_DPHY\_BCTRL\_L)

Address: 3075\_0000h base + 30h offset = 3075\_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	B_DPHYCTRL																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### MIPI\_CSI2\_DPHY\_BCTRL\_L field descriptions

Field	Description
B_DPHYCTRL	D-PHY Master and Slave control register Low part

#### 13.5.4.8 D-PHY Master and Slave Control register high (MIPI\_CSI2\_DPHY\_BCTRL\_H)

Address: 3075\_0000h base + 34h offset = 3075\_0034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	B_DPHYCTRL																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**MIPI\_CSI2\_DPHY\_BCTRL\_H field descriptions**

Field	Description
B_DPHYCTRL	D-PHY Master and Slave control register High part

**13.5.4.9 D-PHY Slave Control register low (MIPI\_CSI2\_DPHY\_SCTRL\_L)**

Address: 3075\_0000h base + 38h offset = 3075\_0038h

**MIPI\_CSI2\_DPHY\_SCTRL\_L field descriptions**

Field	Description
S_DPHYCTRL	D-PHY Slave control register Low part

**13.5.4.10 D-PHY Slave Control register high (MIPI\_CSI2\_DPHY\_SCTRL\_H)**

Address: 3075\_0000h base + 3Ch offset = 3075\_003Ch

**MIPI\_CSI2\_DPHY\_SCTRL\_H field descriptions**

Field	Description
S_DPHYCTRL	D-PHY Slave control register High part

### 13.5.4.11 ISP Configuration register of CH0 (MIPI\_CSI2\_ISP\_CONFIG\_CH0)

Address: 3075\_0000h base + 40h offset = 3075\_0040h

**MIPI\_CSI2\_ISP\_CONFIG\_CH0 field descriptions**

Field	Description
31–24 MEM_FULL_GAP	When the room of Image memory is lower than this, STOPREQ_EN is 0, then the image data cannot be blocked (Do not set this register lower than 4).
23–13 RSVD8	Reserved Read as zero, do not modify.
12 DOUBLE_CMPNT	Double component per clock cycle in YUV422 formats 0 Single component per clock cycle (half pixel per clock cycle) 1 Double component per clock cycle (a pixel per clock cycle)

Table continues on the next page...

**MIPI\_CSI2\_ISP\_CONFIG\_CH0 field descriptions (continued)**

Field	Description																										
11 PARALLEL	Output bus width of CH0 is 32 bits. When this bit is set, the outer bus width of CSIS V3.3 is 32.  0 Normal output 1 32-bit data alignment																										
10 RGB_SWAP	Swapping RGB sequence  0 MSB is R and LSB is B. 1 MSB is B and LSB is R (swapped).

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	EARLY_FE				EARLY_FS				CAM_VSYNC_FALL				CAM_VSYNC_RISE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**MIPI\_CSI2\_DBG\_INTR\_SRC field descriptions**

Field	Description
31–26 RSVD14	Reserved Read as zero, do not modify.
25 DT_NOT_SUPPORT	The data type of the received packet is not supported (RGB444 or RGB555)
24 DT_IGNORE	The data type of the received packet is ignored (NULL or BLANKING)
23–20 ERR_FRAME_SIZE	The received frame is not matched with the configured. [23] CH3 [22] CH2 [21] CH1 [20] CH0
19–16 TRUNCATED_FRAME	Truncated frame is received. [19] CH3 [18] CH2 [17] CH1 [16] CH0

*Table continues on the next page...*

**MIPI\_CSI2\_DBG\_INTR\_SRC field descriptions (continued)**

Field	Description
15–12 EARLY_FE	Frame End packet is received during transfer of image. [15] CH3 [14] CH2 [13] CH1 [12] CH0
11–8 EARLY_FS	Frame Start packet is received during transfer of image. [11] CH3 [10] CH2 [9] CH1 [8] CH0
7–4 CAM_VSYNC_FALL	The falling of vsync in the CAM I/F [7] CH3 [6] CH2 [5] CH1 [4] CH0
CAM_VSYNC_RISE	The rising of vsync in the CAM I/F [3] CH3 [2] CH2 [1] CH1 [0] CH0

**13.5.4.20 Non Image Data (MIPI\_CSI2\_NON\_IMG\_DATA)**

For the double buffering, Non-image data region is divided as following address.

- 0x2000 - 0x2FFC: Odd frame / 0x3000 - 0x3FFC: Even frame (8 KB memory)
- 0x2000 - 0x27FC: Odd frame / 0x2800 - 0x2FFC: Even frame (4 KB memory)
- 0x2000 - 0x23FC: Odd frame / 0x2400 – 0x27FC: Even frame (2 KB memory)

Address: 3075\_0000h base + 2000h offset = 3075\_2000h

\* Notes:

- x = Undefined at reset.

**MIPI\_CSI2\_NON\_IMG\_DATA field descriptions**

Field	Description
NONIMGDATA	Non Image data memory

**13.6 Electrophoretic Display Controller (EPDC)**

**13.6.1 Overview**

This chapter describes the architecture of the EPDC. It provides a detailed description of the block for digital design and software driver development.

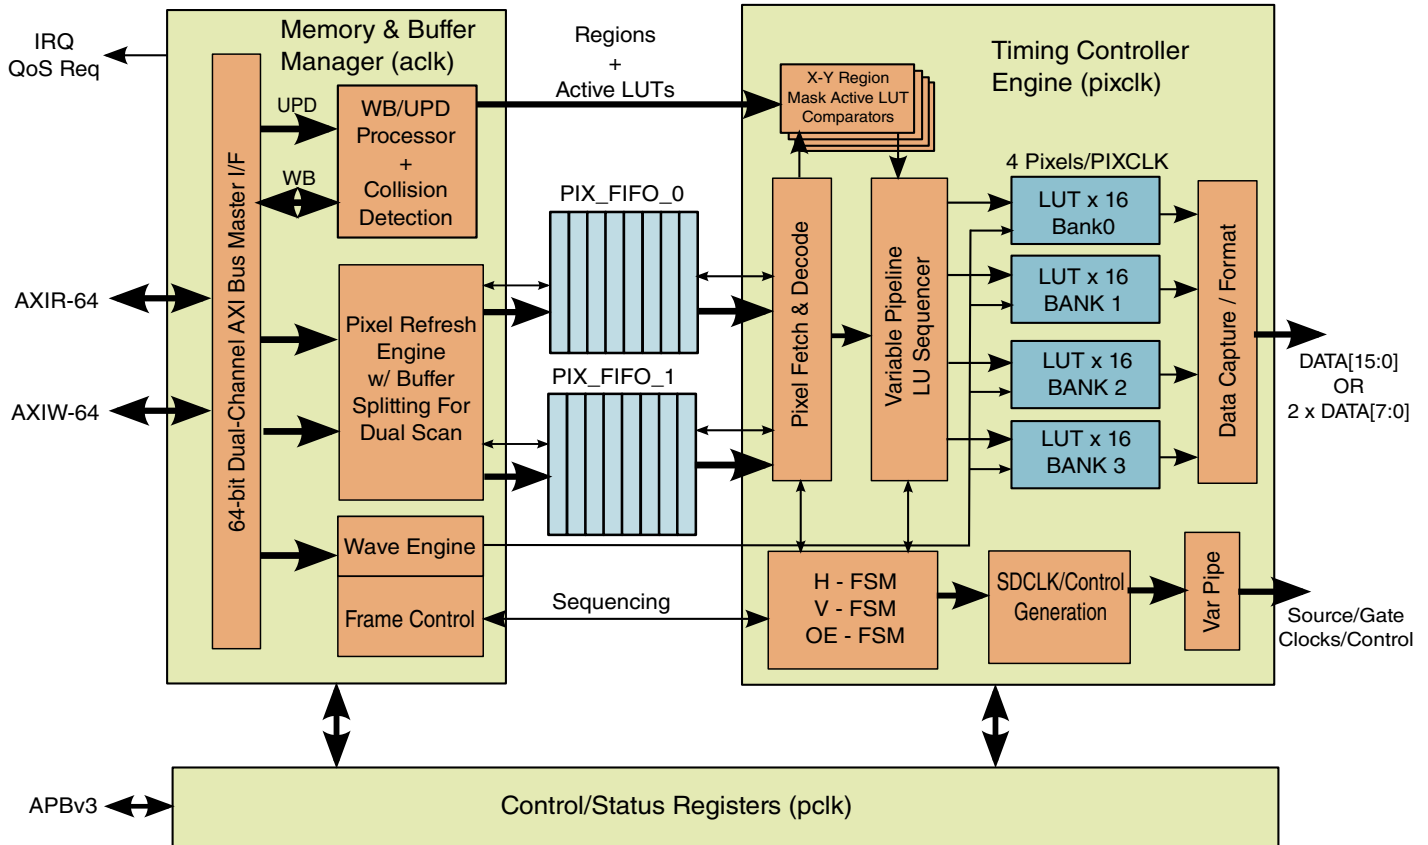

The EPDC is a feature-rich, low power and high performance direct drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution, while reaching much higher levels of performance at lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the PXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- TFT resolutions up to 4096 x 4096 pixels with 20 Hz refresh (programmable up to 8191 x 8191)
- TFT resolutions up to 1650 x 2332 pixels at 106 Hz refresh
- Industry standard bus interfaces (AMBA AXI and APB)
- Up to 5-bit pixel representation for up to 32 greyscale levels
- Up to 64 concurrent updates with partial update support, except for 32(5-bit) grey level panel for which only 16 concurrent updates can be used
- Automatic collision handling when used in conjunction with the i.MX device driver
- Dual-scan TFT drive mode to support ultra high resolution/refresh rate displays
- Flexible direct drive TFT interface supporting next generation source driver, gate driver and panel architectures, including LVDS, DDR and multi-level source drivers
- Unified generic configurable timing mode (Pigeon Mode) available on most panel timing control signals
- High performance pixel pipeline architecture to guarantee refresh performance at high pixel rates without the need for high internal clocking
- Ability to process multiple updates asynchronously to refresh/update operations with ability to intercept each frame scan will multiple update requests
- Performance tuning capabilities which can interface with SoC level memory arbitration mechanisms further guaranteeing frame refresh operation
- Decoupled clocking architecture allowing for independent and asynchronous clock sources for memory bus, peripheral bus and pixel clock domains
- Full and partial update mode support
- Support for up to 256 waveform modes, also support optimal waveform auto-selection based on grey level of the pixels being updated
- Low power mode operation via architectural clock gating
- Update buffer analysis functions to get information like collision rectangle, grey level

### 13.6.1.1 EPDC Block Diagram

The top-level view of the EPDC is shown in the following figure.

**Figure 13-71. EPDC Top-Level Block Diagram**

The EPD function can be separated into two major asynchronous processes. The first is the front end portion which is responsible for processing display updates. The second is the function of driving waveforms to the TFT panel in order to update the screen contents (the refresh operation). The EPDC is comprised of two major submodules (MBM and TCE) which mirror the architectural split in the EPD algorithm. These submodules communicate through a number of control/sequencing signals and data (through the pixel FIFOs and LUT memories):

- **Memory and Buffer Manager (MBM):** This submodule is responsible for all memory-related operations and LUT life cycle control, which involves the frame count management for all updates. This module is clocked by both *aclk* and *pixclk*. It also encapsulates the APB register interface which is clocked by *aclk* too.
- **Timing Control Engine (TCE):** This submodule is responsible for performing TFT scan frame refreshes. It is clocked by *pixclk*. It also houses the LUT memory system.

## 13.6.2 External Signals

**Table 13-39. EPDC External Signals (continued)**

Signal	Description	Pad	Mode	Direction
		I2C4_SDA	ALT6	

The following table describes the external signals of EPDC:

### 13.6.3 Programming Model

From an application perspective, the EPDC HW/SW solution aims to abstract much of the details of driving an EPD display from the user space.

This is achieved through a blend of HW features and the kernel-level SW driver implementation of the EPD frame buffer. The scope of this chapter mostly pertains to EPDC HW but in order to correctly define the context of the programming model, certain assumptions about the driver architecture (including use of the ePXP IP) are described below.

#### 13.6.3.1 Assumptions

The scope of the EPDC does not include certain functions performed by the driver and application layer.

These features are as follows:

- Maintenance of update and collision lists. This includes, but is not limited to, responsibility for managing update order. Updates are processed in the order they are received by the EPDC. Actual start times of multiple updates can occur on the same frame scan. All pixels contained within an update will always begin on the same frame scan.
- Border control. This function is assumed to be performed by a GPIO functionality.
- EPD Panel Power Management. It is assumed that the driver and application layers will control the panel PMIC functions including relevant interfaces such as I<sup>2</sup>C and 4-wire power sequencing signals.
- Reading and decompression of the waveform file. This is assumed to be unpacked, reformatted and written to system memory into a form that is easily accessed by the EPDC.
- Waveform mode selection. The EPDC provides a mechanism through its histogram analysis feature (which can be run as part of any frame/region processing operations) to allow the SW driver to characterize the region/buffer in terms of gray-map content. For example, EPDC can determine if the update region (considering only

those pixels undergoing a transition) contains only 2, 4, 8 or 16 gray levels, HW can automatically select waveform mode according to a programmed LUT holding mapping between grey level and waveform mode. SW driver can also manually choose the appropriate waveform update mode (e.g., when doing an update to repair ghosting artifacts).

### 13.6.3.2 Register Space (Write/Set/Clear/Toggle)

The EPDC registers utilize four word address locations per 32-bit register.

For control registers (especially interrupts), this provides for a unique address for the following operations:

- Write (0x0). The base address of the register allows full writes to the 32-bit register.
- Set (0x4). This address allows a set operation on the register or its fields; writing a 1 to a register bit/field with the set address will set that bit. Writing a 0 to the set address has no effect.
- Clear (0x8). This address allows a clear operation on the register or its fields; writing a 1 to a register bit/field with the clear address will clear that bit or field.

#### NOTE

Interrupt status bits (such as those contained in EPDC\_IRQ) must be cleared with the clear address only. Writing to the EPDC\_IRQ register with a 0 will not clear the interrupt status/source. Writing a 0 to the clear address has no effect.

- Toggle (0xc). This address allows a toggle operation on the register or its fields; writing a 1 to a register bit/field with the toggle address will invert the state of that bit/field. This address is especially useful because it provides the ability to perform a read-modify-write operation with a single write operation. Writing a 0 to the toggle address has no effect.

### 13.6.3.3 Interrupts

#### 13.6.3.3.1 Interrupt Sources

The EPDC contains 72 ( 64 of LUT completes IRQs and 8 of common IRQs ) unique interrupt sources. Each interrupt source has an interrupt status bit captured in EPDC\_IRQ /EPDC\_IRQ1/EPDC\_IRQ2 .

When an interrupt event occurs, the appropriate bit within the EPDC\_IRQ\* register is set by the EPDC. Each of the bits in EPDC\_IRQ is first AND'ed with its enable bit (in EPDC\_IRQ\_MASK\*), and then the masked bits are logically OR'ed together to generate the final output.

### 13.6.3.3.2 Enabling/Masking Interrupts

Each of the EPDC interrupt sources can be individually enabled through the bits in the EPDC\_IRQ\_MASK\* register.

Even if an interrupt source is masked out (IRQ\_EN bit set to 0), its status will still be available in the EPDC\_IRQ\* register. The difference is that it does not result in the interrupt line being asserted.

### 13.6.3.3.3 Handling/Clearing Interrupts

When the software driver is entered as a result of an EPDC interrupt it should read the EPDC\_IRQ\* interrupt status register.

Because multiple interrupts may have fired, in the case of a collision for example, both WB\_CMPLT\_IRQ and LUT\_COL\_IRQ fields of EPDC\_IRQ will be set. Once the interrupt has been handled, the driver should clear the interrupt source by writing to the CLEAR address (see [Register Space \(Write/Set/Clear/Toggle\)](#) for details).

When collision has occurred and the LUT\_COL\_IRQ bit is set, SW will handle the collision and clear LUT\_COL\_IRQ. Please note HW will also clear the entire EPDC\_STATUS\_COL\* register at the same time on LUT\_COL\_IRQ clearing by SW.

### 13.6.3.4 Controller Setup

Before screen update operations can be performed, the EPDC should be configured appropriately.

These rudimentary setup operations include:

- Waveform data must be present in memory (in a format that is consistent with the method in which the EPDC accesses it). Because the format of the waveform data is supplier proprietary information, it is not discussed in this chapter.
- Configuring the panel architecture parameters (source and gate-driver configuration)
- Configuring line and frame timing parameters
- Initializing the working buffer and panel

### 13.6.3.4.1 Memory Requirements

EPDC requires continuous access to the unpacked waveform data, the update region buffer, and its working buffer.

These are all expected to reside in system memory (typically external DRAM). As such, each has particular requirements:

- The Working Buffer (WB), which is pointed to by EPDC\_WB\_ADDR, must have EPDC\_RES[HORIZONTAL] x EPDC\_RES[VERTICAL] x 2 bytes allocated. This buffer is used by the EPDC to process updates and perform TFT refresh operations.
  - EPDC\_RES[HORIZONTAL] mod 4 must equal to 0 for memory allocation calculations because the EPDC constructs each line of the working buffer at a 64-bit boundary.
- The Update Buffer, which is pointed to by EPDC\_UPD\_ADDR (and can be redefined with a different address for each update), must have the following allocation in memory:
  - a. when stride feature not enabled
    - EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_SIZE[WIDTH] bytes
    - Note that EPDC\_UPD\_SIZE[WIDTH] mod 8 must equal to 0 for memory allocation purposes. This means that for the address size allocation, the WIDTH field must be rounded up to the nearest number so that it can be divided by 8. This is because the EPDC reads each line of the update buffer at a 64-bit boundary (it should be noted that this is consistent with the ePXP IP output). The actual value programmed for the update can be at the pixel granularity.
  - b. when stride feature enabled
    - EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_STRIDE bytes
    - EPDC\_UPD\_SIZE[WIDTH] is used to reflect valid bytes in a line with EPDC\_UPD\_STRIDE pixels, STRIDE >= WIDTH
    - no alignment requirement on line start or end, no padding necessary unless STRIDE > WIDTH
- The waveform data set size is a function of mode count, number of temperature tables and number of frames required for each temperature-compensated mode.

In summary, the memory requirements are as follows (in bytes):

- WB-roundup4(EPDC\_RES[HORIZONTAL]) x EPDC\_RES[VERTICAL] x 2
- when stride feature not enabled: UPD-N x roundup8(EPDC\_UPD\_SIZE[WIDTH]) x EPDC\_UPD\_SIZE[HEIGHT]

- N = the number of update requests currently being managed by the i.MX EPD driver (that is, the driver may maintain a list of updates in memory which it uses to feed the EPDC).
- when stride feature enabled:  $UPD-N \times EPDC\_UPD\_STRIDE \times EPDC\_UPD\_SIZE[HEIGHT]$

### 13.6.3.4.2 Panel Architecture Configuration

The EPDC is designed to directly drive EPD panels which typically expose the source and gate driver IC interfaces (these are often abstracted in traditional displays such as TFT-LCD).

The source and gate driver ICs are responsible for driving the TFT matrix. There are variations in both the panel architectures and the underlying source and gate driver IC functionality.

All the key configuration parameters are defined in the EPDC\_RES, EPDC\_FORMAT, EPDC\_TCE\_CTRL, EPDC\_TCE\_SDCFG and EPDC\_TCE\_GDCFG registers as follows.

- EPDC\_RES:
  - HORIZONTAL: The panel horizontal resolution (in pixels). The horizontal resolution must be an integer multiple of the source driver PIXELS\_PER\_SDCLK value. It also must be an integer multiple of the PIXELS\_PER\_CE value.
  - VERTICAL: The panel vertical resolution (in pixels). This can be any integer value.
- EPDC\_FORMAT:
  - DEFAULT\_TFT\_PIXEL: This field should almost always be left at 0x00. This register field is used as the value for the TFT pixel during a frame scan when a pixel is not being updated. This condition is commonplace especially when using partial updates or updates which do not encompass the entire screen resolution. This value must always correspond to the state the source driver should see when no voltage change is needed. Incorrectly setting this value will damage the EPD material.
  - TFT\_PIXEL\_FORMAT: This enumerated field defines the width of the TFT pixel. The TFT pixel is defined as the per-pixel voltage control value. The most common pixel format is 2B (2 bits per pixel). Panels which support source driver voltage modulation (multi-level voltage control) should use the 4B format. For source drivers that support 7 levels, the 4B format can be used and the unused DATA output pins should be left floating at the board level connection (specifically DATA3, 7, 11, 15). The 2BV and 4BV are variations which require the waveform data to supply a 2-bit VCOM value for each pixel.

- EPDC\_TCE\_CTRL:
  - SDDO\_WIDTH: This selects 8- or 16-bit DATA operation using enumerations 8-bit and 16-bit. This field is used to describe useful data for panels that support LVDS. DATA[15:8] would be used to drive differential data. In these modes, SDDO\_WIDTH would be set to 8-bit.
  - VCOM\_MODE, VCOM\_VAL: This VCOM\_MODE bit allows the EPDC to either use the VCOM value supplied in the waveform or a software programmable value defined in the VCOM\_VAL field, for panels which support VCOM modulation.
  - DDR\_MODE: This mode-bit should be set for panels which expect source-driver data to be available on both edges of the SDCLK. This is common place for panels that support differential signaling, but the feature is not limited to LVDS panels. For example, the EPDC supports DDR modes which make full use of DATA[15:0]. In these modes, DDR\_MODE = 1 and LVDS\_MODE = 0.
  - LVDS\_MODE: This mode always requires DDR\_MODE to be set. When this mode bit is set, differential signaling is enabled such that DATA[15:8] always drives the inverse of the pixel data which is presented on DATA[7:0]. Because LVDS source-drivers use 2 pins per data-bit, they are typically configured to work in DDR mode. Differential signaling is also supported on the SDCE pins (as an option selected by LVDS\_MODE\_CE). In this mode SDCE[9:5] are used to drive the inverse differential signals for SDCE[4:0].
  - LVDS\_MODE\_CE: When LVDS\_MODE is set, this bit can also be set to allow SDCE[9:5] to act as differential pairs for each SDCE[4:0].
  - DUAL\_SCAN: Setting this field enables the dual scan function. When this field is set, all other parameters (except resolution) should be programmed in reference to each half of the panel. Because DUAL\_SCAN modes require 2x the pixel-generation capability, there are limitations to the available TFT modes supported in this configuration (see [Table 13-40](#) for details).
  - SCAN\_DIR0, SCAN\_DIR1: These fields determine the vertical scan direction of the panel.
    - SCAN\_DIR0: Determines the vertical scan direction of the panel when DUAL\_SCAN = 0. When DUAL\_SCAN = 1, it determines the vertical scan direction of the top-half of the panel (0 means scan down and 1 means scan up).
    - SCAN\_DIR1 only has meaning when DUAL\_SCAN = 1. It defines the vertical scan direction of the bottom half of the panel.
  - PIXELS\_PER\_SDCLK: This is a key configuration and timing parameter. Each source driver latches a number of TFT pixels per shift clock period (SDCLK). This register defines how many pixels are driven per SDCLK period. When DDR\_MODE = 1, pixels are driven on both edges of the clock, so this value must be adjusted accordingly. See [Table 13-40](#) for the required values per mode.

- EPDC\_TCE\_SDCFG:
  - SDCLK\_HOLD: Holds the SDCLK low during the LINE\_BEGIN time. The purpose of this field is to allow the user to set a LINE\_BEGIN time which is not an integer multiple of SDCLKs (for fine tuning the line-time).
  - SDSHR: Defines the value of the SDSHR output signal which determines the source driver output order mapping.
  - NUM\_CE: Defines the total number of source driver chip-enables (must be 1-10). This number doesn't always correspond to the number of source drivers in the panel. Many panels require only a single chip-enable signal which is active during the entire line data time. This signal is often called SPH (Horizontal Start Pulse) in such cases.
  - PIXELS\_PER\_CE: This register defines the span of each chip-enable expressed in pixels. For panels that utilize a single global CE, this value should be set to the horizontal resolution of the panel.
  - SDDO\_REFORMAT: This enumerated field allows for TFT-pixel level reordering within DATA. For most panels it is recommended to set SDDO\_REFORMAT to the REVERSE\_PIXELS enumeration.
  - SDDO\_INVERT: When this field is set, the values on DATA are inverted relative to the values extracted from the waveform LUT operations.
- EPDC\_TCE\_GDCFG:
  - GDRL: Defines the value of the GDRL output signal which determines the gate driver pulse shift direction.
  - GDOE\_MODE: This field selects between two possible methods for driving the GDOE signal. When GDOE\_MODE = 0, the GDOE output is always driven during the frame scan time, except during FRAME\_SYNC when it is driven low. When GDOE\_MODE = 1, the GDOE signal mimics the GDCLK signal but is only active during the frame-data time (FD). For most panels the recommended setting is 0.
  - GDSP\_MODE: This field selects between two possible methods for driving the GDSP signal. When GDSP\_MODE = 0, the GDSP signal is driven on the first line clock time of the FRAME\_BEGIN time. The signal is driven for one GDCLK period (same as line time), and can be shifted using the GDSP\_OFFSET control. When GDSP\_MODE = 1, GDSP is active during the entire FRAME\_SYNC time, and GDSP\_OFFSET has not effect in this mode.

### 13.6.3.4.3 TFT Panel Timing Configuration

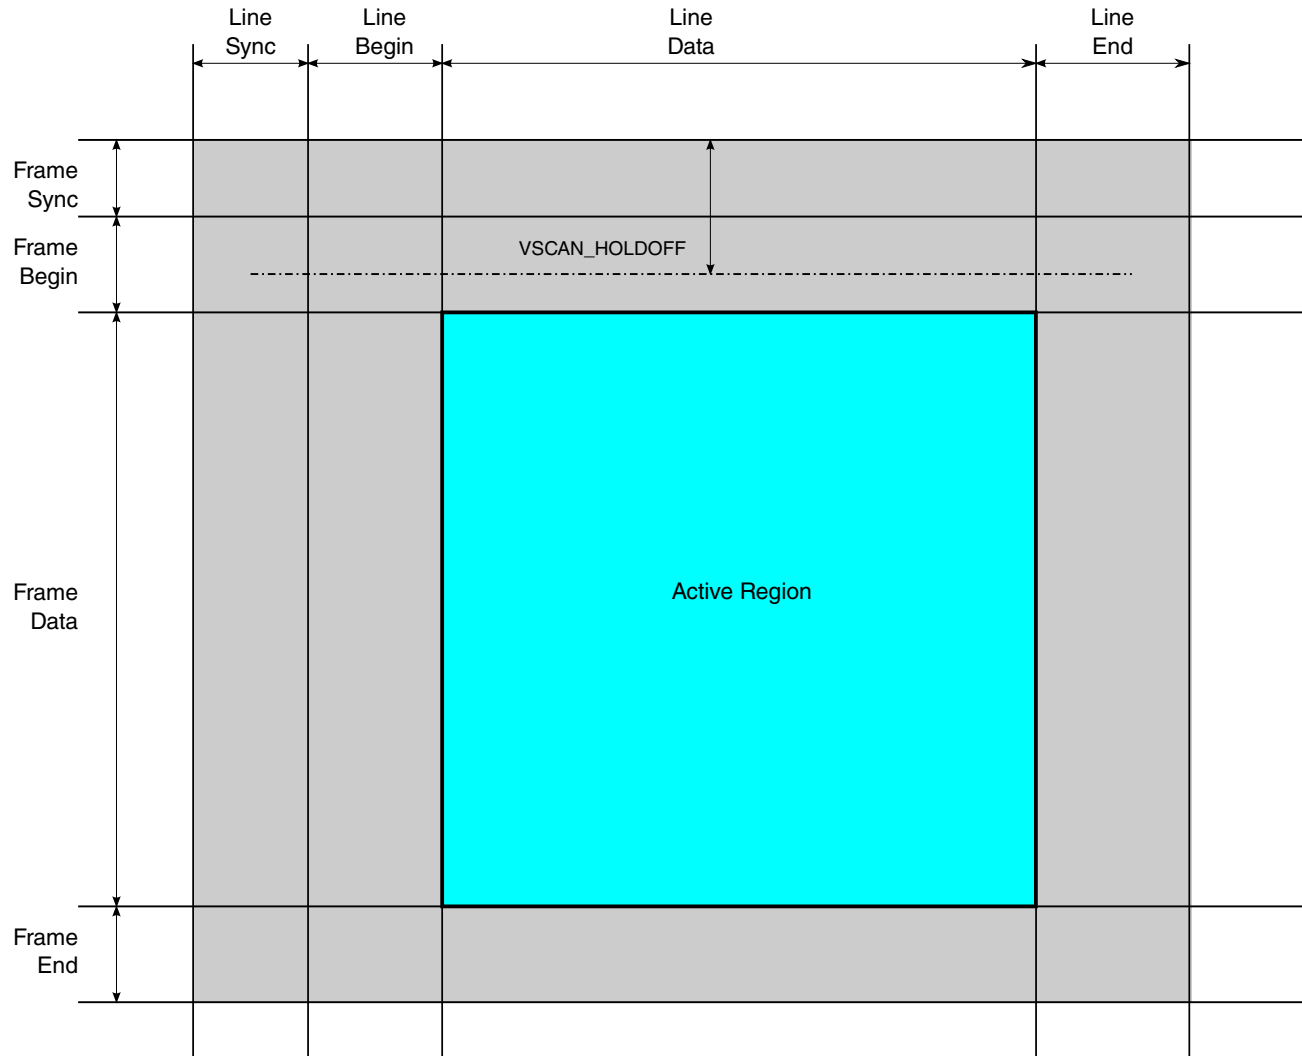

The EPDC provides a simple primary set of registers to define TFT line and frame (refresh) timing.

In addition to these, there are also low-level timing and polarity registers to provide additional flexibility in dealing with future TFT architectures.

The following figure shows how the horizontal and vertical timing is defined in terms of the various timing parameters. When configuring the TFT timing, the following goals should be met:

- Arrive at a refresh rate that matches the waveform requirement (for example, 50 Hz for 50 Hz waveform). The refresh rate is defined as the time between each frame sync event and can be expressed as a multiple of the line timing and the total number of vertical lines.
- Meet the various timing requirements of the gate and source driver clock and control signals (the blanking period provide an infrastructure for controlling these).
- Stay below the maximum source-driver clock (usually referred to as CL) frequency.
- Arrive at a source driver clock frequency which in turn defines the exact pixclk frequency. In most cases, E-INK™ provides the expected SDCLK frequency.
- Meet the line-timing (LT) requirements of the E-INK panels and their associated waveforms.

For proper waveform performance, it is critical to match the refresh frequency to that required by the waveform and associated panel. Deviation from this frequency results in short term inaccuracy of color and in the long term, complete loss of coherency between the EPDC's internal representation of color and the physical representation on the screen.

**Figure 13-72. Frame Timing**

The following equations define the timing of the panel scan frame (where LT = line-timing and FT = frame-timing):

$$LT = TPIXCLK (LS + LB + (HRES \times \left( \frac{\text{Ratio}}{\text{PIXELSPERSDCLK}} \right) + LE)$$

$$FT = LT \times (FS + FB + VRES + LE)$$

Ratio is defined between the internal PIXCLK and the external source driver clock SDCLK. The ratio is automatically determined by the EPDC according to [Table 13-40](#). A simple method to determine the ratio is as follows:

- When `DDR_MODE = 1`, `RATIO = 4`
- When `DDR_MODE = 0`
  - If `PIXELS_PER_SDCLK = 8`, `RATIO = 4`
  - Else, `RATIO = 2`

Typically it is recommended to seed these equations with an estimated (or provided) SDCLK frequency and adjust the various timings until the desired refresh rate is attained.

The following figure shows line timing for cases, where `DDR_MODE = 0` (those cases where data is only sampled by the source driver on the rising edge of SDCLK). Depending on the mode (see [Table 13-40](#)), the ratio is a function of TFT pixel width and `PIXELS_PER_SDCLK`, so the timings are shown generically. For the purposes of this diagram, `RATIO` can either be 2 or 4.

**Figure 13-73. Line Timing (`DDR_MODE = 0`)**

As per [Table 13-40](#), when `DDR_MODE=1` (for example, for source drivers that require data to be driven on each edge of SDCLK), the `RATIO` is always set to 4. The timing for such cases is shown in the figure below.

**Figure 13-74. Line Timing (DDR\_MODE = 1) - RATIO = 4**

Vertical timing or frame timing (FT) is always expressed in terms of line timing (LT). This is shown in the following figure, followed by a detailed view of the GDCLK timing (which has programmable duty cycle to allow programming of gate-on/gate-off time) in [Figure 13-76](#). The following important points should be noted in regard to gate driver timing:

- All gate driver timing signals are independently referenced to the LINE\_SYNC leading edge (this includes GDCLK\_OFFSET, GDSP\_OFFSET, and GDOE\_OFFSET).
- GDSP\_OFFSET is only supported for GDSP\_MODE = 1
- For GDOE\_MODE = 1, if GDOE is expected to be delayed relative to GDCLK, the GDOE\_OFFSET value should be set at a value appropriately greater than GDCLK\_OFFSET.
- All offset settings are programmed in terms of PIXCLK cycles.
- By default, if all offset values are set to 0, the gate driver signals are always one PIXCLK cycle delayed from the LINE\_SYNC leading edge.
- The LINE\_SYNC leading edge doesn't depend on the LINE\_SYNC\_WIDTH value. In cases where LINE\_SYNC\_WIDTH is set to some value that is less than LINE\_SYNC, a virtual leading edge which determines the line start time still exists.

## Electrophoretic Display Controller (EPDC)

**Figure 13-75. Frame Timing (Vertical)**

**Figure 13-76. GDCLK Duty Cycle**

An example calculation based on the 800 x 600 E-INK 6" panel with 50 Hz waveforms is shown be:

- $\text{PIXELS\_PER\_SDCLK} = 4$
- Ratio = 2 (2 bpp, 8-bit single-ended, SDR per [Table 13-40](#))
- $t_{\text{PIXCLK}} = 17.64 \text{ MHz}$  (assuming available chip clock frequency)
- $\text{LS} = 20 \times t_{\text{PIXCLK}}$
- $\text{LB} = 8 \times t_{\text{PIXCLK}}$
- $\text{LD} = 800 \times (2/4) \times t_{\text{PIXCLK}} = 400 \times t_{\text{PIXCLK}}$
- $\text{LE} = 142 \times t_{\text{PIXCLK}}$
- $\text{LT} = (20 + 8 + 400 + 142) \times t_{\text{PIXCLK}} = 32.31293 \text{ uS}$

`LINE_SYNC_WIDTH` does not affect line timing. It should be set to the same value as `LINE_SYNC`, unless `LB` and `LE` are short and it is used to shorten the width of `SDLE` whilst still maintaining the same line-timing.

It is important to meet the target line time of the panel which was 32.312  $\mu$ S. Then the frame-rate can be calculated and given the vertical timings:

- $FS = 4 \times LT$
- $FB = 4 \times LT$
- $FD = 600 \times LT$
- $FE = 10 \times LT$
- $FT = (4 + 4 + 600 + 10) \times LT = 50.07665 \text{ Hz}$

In addition to this, E-INK panels require a particular duty cycle for the GDCLK signal which is specified as gate-on-time and gate-off-time. The sum of gate-off and gate-on should equal LT and the value of gate-on can be programmed through HW\_EPDC\_TCE\_TIMING2[GDCLK\_HP], or GDCLK High-Pulse time.

#### 13.6.3.4.4 Source Driver and Pixel Clock Configuration

The EPDC supports a number of source driver architectures. Each architecture forces a particular shift clock pixel rate.

In addition to this, the selection of the architecture requires a particular clock ratio between the internal pixel clock (pixclk) and external shift clock EPDC\_SDCLK. The table below outlines the various configurations and clock ratios. It also lists the relevant register settings for this configuration.

**Table 13-40. Interface Modes**

High-Level Mode	HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
Single Scan	0	[7:0]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	0	[15:0]	2B[V]	EIGHT	0	0	16BIT	SDCLK x 4
	0	[7:0],[15:8]	2B[V]	EIGHT	110	1	8BIT	SDCLK x 4
	0	[7:0]	4B[V]	TWO	0	0	8BIT	SDCLK x 2

*Table continues on the next page...*

Table 13-40. Interface Modes (continued)

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
	4bpp, 16-bit, single-ended SDR	0	[15:0]	4B[V]	FOUR	0	0	16BIT	SDCLK x 2
	4bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	4B[V]	FOUR	110	1	8BIT	SDCLK x 4
	4bpp, 16-bit, single-ended, DDR	0	[15:0]	4B[V]	EIGHT	0	1	16BIT	SDCLK x 4
Dual Scan	2bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 8-bit, DDR	1	[7:0],[15:8]	2B[V]	EIGHT	0	1	8BIT	SDCLK x 4
	4bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 8-bit, DDR	1	[7:0],[15:8]	4B[V]	FOUR	0	1	8BIT	SDCLK x 4

### 13.6.3.4.5 Initializing the Display

Because of the nature of the EPD technology, a typical scenario would involve the EPDC's working buffer (WB) being maintained in system memory. In such power states (where memory is maintained), it is not required to initialize the display (even if the EPD panel had been powered off for example).

In low-power modes where system memory is not maintained, there are two possible methods to initialize the display.

The first method includes initialization from an unknown state and the second mode simply requires software to load the last state of the WB into memory and configure the EPDC to point to it.

### 13.6.3.4.5.1 Reset/Clocks and Buffer Preparation

In cases in which the user wants to initialize the screen to a new known state, the following sequence should be followed. Assume that all relevant display power supplies are active.

First, the user must complete a soft reset sequence which includes enabling the main EPDC block-level clock gate. This sequence is described in the example code below. Setting SFTRST enables the CLKGATE. In order to correctly cycle reset values through pipeline registers, the CLKGATE bit stays asserted for some finite amount of time before it sets. After this time, it is safe to clear both the SFTRST and CLKGATE. The example below shows a typical use of these registers.

```
EPDC_CTRL_SET(BM_EPDC_CTRL_SFTRST);
while (!EPDC_CTRL.B.CLKGATE);
EPDC_CTRL_CLR(BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE);
while (EPDC_CTRL_RD() & (BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE));
```

Before any display update is performed, the waveform address and working buffer (WB) pointers must be set (both must be aligned to a 64-bit double long word address):

- EPDC\_WVADDR: Must point to the base address of the waveform data (managed by the i.MX driver)
- EPDC\_WB\_ADDR: An area of memory must be assigned for the EPDC's working buffer (WB). Once assigned, this memory space should be reserved purely for the use of the EPDC. The requirements for the memory allocation are described in [Memory Requirements](#).

After this, the various panel configuration parameters must be set including resolutions, source and gate driver formats, TFT and buffer pixel formats.

### 13.6.3.4.5.2 Performing an Initialization Display Update

Once all the panel timing and format parameters are defined, a command sequence must be sent to the EPDC with the properties found here.

- Update size must be full screen resolution
- HW\_EPDC\_UPD\_CTRL[UPDATE\_MODE] must be set to FULL
- HW\_EPDC\_UPD\_CTRL[WAVEFORM\_MODE] must be set to the INIT waveform (typically 0x00)
- HW\_EPDC\_UPD\_CTRL[USE\_FIXED] must be set
- HW\_EPDC\_UPD\_FIXED[FIXNP\_EN], FIXCP\_EN must be set to 1, and FIXNP and FIXCP must be set to 0xFF

The use of `HW_EPDC_UPD_FIXED` allows the EPDC working buffer to be primed to a state that matches the result of the initialization waveform.

If the application loads the previous WB of the EPDC, these steps are not necessary.

### 13.6.3.5 Dual-Scan Configuration

The EPDC supports ultra-high resolution/refresh rate EPD panels.

At certain resolutions/refresh rates, there exist electrical limitations of the TFT devices and TFT driver ICs such as source drivers. In order to support driving such displays, the EPDC supports the dual-scan driver method.

The specific method involves driving a TFT configuration where there are two sets of source drivers. All source driver control signals are expected to be shared across all source drivers (except the SDCE signals unless a unified CE is presented by the panel).

In this mode, `EPDC_DATA[7:0]` is reserved to drive the upper half of the display and `EPDC_DATA[15:8]` is reserved to drive the lower half of the panel. The update and working buffers do not have to be aware of the dual-scan operation because the MBM knows how to access the WB for refresh operations based on the settings of the `EPDC_TCE_CTRL[SCAN_DIR_0,1]`. The EPDC supports four scan configurations for dual-scan which are shown in the following figures. Each figure shows an example configuration (that is to say, the EPDC is not limited to the support of only 2 source drivers per side).

The dual-scan drive method allows the SDCLK frequency to be halved relative to a single-scan method for the same resolution and refresh rate. In addition to this, each TFT is only charged in half frequency (for any given SDCLK cycle, twice as many pixels are being driven per frame scan).

Because all 16 DATA signals must be utilized for dual-scan, there is no support for the `LVDS_MODE`. The supported source-driver modes for dual scan are shown in [Table 13-40](#). For the 2bpp DDR mode, the EPDC is capable of generating a total of 16 pixels per SDCLK cycle.

**Figure 13-77. Dual-Scan Method (Scan = 00)**

**Figure 13-78. Dual-Scan Method (Scan = 01)**

Figure 13-79. Dual-Scan Method (Scan = 10)

Figure 13-80. Dual-Scan Method (Scan = 11)

### 13.6.3.6 Update Buffer Analysis Functions

EPDC can perform several analyses on the update buffer.

The information collected during processing will be reported to the register after update buffer processing is complete.

- **Collision Rectangle Detection**

For a collided update buffer, this function will report a minimal rectangle that can cover all collided pixels.

When a collision occurs, it's possible that not all, but only part of that update buffer generate a collision, so only the pixels inside a minimal collision rectangle need to be re-submitted.

Details of minimal collision rectangle reported in UPD\_COL\_CORD/  
UPD\_COL\_SIZE.

- **Grey Level Detection (histogram)**

This function reports the minimal grey level that covers all pixels and which must be updated. This histogram differs from that of PXP; here we ignore those pixels which need no update, while the PXP histogram is calculated on the whole update buffer. The histogram feature is capable of reporting a histogram for 1, 2, 4, 8, or 16 grey levels. The valid grey levels value should be programmed into the HIST(1/2/4/8/16)\_PARAM registers before using this functionality.

- **Dry-Run Mode**

Dry-Run mode allows the user to run an update for the purpose of obtaining information without performing any real action. This mode is enabled by setting UPD\_CTRL[DRY\_RUN] = 1 when writing UPD\_CTRL register .

In this mode, Update Buffer will be read and checked against the current Working Buffer. As with a normal update, an interrupt will be generated when the Working Buffer processing completes.

Several pieces of information about the update can then be acquired from the EPDC registers: whether a collision occurred, the minimal collision area, and histogram data.. However, the result (Next Pixel, LUT info) will not be written back into the Working Buffer for further panel scan operation, nor will the LUT waveform be loaded.

The LUT resource specified by `UPD_CTRL[LUT_SEL]` is not used here; the user can start this dry-run update when no LUTs are available.

### 13.6.3.7 Waveform Mode Selection (AUTOWV)

This function is provided to support waveform selection based on the grey level (histogram) information collected during the update buffer processing stage.

Then AUTOWV LUT is provided to hold a mapping between the grey level of NP(pixel value from update buffer) and optimal waveform mode. This LUT mapping should be programmed before using this function by writing into the AUTOWV\_LUT register with `AUTOWV_LUT[ADDR]="grey level"`, `AUTOWV_LUT[DATA]="waveform mode"` for each possible grey level reported by the EPDC histogram.

After AUTOWV\_LUT is programmed, AUTOWV mode can be enabled by setting `UPD_CTRL[AUTOWV]=1`. When enabling AUTOWV, the waveform mode written into `UPD_CTRL[WAVEFORM_MODE]` will be ignored and the loading waveform will initially be put on hold.

After the Update Buffer processing completes, EPDC reports the minimal grey level, retrieves the mapped waveform mode from AUTOWV LUT, and writes it back into `UPD_CTRL[WAVEFORM_MODE]`.

If the user also sets `UPD_CTRL[DRY_RUN]`, EPDC will be finished at this point.

Otherwise, EPDC continues with the following, depending upon the `UPD_CTRL[AUTOWV_PAUSE]` setting:

1. `UPD_CTRL[AUTOWV_PAUSE] = 0, AUTO MODE)`

EPDC will begin waveform loading immediately without any software interaction

2. `UPD_CTRL[AUTOWV_PAUSE] = 1, MANUAL MODE)`

EPDC waits for software to decide whether the selected waveform is ok, then if necessary software can use some other criteria to select a waveform mode. After software selects the waveform mode, it writes again into `UPD_CTRL` with final waveform mode, and waveform loading then panel scan will start.

#### NOTE

`AUTOWV_PAUSE` is extended for general use so that it can be used independent of AUTOWV feature. Regardless of whether AUTOWV is enabled or not, the user can send updates with `AUTOWV_PAUSE=1`. EPDC will stop after WB processing and pause before LUT loading and panel scan. Software can

explicitly do that latter by writing to UPD\_CTRL with AUTOWV\_PAUSE=0. EPDC will ignore the Update Buffer for this time, and kick off the LUT loading and panel scanning. This feature allows SW modification to the working buffer after EPDC hardware has finished processing it.

### 13.6.3.8 Panel Interface Generator (Pigeon Mode)

There are seventeen panel interface signal outputs (DATA/SDCLK not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode".

Pigeon Mode is a timing mode which can be independently enabled on any of the seventeen timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable.

The following are the legacy timing signals which support pigeon mode:

- PIGEON[00] - SDCE0
- PIGEON[01] - SDCE1
- PIGEON[02] - SDCE2
- PIGEON[03] - SDCE3
- PIGEON[04] - SDCE4
- PIGEON[05] - SDCE5
- PIGEON[06] - SDCE6
- PIGEON[07] - SDCE7
- PIGEON[08] - SDCE8
- PIGEON[09] - SDCE9
- PIGEON[10] - SDOE
- PIGEON[11] - SDL3
- PIGEON[12] - SDOEZ
- PIGEON[13] - SDOED
- PIGEON[14] - GDSP
- PIGEON[15] - GDOE

#### Working Theory

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)
2. Increment on event selected through INC\_SEL

3. Count and match SET\_CNT: assert signal, reset counter  
( SET\_CNT==0 means assert immediately on MASK's rising edge )
4. Count and match CLR\_CNT: de-assert signal, stop counter  
(CLR\_CNT==0 means de-assert on MASK's falling edge)

**NOTE**

When local counter is running, further changes to MASK are not cared unless CLR\_CNT==0

MASK - start point for local counter

Created using any combination of below options (ANDed)

1. STATE\_MASK = (FS|FB|FD|FE) AND (LS|LB|LD|LE)

8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

For example, for a line timing signal start on Line Begin phase during Frame Begin/ Frame Data lines, use the configuration below:

**Table 13-41. STATE\_MASK combinations**

STATE_MASK	LS	LB =1	LD	LE
FS				
FB =1		X		
FD =1		X		
FE				

2. MASK\_CNT/MASK\_CNT\_SEL(global counter)

Sometimes a more accurate reference point is required, such as " line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK\_CNT\_SEL, when global counter matches the MASK\_CNT value. The pigeon local counter will start ticking.

3. Use another pigeon signal as mask (SIG\_LOGIC=MASK)

For some tightly coupled signals it is possible to use one as a reference to generate another.

INC\_SEL- select local counter tick event

1. pclk - pixel clk
2. line - line start pulse
3. frame - frame start pulse
4. another - another pigeon signal

OFFSET- offset on pclk basis

Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set OFFSET to a negative value to achieve this.

Global Counters (selectable through MASK\_CNT\_SEL)

- HCNT / VCNT

normal pclk counter / line counter

- HSTATE\_CNT / VSTATE\_CNT

similar to above, but reset when state changes

- HSTATE\_CYCLE / VSTATE\_CYCLE

(see figure below for definition of CYCLE/PERIOD/CNT)

Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as CE[n] are only valid during part n of Line Data. For such signals, use HW\_EPDC\_PIGEON\_CTRL.\*\_PERIOD to specify PERIOD where CNT is reset and CYCLE is included. Then the user can select CYCLE as MASK\_CNT to generate mask for CE[n].

- FRAME\_CNT / FRAME\_CYCLE (only for frame-crossing signals)

frame cycle counter doesn't have a reset condition; use

HW\_EPDC\_PIGEON\_CTRL1.FRAME\_CNT\_CYCLES to reset it.

## Electrophoretic Display Controller (EPDC)

**Figure 13-81. Definition of CNT, CYCLE, PERIOD**

The following are register settings for the figure above:

- `HW_EPDC_PIGEON_CTRL0.LD_PERIOD=2`
- `MASK_CNT_SEL = 1 // HSTATE_CYCLE`
- `MASK_CNT = 1 // CE[1]`
- `MASK_CNT = 2 // CE[2]`

### 13.6.3.9 Display Update Programming

The EPDC is designed to communicate with the kernel driver through the interrupts and status registers.

The driver entry is always assumed to occur as a result of an interrupt.

#### 13.6.3.9.1 Initiating a Display Update

The typical flow for performing a display update involves the following:

- `EPDC_STATUS[WB_BUSY]` must be 0. The EPDC cannot process new updates if it is currently processing an update.
- `EPDC_STATUS[LUTS_BUSY]` must be 0. The EPDC cannot accept new updates if all LUT resources are currently active.

Assuming both conditions above are met, an update request is programmed in the following manner (it is important to note that the last step must be writing to `EPDC_UPD_CTRL` which initiates the display update).

The following steps can be performed before WB\_BUSY and LUTS\_BUSY are clear:

- At this time it is assumed that the correct temperature is selected and written to EPDC\_TEMP.
- EPDC\_UPD\_ADDR must be set to the 8-bit buffer for the update **if stride feature not enabled (when enabled stride feature, no requirement on align)**. This buffer must be aligned to a 64-bit word address. In addition, each line address must begin at a 64-bit word address. Both criteria can be met by utilizing the PXP pixel processing engine which always aligns lines at a 64-bit raster (see [Memory Requirements](#) for details).
- EPDC\_UPD\_CORD defines the insertion co-ordinate into the panel resolution.
- EPDC\_UPD\_SIZE defines the dimension of the update (pixels).
- EPDC\_UPD\_FIXED is used for panel initialization or rectangular fill operations.

Writing the EPDC\_UPD\_CTRL register initiates a display update:

- USE\_FIXED-This field is set when EPDC\_UPD\_FIXED is used.
- LUT\_SEL-The driver should read EPDC\_STATUS\_NEXLUT[NEXT\_LUT] (qualified by NEXT\_LUT\_VALID) to select an available LUT to assign this update.
- WAVEFORM\_MODE selects the E-INK waveform mode (for example, INIT, DU, GC16 and so on). The number corresponds to the waveform number in the waveform specification document.
- UPDATE\_MODE selects one of two enumerated updated modes.
  - FULL-In this mode, all pixels defined in the update rectangle have the waveform applied.
  - PARTIAL-In this mode, the EPDC shall only apply the waveform to pixels which are changing, otherwise the EPDC\_FORMAT[DEFAULT\_TFT\_PIXEL] is applied to the pixels which are not changing.

### 13.6.3.9.2 Update Processing and Collisions

After the update is initiated (by writing EPDC\_UPD\_CTRL), the EPDC performs update-buffer processing. This involves processing this update region into its working buffer (WB).

During this time, the EPDC also performs collision detection. At the end of the WB processing, the EPDC asserts the WB\_CMPLT\_IRQ interrupt. If a collision is detected, the LUT\_COL\_IRQ interrupt status bit will also be asserted.

The EPDC performs image updates to the EPD by applying waveforms to individual pixels. Waveforms are applied to groups of pixels (ranging from a single pixel to the entire display). Each individual update request is bound to a rectangle. Each pixel within this rectangle has a waveform applied to it using the waveform and update mode specified in EPDC\_UPD\_CTRL. After this process is initiated, a waveform takes an

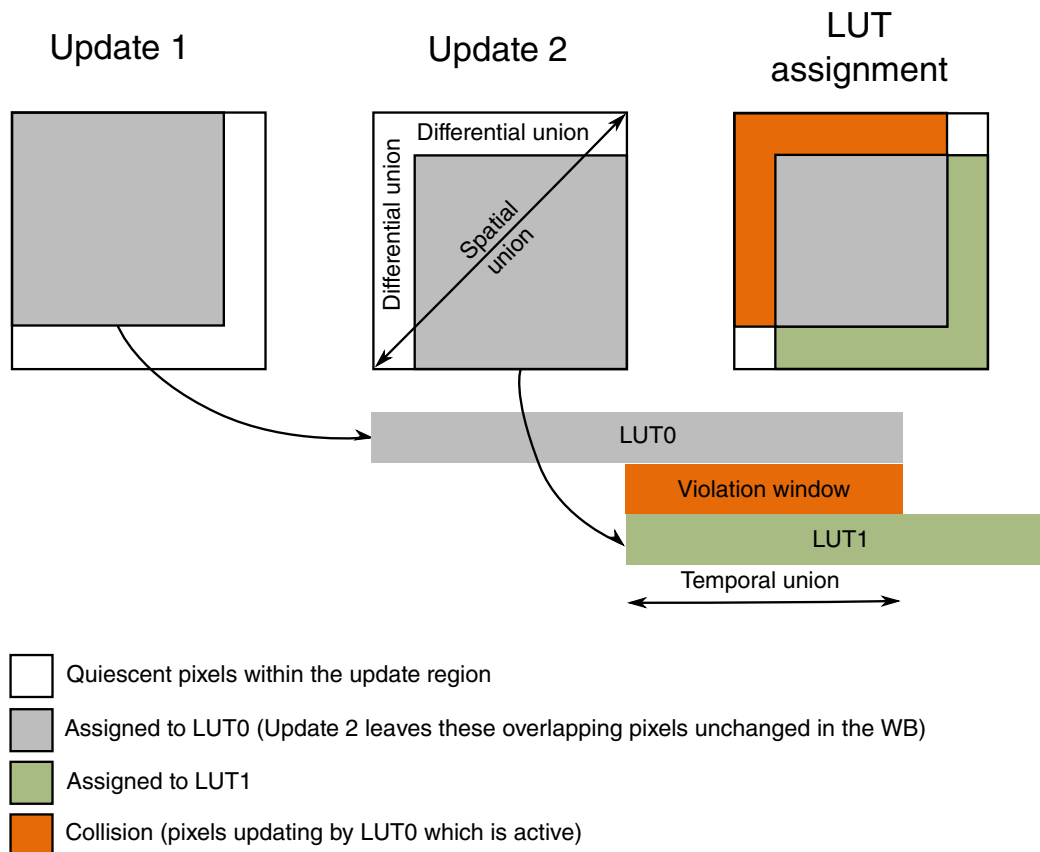

amount of time to complete which is usually determined by the specifications of the waveform mode. For proper display operation and optimum performance, a waveform must not be interrupted once it has begun.

A collision is defined simply as the interruption of the application of waveform to a pixel or group of pixels. As such, it must be avoided. Because the waveforms take a finite amount of time to complete, the EPDC provides a mechanism to automatically manage collisions, which allows the application to perform multiple updates resulting in a richer user experience without having to be cognizant of the panel and waveform characteristics.

Depending on the update mode (FULL or PARTIAL) a collision is defined as follows:

- For a full-update mode, a collision is defined as the temporal and spatial union of rectangles pertaining to active unique update requests. An active update is one which is still in the process of being updated (that is, a waveform is being applied).
- For a partial-update mode, a collision is defined as the temporal, spatial and differential union of pixels pertaining to unique update requests which are active. The difference between a full-updated and a partial-updated collision is that in the latter case, the collision state occurs only if the next-pixel states differ between the updates. Thus, two partial-update rectangles may intersect, but if all of the pixels in the intersecting update regions are being updated to the same gray-state, the original update and associated LUT/waveform are not disturbed and the intersection does not constitute a collision.
- It should be noted that collisions may be a one-to-many effect. In the case of partial updates, there may be a spatial and temporal union of rectangles with no differential pixel-level union. A subsequent update however might form such a pixel-level differential union to all active updates. Since each update pertains to an active LUT, these many collided updates are referred to as victim LUTs. The update/LUT that caused the collision is referred to as the aggressor LUT.

An example of a partial-update mode collision is shown in the following figure. Each update encompasses the outer rectangle which meets the criteria of the spatial union. The red areas show the pixels which are currently transitioning to gray (from update 1) but need to transition to white (in update 2). These pixels meet the criteria of the differential union and lastly in the temporal domain, the period of time where LUT0 and LUT1 overlap is the temporal union. The pixels that did not change (grey and green areas in the LUT assignment box) are not part of the collision area. In the case of the gray overlapping pixels, LUT0 can continue to update. In the case of the white pixels (which were previously inactive) a new LUT (if available can be assigned) and forms the green region. Note that a subsequent update could potentially collide with the green pixels in update 2.

**Figure 13-82. Partial Update Collision Handling**

### NOTE

For FULL update modes, a collision occurs at any intersection of active rectangles/LUTs because in FULL update mode, all pixels within the update rectangle have the waveform applied (even if pixel values are not changing).

It can be seen that when collision is detected (during the WB update process), the EPDC will "block" the collided pixels being updated, and any pixels which are not collided will be assigned to the requested LUT process. When a collision occurs, the EPDC will raise the LUT\_COL\_IRQ interrupt status bit (this will always happen in conjunction with WB\_CMPLT\_IRQ).

Because the driver is always entered via an interrupt, when the EPDC interrupt fires, driver should not only check for WB\_CMPLT\_IRQ but also for the LUT\_COL\_IRQ status bit within the EPDC\_IRQ register. If LUT\_COL\_IRQ is set, this means that a collision has occurred. If this is the case the driver should check the value of the EPDC\_STATUS\_COL register. This register contains one bit for each LUT that has been collided with, that is, it holds the vector of the victim LUTs as a result of the last update LUT. Since the driver knows the value of the LUT of the last update, it can store this update LUT value along with this associated victim LUT vector in a collision list.

Because the EPDC can drive up to 16 concurrent updates (which can be overlapping when using PARTIAL mode updates), a unique interrupt status bit is provided per LUT so that when an update completes (physically completes the waveform), the SW driver can know which LUT completed. In addition to the LUT completion interrupts (which are mapped into the EPDC\_IRQ[LUTn\_CMPLT\_IRQ] interrupt status bits), the current state of each LUT can also be read from the EPDC\_STATUS\_LUTS status register.

The driver can use the LUT status interrupts in conjunction with EPDC\_STATUS\_LUTS to perform regular checks on the completion of victim LUTs against the vectors stored for each colliding LUT in the collision list. The driver may also choose to serialize updates such that it might wait until all victim LUTs have completed before re-issuing the colliding update.

The figure below shows a more extended sequence of a collision. In this case there are a series of updates coming from the application layer. They are A, B, C and D. Updates A, B, and C are set without any collision. When update D is requested a collision is detected. Using the interrupt status collision registers, the SW-driver stores D in a collision-list. For that list entry it also store B which is the victim LUT. It uses this information to check when a LUT completes to see if the victim LUTs for any update in the collision list have completed. If they have completed (through a LUT completion interrupt), the SW-driver then sends this update (D in this case) again to the EPDC. It should be noted that from the application perspective it appears that all updates A, B, C and D have been accepted, that is, the collision handling is completely hidden from user-space. Using the collision detection and LUT status interrupts, the application (in conjunction with the driver) could also choose to completely serialize the requests (such that between the first and second D update, no other update is accepted).

Figure 13-83. Collision Sequence

### 13.6.3.9.3 Multiple Update Flow

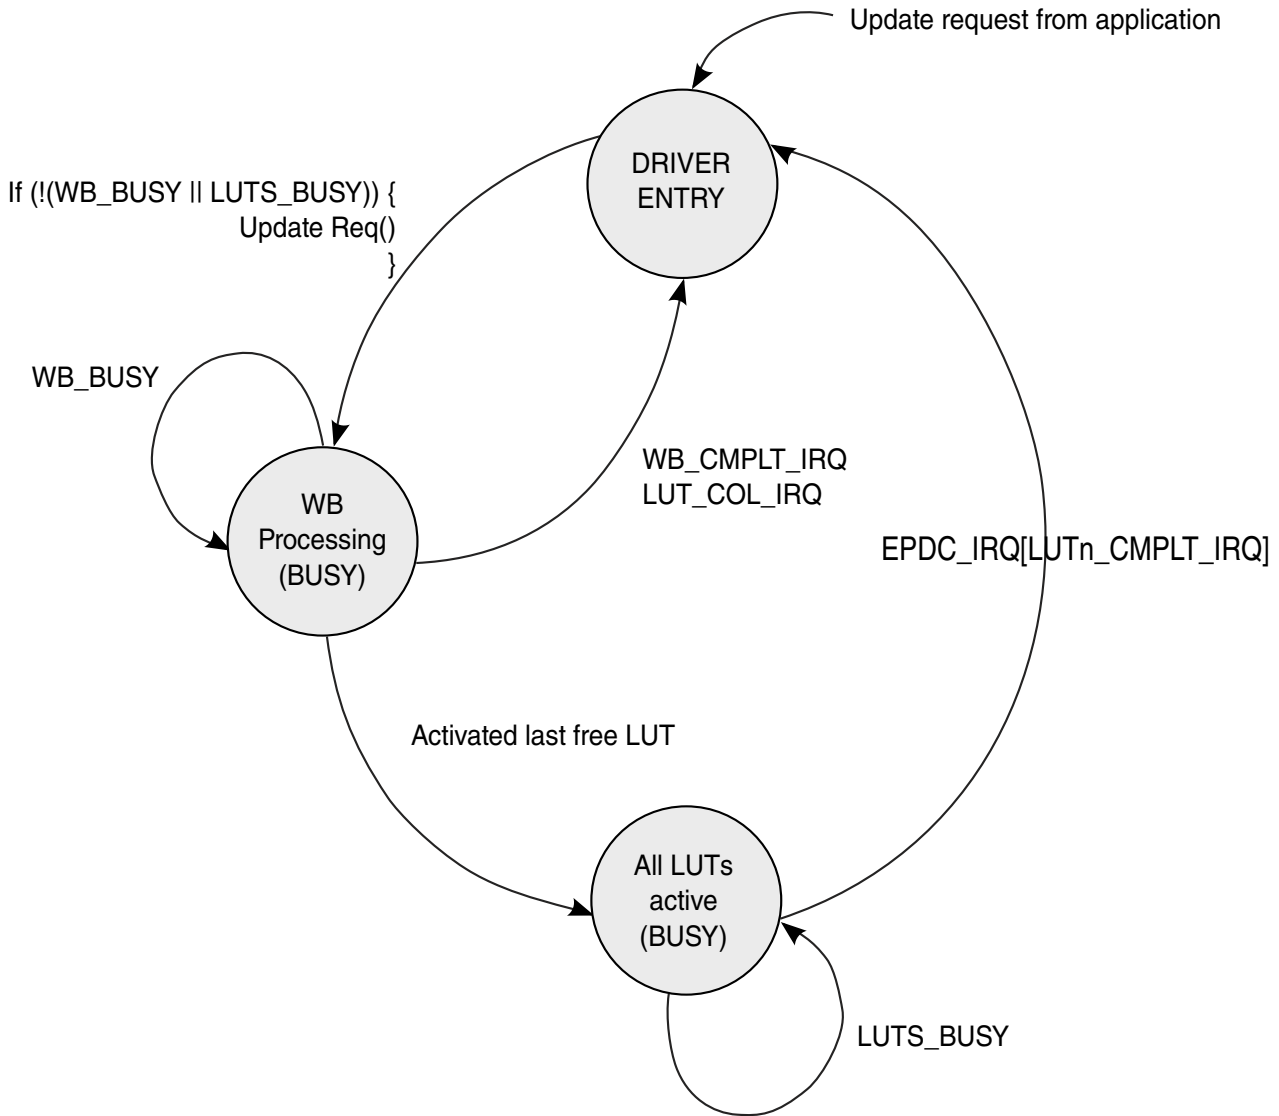

In most applications, such as e-book readers, besides full-screen page turns, user interfaces require multiple updates to be performed.

Examples of this include cursors, pen input, drop-down menus (with highlighting) and other movable graphical objects. Each update takes such a limited amount of time to complete (up to 1 second depending on the waveform mode) that it would be too prohibitive to only process updates serially.

As described in [Initiating a Display Update](#), there are two conditions that must be met before the SW driver can issue a new update request:

- The Working buffer (WB) update process must be complete.
- There must be an available LUT.

Assuming a free LUT is available, the EPDC is designed to have the capability to start new updates at each TFT frame scan (even being able to commence multiple updates within a frame scan blanking period). The general flow for sequential updates (concurrent or serialized) is shown in the following figure.

**Figure 13-84. Driver Update Flow**

This flow assumes that the driver is entered via interrupts. The two busy states are shown to illustrate the conditions under which the driver will not issue new updates. In general, the driver should be throttled by the WB\_CMPLT\_IRQ interrupt. Because the EPDC can support up to 64 concurrent updates, it is possible to re-enter the update-request (show as Update\_Req() in the figure above) any-time that the WB is not busy (even though LUTs are active and the display is being updated). It is possible that when there are 63 LUTs currently active and a new update is sent, there will be a WB\_CMPLT\_IRQ interrupt issued, but the driver at that time would be in a busy state (because LUTS\_BUSY is signaled). The driver will be re-entered on the next LUTn\_CMPLT\_IRQ interrupt during which time it can issue a new update (since WB\_BUSY and LUTS\_BUSY status bits are low).

The update-processing process (which is controlled by the MBM module) is asynchronous to the actual TFT refresh operations (which carry out the physical screen updates), so there is no particular relationship between the WB\_BUSY status and the state of the screen update. In contrast, the LUTn\_CMPLT\_IRQ interrupt status and EPDC\_STATUS\_LUTS provide the status of the physical waveform update. This means that when LUTn\_CMPLT\_IRQ interrupt fires, it means that the last physical TFT frame scan just completed for that update/LUT.

The EPDC implements proprietary methods to efficiently process the WB such that the WB processing time (the time from the SW driver writing EPDC\_UPD\_CTRL to EPDC\_IRQ[WB\_CMPLT\_IRQ] fires), is dependent on the size of the update rectangle. This allows smaller updates to be processed faster. In most EPD applications, this is ideal because it's typically smaller sprites that require the fastest performance. In addition, the EPDC implements methods to allow store pending updates and activate them on the next available frame-scan. For example, if the TFT scanning is currently in the active region and during this time a series of small update requests are sent, the EPDC can begin all of those updates on the next available blanking period.

The figure below shows an example of two larger update requests, one to LUT4 and one to LUT5. These update requests are shown in the context of active LUTs and thus active frame scan times. The time when both WB\_BUSY and LUT\_BUSY is high are defined as "blocking" because no new updates can be accepted. It should also be noted that new updates are physically commenced by the EPDC on blanking periods. From a SW programming model perspective, the EPDC\_STATUS\_LUTS[LUTn\_STATUS] is activated immediately upon the update request being written to the EPDC. The physical frame-scanning for this particular update does not being commenced until the next available frame scan.

It should be noted that updates and WB processing can actually occur during the blanking period (or can begin in the active scan time and continue into the blanking period). For this reason, the EPDC provides some tuning controls via EPDC\_TCE\_CTRL[VSCAN\_HOLDOFF] such that more time can be given to finish processing update request and less time "locking down" the set of LUTs that will be activated for the upcoming active scan. The EPDC will start to pre-fill its refresh pixel FIFOs after the VSCAN\_HOLDOFF period. Its possible to tune this value to allow the minimum time for the pixel FIFO pre-fill operation (making sure that refresh under-runs do not occur). If a pixel-FIFO under-run occurs, EPDC\_IRQ[TCE\_UNDERRUN\_IRQ] will fire.

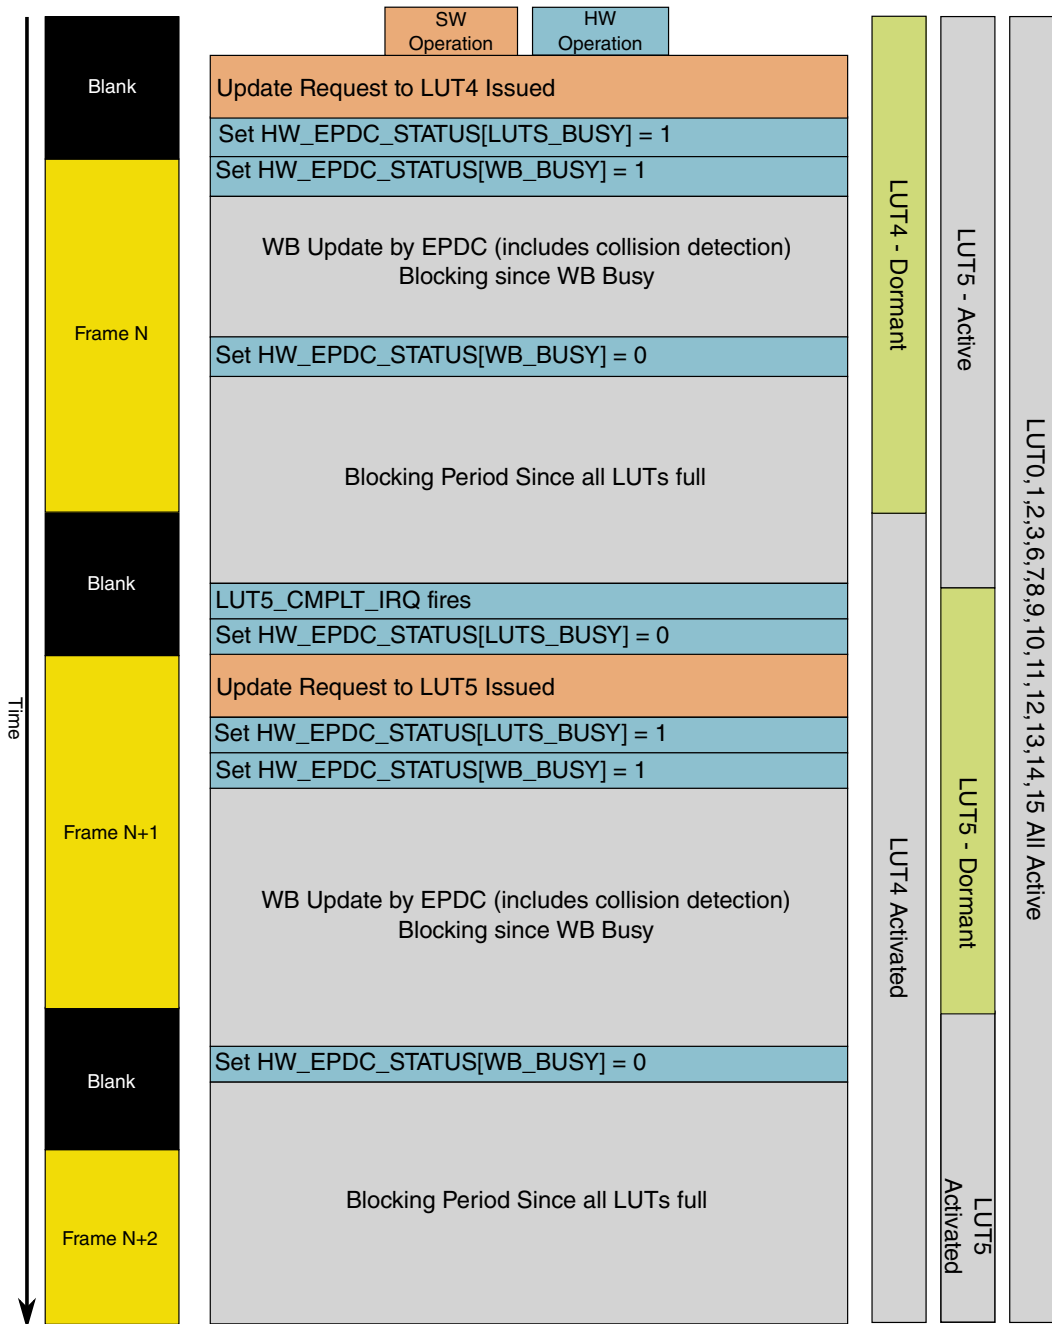

Figure 13-85. Temporal Flow of Update Processing

### 13.6.3.10 Architectural Clock Gating (Low Power Mode)

As with most modern IP, the EPDC contains low-level hardware controlled automatic clock gating throughout the design.

These clock gating elements typically gate clocks locally for individual or groups of sequential elements (flip flops) when these registers are not currently active.

This tier of clock gating is useful for reducing power during active operation of the EPDC.

Most e-paper applications utilizing EPDs involve the processor and display controller to be a low-power inactive state in most of the time. This is because EPDs only require refresh operations when the display content is being updated. As such, in between update operations, the EPDC provides a module level clock-gating feature that can be controlled by the SW driver as part of a higher-level power management solution.

The EPDC module can have all its clocks completely gated-off by the setting of EPDC\_CTRL[CLKGATE]. There are a couple of considerations that the SW driver must adhere to before placing the EPDC into this low power state:

- All active LUTs (updates) must complete
- Any TFT operations must be complete (including any final blanking operations)

In order to maximize display update frequency (the ability accept new updates during each frame scan), the LUT completion interrupts fire on the end of the last frame's active scan period for that update. This means that the TCE still must complete the final FRAME\_END blanking time to guarantee coherency of its state machines with the panel state (receiving the final LUT completion IRQ is not enough to determine that the EPDC can have all of its clocks shut down). Based on this, the EPDC provides the necessary interrupt and status bits to allow the driver to correctly perform the clock-gating operation by using the following method:

- Once the final EPDC\_IRQ[LUTn\_CMPLT\_IRQ] is reached, the driver should enable the TCE\_IDLE interrupt mask bit via EPDC\_IRQ\_MASK[TCE\_IDLE\_IRQ\_EN], unmask other interrupts and return.
- Once the final blanking time of the last LUT (FRAME\_END time) is completed and the TCE reaches its idle state, the EPDC will assert the EPDC\_IRQ[TCE\_IDLE\_IRQ] interrupt which will cause the driver to re-enter. At this point, the SW knows that the EPDC is in a completely idle state and can perform a set on EPDC\_CTRL[CLKGATE].

Alternative implementations of the driver could simply involve polling for the EPDC\_IRQ[TCE\_IDLE\_IRQ] interrupt status bit (which operates regardless of the interrupt being masked or not) before setting the clock gate (this prevents two iterations of interrupt based driver-entry, but requires a wait loop in the interrupt handler which might be undesirable).

It should be noted that the time interval between the last LUTs LUTn\_CMPLT\_IRQ time and TCE\_IDLE\_IRQ interrupt is equal to the FRAME\_END time.

When the application is ready to send more updates, the driver can immediately re-enable the EPDC by un-gating the module-level clock by clearing the EPDC\_CTRL[CLKGATE] field. This un-gating of the clock is instant and the driver is free to immediately send update requests.

### 13.6.3.11 Performance Tuning and Considerations

The EPDC is designed to meet the performance requirements of the most demanding e-paper applications. These performance targets must be met in the context of highly integrated SoCs.

In such a context, system memory is typically shared across multiple masters including the ARM platform. Because of this, there is no guarantee of latency from system memory. EPDC provides a number of mechanisms to deal with this as well as some ability to tune various parameters allowing the user to trade-off between update processing performance and refresh functionality.

#### 13.6.3.11.1 Memory and Bus Bandwidth Requirements

The EPDC MBM module contains up to 6 internal AXI requesting functions (5 read and 1 write). These are arbitrated internally before being sent to the SoC memory system.

The EPDC interfaces to the SoC bus system via a dual-channel 64-bit AXI bus master port. The following table shows the various internal requesters and their properties. Note that there are two round-robin (RR) loops. Because there is only one write source, and the EPDC supports dual-channel AXI, there is no arbitration on the WB write operations.

**Table 13-42. EPDC Bus Requestor Profiles**

Operation	Priority	Burst Length (x8 Bytes)	Maximum Outstanding Transactions	FIFO size
Waveform LUT read	0	8	2	16x68
WB pixel read FIFO0 (refresh)	RR 1	8 or 16	8	256x64
WB pixel read FIFO1 (refresh)	RR 1	8 or 16	8	256x64
WB read for update processing	RR 2	8	2	16x64
WB write for update processing	N/A	8	2	16x64
UPD read for update processing	RR 2	8	2	16x64

As described in [Memory Requirements](#), it can be seen that all lines in a buffer are padded to the nearest 8 byte boundary. This is important to be noted for the bandwidth calculations. The maximum bandwidth scenario involves processing a full-screen update while performing refresh operations, but refresh operations always have the highest

priority. Based on this, the memory bandwidth required by the EPDC is a function of the refresh pixel rate which in turn is a function of resolution, frame-rate and blanking/active time.

The refresh bandwidth can be calculated as follows:

Active Time = Active time of the frame-scan time as a fraction (for example, 0.8)

Frame Rate = TFT frame refresh rate (Hz) (for example, 106 Hz)

Bandwidth (MB/s) =  $\text{roundup4}(\text{EPDC\_RES}[\text{HORIZONTAL}]) \times \text{EPDC\_RES}[\text{VERTICAL}] \times \text{Frame Rate} \times (1/\text{Active Time}) \times 2 \times (1/1024^2)$

For example, a panel with resolution 2048 x 1536 with 106 Hz refresh and estimated 80% active time, 20% blanking time, the refresh bandwidth is:

$\text{BW (MB/S)} = 2048 \times 1536 \times 106 \times (1/0.8) \times 2 \times (1/1024^2) = 795 \text{ MB/s}$

(Note that  $2048 \bmod 4 = 0$ .)

The WB requires 2 bytes per pixel.

Remaining bandwidth is used for other operations. Because update processing operations are not real-time (they do not necessarily have to occur at the refresh frame-rate), the time required to perform the update can be calculated as a function of the available bandwidth (actual bandwidth minus refresh bandwidth) and the update size.

### 13.6.3.11.2 Pixel Latency FIFO

The EPDC contains one working buffer latency FIFO which is used to load working buffer pixel data which is used by the TCE to perform the panel refresh operations.

The FIFO is sized at 1024 pixels each in order to provide significant system memory latency tolerance. The pixel FIFO is dedicated for the main screen and the second is in dual-scan cases for the second half of the screen.

Under no circumstance should the EPDC pixel FIFO reach an under-run condition. The EPDC provides an interrupt status bit to flag such a condition (TCE\_UNDERRUN\_IRQ). During development, this interrupt must be enabled. The pixel values stored in the FIFO are used by the TCE to perform look-up operations (from the LUTs) to generate TFT voltage control pixels. If an under-run occurs, the result will be unknown data being used as the source for the look-ups, which can damage the panel.

### 13.6.3.11.3 Basic Watermarking Control

The EPDC provides a basic pixel pre-fetching control mechanism that is applied to the beginning of a new update (from an idle state). This control is provided by EPDC\_FIFOCTRL[FIFO\_INIT\_LEVEL].

The control allows the value to be set between 0-255, with a reset value of 128. Because the internal width of the FIFO holds 4-pixels per entry, the actual number of pixels is  $(\text{FIFO\_INIT\_LEVEL}+1) \times 4$ .

The EPDC uses this value to pre-fill the pixel latency FIFO(s) to this level before the TCE commences the refresh operations which drive the update to the panel. This control has no effect on the FIFO(s) when the EPDC is performing sequential frame-scans.

It must be noted that this value must be set less than  $(\text{EPDC\_RES}[\text{VERTICAL}] \times \text{EPDC\_RE}[\text{HORIZONTAL}]) / 4$ .

### 13.6.3.11.4 Update/Refresh Tuning (VSCAN\_HOLDOFF)

During active frame-scan time, the EPDC provides the ability to process and display new update requests, because all pixels in the WB pertaining to a particular update are bound to a single LUT.

Until all pixels pertaining to that update have been processed in the WB, its LUT cannot be activated. As shown in [Figure 13-85](#), the blanking period provides time to pre-load the pixel FIFOs and for completing WB processing updates and loading the associated frame of waveform data into LUT memories.

The EPDC\_TCE\_CTRL[VSCAN\_HOLDOFF] control field allows control over the vertical blanking period allotment for working buffer processing and pre-loading of the pixel FIFO. The time window defined by VSCAN\_HOLDOFF is allotted for working-buffer processing and LUT loading (of newly processed updates). The remainder of the time is allotted for pre-filling the pixel FIFO.

Note that aggressive use of VSCAN\_HOLDOFF can result in pixel FIFO under-run as the FIFO pre-fill time is compromised.

### 13.6.3.11.5 System-Level Arbitration Control

As previously mentioned, the TCE refresh operation is time critical.

Because the EPDC is designed to be integrated into a multimaster SoC, system memory is shared between multiple requesters in the system.

The EPDC provides a dynamic Quality of Service (QoS) priority elevation mechanism that can be leveraged at the SoC level.

The EPDC\_FIFOCTRL registers can be used to drive the `epdc_panic` output signal during times when the EPDC requests require priority elevation. As long as `epdc_panic` is asserted, transaction requests from the EPDC will have their priority elevated at the SoC-level bus arbitration control points.

The registers and associated functionality are as follows:

- EPDC\_FIFOCTRL[ENABLE\_PRIORITY] must be set to enable `epdc_panic` functionality.
- EPDC\_FIFOCTRL[FIFO\_L\_LEVEL] determines FIFO threshold which causes `epdc_panic` to assert when crossed.
- EPDC\_FIFOCTRL[FIFO\_H\_LEVEL] once `epdc_panic` has been asserted due to the pixel FIFO(s) crossing FIFO\_L\_LEVEL, this value, which must be set higher than FIFO\_L\_LEVEL, determines the point at which `epdc_panic` will de-assert as the FIFO(s) fills.

Note that the delta between FIFO\_H\_LEVEL and FIFO\_L\_LEVEL is intended as a de-bounce mechanism. The purpose is to avoid a constant panic situation, which would cause thrashing of the `epdc_panic` signal.

Figure 13-86. FIFO Priority Elevation

## 13.6.4 EPDC Memory Map/Register Definition

### EPDC Register Format Summary

EPDC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
306F_0000	EPDC Control Register (EPDC_CTRL)	32	R/W	C000_0000h	<a href="#">13.6.4.1/3921</a>
306F_0004	EPDC Control Register (EPDC_CTRL_SET)	32	R/W	C000_0000h	<a href="#">13.6.4.1/3921</a>
306F_0008	EPDC Control Register (EPDC_CTRL_CLR)	32	R/W	C000_0000h	<a href="#">13.6.4.1/3921</a>
306F_000C	EPDC Control Register (EPDC_CTRL_TOG)	32	R/W	C000_0000h	<a href="#">13.6.4.1/3921</a>

### 13.6.4.1 EPDC Control Register (EPDC\_CTRLn)

EPDC Main control register

This register controls various high-level functions of the EPDC

#### EXAMPLE

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;

```

## Electrophoretic Display Controller (EPDC)

```
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 306F\_0000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal EPDC operation. Set this bit to one (default) to disable clocking with the EPDC and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the EPDC block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–8 -	This field is reserved. Reserved.
7–6 UPD_DATA_SWIZZLE	Specifies how to swap the bytes for the UPD data before the WB construction. Please note this swizzle operate right after data fetch from bus, no matter it's aligned access or not. Supported configurations: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
5–4 LUT_DATA_SWIZZLE	Specifies how to swap the bytes for the LUT data before store to LUTRAM. Supported configurations: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
-	This field is reserved. Reserved.

### 13.6.4.2 EPDC Working Buffer Address for TCE (EPDC\_WB\_ADDR\_TCE)

#### EPDC Working Buffer Address for TCE

Address: 306F\_0000h base + 10h offset = 306F\_0010h

#### EPDC\_WB\_ADDR\_TCE field descriptions

Field	Description
ADDR	Address for EPDC working buffer. This address must be aligned to a 64-bit double-word boundary.

### 13.6.4.3 EPDC Waveform Address Pointer (EPDC\_WVADDR)

#### EPDC Waveform Address Pointer

#### EXAMPLE

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while ((__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;

__raw_writel(reg_val, EPDC_CTRL_SET);

```

Address: 306F\_0000h base + 20h offset = 306F\_0020h

**EPDC\_WVADDR field descriptions**

Field	Description
ADDR	Start address of waveform tables. This address needs to be aligned to a 64-bit word boundary.

**13.6.4.4 EPDC Working Buffer Address (EPDC\_WB\_ADDR)**

EPDC Working Buffer Address

This register points to the address of current working buffer.

Address: 306F\_0000h base + 30h offset = 306F\_0030h

**EPDC\_WB\_ADDR field descriptions**

Field	Description
ADDR	Address for EPDC working buffer. This address must be a aligned to a 64-bit double-word boundary.

**13.6.4.5 EPDC Screen Resolution (EPDC\_RES)**

EPDC Screen Resolution.

This register defines the horizontal and vertical resolution of the target display panel

Address: 306F\_0000h base + 40h offset = 306F\_0040h

**EPDC\_RES field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 VERTICAL	Vertical Resolution (in pixels)
15–13 -	This field is reserved. Reserved.
HORIZONTAL	Horizontal Resolution (in pixels)

### 13.6.4.6 EPDC Format Control Register (EPDC\_FORMAT $n$ )

EPDC Pixel format control register. Defines formats for buffer and TFT pixels.

This register controls various functions throughout the digital portion of the chip.

#### EXAMPLE

```
/* EPDC_FORMAT - 2bit TFT and 4bit Buf pixel format */
reg_val = EPDC_FORMAT_TFT_PIXEL_FORMAT_2BIT
          | EPDC_FORMAT_BUF_PIXEL_FORMAT_P4N
          | ((0x0 << EPDC_FORMAT_DEFAULT_TFT_PIXEL_OFFSET) &
            EPDC_FORMAT_DEFAULT_TFT_PIXEL_MASK);
__raw_writel(reg_val, EPDC_FORMAT);
```

Address: 306F\_0000h base + 50h offset + (4d × i), where i=0d to 3d

**EPDC\_FORMAT $n$  field descriptions**

Field	Description
31–25 -	This field is reserved. Reserved.
24 BUF_PIXEL_SCALE	Selects method of conversion from 8-bit input 0x0 <b>TRUNCATE</b> — Use Truncate method (LSB) 0x1 <b>ROUND</b> — Use rounding method (with saturation)

*Table continues on the next page...*

EPDC\_FORMAT $n$  field descriptions (continued)

Field	Description
23–16 DEFAULT_TFT_PIXEL	Default TFT pixel value. This value is used as the source-driver voltage value (TFT-pixel) for either partial-updates where a pixel has not changed or for any part of the screen which is not being updated during active frame scans.
15 -	This field is reserved. Reserved.
14 WB_ADDR_NO_COPY	1 means do not automatically copy WB_ADDR to WB_ADDR_TCE before starting every frame
13–12 WB_TYPE	00 <b>WB_INTERNAL</b> — internal Working Buffer written by EPDC itself 01 <b>WB_WAVEFORM</b> — working buffer is actually holding waveform 10 <b>WB_EXTERNAL16</b> — 16bit working buffer written by PXP or CPU 11 <b>WB_EXTERNAL32</b> — 32bit working buffer written by PXP or CPU
11 WB_COMPRESS	whether the working buffer is compressed, only available on WB_FORMAT=EXTERNAL16/32 mode
10–8 BUF_PIXEL_FORMAT	this field is deprecated in EPDCv3, replaced by WB_FIELDx where we can specify width for each field EPDC Input Buffer Pixel format. All update buffers are expected to have 8-bit grayscale pixels. This register defines which MSB's of those pixels are used. It must be noted that this format must match the waveform (e.g. P4N is not compatible with 3-bit waveforms)  0x2 <b>P2N</b> — 2-bit pixel 0x3 <b>P3N</b> — 3-bit pixel 0x4 <b>P4N</b> — 4-bit pixel 0x5 <b>P5N</b> — 5-bit pixel
7–2 -	This field is reserved. Reserved.
TFT_PIXEL_FORMAT	EPDC TFT Pixel Format. This defines how many bits of the SDDO bus are required per pixel. This field must be consistent with the waveform and panel architecture.  0x0 <b>2B</b> — 2-bit 0x1 <b>2BV</b> — 2-bit and VCOM 0x2 <b>4B</b> — 4-bit 0x3 <b>4BV</b> — 4-bit and VCOM

### 13.6.4.7 Working Buffer Field Setting (EPDC\_WB\_FIELD0)

specify the pixel fields mapping from working buffer to lut index : WB[FROM +LEN:FROM] =>LUT [TO+LEN:TO]

Address: 306F\_0000h base + 60h offset = 306F\_0060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R									Reserved						USE_FIXED

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	USAGE			FROM				TO				LEN				
W																
Reset	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0	0

#### EPDC\_WB\_FIELD3 field descriptions

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value 00 <b>NO_FIXED</b> — not using FIXED field 01 <b>USE_FIXED</b> — set this field to a FIXED value which specified by FIXED[31:24] 10 <b>NE_FIXED</b> — mask off this pixel if this field is non equal to FIXED[31:24] 11 <b>EQ_FIXED</b> — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 <b>NOT_USED</b> — NOT USED 011 <b>PARTIAL</b> — PARTIAL 100 <b>LUT</b> — LUT 101 <b>CP</b> — CP 110 <b>NP</b> — NP 111 <b>PTS</b> — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

### 13.6.4.11 EPDC FIFO control register (EPDC\_FIFOCTRLn)

Allows for programmability of pixel FIFO watermarks used in conjunction with system arbitration hardware

This register houses FIFO control bits

**EXAMPLE**

```

/* EPDC_FIFOCTRL (disabled) */
reg_val =
    ((100 << EPDC_FIFOCTRL_FIFO_INIT_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_INIT_LEVEL_MASK)
    | ((200 << EPDC_FIFOCTRL_FIFO_H_LEVEL_OFFSET) &
       EPDC_FIFOCTRL_FIFO_H_LEVEL_MASK)
    | ((100 << EPDC_FIFOCTRL_FIFO_L_LEVEL_OFFSET) &
       EPDC_FIFOCTRL_FIFO_L_LEVEL_MASK);
__raw_writel(reg_val, EPDC_FIFOCTRL);

```

Address: 306F\_0000h base + A0h offset + (4d × i), where i=0d to 3d

**EPDC\_FIFOCTRL<sub>n</sub> field descriptions**

Field	Description
31 ENABLE_PRIORITY	Enable watermark-based priority elevation mechanism. 1=Enabled, 0=Disabled. (Only applies to FIFO_H_LEVEL and FIFO_L_LEVEL)
30–24 -	This field is reserved. Reserved.
23–16 FIFO_INIT_LEVEL	This register sets the watermark for the pixel-fifo.
15–8 FIFO_H_LEVEL	Upper level value of FIFO watermark. Must be greater than FIFO_L_LEVEL. When the pixel FIFO reaches this level or above, the priority elevation request is negated
FIFO_L_LEVEL	Lower level value of FIFO watermark. When the pixel FIFO reaches this level or below, the priority elevation request is asserted.

**13.6.4.12 EPDC Update Region Address (EPDC\_UPD\_ADDR)**

## EPDC Update Region Address

## Electrophoretic Display Controller (EPDC)

The address alignment depends on whether the update region stride register (EPDC\_UPD\_STRIDE) is set or not.

If EPDC\_UPD\_STRIDE is zero, the update region address must start and end on the 8-byte aligned addresses.

If EPDC\_UPD\_STRIDE is non-zero, the update region address can start and/or end on any byte addressing. But aligned address still recommended to get best bus performance.

### EXAMPLE1

```
/* no update stride case */
u32 stride = 0;
u32 addr = 0x100; /* 8-byte aligned */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

### EXAMPLE2

```
/* update stride = 345 */
u32 stride = 345;
u32 addr = 0x123; /* 8-byte unaligned is OK */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

Address: 306F\_0000h base + 100h offset = 306F\_0100h

### EPDC\_UPD\_ADDR field descriptions

Field	Description
ADDR	Address for incoming region update. This address points to update region which will be processed into the working buffer.

## 13.6.4.13 EPDC Update Region Stride (EPDC\_UPD\_STRIDE)

### EPDC Update Region Stride

When UPD\_STRIDE==0 (stride feature disabled), UPD buffer line must start from 64-bit boundary and end on 64-bit boundary(padding if not). When UPD\_STRIDE!=0 (stride feature enabled), UPD buffer line can start or end on any byte address, UPD\_WIDTH should be set to real line bytes count as normal, while UPD\_STRIDE set to byte distance between two lines' start.

### EXAMPLE

see details on stride feature introduction

Address: 306F\_0000h base + 110h offset = 306F\_0110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_UPD\_STRIDE field descriptions

Field	Description
STRIDE	line stride for incoming region update

## 13.6.4.14 EPDC Update Command Co-ordinate (EPDC\_UPD\_CORD)

EPDC Update Command Co-ordinate

This register is used for setting up the coordinate of a new update region.

Address: 306F\_0000h base + 120h offset = 306F\_0120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	Reserved	YCORD														Reserved	XCORD

### EPDC\_UPD\_CORD field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 YCORD	Y co-ordinate for incoming region update
15–13 -	This field is reserved. Reserved.
XCORD	X co-ordinate for incoming region update

## 13.6.4.15 EPDC Update Command Size (EPDC\_UPD\_SIZE)

EPDC Update Command Size

This register sets up the size of an update region.

Address: 306F\_0000h base + 140h offset = 306F\_0140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	Reserved	HEIGHT														Reserved	WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_UPD\_SIZE field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 -	This field is reserved. Reserved.
WIDTH	Width (in pixels)

**13.6.4.16 EPDC Update Command Control (EPDC\_UPD\_CTRLn)**

EPDC Update Command Control.

Writing to this registers triggers and update request operation.

Address: 306F\_0000h base + 160h offset + (4d × i), where i=0d to 3d

**EPDC\_UPD\_CTRLn field descriptions**

Field	Description
31 USE_FIXED	Use fixed pixel values (requires programming of EPDC_UPD_FIXED)
30–22 -	This field is reserved. Reserved.
21–16 LUT_SEL	LUT select 0-63
15–8 WAVEFORM_MODE	Waveform Mode 0-255

Table continues on the next page...

## EPDC\_UPD\_CTRLn field descriptions (continued)

Field	Description
7–6 -	This field is reserved. Reserved.
5 STANDBY	
4 NO_LUT_ CANCEL	EPDC will cancel LUT loading for void update (no real update needed because of partial or collision), set this bit to 1 to disable this feature
3 PAUSE	0x0 <b>AUTO</b> — epdc will analyze update buffer, report histogram, then update waveform mode using the programmed mode mapping in AUTOWV_LUT and start LUT loading 0x1 <b>MANUAL</b> — epdc will analyze update buffer, report histogram, then pause and waiting software to write again with selected waveform mode to start lut loading
2 AUTOWV	enable automatical waveform mode selection
1 DRY_RUN	Enable Dry Run mode(set to 1). WB won't be updated in this mode, and lut_sel will be ignored, so actually you don't need to wait for LUT available to use this feature
0 UPDATE_MODE	Update Mode 0x0 <b>PARTIAL</b> — Partial Update : only process changed pixels in region 0x1 <b>FULL</b> — Full Update : process all pixels in region

## 13.6.4.17 EPDC Update Fixed Pixel Control (EPDC\_UPD\_FIXEDn)

EPDC Update Control register for fixed-pixel updates (enabled via EPDC\_UPD\_CTRL[USE\_FIXED])

Address: 306F\_0000h base + 180h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	FIXNP								FIXCP							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_UPD\_FIXEDn field descriptions**

Field	Description
31 FIXNP_EN	If set to 1, current updated region has the NP value defined by FIXNP
30 FIXCP_EN	If set to 1, current updated region has the CP value defined by FIXCP
29–16 -	This field is reserved. Reserved.
15–8 FIXNP	NP value if fixenp_en is set to 1. Data in Y8 format.
FIXCP	CP value if fixecp_en is set to 1. Data in Y8 format.

**13.6.4.18 EPDC Temperature Register (EPDC\_TEMP)**

EPDC Temperature Compensation Register

Address: 306F\_0000h base + 1A0h offset = 306F\_01A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_TEMP field descriptions**

Field	Description
TEMPERATURE	Temperature Value. This value is simply an index (not a temperature value). The index is used by the EPDC to access the correct temperature compensated waveform.

**13.6.4.19 Waveform Mode Lookup Table Control Register. (EPDC\_AUTOWV\_LUT)**

This register is used to access the waveform mode lookup table.

DATA -> AUTOWV\_LUT[ADDR] : Writing this reg with 'ADDR' and 'DATA' info will get 'DATA' written to AUTOWV\_LUT mem indexed with 'ADDR'

Address: 306F\_0000h base + 1C0h offset = 306F\_01C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_TCE\_CTRLn field descriptions

Field	Description
31–25 -	This field is reserved. Reserved.
24–16 VSCAN_	This period (expressed in vertical lines), sets the portion of the vertical blanking available for new LUTs to be activated. The remainder of the blanking period is reserved for pre-filling the TCE pixel FIFOs. Increasing this value allows for multiple smaller updates to be intercepted by the current frame scan. This number should not exceed FRAME_END+FRAME_SYNC+FRAME_BEGIN. Increasing this value can improve the ability for any given update to intercept the next available frame-scan. Excessive values can result in TCE FIFO under-runs.
15–12 -	This field is reserved. Reserved.
11–10 VCOM_VAL	When VCOM_MODE = MANUAL, this value is used to manually set the VCOM value for the VCOM[1:0] pins
9 VCOM_MODE	This field determines the method used to drive the VCOM signal. 0x0 <b>MANUAL</b> — VCOM Value is set manually using VCOM_VAL field 0x1 <b>AUTO</b> — VCOM Value is used from waveform
8 DDR_MODE	If set, SDDO data is driven on both positive and negative edges of SDCLK. Note that this mode is not supported when SDDO_BUS_FORMAT=16BIT and LVDS is not used. This must always be set when LVDS_MODE is set.
7 LVDS_MODE_	If set (together with LVDS_MODE=1), SDCE[9:5] shall be driven as the differential inverse of SDCE[4:0]. In this mode the EPDC only supports 5 CE lines.
6 LVDS_MODE	If set, the upper 8-bit of the SDDO bus are used for LVDS differential signalling. Note that this can only be used when SDDO_BUS_FORMAT is set to 16BIT, i.e. LVDS signaling is not supported with an 8-bit SDDO interface. Note that for LVDS_MODE, DDR_MODE must also be set.
5 SCAN_DIR_1	Determines scan direction for each half of the TFT panel

Table continues on the next page...

## EPDC\_TCE\_CTRLn field descriptions (continued)

Field	Description
	0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
4 SCAN_DIR_0	Determines scan direction for each half of the TFT panel  0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
3 DUAL_SCAN	Enables dual scan-mode. Note in this mode, SDDO_BUS_FORMAT=16BIT must be selected. and PIXELS_PER_CLK applies to each 8-bit segment of the SDDO bus.
2 SDDO_WIDTH	Selects either 8 or 16 bit SDDO bus format  0x0 <b>8BIT</b> — Connect to 8-bit source driver 0x1 <b>16BIT</b> — Connct to 16-bit source driver
PIXELS_PER_SDCLK	Number of TFT pixels per SDCLK period. Note that this value forms the division of the PIXCLK to generate the SDCLK such that SDCLK = PIXCLK/PIXELS_PER_SDCLK. For dual-scan mode (DUAL_SCAN=1), this applies to 8-bit half of the 16-bit SDDO. It should be noted that when DDR_MODE is enabled, both edges of the clock have to be accounted for in this value, so for example with an 8-bit SDDO, 2-bit TFT pixel, this field should be set to EIGHT (four pixels on the pos-edge and 4-pixels on the neg-edge)  0x0 <b>RESERVED</b> — Reserved 0x1 <b>TWO</b> — Two TFT-pixels per SDCLK 0x2 <b>FOUR</b> — Four TFT-pixels per SDCLK 0x3 <b>EIGHT</b> — Eight TFT-pixels per SDCLK

### 13.6.4.23 EPDC Timing Control Engine Source-Driver Config Register (EPDC\_TCE\_SDCFGn)

#### Source-driver configuration register

Address: 306F\_0000h base + 220h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved										SDCLK_HOLD	SDSHR	NUM_CE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SDDO_REFORMAT		SDDO_INVERT	PIXELS_PER_CE												
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_TCE\_SDCFGn field descriptions**

Field	Description
31–22 -	This field is reserved. Reserved.
21 SDCLK_HOLD	Setting this bit to 1 holds the SDCLK low during LINE_BEGIN
20 SDSHR	Value for source-driver shift direction output port
19–16 NUM_CE	Number of source driver IC chip-enables. Must be 1-10
15–14 SDDO_ REFORMAT	This register defines the various re-formatting options to enable more flexibility in the source-driver interface:  0x0 <b>STANDARD</b> — No change. 0x1 <b>FLIP_PIXELS</b> — Reverses the order of the pixels on SDDO. This register setting is sensitive to the TFT pixel width (TFT_PIXEL_FORMAT), e.g. for TFT_PIXEL_FORMAT=2B on an 8-bit bus P3,P2,P1,P0 becomes P0,P1,P2,P3, whereas with TFT_PIXEL_FORMAT=4B, on an 8-bit bus, P1,P0 becomes P0,P1
13 SDDO_INVERT	Setting this bit to 1 reverses the polarity of each SDDO bit so 0xAAAA in 16-bit mode for example becomes 0x5555. This setting can be made in addition to the SDDO_REFORMAT register setting.
PIXELS_PER_ CE	Number of pixels (outputs) per source-driver IC. Please note that EPDC_RES[HORIZONTAL] must be an integer multiple of PINS_PER_CE.

**13.6.4.24 EPDC Timing Control Engine Gate-Driver Config Register (EPDC\_TCE\_GDCFGn)**

This register houses gate-driver configuration.

Address: 306F\_0000h base + 240h offset + (4d × i), where i=0d to 3d

### EPDC\_TCE\_GDCFGn field descriptions

Field	Description
31–16 PERIOD_VSCAN	when vscan state is splited, this reg defines the counter period
15–5 -	This field is reserved. Reserved.
4 GDRL	Value for gate-driver right/left shift output port
3–2 -	This field is reserved. Reserved.
1 GDOE_MODE	Selects method for driving GDOE signal. When set to 0, GDOE is driven at all times during the frame-scan except FRAME_SYNC. When set to 1, GDOE is driven as a delayed version of GDCLK delayed by EPDC_TCE_TIMING3[GDOE_OFFSET].
0 GDSP_MODE	Selects method for driving GDSP pulse. When set to 0, GDSP is is always fixed to have a pulse width of one line-time. When set to 1, GDSP has a pulse-width determined by the FRAME_SYNC setting. Note that GDSP_MODE=1 is not compatible with the GDSP_OFFSET function

#### 13.6.4.25 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC\_TCE\_HSCAN1n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 306F\_0000h base + 260h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### EPDC\_TCE\_HSCAN1n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_SYNC_ WIDTH	Number of PIXCLK cycles for the SDLE active time. Note that this value cannot be larger than LINE_SYNC and must be greater than 0. Typically it is recommended to set this value to be the same as LINE_SYNC
15–12 -	This field is reserved. Reserved.
LINE_SYNC	Number of PIXCLK cycles for line sync duration. Note that this value encompasses the LINE_SYNC_WIDTH duration. This value must be programmed to a multiple of SDCLK cycles

### 13.6.4.26 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC\_TCE\_HSCAN2n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 306F\_0000h base + 280h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### EPDC\_TCE\_HSCAN2n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_END	Number of PIXCLK cycles for line end duration. This defines the duration from the de-assertion of SDCE and assertion of the next SDLE.
15–12 -	This field is reserved. Reserved.
LINE_BEGIN	Number of PIXCLK cycles for line begin duration. This defines the interval between de-assertion of SDLE and assertion of the SDCE signals. This value must be programmed to a multiple of SDCLK cycles

### 13.6.4.27 EPDC Timing Control Engine Vertical Timing Register (EPDC\_TCE\_VSCANn)

Vertical scan timing registers

This register houses vertical scan timing. Note that frame data length is derived from EPDC\_RES.

Address: 306F\_0000h base + 2A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_TCE\_VSCAN $n$ field descriptions

Field	Description
31–24 -	This field is reserved. Reserved.
23–16 FRAME_END	Number of lines for frame end duration.
15–8 FRAME_BEGIN	Number of lines for frame begin duration.
FRAME_SYNC	Number of lines for frame sync duration.

#### 13.6.4.28 EPDC Timing Control Engine OE timing control Register (EPDC\_TCE\_OE $n$ )

This register contain delay programming values for the SDOEZ and SDOED source driver control signals

This register contain delay programming values for the SDOZ and SDOE source driver control signals

Address: 306F\_0000h base + 2C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	SDOED_WIDTH								SDOED_DLY								SDOEZ_WIDTH								SDOEZ_DLY								
W																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_TCE\_OE $n$ field descriptions

Field	Description
31–24 SDOED_WIDTH	Number of PIXCLK cycles from SDOED high to SDOED falling (Must be greater than 0)
23–16 SDOED_DLY	Number of PIXCLK cycles from SDOEZ low to SDOED rising (Must be greater than 0)
15–8 SDOEZ_WIDTH	Number of PIXCLK cycles from SDOEZ high to SDOEZ falling (Must be greater than 0)
SDOEZ_DLY	Number of PIXCLK cycles from SDLE falling edge to SDOEZ rising (Must be greater than 0)

#### 13.6.4.29 EPDC Timing Control Engine Driver Polarity Register (EPDC\_TCE\_POLARITY $n$ )

This registers allows for programming the polarity of source/gate driver control signals

This register houses FIFO control bits

## Electrophoretic Display Controller (EPDC)

Address: 306F\_0000h base + 2E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved															
W	Reserved

R	Reserved											GDSP_POL	GDOE_POL	SDOE_POL	SDLE_POL	SDCE_POL
W	Reserved											GDSP_POL	GDOE_POL	SDOE_POL	SDLE_POL	SDCE_POL
Reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0

### EPDC\_TCE\_POLARITY $n$ field descriptions

Field	Description
31–5 -	This field is reserved. Reserved.
4 GDSP_POL	0 = Active Low, 1 = Active High. Applies to the GDSP output
3 GDOE_POL	0 = Active Low, 1 = Active High. Applies to the GDOE output
2 SDOE_POL	0 = Active Low, 1 = Active High. Applies to the SDOE. Does not apply to SDOEZ and SDOED outputs
1 SDLE_POL	0 = Active Low, 1 = Active High. Applies to the SDLE output
0 SDCE_POL	0 = Active Low, 1 = Active High. Applies to all 10 SDCE outputs

### 13.6.4.30 EPDC Timing Control Engine Timing Register 1 (EPDC\_TCE\_TIMING1 $n$ )

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 306F\_0000h base + 300h offset + (4d × i), where i=0d to 3d

**EPDC\_TCE\_TIMING1n field descriptions**

Field	Description
31–6 -	This field is reserved. Reserved.
5–4 SDLE_SHIFT	This register can be used to implement additional timing setup/hold adjustment of source driver signals by adjusting the SDCLK up to 3 PIXCLK cycles  0x0 <b>NONE</b> — No shift of SDLE 0x1 <b>ONE</b> — Shift SDLE 1 pixclk cycle 0x2 <b>TWO</b> — Shift SDLE 2 pixclk cycles 0x3 <b>THREE</b> — Shift SDLE 3 pixclk cycles
3 SDCLK_INVERT	Invert phase of SDCLK
2 -	This field is reserved. Reserved.
SDCLK_SHIFT	This register can be used to implement additional timing setup/hold adjustment of source driver signals by adjusting the SDCLK up to 4 cycles  0x0 <b>NONE</b> — No shift of SDCLK 0x1 <b>ONE</b> — Shift SDCLK 1 pixclk cycle 0x2 <b>TWO</b> — Shift SDCLK 2 pixclk cycles 0x3 <b>THREE</b> — Shift SDCLK 3 pixclk cycles

### 13.6.4.31 EPDC Timing Control Engine Timing Register 2 (EPDC\_TCE\_TIMING2n)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 306F\_0000h base + 310h offset + (4d × i), where i=0d to 3d

#### EPDC\_TCE\_TIMING2n field descriptions

Field	Description
31–16 GDCLK_HP	This register controls the GDCLK high-pulse width. It is expressed by N PIXCLKs where N=1 to 65535. Note that GDCLK will always have a period equal to the line-clock timing. A value of 0 is not supported. It is recommended that this value be set to at least a half line-clock time. For panels which use GDCLK to drive GDOE, this high-pulse width should be set to cover the majority of the line timing
GDSP_OFFSET	This register allows the user to shift the GDSP pulse by N PIXCLKs where N=1 to 65535. Note that GDSP will always have a pulse width equivalent to the line-clock timing. A value of 0 is not supported.

### 13.6.4.32 EPDC Timing Control Engine Timing Register 3 (EPDC\_TCE\_TIMING3n)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 306F\_0000h base + 320h offset + (4d × i), where i=0d to 3d

#### EPDC\_TCE\_TIMING3n field descriptions

Field	Description
31–16 GDOE_OFFSET	When using GDOE_MODE=1, this register sets the delay from GDCLK to the GDOE in terms of N PIXCLK cycles
GDCLK_OFFSET	This register allows the user to shift the GDCLK from the line time by N PIXCLK cycles.

### 13.6.4.33 EPDC Pigeon Mode Control Register 0 (EPDC\_PIGEON\_CTRL0n)

This register contains global counter settings for Pigeon Mode

This register houses general purpose timing adjustment registers

Address: 306F\_0000h base + 380h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### EPDC\_PIGEON\_CTRL0n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LD_PERIOD	period of pclk counter during LD phase
15–12 -	This field is reserved. Reserved.
FD_PERIOD	period of line counter during FD phase

### 13.6.4.34 EPDC Pigeon Mode Control Register 1 (EPDC\_PIGEON\_CTRL1n)

This register contains global counter setting for pigeon mode

This register houses general purpose timing adjustment registers

Address: 306F\_0000h base + 390h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### EPDC\_PIGEON\_CTRL1n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 FRAME_CNT_ CYCLES	max cycles of frame counter
15–12 -	This field is reserved. Reserved.

Table continues on the next page...

**EPDC\_PIGEON\_CTRL1n field descriptions (continued)**

Field	Description
FRAME_CNT_PERIOD	period of frame counter

**13.6.4.35 EPDC IRQ Mask Register for LUT 0~31 (EPDC\_IRQ\_MASK1n)**

Controls masking EPDC LUT complete interrupts

This register controls LUT0~31 IRQ masks for EPDC interrupts

Address: 306F\_0000h base + 3C0h offset + (4d × i), where i=0d to 3d

**EPDC\_IRQ\_MASK1n field descriptions**

Field	Description
LUTN_CMPLT_IRQ_EN	LUT0~31 Complete Interrupt Enable

**13.6.4.36 EPDC IRQ Mask Register for LUT 32~63 (EPDC\_IRQ\_MASK2n)**

Controls masking EPDC LUT complete interrupts

This register controls LUT0~31 IRQ masks for EPDC interrupts

Address: 306F\_0000h base + 3D0h offset + (4d × i), where i=0d to 3d

**EPDC\_IRQ\_MASK2n field descriptions**

Field	Description
LUTN_CMPLT_IRQ_EN	LUT32~64 Complete Interrupt Enable

### 13.6.4.37 EPDC Interrupt Register for LUT 0~31 (EPDC\_IRQ1n)

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is completed on the screen. Each interrupt has a corresponding mask register in EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 306F\_0000h base + 3E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_IRQ\_MASKn field descriptions

Field	Description
31–24 -	This field is reserved. Reserved.
23 PWR_IRQ_EN	Enable power interrupt
22 UPD_DONE_IRQ_EN	Enable UPD complete interrupt
21 TCE_IDLE_IRQ_EN	Enable TCE Idle interrupt detection.
20 BUS_ERROR_IRQ_EN	Enable AXI BUS ERROR interrupt detection.
19 FRAME_END_IRQ_EN	If this bit is set, EPDC will assert the current frame end interrupt. This irq is only available during updating period.
18 TCE_UNDERRUN_IRQ_EN	Enable pixel FIFO under-run condition detection.
17 COL_IRQ_EN	Enable collision detection interrupts for all LUTs
16 WB_CMPLT_IRQ_EN	Enable WB complete interrupt
-	This field is reserved. Reserved.

### 13.6.4.40 EPDC Interrupt Register (EPDC\_IRQn)

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is completed on the screen. Each interrupt has a corresponding mask register in EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 306F\_0000h base + 420h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

#### EPDC\_IRQn field descriptions

Field	Description
31–24 -	This field is reserved. Reserved.
23 PWR_IRQ	Power Interrupt
22 UPD_DONE_IRQ	Working buffer process complete Interrupt
21 TCE_IDLE_IRQ	Interrupt to indicate that the TCE has completed TFT frame scans and is in an idle state.
20 BUS_ERROR_IRQ	Interrupt to indicate AXI BUS error occurs.
19 FRAME_END_IRQ	Interrupt to indicate EPDC has completed the current frame and is in the vertical blanking period.
18 TCE_UNDRUN_IRQ	Interrupt to indicate that a pixel FIFO under-run has occurred.

Table continues on the next page...

**EPDC\_IRQn field descriptions (continued)**

Field	Description
17 LUT_COL_IRQ	Collision detection interrupt. Check EPDC_STATUS_COL.
16 WB_CMPLT_IRQ	Working buffer process complete Interrupt
-	This field is reserved. Reserved.

**13.6.4.41 EPDC Status Register - LUTs (EPDC\_STATUS\_LUTS1n)**

EPDC Status Register - LUTS 0~31

Address: 306F\_0000h base + 440h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_LUTS1n field descriptions**

Field	Description
LUTN_STS	LUT 0~31 Status : 1=ACTIVE, 0=IDLE

**13.6.4.42 EPDC Status Register - LUTs (EPDC\_STATUS\_LUTS2n)**

EPDC Status Register - LUTS 0~31

Address: 306F\_0000h base + 450h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_LUTS2n field descriptions**

Field	Description
LUTN_STS	LUT 32~63 Status : 1=ACTIVE, 0=IDLE

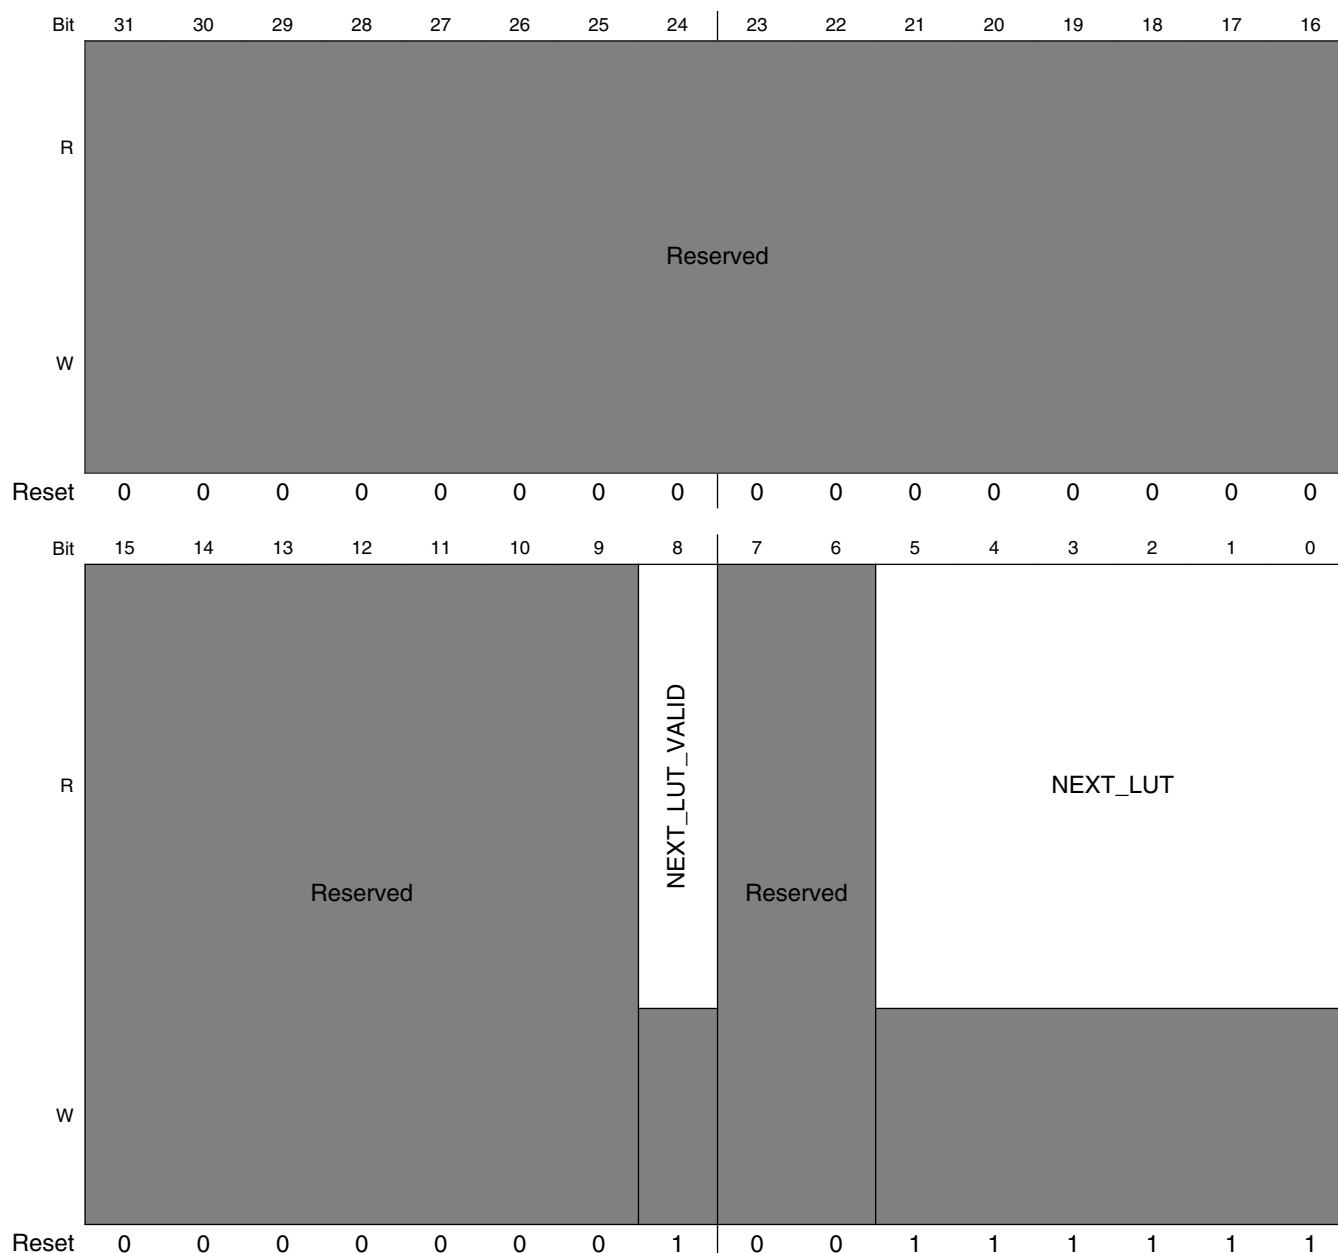

### 13.6.4.43 EPDC Status Register - Next Available LUT (EPDC\_STATUS\_NEXTLUT)

Holds value of next available LUT. Can be used for fast LUT assignment. This value can be read and then used in an update command as part of the EPDC\_UPD\_CTRL register write

The DIGCTL Status Register provides a read-only view to various input conditions and internal states.

Address: 306F\_0000h base + 460h offset = 306F\_0460h

**EPDC\_STATUS\_NEXTLUT field descriptions**

Field	Description
31–9 -	This field is reserved. Reserved.
8 NEXT_LUT_VALID	This bitfield can be used to check against a LUTs full condition
7–6 -	This field is reserved. Reserved.
NEXT_LUT	Next available LUT value

**13.6.4.44 EPDC LUT Collision Status (EPDC\_STATUS\_COL1n)**

EPDC LUT Collision Status Register and works in conjunction with EPDC\_IRQ[LUT\_COL\_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit EPDC\_IRQ[LUT\_COL\_IRQ] clears this register

Address: 306F\_0000h base + 480h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_COL1n field descriptions**

Field	Description
LUTN_COL_STS	LUTn Collision Status

### 13.6.4.45 EPDC LUT Collision Status (EPDC\_STATUS\_COL2n)

EPDC LUT Collision Status Register and works in conjunction with EPDC\_IRQ[LUT\_COL\_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit EPDC\_IRQ[LUT\_COL\_IRQ] clears this register

Address: 306F\_0000h base + 490h offset + (4d × i), where i=0d to 3d

#### EPDC\_STATUS\_COL2n field descriptions

Field	Description
LUTN_COL_STS	LUTn Collision Status

### 13.6.4.46 EPDC General Status Register (EPDC\_STATUSn)

Register to house non LUT specific status bits

This register houses general status bits

## Electrophoretic Display Controller (EPDC)

Address: 306F\_0000h base + 4A0h offset + (4d × i), where i=0d to 3d

### EPDC\_STATUSn field descriptions

Field	Description
31–21 -	This field is reserved. Reserved.
20–16 HISTOGRAM_CP	Indicates which histogram matched the existing bitmap(CP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color ) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white ) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram.

Table continues on the next page...

### EPDC\_STATUS<sub>n</sub> field descriptions (continued)

Field	Description
	Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
15–13 -	This field is reserved. Reserved.
12–8 HISTOGRAM_ NP	Indicates which histogram matched the processed bitmap(NP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color ) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white ) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
7–4 -	This field is reserved. Reserved.
3 UPD_VOID	Indicates that the update buffer is void. This means either no pixels need updating or all pixels requiring updating were collided.
2 LUTS_ UNDERRUN	Provides a summary status of LUT fill. 1= not enough time for active luts read during blanking period before vscan_holdoff. 0=complete all active luts fill during blanking period before VSCAN_HOLDOFF.
1 LUTS_BUSY	Provides a summary status of LUTs. 1= All LUTs are busy, 0= LUTs are available
0 WB_BUSY	Working buffer process is busy cannot accept new update requests. When WB_BUSY is 1, software should wait for the WB_CMPLT_IRQ interrupt. When this interrupt occurs WB_BUSY is cleared immediately. This is a real-time status of the process.

#### 13.6.4.47 EPDC Collision Region Co-ordinate (EPDC\_UPD\_COL\_CORD)

EPDC Collision Region Co-ordinate, cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 306F\_0000h base + 4C0h offset = 306F\_04C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved			YCORD												Reserved			XCORD													
W	Reserved																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### EPDC\_UPD\_COL\_CORD field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 YCORD	Y co-ordinate for collision region of the latest completed update

Table continues on the next page...

**EPDC\_UPD\_COL\_CORD field descriptions (continued)**

Field	Description
15–13 -	This field is reserved. Reserved.
XCORD	X co-ordinate for collision region of the latest completed update

**13.6.4.48 EPDC Collision Region Size (EPDC\_UPD\_COL\_SIZE)**

EPDC Collision Region Size of the latest completed update cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 306F\_0000h base + 4E0h offset = 306F\_04E0h

**EPDC\_UPD\_COL\_SIZE field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 -	This field is reserved. Reserved.
WIDTH	Width (in pixels)

**13.6.4.49 1-level Histogram Parameter Register. (EPDC\_HIST1\_PARAM)**

This register specifies the valid values for a 1-level(single color) histogram. If all pixels in a bitmap is only one color, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 600h offset = 306F\_0600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	Reserved																VALUE0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_HIST1\_PARAM field descriptions**

Field	Description
31–5 RSVD	This field is reserved. Reserved, always set to zero.
VALUE0	value for 1-level histogram

**13.6.4.50 2-level Histogram Parameter Register.  
(EPDC\_HIST2\_PARAM)**

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match these two values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 610h offset = 306F\_0610h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST2\_PARAM field descriptions**

Field	Description
31–16 RSVD	This field is reserved. Reserved, always set to zero.
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE1	White value for 2-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE0	Black value for 2-level histogram

### 13.6.4.51 4-level Histogram Parameter Register. (EPDC\_HIST4\_PARAM)

This register specifies the valid values for a 4-level histogram. If all pixels in a bitmap match these two values, STATUS[1] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 620h offset = 306F\_0620h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### EPDC\_HIST4\_PARAM field descriptions

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE3	GRAY3 (White) value for 4-level histogram
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 4-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 4-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 4-level histogram

### 13.6.4.52 8-level Histogram Parameter 0 Register. (EPDC\_HIST8\_PARAM0)

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 630h offset = 306F\_0630h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST8\_PARAM0 field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE3	GRAY3 value for 8-level histogram
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 8-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 8-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 8-level histogram

**13.6.4.53 8-level Histogram Parameter 1 Register.  
(EPDC\_HIST8\_PARAM1)**

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 640h offset = 306F\_0640h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST8\_PARAM1 field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE7	GRAY7 (White) value for 8-level histogram

*Table continues on the next page...*

**EPDC\_HIST8\_PARAM1 field descriptions (continued)**

Field	Description
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE6	GRAY6 value for 8-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE5	GRAY5 value for 8-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE4	GRAY4 value for 8-level histogram

**13.6.4.54 16-level Histogram Parameter 0 Register. (EPDC\_HIST16\_PARAM0)**

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 650h offset = 306F\_0650h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### EPDC\_HIST16\_PARAM1 field descriptions

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE7	GRAY7 value for 16-level histogram
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE6	GRAY6 value for 16-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE5	GRAY5 value for 16-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE4	GRAY4 value for 16-level histogram

### 13.6.4.56 16-level Histogram Parameter Register. (EPDC\_HIST16\_PARAM2)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

## Electrophoretic Display Controller (EPDC)

Address: 306F\_0000h base + 670h offset = 306F\_0670h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_HIST16\_PARAM2 field descriptions

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE11	GRAY11 value for 16-level histogram
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE10	GRAY10 value for 16-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE9	GRAY9 value for 16-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE8	GRAY8 value for 16-level histogram

### 13.6.4.57 16-level Histogram Parameter Register. (EPDC\_HIST16\_PARAM3)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 306F\_0000h base + 680h offset = 306F\_0680h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_HIST16\_PARAM3 field descriptions

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE15	GRAY15 (White) value for 16-level histogram

Table continues on the next page...

## EPDC\_HIST16\_PARAM3 field descriptions (continued)

Field	Description
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE14	GRAY14 value for 16-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE13	GRAY13 value for 16-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE12	GRAY12 value for 16-level histogram

## 13.6.4.58 EPDC General Purpose I/O Debug register (EPDC\_GPIOn)

GPIO register to control ipp\_epdc\_bdr[1:0], ipp\_epdc\_pwr[3:0] and ipp\_epdc\_pwrcom output signals

Houses software control signal registers

Address: 306F\_0000h base + 700h offset + (4d × i), where i=0d to 3d

## Electrochromic Display Controller (EPDC)

**EPDC\_GPIOn field descriptions**

Field	Description
31–9 -	This field is reserved. Reserved.
8 PWRSTAT	reflect ipp_epdc_pwrstat input
7 PWRWAKE	Controls ipp_epdc_pwrwake output
6 PWRCOM	Controls ipp_epdc_pwrcom output
5–2 PWRCTRL	Controls ipp_epdc_pwrctrl[3:0] output
BDR	Controls ipp_epdc_bdr[1:0] output

### 13.6.4.59 EPDC Version Register (EPDC\_VERSION)

This register reflects the version number for the EPDC.

#### EXAMPLE

No Example.

Address: 306F\_0000h base + 7F0h offset = 306F\_07F0h

### EPDC\_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

### 13.6.4.60 Panel Interface Signal Generator Register 0\_0 (EPDC\_PIGEON\_0\_0)

parameters for timing signal generation

Address: 306F\_0000h base + 800h offset = 306F\_0800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	STATE_MASK								MASK_CNT							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MASK_CNT				MASK_CNT_SEL				OFFSET				INC_SEL	POL	EN	
W																
Reset	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0

### EPDC\_PIGEON\_0\_0 field descriptions

Field	Description
31–24 STATE_MASK	state_mask = (FSIFBIFDIFE) and (LSILBILDILE) , select any combination of scan states as reference point for local counter to start ticking  0x1 <b>FS</b> — FRAME SYNC 0x2 <b>FB</b> — FRAME BEGIN 0x4 <b>FD</b> — FRAME DATA 0x8 <b>FE</b> — FRAME END 0x10 <b>LS</b> — LINE SYNC 0x20 <b>LB</b> — LINE BEGIN 0x40 <b>LD</b> — LINE DATA 0x80 <b>LE</b> — LINE END
23–12 MASK_CNT	When the global counter selected through MASK_CNT_SEL matches value in this reg, pigeon local counter start ticking. 0=disable
11–8 MASK_CNT_SEL	select global counters as mask condition, use together with MASK_CNT  0x0 <b>HSTATE_CNT</b> — pclk counter within one hscan state 0x1 <b>HSTATE_CYCLE</b> — pclk cycle within one hscan state 0x2 <b>VSTATE_CNT</b> — line counter within one vscan state 0x3 <b>VSTATE_CYCLE</b> — line cycle within one vscan state 0x4 <b>FRAME_CNT</b> — frame counter

*Table continues on the next page...*

**EPDC\_PIGEON\_0\_0 field descriptions (continued)**

Field	Description
	0x5 <b>FRAME_CYCLE</b> — frame cycle 0x6 <b>HCNT</b> — horizontal counter (pclk counter within one line ) 0x7 <b>VCNT</b> — vertical counter (line counter within one frame)
7–4 OFFSET	offset on pclk unit. 0=align with data, positive value means delay, minus value mean ahead. Supported range depends on panel mode
3–2 INC_SEL	event to increment local counter  0x0 <b>PCLK</b> — pclk 0x1 <b>LINE</b> — line start pulse 0x2 <b>FRAME</b> — frame start pulse 0x3 <b>SIG_ANOTHER</b> — use another signal as tick event
1 POL	polarity of signal output  0x0 <b>ACTIVE_HIGH</b> — normal signal (active high) 0x1 <b>ACTIVE_LOW</b> — inverted signal (active low)
0 EN	enable pigeon mode on this signal

**13.6.4.61 Panel Interface Signal Generator Register 0\_1 (EPDC\_PIGEON\_0\_1)**

parameters for timing signal generation

Address: 306F\_0000h base + 810h offset = 306F\_0810h

**EPDC\_PIGEON\_0\_1 field descriptions**

Field	Description
31–16 CLR_CNT	deassert signal output when counter match this value  0x0 <b>CLEAR_USING_MASK</b> — keep active until mask off
SET_CNT	assert signal output when counter match this value  0x0 <b>START_ACTIVE</b> — start as active

**13.6.4.62 Panel Interface Signal Generator Register 0\_1 (EPDC\_PIGEON\_0\_2)**

parameters for timing signal generation

Address: 306F\_0000h base + 820h offset = 306F\_0820h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 13.7 Pixel Pipeline (PXP)

### 13.7.1 Overview

This document describes the micro-architecture for the Pixel Processing Pipeline used to process graphics buffers or composite video and graphics data before sending to an LCD display or TV encoder.

It is used to minimize the memory footprint required for the display pipeline and provide an area and performance optimized to both SDRAM-less and SRAM-based systems.

The PXP integrates of several independent processing stages into a cohesive strategy to create flexible pixel pipeline.

The PXP combines scaling, color space conversion (or CSC), alpha-blending, secondary color space conversion (or CSC2), pixel conversion lookup memory table (or LUT), rotation, dithering and waveform processing into a single processing engine, as shown in [Figure 13-87](#). By integrating multiple blocks, a few intermediate buffer operations to external memory are removed, reducing external memory bandwidth, power, and software control complexity.

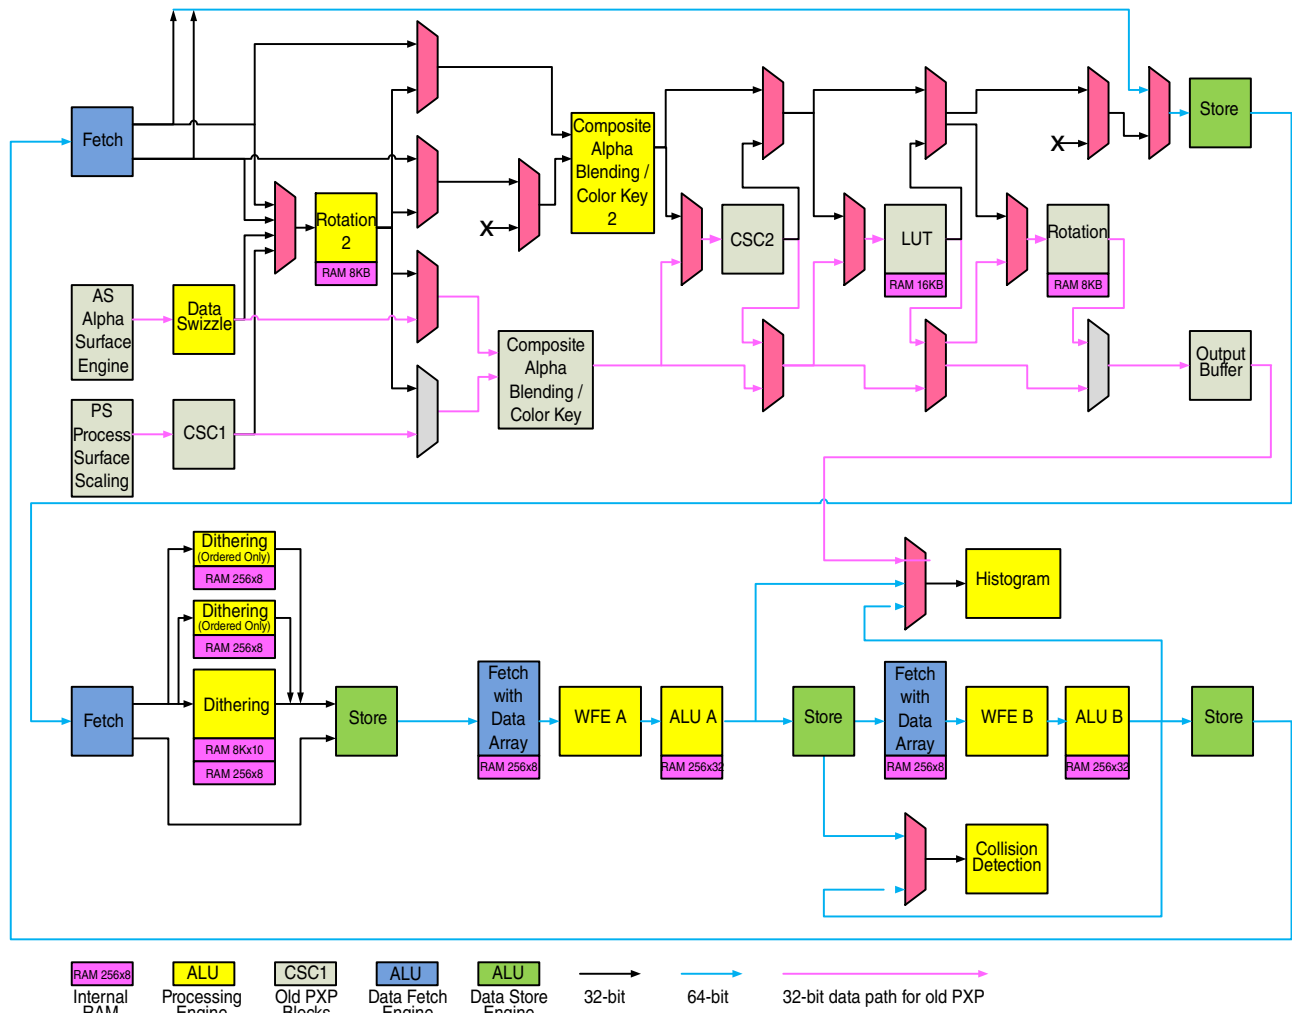

Figure 13-87. PXP Architecture

### 13.7.2 Clocks

The following table describes the clock sources for PXP. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 13-43. PXP Clocks

Clock name	Clock Root	Description
clk	pxp_axi_clk_root	PXP clock

### 13.7.3 Top-level architecture

The PXP consist of several pipelined blocks that perform the video source frame scaling, color space conversion, alpha-blending/color key algorithm, secondary CSC, pixel correction , input and/or output rotation, dithering and waveform processing. It is also capable of fetching data from and storing data to memory.

The legacy blocks operate within the requirements of the legacy PXP architecture, and perform operations on either 8x8 or 16x16 pixel blocks in the representative source buffers. The legacy pipeline operate within the context of two iteration counters that iterate through the appropriate grid of input blocks to produce the rotated output grid blocks in scan-line order. The dither blocks and the waveform processing engines (WFE) will operate in a scan line format based on the active size. The input fetch and store engines can work on either on a block by block basis or in the scan line format.

Figure 13-87 shows the high-level architecture of the scaling, color space conversion, blending, pixel correction , rotation engines, dithering, waveform processing, histogram along with four sets of fetch and store engines. The Alpha Surface Engine fetches one RGB graphics plane alpha surface (AS). The scaling engine fetches a single processed surface (PS), which can be blended with the AS surface. The scaling engine also supports an alpha channel for the PS image. Although the legacy PXP processes NxN pixel macro blocks, each of the AS or PS surfaces can have any pixel alignment within the output buffer. There are no restrictions and any pixel coordinates within the output buffer are valid. The upper left origin of the output buffer is defined as pixel 0,0. The upper left and lower right coordinates for each of the AS and PS are inclusive within the output buffer.

Figure 13-88 represents a sample output buffer configuration with both an AS and PS included. The alignment of each AS and PS within the output buffer can be at any arbitrary pixel locations. For example, the PS has an upper left coordinate (ULC) of 2,2 and a lower right coordinate (LRC) at pixel 13,13. The maximum value for the ULC and LRC for each of the AS and PS is bounded by the LRC of the output buffer, 15,15 for this example.

**Figure 13-88. Sample output buffer configuration**

The AS engine supports RGB pixel formats, and the PS engine supports ARGB, RGB, YUV, and YCbCr pixel formats. The CSC1 can be used to convert to RGB pixel formats so that the PS surface can be blended with the AS surfaces in the compositing engine in the RGB color space. There are two rotate engines in the PXP pipeline. Rotation can occur after image composition, at the output of the PS engine, or both. In the first scenario, all the data produced by the AS and PS engines is rotated. When the rotation module is programmed to rotate only PS images, the AS is not rotated, and AS pixels are combined with rotated PS surfaces. The Rotate engine at the input can also be used with the input fetch engine. For this, the fetch engine needs to be programmed in the blok mode to fetch a block of size 8x8. The CSC2 unit can convert to any RGB, YUV, or YCbCr color spaces for final output. Pixels can be corrected using a programmable LUT resource to achieve any desired pixels effects. For detailed information, please refer to [Output Modes](#) to [RGBW4444CFA](#). The dither engine supports 3 dithering modes in addition to the standard quantization and pass-through modes. The dithering algorithms supported are: Ordered, Floyd-Steinberg and Atkinson. The WFE is a programmable engine that can be programed as required to process each pixel and pixel meta data. The Histogram sub-block collects statistics about the pixel data passing through it that is

useful to the EPDC in waveform selection and displaying the frame. The Histogram also contains mask and comparison functionality that can be used for collision detection and reporting of the collided area within an update area.

The PXP also supports two parallel image processing paths. The legacy flow can operate in parallel with the input fetch engine or the dithering or waveform processing engines. Please refer to HW\_PXP\_CTRL and HW\_PXP\_CTRL2 for details on how to enable each of the individual data flows. In addition to this, the CSC, Rotation 1 and LUT engines can be used as either part of the legacy flow or as a part of the second parallel data flow. These blocks can work in the scan line format or in block format. There are two separate blending engines for each flow.

### 13.7.3.1 Processing Details

The legacy PXP architecture has been driven primarily by the requirement that the output buffer must be processed and rotated without intermediate frame buffer stored in external memory.

This reduces the use of external memory bandwidth requirements thus reducing overall system power consumed. The new architecture has four sets of fetch and store engines to enable parallel image processing and the ability to use only parts of the block like the dithering, or WFE or parts of the legacy flow.

Since the output of the rotation block must be NxN pixel blocks in scan order, the entire legacy pipeline will operate on NxN pixel blocks. In essence, the pipeline will be able to operate on blocks in a random access fashion, but the entire pipeline will operate within the context of two iteration counters that will iterate through the horizontal and vertical input blocks to generate the required output block.

#### Legacy Processing Pipeline

The control block will coordinate the processing of the pixel blocks within the source and destination image buffers. It begins by issuing a command to each stage of the pipeline requesting that operations be done for the block at offset x, y. When the block accepts the command, it asserts its acknowledge signal for a single cycle to indicate the acceptance and allow the control unit to move to the next block.

When the PS and AS fetch engines have received a command, they will fetch the required data and place it into their fetch buffers. If compositing the RGB AS surface with the PS surface, then the output of the PS engine needs to be converted to the RGB color space using CSC1, since all compositing occurs in the RGB color space. For YUV output pixel formats, the CSC1 unit can be enabled to convert pixels into the RGB space for subsequent compositing with AS pixels. Then, the CSC2 module can convert the

resulting pixels back into the YUV output color space. If the final output color space is YUV and there is no compositing required (AS not present, for example), then both the CSC units can be bypassed and the pixel data path will pass the YUV pixels to the rotation engine. For YUV output formats, scaling operations, LUT, and rotation operations are still valid, but blending RGB AS surfaces with YUV PS surfaces is NOT supported. The two CSC units in the overall pixel data path must be used to achieve the desired source frame compositing and output pixel formatting.

The alpha blender/color key module will process a pixel any time that both inputs present valid data.

A handshake will be created between each stage and a pipeline controller to handle the advance of the pipeline and generation of the iteration counters. The pipeline controller will also maintain the interlocks with the LCD interface for the case where the LCD display and pixel processing pipeline use the SRAM to maintain the double buffer block intermediate buffer.

### The New Processing Pipelines

The input fetch and store engines can work in either block mode or in scan line format. As they can work with the rotate1 engine, they were designed to support blocks of size 8x8. The dither and WFE fetch and store engines work in scan line format. The WFE fetch engines have internal memory of 32 words where each word is 64 bits. The store engines can co-ordinate data flow through the pipeline to the next fetch engine by either using the handshake mode or the bypass mode. In the handshake mode, the store engine of the previous stage writes to the memory and signals the next stage fetch engine that the programmed number of lines are ready to be fetched. In the bypass mode, the store engine sends data to the next stage fetch engine through standard handshake protocol followed by the legacy modules.

The input fetch engine has another alpha blender/color key module connected to it. Along with that, the muxes can be programmed to use the rotate1 engine, the LUT and the CSC2 engine.

### 13.7.3.2 Scaling Operation

The scaling engine operates on YUV (or YCbCr) 422 or 420 and any RGB formatted pixels. Each color plane is sourced from color planes indicated by different base address registers.

The scaling source data can be stored as 3 individual planes for each Y, U, and V data, stored as two planes as a single Y and interleaved UV plane, or stored as a single plane with YUV/RGB interleaved on a per byte basis.

The scaled output image is presented to the CSC module as YUV444 or RGB888 pixels with a single byte for each color channel. The scaler can reduce an input image by a maximum factor of 16. In this case, the output image will be 1/16 the dimension of the input image in each of the X and Y axis. There are no limits, essentially, on increasing the source image size. The theoretical maximum increase is 4096 since a 12 bit fractional step function is used when scaling an input image. Scaling in either axis, X or Y is independent, so a source image can appear stretched in either direction.

All source images pass through the scale engine. The PXP alpha blend module and AS pixel streams are in the RGB888 format, so PS pixel buffers must be converted to the RGB888 format for alpha blending. The scaling engine works with the CSC1 module to translate YUV/YCbCr pixel formats to RGB888 for output frame buffer compositing using the alpha blender. The CSC2 module can be bypassed or enabled to convert pixels to any output color space. In the case of processing RGB pixels in the PS engine, the CSC1 unit can be bypassed so compositing can occur in the alpha engine.

The scaling operation is divided into two scaling steps. The first step is a decimation scaler, and the second step is a bilinear filter. The decimation filter provides a maximum down scaling factor of 8, and the subsequent bilinear filter provides a maximum scaling factor of 2. Combined, the maximum scaling factor can be up to 16. The decimation and bilinear scaling engines are independently programmable. There is also an initial offset that is programmable to allow more source data to be considered in the bilinear scaling engine.

### 13.7.3.3 Decimation Image Scaling

The first of two scaling engines is the decimation filter.

The intent of the decimation filter is to use as much source data as is possible to create the output image frame buffer. The decimation filter simply discards certain pixels from the source PS image depending on the reduction selected.

For RGB pixel formats, each color channel is treated equally since there is the same amount of pixel data within each color plane. For YUV422/420 formats, the chroma samples are already subsampled by 2. In these decimation scenarios, the chroma decimation factor is adjusted to account for the pre-decimation of the chroma samples. For example, since YUV422 is already sub-sampled by 2 horizontally, an X decimation factor of 2 does not apply to the YUV422 pixels in the X direction. All the chroma samples are passed on to the bilinear filter in this case. As another example, an X decimation factor of 4 will decimate the chroma samples by 2, since this factor combined with the pre-decimation factor of 2 in the pixel source buffers totals an overall decimation factor of 4.

The following example will show which pixels (in green) in a source RGB buffer that are passed to the bilinear filter for an X decimation factor of 2 and a Y decimation factor of 4. All pixels coincident with dashed lines are discarded.

**Figure 13-89. RGB decimation X /2, Y /4**

Using the same decimation factor as the above scenario for RGB pixels, but using YUV420 source buffers, it can be shown that the decimation factor for the Y and UV components of data are decimated differently. This is due to the pre-decimation of the chroma samples in the source frame buffers. Figure 4: YUV420 decimation X /2, Y /4 indicates that the U/V samples in the X direction are not decimated, but the Y samples in the X direction are decimated by the factor of 2.

Figure 13-90. YUV420 decimation X /2, Y /4

### 13.7.3.4 Bilinear Image Scaling Filter

The PXP implements a bilinear scaling filter to resize an input image to a different resolution for display output.

The bilinear filter is a weighted average of the four nearest pixels that can be sourced to approximate the pixel in the output frame buffer.

## Pixel Pipeline (PXP)

When scaling YUV data, the UV values are offset by 0x80 (top bit inverted) to shift the signed UV bits into an unsigned equivalent with a range of 0 to 255. YCbCr data does not have to be shifted since it is defined as an unsigned byte. The REG\_CSC1\_COEF0[YCBCR\_MODE] bit controls whether this operation is applied to the input UV bytes.

After scaling, the offset is removed so that the range for UV data is signed from -128 to 127.

The reason for this adjustment is based on the implementation of an unsigned scaling engine, and therefore, is to ensure that the scaled values are handled properly. Consider the following table:

Format	pixel0	pixel1	average	Result
decimal	-2	+2	0	Correct
CbCr	0x7E	0x82	0x80	Correct (0x80 is 0 in CbCr)
UV	0xFE	0x02	0x80	Incorrect (0x80 is -128 in UV)
decimal	-32	+16	-8	Correct
CbCr	0x60	0x90	0x78	Correct (0x78 is -8 in CbCr)
UV	0xE0	0x10	0x78	Incorrect (0x78 is +120 in UV)

To compute the output pixel value at position as indicated by P, consider the diagram below.

**Figure 13-91. Output Pixel Value**

A step function is used to indicate the position of the pixel "P" in the output frame. This position may not coincide with a single pixel position in the input frame buffer. In this case, the four closest pixels in the input frame are used to approximate the value of the pixel in the output frame.

The PXP scaler first computes a linear filter in the X axis to create the two intermediate pixel values  $P_{x0}$  and  $P_{x1}$ . The step function's X fractional component is used to provide the weighting factor for blending  $p_{00}$  with  $p_{10}$  to provide  $P_{x0}$ . Likewise,  $P_{x1}$  is also derived from a linear filter using  $p_{01}$  and  $p_{11}$ .

The equations for  $P_{x0}$  and  $P_{x1}$  are as follows:

$$P_{x0} = p_{00}*(1-R_x) + p_{10}*R_x$$

$$P_{x1} = p_{01}*(1-R_x) + p_{11}*R_x$$

The PXP scaler uses the intermediate X pixels  $P_{x0}$  and  $P_{x1}$  and implements a bilinear filter on these two pixel values to produce the final pixel value at position P. The remainder of the step function for the Y axis is used to compute the weighted average pixel result. The equation for final filtered pixel is:

$$P = P_{x0}*(1-R_y) + P_{x1}*R_y$$

### 13.7.3.5 YUV 4:2:2 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:2 formats. There are twice as many Y luma samples then U and V chroma samples horizontally.

**Figure 13-92. YUV Sample Positioning, 4:2:2**

Consider the scaled output pixel  $P_s$  (pixel scaled) which has an accumulated step function of  $X=1.5$  and  $Y=0.5$ . The remainder for the step function is  $R_x = 0.5$  and  $R_y = 0.5$ . Or, the sub pixel position of output pixel  $P_s$  is half way between line 0 and 1 and half way between column 1 and 2.

The Y output component of  $P_s$  is simply the bilinear function of the four nearest Y samples from the input image. Specifically, the Y values at [1,0], [2,0], [1,1], and [2,1] are used to compute the Y for  $P_s$ .

For the U and V components of  $P_s$ , there are no samples present in the column position 1. The bilinear filter uses chroma components located at [0,0], [2,0], [0,1] and [2,1]. Since the chroma components are not sub sampled vertically, the remainder used to combine pixels vertically is  $R_y=0.5$  (the same as for Y). However, horizontally, the scaling engine shifts the remainder by a factor of 2. So an X axis step function value of  $X=1.5$  has a remainder  $R_x=0.75$ . Source chroma values are not replicated, they are completely interpolated using the four nearest chroma samples to approximate U and V at  $P_s$ .

### 13.7.3.6 YUV 4:2:0 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:0 formats. Chroma is sub sampled both horizontally and vertically. In this format, the chroma frame buffers contain  $\frac{1}{4}$  the data that the luma frame buffers store.

**Figure 13-93. YUV Sample Positioning, 4:2:0**

The Y output component for all scaled pixels in 4:2:0 formats are the same as for the 4:2:2 pixel formats.

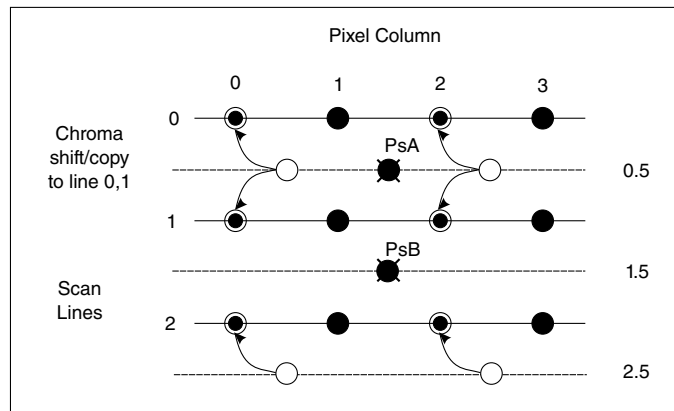

The U and V output components have two considerations when computing the output pixel Ps.

1. All chroma samples from the input source image are shifted left and up by  $\frac{1}{2}$  a sample position of the input pixel matrix.
2. Odd scan lines are replicated using the previous even chroma scan line values. So, output image chroma values that map between even to odd scan lines are replicated in the vertical axis. In contrast, output image chroma values between odd to even scan lines are interpolated vertically.

The chroma values are interpolated horizontally as in the 4:2:2 pixel format.

As an example, consider the interpolated pixel Ps in the 4:2:0 diagram above. For the Y component, the interpolated output luma is a function of the Y values in the source frame buffer at position [1,0], [2,0], [1,1], [2,1].

For the U and V interpolated samples, the chroma values on scan line position 0.5 are shifted so that they coincide with the even luma sample points. They are also replicated so that a single chroma scan line is used twice. The chroma scan line at 0.5 is replicated to represent the 4:2:2 sample points for scan line 0 and 1. The chroma scan line at 2.5 is replicated to represent the 4:2:2 sample points for scan line 2 and 3. This pattern of chroma replication occurs for the entire source frame buffer during the scaling operation.

**Figure 13-94. Scaled Chroma Computation Examples**

The preceding diagram has two examples for the computation of the scaled chroma output pixel. For chroma at output position PsA (vertical position 0.5), interpolation occurs in the X axis using chroma values at column 0 and column 2. However, since line 0 and line 1 have equal chroma values due to chroma line replication, scaling in the Y axis results in replication of chroma values.

For chroma at output position PsB (vertical position 1.5), interpolation occurs in both the X and Y axis. The Y axis is an interpolation since the chroma values copied to scan line 1 and 2 and not the same.

In summary, any output image pixels that map to an odd scan line above and an even scan line below are interpolated vertically. Output image pixels that map to an even scan line above and an odd scan line below are replicated vertically.

### 13.7.3.7 RGB/YUV444 Image Scaling

For all RGB formats, the RGB pixels are converted up to RGB888 with 8 bits per each color component.

Then each color component is passed to the scaling engine and each component is treated in the same manner. The RGB scaling operation is the same as for the Y scaling operation described in the preceding sections. Also, YUV444 contains a byte for each color plane at each pixel location, so all three color components are scaled in the same manner.

### 13.7.3.8 Color Space Conversion (CSC)

There are two modules in the PXP to convert pixels between color spaces. They are referred to as CSC1 and CSC2 (for lack of a better naming convention).

CSC1 exists after the scaling unit and is dedicated to converting from YUV to RGB. CSC2 is a full duplex color space converter in that it can convert into either RGB or YUV (or YCbCr) color spaces depending on the desired output pixel format. All coefficients are programmed as two's complement numbers and both CSC units can be bypassed if CSC is not desired at either position of these CSC units in the pixel data path.

### 13.7.3.9 CSC1 Operation

The CSC1 module receives scaled YUV/YCbCr444 pixels from the scale engine and converts the pixels to the RGB888 color space only if CSC1 is enabled.

The CSC1 module will convert only to the RGB color space and it can be bypassed to allow YUV pixels through the data path. These pixels are loaded into the pixel FIFO for processing by subsequent modules in the pixel data path.

The following equations are used to perform YUV/YCbCr -> RGB conversion. The constants will be stored in the PXP control registers as two's complement values to allow flexibility in the implementation and to allow for differences in the video encode and decode operations. In addition, this provides a software mechanism to manipulate brightness or contrast.

$$R = C0(Y+Yoffset) + C1(V+UVoffset)$$

$$G = C0(Y+Yoffset) + C3(U+UVoffset) + C2(V+UVoffset)$$

$$B = C0(Y+Yoffset) + C4(U+UVoffset)$$

Note: In the equations above, U and V are synonymous with Cb and Cr in regards to the color space format of the source frame buffer.

Saturation of each color channel is checked and corrected for excursions outside the nominal YUV/YCbCr color spaces. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

The table below indicates the expected coefficients for YUV and YCbCr modes of operation:

Coefficient	YUV	YCbCr
Yoffset	0x000	0x1F0 (-16)
UVoffset	0x000	0x180 (-128)
C0	0x100 (1.00)	0x12A (1.164)
C1	0x123 (1.140)	0x198 (1.596)
C2	0x76B (-0.581)	0x730 (-0.813)
C3	0x79B (-0.394)	0x79C (-0.392)
C4	0x208 (2.032)	0x204 (2.017)

### 13.7.3.10 YUV versus YCbCr Support

By default, the PXP color space coefficients are set to support the conversion of YUV data to RGB data.

If YCbCr input is present, software must change the coefficient registers appropriately (see the register definitions for values). Software must also set the YCBCR\_MODE bit in the COEFF0 register to ensure proper conversion of YUV versus YCBCR data.

### 13.7.3.11 CSC2 operation

The CSC2 module receives pixels in any color space and can convert the pixels into any of RGB, YUV, or YCbCr color spaces.

All coefficients are programmable and in the two's complement notation. The output pixels are passed onto the LUT and rotation engine for further processing.

The following equations indicate the CSC2 modules ALU architecture.

Selecting RGB output in REG\_CSC2\_CTRL[CSC\_MODE] configures the ALU in the following manor:

$$R = A1(Y-D1) + A2(U-D2) + A3(V-D3)$$

$$G = B1(Y-D1) + B2(U-D2) + B3(V-D3)$$

$$B = C1(Y-D1) + C2(U-D2) + C3(V-D3)$$

Selecting YUV output configures the ALU in the alternate manor:

$$Y = A1*R + A2*G + A3*B + D1$$

$$U = B1*R + B2*G + B3*B + D2$$

$$V = C1*R + C2*G + C3*B + D3$$

Saturation of each color channel is checked and corrected for excursions outside the nominal color space. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

#### NOTE

CSC2 may not be able to perform RGB to YCbCr or RGB to YUV conversion correctly. Only the Y conversion may be correct. In that case, conversion for CbCr and UV components

may require alternate chip resources either from GPU, IPU, or CPU if applicable.

### 13.7.3.12 Alpha Blending/Color Key

There are two alpha blending/color key engines in the new PXP. Regardless of pixel input format, the PS and AS pixels are normalized to 32-bits, organized as one alpha and three data bytes. For the second alpha blending engine, the fetch engine should be programmed to fetch data in the RGB format. You can either use the 2 fetch channels or use either fetch channel with the PS.

Alpha blending occurs in the RGB space, if blending is required, PS pixels should be converted to RGB space. If no alpha blending is required, then YUV pixels can bypass the alpha blending ALU without color space conversion.

All pixels are processed by the pixel ALU, but the ALU operations can be disabled to achieve pixel pass through for either PS or AS or fetch data channels source pixels.

### 13.7.3.13 Alpha Blend

The alpha value for an individual pixel represents a mathematical weighting factor applied to the AS pixel.

An alpha value of 0x00 corresponds to a transparent pixel and a value of 0xFF corresponds to an opaque pixel.

The effective alpha value for an AS pixel is determined by the REG\_AS\_CTRL[ALPHA] and REG\_AS\_CTRL[ALPHA\_CTRL] register fields. If

REG\_AS\_CTRL[ALPHA\_CTRL] = ALPHA\_OVERRIDE, the alpha value for the pixel is taken from the REG\_AS\_CTRL[ALPHA]. This can be useful for applying a constant alpha to an entire image or for image formats that don't include an alpha value. If REG\_AS\_CTRL[ALPHA\_CTRL] = ALPHA\_MULTIPLY, the pixel's alpha value will be multiplied by the pixel's ALPHA value in order to allow scaling of the pixel's alpha or to provide better control for pixel formats such as RGB1555, which only contains a single bit of alpha.

For each color channel, the equation used to blend two source pixels is defined below:

$Gá$  = PIO programmed global alpha (8-bit value).

$Eá$  = Embedded alpha associated with AS pixel.

$á$  =  $Gá * Eá + 0x80$

The result for the red channel as an example:

$$R[7:0] = (\hat{a} * PS.r) + ((1 - \hat{a}) * AS.r)$$

When  $\hat{a}$  is 0xff, the PS pixel will not be blended with the AS pixel, but PS will be passed as the output pixel and will not be blended with AS. In this case, AS will be discarded. Likewise, if  $\hat{a}$  is 0x00 for a given pixel, PS will be loaded as the output pixel.

REG\_AS\_CTRL[ALPHA\_INVERT] provides the option to invert the final alpha value. This essentially inverts the effect the alpha value has on the AS and PS blending operation.

### 13.7.3.14 Color Key

The color key function is provided to create transparent effects on the output pixel.

Color keying is applied on the input pixels after they are converted to 8-bits for each red, green, and blue color channels (color keys are not applied directly to 16-bit pixel formats but to their corresponding 24-bit representation). A color key range is programmable for both PS and AS pixels. If the PS 24-bit pixel is within the PS color key range, then AS is passed through the pixel pipeline. In this case, alpha blending does NOT occur. Conversely, if PS is within the AS color key range, then PS is passed via the PXP data pipeline. If both PS and AS color key tests pass, then the back ground color register is passed onto following PXP processing components in the pipeline.

The condition for color keying to be satisfied is:

$$CK0.r.low \leq PS.r \leq CK0.r.high$$

$$CK0.g.low \leq PS.g \leq CK0.g.high$$

$$CK0.b.low \leq PS.b \leq CK0.b.high$$

For example, if the "red" 8-bit value for the PS pixel (or PS.r) is between the color key low and high values (CK0.r.l and CK0.r.h), the condition is true for the red color plane. When ALL three color planes meet this condition, then only the PS pixel is loaded into the output register.

To disable color keying, program the low color key register value to 0xff and the high value to 0x00. This will guarantee that the color key range test will never be true.

### 13.7.3.15 LUT

The lookup table (LUT) is used to modify pixels in a manner that is not linear and that cannot be achieved by the color space conversion modules.

Nonlinear response to the input pixels can be achieved based on how the lookup table is programmed.

Programming of the direct access LUT table can be facilitated by single PIO register writes or DMA access. For efficient loading of the LUT, DMA access should be used.

### 13.7.3.16 Lookup Modes

The LUT has four lookup modes. The lookup modes determine how the `src_pixel` is used to address the LUT memory.

The four lookup modes are:

1. `DIRECT_Y8`
2. `DIRECT_RGB444`
3. `DIRECT_RGB454`
4. `CACHE_RGB565`

The `DIRECT` modes access the LUT memory as a monolithic SRAM. The `CACHE_RGB565` will access the memory as a 2-way set associative cache.

### 13.7.3.17 `DIRECT_Y8`

`DIRECT_Y8` is used for a 256-byte lookup. In `DIRECT_Y8`, the most significant byte of the pixel is used to address the LUT entry.

This byte reflects the Y/R channel of the pixel data path. Luma, or monochrome, transformations are possible with this lookup mode. The address is generated as: `src_pixel[23:16]`. In `DIRECT_Y8` operation, the memory is byte addressable.

### 13.7.3.18 `DIRECT_RGB444`

`DIRECT_RGB444` is used for a 8KB (4K pixel) RGB444 to RGB565 lookup.

Pixel formats that are in the YUV color space at the position of the LUT in the PXP data path can also be converted. To take advantage of the full 16KB memory, the `REG_LUT_CTRL[SEL_8KB]` bit can be used to select the upper or lower 8KB memory, thus facilitating the use of 2 separate 444 LUT tables. In `DIRECT_RGB444`, the `src_pixel` is RGB/YUV[23:0] data is used to generate the lookup address. The address is generated as: `{R/Y[23:20],G/U[15:12],B/V[7:4]}`. In `DIRECT_RGB444`, the memory is pixel (2 byte) addressable.

### 13.7.3.19 DIRECT\_RGB454

DIRECT\_RGB454 is used for a 16KB (8K pixel) RGB454 to RGB565 lookup.

Pixel formats that are in the YUV color space at the position of the LUT in the PXP data path can also be converted. In DIRECT\_RGB454, the src\_pixel is RGB/YUV[23:0] data is used to generate the lookup address. The address is generated as: {R/Y[23:20],G/U[15:11],B/V[7:4]}. In DIRECT\_RGB454, the memory is pixel (2 byte) addressable.

### 13.7.3.20 CACHE\_RGB565

The CACHE\_RGB565 lookup is used for a 128KB (65K pixel) RGB/YUV565 to RGB/YUV565 lookup.

The 128KB memory requirement is too costly from an area perspective to implement a complete lookup table in the LUT's on chip memory. For this reason, a LRU (least recently used) 16KB 2-way set associative cache has been implemented to reference the full 128KB lookup table stored in external memory.

The 2-way set associative cache is organized in the following way:

- 16KB total data storage
- 512 entries split between 256 ways
- 6 pixels/entry cache line

Cache efficiency is very critical. For a cache miss, the PXP will be stalled until the cache line can be filled. For a 32 bit DDR memory interface, the latency can be calculated as follows:

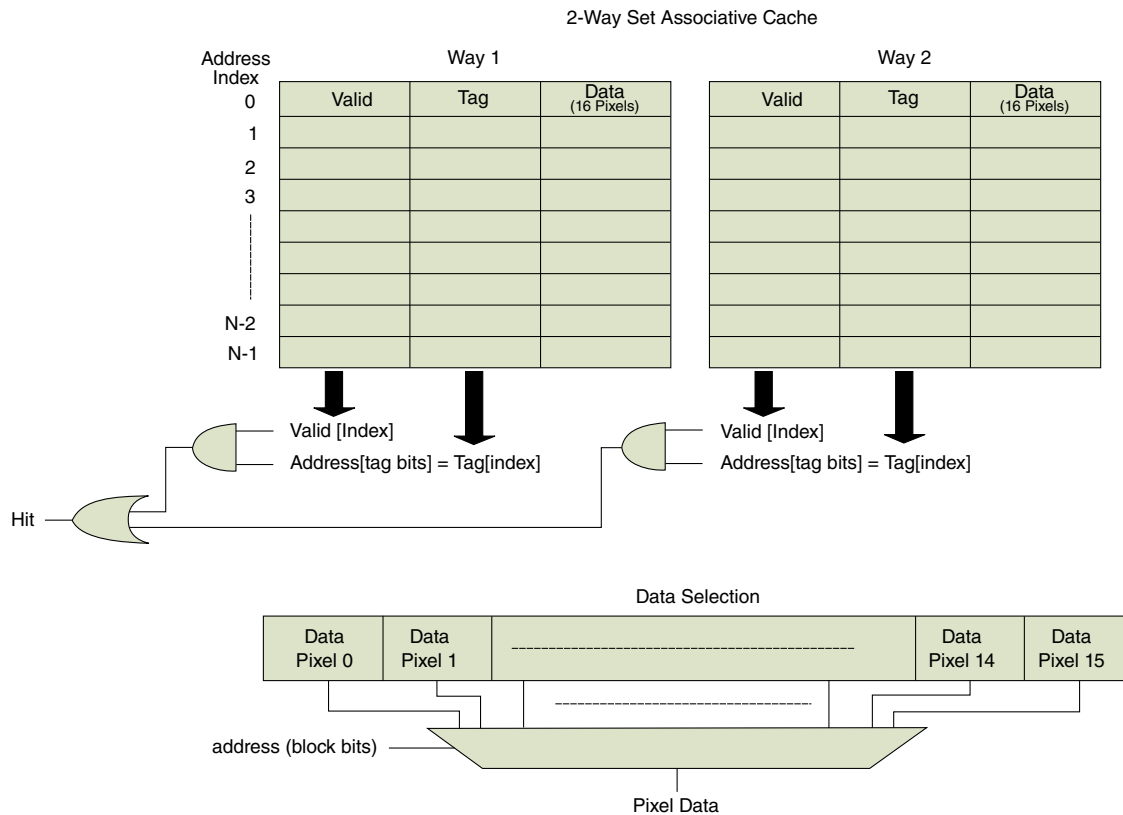

# cycles latency for read command through DDR controller + CAS Latency + # burst cycles for read data to be returned + # cycles latency for data through DDR controller to LUT + 1 cycle for cache access of new data

The src\_pixel is RGB[23:0] data used to generate the lookup address. To improve the cache efficiency the RGB/YUV565 address and the lookup table must be formatted in the following way:

Address:  $A[15:0] = R_7G_7G_6B_7 R_6G_5B_6 R_5G_4B_5 R_4G_3B_4 R_3G_2B_3$

The address is organized as follows:

- A[15:12] tag address, used to compare a hit between cache ways
- A[11:4] index address, used to select cache set (i.e. row of memory)
- A[3:0] block address, used to select Pixel in the cache line

**Figure 13-95. 2-Way Set Associative Cache and Data Selection**

### 13.7.3.21 Output Modes

The LUT has three output modes for color space conversion.

1. Y8
2. RGBW4444CFA
3. RGB888

### 13.7.3.22 Y8

With `out_mode` set to Y8, in conjunction with `DIRECT_Y8` lookup mode, the intended operation is Gamma Correction.

Only the third byte is processed by the lookup table. The third byte is represented by the Y value or the R value in the data path since pixel data is either YUV[23:0] or RGB[23:0] where the Y or R byte encompasses bits [23:16] respectively. So, bits 15:0 are

always bypassed and left unchanged. Currently, the LUT is intended to process Y data when any YUV, Y8, or Y4 output pixel formats are selected. However, this resource can be enabled and used for any conceivable purpose.

Note: When the DIRECT\_RGB444, DIRECT\_RGB454 or CACHE\_RGB565 lookup mode is selected in conjunction with the Y8 output mode the low order byte of the two bytes read from the LUT memory will be used as the Gama Correction value.

### 13.7.3.23 RGBW4444CFA

With REG\_LUT\_CTRL[OUT\_MODE] set to RGBW4444CFA, the REG\_CFA[DATA] is used to select one nibble from the LUT 16 bit output value.

The LUT memory lookup will contain a RGBW4444 value. The REG\_CFA[DATA] will select the R,G,B or W nibble as the pixel value to present to the PXP data path based on the matrix defined by the REG\_CFA[DATA] register. The 4 bit value is presented in the Y, or third byte lane, of the PXP data path. The final pixel transferred to the next PXP stage is {CFA[3:0],CFA[3:0],LUT[15:0]}

#### 13.7.3.23.1 CFA Correction

The 32-bit REG\_\_CFA[DATA] register is used to encode 16 CFA correction values.

The CFA correction values are encoded as follows:

- 00 selects R
- 01 selects G
- 10 selects B
- 11 selects W

The CFA correction uses 4x4 block processing. Figure 5; CFA mapping translation shows how CFA 4x4 blocks will iterate over the PXP's 8x8 or 16x16 pixel block being processed:

Figure 13-96. CFA mapping translation

### 13.7.3.24 RGB888

With `out_mode` set to RGB888, the memory output data is interpolated from RGB565 to RGB888.

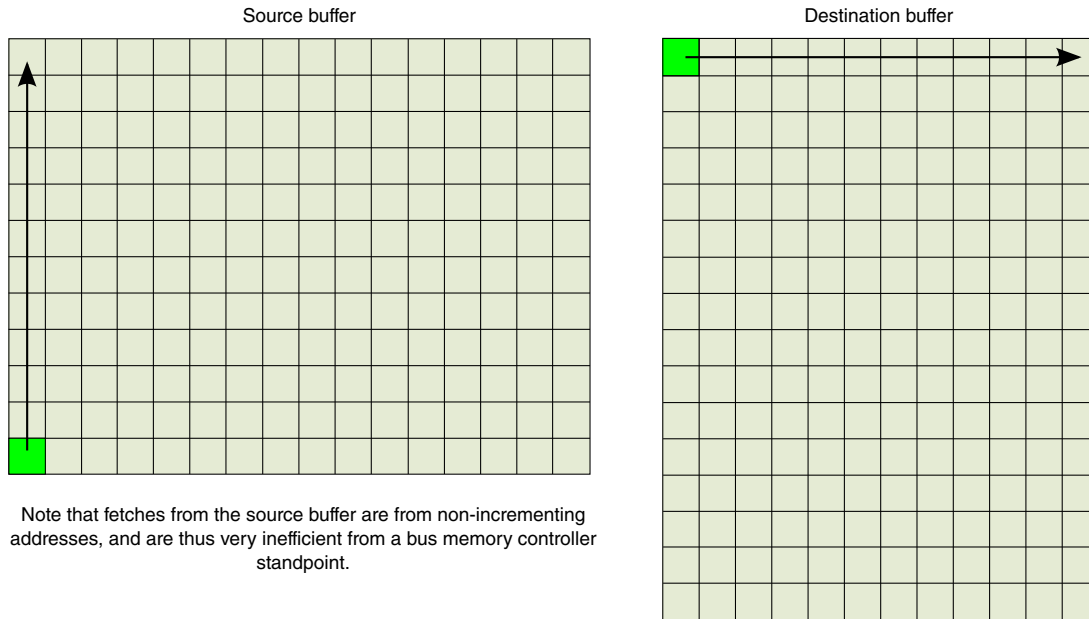

The RGB[23:0] data is formatted as follows: R[7:3]R[7:5],G[7:2]G[7:6],B[7:3]B[7:5].

### 13.7.3.25 Rotation

There are two rotation engines integrated into the PXP. Rotation can occur after compositing the AS and PS buffers in the output stage.

The PS buffer can be rotated and later composited with the AS surface that is not rotated. The rotation1 engine can also be used with the Input Fetch engine.

To rotate graphics, the hardware must read pixels in one direction across a frame buffer and write them in an alternate orientation. For the 90 and 270 degree cases, this means that lines of pixels must either be read or written vertically in a frame buffer.

**Figure 13-97. Rotation Read and Write**

In order to rotate efficiently, multiple columns must be rotated to enable the engine to both fetch and store bursts of pixels, thus improving memory performance. The simplest method of doing this is to operate on square blocks of pixels. To rotate the image, each sub-block of pixels must be rotated by the required rotation angle.

**Figure 13-98. Rotated Sub-blocks**

To manage the rotation process, the source image can be broken into a grid of sub-blocks that have coordinates as shown in the diagram below. In addition to rotating the sub-block, each block must be translated to a new coordinate location. For each of the rotation angles (0, 90, 180, 270), it is possible to define a simple algorithm for computing the new translated grid address. The hardware must then simply compute the memory address from the base grid address for both load and store operations.

**Figure 13-99. Grid of Sub-Blocks with Coordinates**

In order to balance the requirements of reasonable burst sizes to the memory controller as well as keep the hardware storage requirements to a minimum, the blending/rotation engine will operate on either 8x8 or 16x16 pixel blocks. When using the Rotate engine with the input fetch engine, you need to program the input fetch engine to work in 8x8 block mode.

### NOTE

An important artifact of the PXP is when rotating a source image and the output is NOT divisible by the block size selected. The output engine essentially truncates any output pixels after the desired number of pixels has been written. Since the output buffer is written as a horizontal row of blocks, the incorrect pixels could be truncated and the final output image can look shifted. In the case where the block size is programmed to 8x8, and the output size that is programmed is 12x12, then there is a remainder of 4 pixels that will be truncated in either the X and/or Y axis when the PXP operation

is complete. The output will be shifted by 4 pixels in this example. To compensate for this, the source base address needs to be adjusted so the correct pixels get truncated and the image does not look shifted. In this example, with 90 degrees of rotation, the PS base address should be adjusted by 4 times the actual PS base address  $-(4 * \text{pitch})$ .

#### **NOTE**

First position Rotation occurs after compositing the AS and PS buffers in the output stage. When processing PS and AS buffers that are unaligned (buffers are not aligned to block boundaries), a rotation operation that is combined with a flip, decimation, or scaling operation will not execute correctly. Rotation operation must be done in separate passes. Combination operations execute correctly for aligned buffers.

#### **NOTE**

Second position Rotation only supports simple aligned rotation. Unaligned buffer rotation will not execute correctly. Rotation operations combined with flip, scaling, or decimation will not execute correctly.

### **13.7.3.26 Output Buffer**

The output buffer engine accepts data from the PXP pixel pipeline and issues requests to transfer the output pixels to external DRAM or the internal SRAM double buffer row of blocks. It can also connect to the dither engine using the handshake mode. This works for the output engine programmed in the scan line mode as well as block mode. For more details, please refer to the Dither fetch engine.

### **13.7.3.27 Address calculator**

Each of the blocks will manage its own fetch address using a common address calculator block that computes real addresses from a base address and relative block offset from the base.

Each block will then perform the multiple line fetches (or stores) required to perform the operation. This hides all the address buffer computations from the processing blocks and allows each block to simply track the coordinate of the block it is working on.

### 13.7.3.28 Block size selection

The PXP can be configured to process blocks that are either 8x8 pixels or 16x16 pixels with the REG\_CTRL[BLOCK\_SIZE] control bit.

When selecting a 16x16 pixel block size, the accesses to fetch AS and PS images and write the final frame buffer are more efficient since twice as much data is requested and processed per memory request.

When optimizing the system for memory bandwidth and image processing time, configure the PXP to process 16x16 pixel blocks.

### 13.7.3.29 Interlaced Video Support

The PXP has some minimal ability to generate interlaced video content from a progressive source. There two available options, based on the bandwidth requirements and how software is managing video frames.

The PXP can either interlace on the input side (by reading every other line of input data) or on the output side (by writing the individual lines of video into two separate fields). Generally, output interleaving should be used since it is the most flexible mode (it allows scaling and full overlay support) and it only requires a single pass of the PXP to generate two separate output fields.

Input interleaving can be beneficial in cases where the PXP is running at 60fps, since it requires fewer fetches to produce the output data. There is no direct hardware support for input interleaving, in that, there is no configuration bit that can be set to alter how the PXP processes a frame for input interleaving. Input interleaving is achieved by simply setting the source frame buffer pitch value to twice the value it would normally be set to for the equivalent progressive frame. The output parameters also need to be consistent with the desired processing effect. For example, the vertical resolution would be set to account for the reduced resolution to process the interlaced input buffers.

### 13.7.3.30 LCDIF Handshake

The PXP and LCDIF support a mode where the internal SRAM can be used for the frame buffer to minimize external memory bandwidth required.

This is accomplished by creating two buffers in SRAM, a double buffer row of blocks, where each correspond to 8/16-lines of the frame buffer. The buffers must be consecutive and allocated as a single block of data.

**Figure 13-100. Buffer in OCRAM**

The storage required can be calculated for an 8x8 block size as

- storage = 16 (lines) \* rotated\_row\_length \* pixel\_size

and for 16x16 block size as

- storage = 32 (lines) \* rotated\_row\_length \* pixel\_size

where pixel\_size = 4 for 32bpp or 2 for 16bpp modes. The following table lists the storage requirements for common image sizes using 8x8 block size:

Image Size	Storage (16bpp)	Storage (24bpp)	Storage (32bpp)
320x240 (QVGA) - 0/180 rotation	10KB	15KB	20KB
320x240 (QVGA) - 90/270 rotation	7.5KB	11.5KB	15KB
640x480 (VGA) - 0/180 rotation	20KB	30KB	40KB
640x480 (VGA) - 90/270 rotation	15KB	22.5KB	30KB

The following diagram shows how the minimal rotation buffer would be organized. As the engine and LCD progress down the image, they continually swap roles of filling and emptying each eight-line buffer.

**Figure 13-101. Minimal Rotation Buffer Organization**

When this mode is enabled, the PXP will process one row of pixel blocks and write the results to the first SRAM buffer (buffer 0). The PXP will then alternate between writing subsequent rows to buffer 0 and buffer 1. After the PXP generates the data for one buffer, the LCDIF will begin reading that buffer and send the contents to the display device. Once the LCDIF finishes reading a buffer, it will start displaying from the other buffer while the PXP continues filling the previously processed buffer.

**Figure 13-102. PXP and LCDIF Buffer Sharing**

To accomplish the buffer sharing, the PXP and LCDIF will maintain buffer status using a pair of handshake signals. When a buffer is filled by the PXP, it will assert the `pxp_lcdif_bx_ready` (where `x` is 0 or 1) signal to indicate to the LCDIF that the buffer has valid data. The LCDIF will then release the buffer by asserting the `lcdif_pxp_bx_done` signal.

The basic protocol is shown in the diagram below:

**Figure 13-103. Buffer Sharing Protocol**

The PXP will continue to assert the `bx_ready` signal until the corresponding `bx_done` signal is sampled high for one clock cycle. It will then deassert the `bn_ready` until the next time the buffer has been filled. After the PXP samples the `bx_done` signal asserted, it is free to begin filling the buffer with the next block size lines of display data. If a buffer has not been released when the PXP is ready to process data for that buffer, it will suspend rendering operations until the buffer has been released by the LCDIF.

### 13.7.3.31 LCDIF Abort

When the memory subsystem is not loaded, the PXP should be able to render the buffers faster than the LCDIF can drain the buffers.

It is possible under some scenarios (high LCDIF output rates with high memory latency) that the PXP may not be able to keep up with the LCDIF, even in the SRAM mode of operation. When this happens, the LCDIF will signal that it has completed one of the buffers before the other has been rendered by the PXP. This condition will be detected by the PXP's control logic as an "LCDIF Abort", which will cause the PXP to abort processing in the current row and proceed to the following row. It will acknowledge the abort to the LCDIF by raising the `buffer_ready` signal for the current buffer to enable the LCDIF to begin displaying the partially-filled buffer. While an abort will create artifacts in the video display, it does minimize the artifacts by limiting them to the remaining pixels blocks in the current row versus ruining the entire frame buffer.

Figure 13-104. LCDIF Abort

### 13.7.3.32 Theory of Operation

The PXP can be used to accelerate graphics operations by offloading graphics processing from the processor. The block can perform alpha blending and color key substitution on two RGB graphics buffers.

The PXP is organized as having a processed surface (PS) and an alpha surface (AS) that can be blended with the processed surface. There are no restrictions on the location of the AS or PS within the output surface (OS). As the PXP processes  $N \times N$  blocks, operations

are performed on a pixel by pixel basis. The AS and PS pixels are alpha blended, color keyed, process by CSC and LUT resources as individual pixel components. This allows efficient block processing with supporting arbitrary alignment for both the AS and PS surfaces. The resulting pixel block is then written to the corresponding block in the output buffer.

### **13.7.3.33 Pixel Handling**

All pixels are internally represented as 24-bit values regardless of input or output pixel formats.

The pixels get converted in the AS and PS buffer engines to 24-bit pixel values.. There is also an 8-bit alpha value at stages up to the alpha blender within the PXP for blending within the RGB color space. Compositing of AS and PS images can only occur in the RGB color space. If compositing is not required, then YUV pixels can be transferred and processed at all PXP pixel resource components.. The color orientation of pixels within the PXP can be controlled by the CSC1, CSC2, and LUT resources.

For RGB, input pixels are converted into 24-bit pixel values using the following rules:

1. 32-bit ARGB8888 pixels are read directly with no conversion for both the AS and PS.
2. 32-bit RGB888 pixels are assumed to have an alpha value of 0xFF (full opaque).
3. 6-bit RGB565 and RGB555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of 0xFF (opaque). The expansion process replicates the upper pixel bits into the lower pixel bits (for instance a 16-bit RGB555 triplet of 0x1F/0x10/0x07 would be expanded to 0xFF/0x84/0x39).
4. 16-bit RGB1555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of either 0x00 or 0xFF, based on the 1-bit alpha value in the pixel. The ALPHA\_MULTIPLY function is useful in this scenario to allow scaling of the opaque pixels to a semi-transparent value.

Alpha values can be passed through the entire PXP data path and output in ARGB888 and ARGB555 pixel modes. Also, output pixels can be assigned an alpha value using the REG\_OUT\_CTRL[ALPHA] register. 16-bit pixels values are formed from the most significant bits of the 24-bit pixel values.

When YUV/YCbCr output formats are selected, all pixels are internally represented as either RGB or YUV pixels values. The CSC2 or LUT can convert internal RGB/YUV pixels into the correct output format. In this way, any PS color space can be blended with AS RGB pixels and output in any color space.

### 13.7.3.34 Output Buffer Composition

The output buffer will be rendered by composing each pixel block from the associated PS and AS buffers.

The AS pixel buffer can be blended or color-keyed with the associated data from the PS buffer (either the PS image pixels or REG\_PS\_BACKGROUND register based on PS programmed coordinates).

Figure 13-105. Output Buffer Composition

### 13.7.3.35 PS Image Processing

As the PXP processes image buffers, it iterates over the output buffer by fetching the corresponding input buffer blocks and processing the pixels embedded in these.

### 13.7.3.36 Letterboxing

At each pixel coordinate, the control logic determines if the PS pixel (argument also applies to AS pixels) will be used in rendering the output pixel.

This is determined by checking the output pixel's coordinates against the REG\_OUT\_PS\_ULC and REG\_OUT\_PS\_LRC (ULC and LRC in short) register contents. For pixels outside this region, the PS pixel will be loaded with the pixel value from REG\_PS\_BACKGROUND, which can be used to effectively control the letterboxing color. There are no block size or block boundary restrictions when setting the ULC or LRC for either the AS or PS. The only restriction is that the ULC and LRC are within the OUT LRC extents.

**Figure 13-106. OUT Buffer**

### 13.7.3.37 Clipping source images

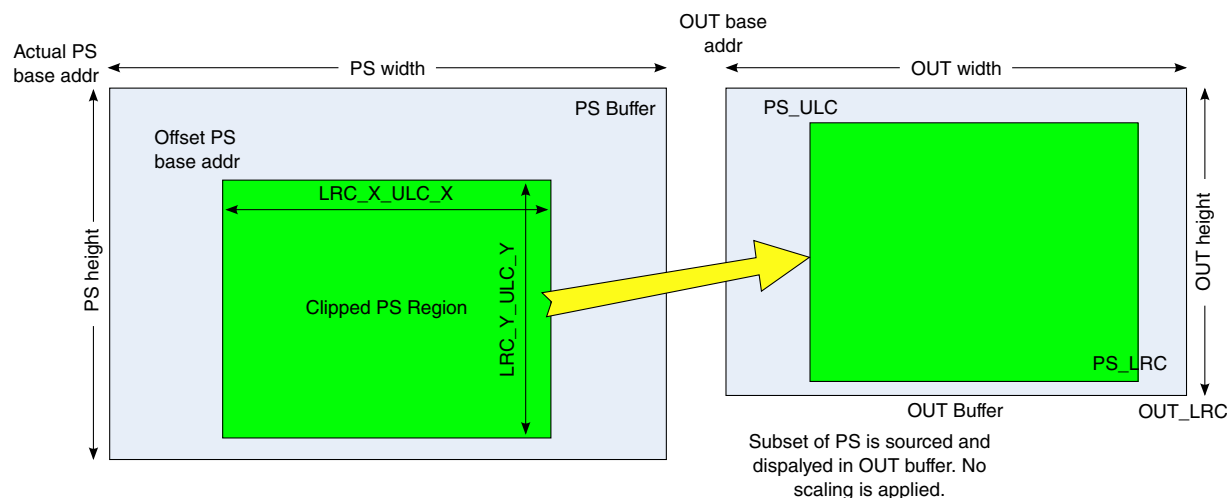

A subset of the PS buffer can be used in rendering the output buffer. The PXP\_PS\_BUF register can indicate an offset into the PS buffer that will be used for display within the OUTPUT buffer.

The pixel at the address defined in the PXP\_PS\_BUF register will be the pixel that is displayed at the pixel coordinate indicated by PXP\_OUT\_PS\_ULC within the output buffer. Essentially, the PXP\_PS\_BUF register can be used to establish an offset into the PS buffer thus clipping all PS buffer pixels that are at a lower address. The PXP\_PS\_PITCH will always indicate the number of bytes that are vertically adjacent in

the PS buffer. The settings in the PXP\_PS\_BUF, PXP\_OUT\_PS\_ULC, and PXP\_OUT\_PS\_LRC will determine the subset of the PS buffer, or clipped PS source buffer, that will be used in the output buffer.

It is important to note that when scaling the PS buffer, the coordinates of the PS buffer within the output buffer need to be consistent with the scaling factors and original PS buffer size.

**Figure 13-107. PS Buffer Scaling**

When sourcing a subset of the PS image, it should fall completely within the PS buffer to avoid displaying incorrect data. The following conditions should be met:

$$x\_base\_addr\_offset + x\_scale * (LRC\_X - ULC\_X) \leq PS\_pitch$$

$$y\_base\_addr\_offset + y\_scale * (LRC\_Y - ULC\_Y) \leq PS\_size$$

The PXP hardware does not check for these conditions and will render the image as programmed. The following case could indicate invalid programming parameters for the PXP:

## Pixel Pipeline (PXP)

**Figure 13-108. Example with Invalid Parameters**

### 13.7.3.38 Color Key Processing

Pixels may be made transparent to the corresponding AS by using the PS color key registers.

If a PS pixel matches the range specified by the REG\_PS\_COLORKEYLOW and REG\_PS\_COLORKEYHIGH registers, the pixel from the associated AS will be displayed. If no AS is present for the pixel, a black pixel will be generated since the default AS pixel is 0x00000000 (transparent black pixel).

The most common use for this is when a bitmap does not support an alpha-field or for applications such as "green screen" where an image is substituted for a solid background color .

**Figure 13-109. The PS image (player) and AS image (stadium)**

The green portion of the background image can be color keyed to display the contents of the AS buffer for locations that match the color range. For this example, the color range is:

PS Colorkey: 00<R<80 70<G<ff 00<B<80

The resulting image becomes:

**Figure 13-110. Resulting Image**

### 13.7.3.39 In Place Processing (PS buffer is destination buffer)

The PXP also has the ability to process an image and write the resulting buffer back to the original PS buffer. This is referred to as "in place" rendering.

This could be useful for basic blit operations into the PS buffer. IN\_PLACE operations are achieved by programming the OUT base address to the pixel location in the PS buffer that marks the upper left pixel of the update region. The actual region that is updated should be indicated by programming the ULC = (0,0) and the LRC = (X,Y). The region bounded by the coordinates will be updated, and the rest of the PS buffer will not be modified.

### 13.7.3.40 Alpha Surface (AS) Processing

The AS surface has a complete set of registers that determines how the AS effects the final OUT surface.

Most of the registers that exist for the PS surface also are defined for the AS surface where applicable. This is provided to replicate the SW interface for each PS and AS processes.

### 13.7.3.41 Alpha Handling

Alpha values in the AS are embedded in the source image pixels. For AS pixel formats that do not support an alpha value, the pixel is assigned an alpha value of 0xFF (opaque).

This can be modified by the AS control by setting either the ALPHA\_MULTIPLY or ALPHA\_OVERRIDE bit in the associated AS\_CTRL register. If ALPHA\_MULTIPLY is enabled, the 8-bit ALPHA value from the AS\_CTRL register is multiplied by the source alpha before blending with the PS image. If the ALPHA\_OVERRIDE bit is set, the 8-bit ALPHA value is simply substituted for the pixel.

### 13.7.3.42 Color Key Processing (AS\_CTRL)

The AS\_CTRL register also contains an ENABLE\_COLORKEY bit that can be used to enable or disable color key substitution for the AS.

When enabled, the pixel values are compared to the ASCOLORKEYLOW and ASCOLORKEYHIGH registers to determine if a match has occurred. When an AS pixel matches the color key range, the pixel from the AS image is considered transparent and the corresponding PS pixel is rendered. If both the PS and AS pixels match their corresponding color key ranges, the AS pixel is displayed unmodified.

AS color keys are handled in a manner similar to PS color keys. The same images used in the PS color key example could be used with the images swapped. In this case, matches on the AS image to the ASCOLORKEY register would display the PS pixels.

## 13.7.4 Output Image Processing

Several PXP options affect the resulting output image.

### 13.7.4.1 Output Image Size

The PXP generates an output image in the resolution programmed by the REG\_OUT\_LRC. As the PXP processes pixels, it iterates over the NxN blocks (in output scan-block order) based on the final image resolution.

### 13.7.4.2 Output Format

The result of PXP operations are written to the buffer pointed to by the REG\_OUT\_BUF/REG\_OUT\_BUF2 registers. The pixel format is controlled by the REG\_OUT\_CTRL[FORMAT] bit-field.

32-bit pixels are formed directly from the internal 24-bit representations and 16-bit pixel formats are generated by truncating the internal 24-bit values to the appropriate number of bits. For formats supporting an alpha value, the PXP assigns the alpha using the 8-bit value in the REG\_OUT\_CTRL[ALPHA] field. For ARGB1555, the most significant alpha bit is appended to the output pixel. Also, for ARGB4444, the most significant nibble is appended to the output pixel. Single and dual buffer YUV output formats are also available. Since each pixel in the data path is represented by a full YUV444 24bpp value, decimation reduces the output in cases of YUV422/420 output formats.

### 13.7.4.3 Rotation/Flip operations

The PXP supports four rotation angles in conjunction with vertical and horizontal flip options. The flip operations effectively take place before the rotation.

Rotations of 0, 90, 180, and 270 degrees are supported and any combination of rotation and flip are supported. There is no performance difference between any of these modes of operation.

### **13.7.5 Queuing PXP transactions**

The PXP supports a primitive ability to queue up one operation while the current operation is running. This is enabled through the use of the REG\_NEXT register.

When this register is written, it enables the PXP to reload its current register contents with the data found at the location pointed to by this address when it completes processing of the current frame. This feature may be useful in helping to reduce the interrupt latency in servicing the PXP, especially in cases where the PXP and LCDIF are using the on-chip SRAM buffer handshake (since the PXP must begin generating next frame data immediately).

If the PXP is idle when the REG\_NEXT register is written, the PXP treats this as an indication that it should immediately load the values at the pointer and begin processing the frame. This ability should allow software to use the same routines when programming the PXP (so that the first frame doesn't differ from subsequent frames).

When loading values from the NEXT register, all registers in the PXP are reloaded. Some register loads have no effect

After writing the REG\_NEXT register, the PXP will set the REG\_NEXT[ENABLED] bit of the REG\_NEXT register to indicate that the next command has been queued. Software should first check the status of this bit to ensure that a previous command has not been enabled. Likewise, after programming the first frame in a sequence of frames, software should poll this bit until it is sampled logic 1'b0 before queuing the next operation.

The PXP will issue interrupts from frames as they complete, regardless of whether they were started by writing the control registers directly or using the REG\_NEXT register. When software receives an interrupt, it should check/clear the PXP's status register as normal, poll the REG\_PXP[ENABLED] bit, and then issue the next operation. A queued operation may be cancelled by issuing a CLEAR operation to the REG\_PXP[ENABLED] register bit. The SET and TOGGLE operations should never be used with this register.

### **13.7.6 Error Handling**

The PXP does minimal checking on the control registers, so it is important that these are correctly specified. The PXP does monitor the bus transactions for errors and will report errors in the status register.

Upon receipt of a bus error, the PXP will set the ERROR interrupt and abort any further operations. Bus errors can be generated from any system access that results in an error response returned from the internal SIM Bus errors in the PXP are signaled as either a read or a write error, but do not indicate the failing address. Software may deduce the failing address from the current block status indicators.

### 13.7.6.1 Known PXP Limitations/Issues

The PXP has the following known limitations:

1. When using the NEXT register, the interrupt enable setting should remain the same for all frames. If not, the PXP will change the interrupt enable register value and possible cause the loss of an interrupt.
2. Rotations of 180/270 are not supported when performing LCD handshakes
3. Rotation 1 engine doesn't support rotation of data in YUV420 format.
4. CSC2 cannot perform RGB to YCbCr and RGB to YUV conversion correctly.

### 13.7.7 Dither Engine Block

The dither engine takes in a buffer of Y8 grayscale pixels (8 bpp) one at a time in raster order from the Fetch engine that is connected to its input. It is designed to process ~1 pixel/clock. It can process the pixels in a number of ways. It can write out the pixels unmodified (pass through), it can quantize the pixels from 8 bits to any smaller number of bits down to 1 bpp. In addition to quantization, it can perform 1 of three different dithering algorithms on the pixel stream. The dithering algorithms supported are Floyd-Steinberg, Atkinson and Ordered dithering. The block contains internal storage for intermediate error data and LUT data which is completely managed within the block.

The pixels passed through the output interface to the connected Store Engine on the output side. The Store Engine is responsible for storing the dithered pixels out to memory or passes them to the WFE-A Fetch engine through bypass mode. The Fetch, Dither and Store engines work together as a unit and they must all three be programmed appropriately and started for the pixels to be read, processed and written correctly. The Store Engine interrupt signal is the indication to software that the operation has completed.

A LUT (Look Up Table) transform can be configured to be done on the pixel either before or after dither dithering but not both. In addition there is a “final” independent register based LUT that can be applied at the end of the dither process just before the pixel is written out to the Store Engine. The LUT values for this final LUT are programmed by software into register.

There are 3 instances of the dither processing block (Dither0, Dither1 and Dither2) instantiated in the system and each has separate controls.

There are 3 instances of the dither processing block (Dither0, Dither1 and Dither2) instantiated in the system and each has separate controls.

### 13.7.7.1 Top Level Connections

The dithering engine is connected to the Fetch Engine on the input side and the Store Engine on the output side. See the figure below:

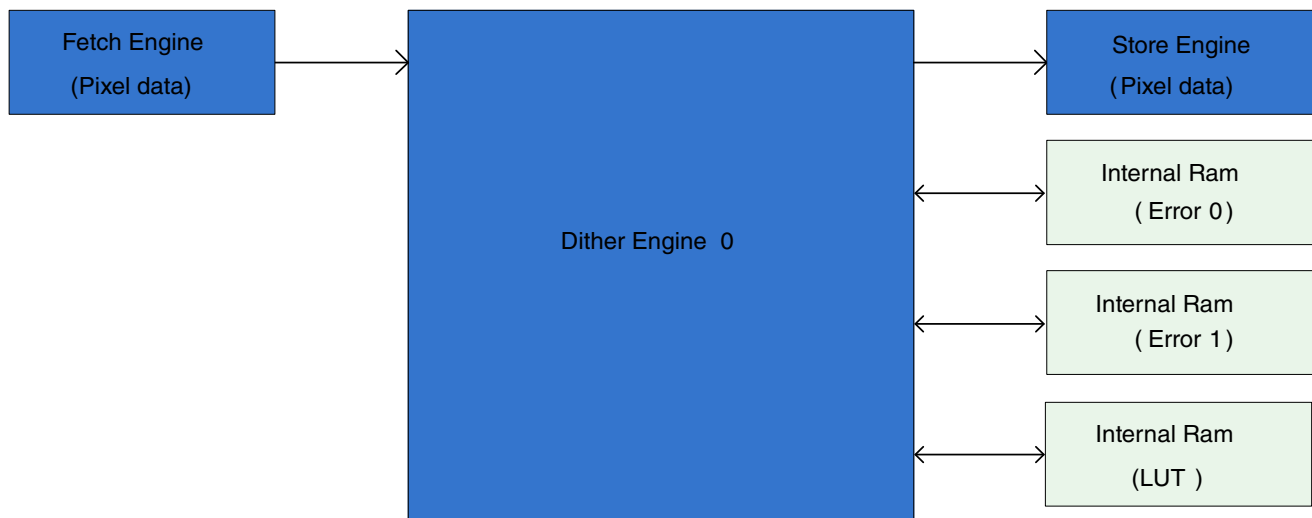

Figure 13-111. Dither Engine External Connections

The Dither Engine must be configured and enabled through the HW\_DITHER\_CTRL control register. The data flow is controlled through the valid, ready and pixel handshake signals with the Fetch and Store blocks. The Dither Engine must be enabled and given all required information such as which dithering algorithm to use, LUT configuration, etc. After starting, the Fetch Engine will signal to the dither engine when it has data for processing. When error information is needed, the block will only take in the pixel and error information when all handshakes are ready. In this case the pixel and error data must be kept synchronized at the processing step. After that however, they can be written out independently to the store engine (They don't have to be written out on the same cycle).

The dimension information of the operation is not programmed in the Dither engine. It comes from the higher level pxp control register fields.

### 13.7.7.2 Dither Engine Design

The following diagram shows the detailed internal structure of the Dither Engine.

**Figure 13-112. Detailed Block Diagram**

Before a detailed discussion of block functionality, it is important to note that there are 3 instances of the dither block within the PXP. All three, Dither0, Dither1 and Dither2 are connected to the same Fetch and Store engines. The system works in two configurations

1. **Y8 configuration:-** In this configuration only Dither0 is enabled. The Fetch Engine will fetch Y8 data and feed it to Dither0. Dither0 then writes resultant data, Y4 for instance, to the Store engine.
2. **RGB configuration:-** In this mode all three dither engine instances are enabled. The Fetch Engine reads in RGB data from memory and gives 8 bits of the triplet to each dither engine. The resulting quantized or dithered data from each dither engine is passed to the same Store engine as in Y8 configuration and the Store Engine synchronizes, packs the data back together and writes it memory.

The Dither0 instance can operate in any of the 5 dither modes mentioned below. The Dither1 and Dither2 instances can only operate in Pass Through, Ordered Dither and Quantization Only modes. It also has the functionality to do a register based final LUT at the end of dither processing. This LUT is controlled by the FINAL\_LUT\_ENABLE bit. Notice that in the HW\_PXP\_DITHER\_CTRL register there are separate ENABLE<sub>x</sub>,

DITHER\_MODE<sub>x</sub> and IDX\_MATRIX<sub>x</sub>\_SIZE controls for each engine. The NUM\_QUANT\_BIT and LUT\_MODE control fields are common and apply to all dither engine instances.

The Dither0 instance is connected to three dedicated instances of internal memory. The error memories are only used when Floyd-Steinberg or Atkinson dithering is selected and are only connected and used by the Dither0 instance. Initialization of these memories is not required.

The Dither1 and Dither2 instances only have dedicated LUT memories connected, one RAM for each of the two instances. There are no error RAM's associated with Dither1 or Dither2.

To be included in a pxp processing flow operation, the HW\_PXP\_CTRL\_ENABLE\_DITHER or HW\_PXP\_CTRL2\_ENABLE\_DITHER bit must be set when the operation is executed. This is in addition to the HW\_PXP\_DITHER\_CTRL.ENABLE<sub>x</sub> bits.

The process flow through the Dither Engine is detailed in the following sections.

#### Step1: Pre-Dither

The pixels are read into the pre-dither pipeline sub-block through the handshake with the Fetch Engine/ If there is error data or Ordered dither LUT matrix data that corresponds with the current pixel (this is mode dependent) then all these elements are fetched, synchronized and presented to the dither stage (green blocks in the above figure) simultaneously. The pre-dither, post\_dither and Ordered dither matrix LUT pipeline module instances keep the data synchronized and flowing through the block. The pixel can go through a lookup table before the dither stage in the Pre-dither LUT pipeline or after in the Post-dither LUT pipeline. These blocks and the Ordered dither index pipeline block share the LUT memory through the LUT Memory Controller block. There is only one memory that is shared between these three functions and only one use can be selected for a given operation. In other words, the block can be configured to use pre-dither lookup, post-dither lookup or ordered dither mode but only one at a time. The pre or post lookup function is enabled through the HW\_PXP\_DITHER\_CTRL.LUT\_MODE field. Ordered dithering is enabled through the HW\_PXP\_DITHER\_CTRL.DITHER\_MODE<sub>x</sub> field (Again, the memory can be used for only one purpose during any given operation). The LUT function uses an 8 bit address (the input data) to lookup 8 bits of data. The LUT memory must be pre-configured with the desired lookup table data.

#### Step2: Dither

After the pre-dither stage, the pixel and colateral data passes through the dither stage. There are 5 programmable modes in this stage that are specified with the HW\_PXP\_DITHER\_CTRL.DITHER\_MODE<sub>x</sub> field.

1. Pass Through:- In this mode the pixel data passes through unmodified
2. Floyd-Steinberg Dithering:- This mode quantizes and dithers the pixels according to the standard Floyd-Steinberg algorithm that can be found in the literature. This algorithm employs an error dispersion technique that saves a fraction of the quantization error from each pixel and adds those partial errors to neighboring pixels. Therefore, the error memory buffers shown in the diagram are used in this mode to save the partial errors and retrieve them as they are needed when processing corresponding pixels in the next row below the current row.
3. Atkinson Dithering:- This mode employs the standard Atkinson dithering algorithm to quantize and dither the pixels. The standard algorithm in the literature is implemented. Atkinson is an error dispersion algorithm similar to Floyd-Steinberg except that the partial error coefficients are different and the error is dispersed two lines below the current row instead of one line below.
4. Ordered Dithering:- This is a standard algorithm that applies an index, or Bayer matrix to the pixels. Applying this matrix has the effect of changing the likelihood of a pixel being rounded up or down when being quantized. If this mode is specified, it requires use of the LUT memory so the HW\_PXP\_DITHER\_CTRL.LUT\_MODE field must be set to 0, or off. The IDX\_MATRIXx\_SIZE field specifies the dimensions of the index, or Bayer matrix. This is used to properly index into the LUT memory to retrieve the correct corresponding value to apply to the current pixel.
5. Quantization only:- This mode simply quantizes the pixel from 8 down to whatever bits per pixel are specified in the NUM\_QUANT\_BIT field. No dithering algorithm is used.

The output of this step is the quantized/dithered pixel packed into the most significant bits of an 8 bit byte. The unused bits in the lower part of the byte will be set to zero. Also, any partial error information that was generated is sent to the Error Memory Controller to be stored for future processing.

### Step3: Post-Dither

The post-dither block is similar to its pre-dither counterpart. The processed pixel is queued up in preparation for write to the Store Engine. Also any relevant error information is stored out to memory for the next lines of the image. If DITHER\_MODE<sub>x</sub> is not equal to Ordered mode, and a lookup operation is not selected in the pre-dither step, the LUT\_MODE can be set to select a lookup operation in this step using the LUT memory.

### Step4: Final Lookup

This combinatorial LUT step takes bits [7:4] of the output pixel and looks up an 8 bit value from the 16 value LUT to generate the final output pixel to the Store Engine. The LUT values are programmed into the LUT through the

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0 - 3 registers. This operation is enabled through the HW\_PXP\_DITHER\_CTRL.FINAL\_LUT\_ENABLE register field. This LUT is only available on the Dither0 instance.

1. Y8 configuration:- In this configuration only Dither0 is enabled. The Fetch Engine will fetch Y8 data and feed it to Dither0. Dither0 then writes resultant data, Y4 for instance, to the Store engine.
2. RGB configuration:- In this mode all three dither engine instances are enabled. The Fetch Engine reads in RGB data from memory and gives 8 bits of the triplet to each dither engine. The resulting quantized or dithered data from each dither engine is packed to 24 bit RGB and be written to memory by Store Engine.
1. Pass Through:- In this mode the pixel data passes through unmodified
2. Ordered Dithering:- This is a standard algorithm that applies an index, or bayer matrix to the pixels. Applying this matrix has the effect of changing the likelihood of a pixel being rounded up or down when being quantized. If this mode is specified, it requires use of the LUT memory so the HW\_PXP\_DITHER\_CTRL.LUT\_MODE field must be set to 0, or off. The IDX\_MATRIXx\_SIZE field specifies the dimensions of the index, or bayer matrix. This is used to properly index into the LUT memory to retrieve the correct corresponding value to apply to the current pixel.
3. Quantization only:- This mode simply quantizes the pixel from 8 down to whatever bits per pixel are specified in the NUM\_QUANT\_BIT field. No dithering algorithm is used.

### 13.7.7.3 Pipelined Data Flow

It is possible that the fetch engine could stall when there are valid pixels in various stages of the dither block. In this case the dither pipelines will not stall but will continue to drain and move data out to the store engine. Also, if Floyd-Steinberg or Atkinson dithering is selected, at the end of each row after the last pixel has been written out to the store engine there will be one extra error that will be written out to the error memories because the pixels and the corresponding errors are offset by one. This is a natural result of the error dispersion algorithms. The dither block handles flushing out this last error automatically before processing the next row. Also, if the Store Engine stalls for a period of time and can not take any more data, flow control is implemented within the Dither block back to the Fetch Engine so that no pixel or error data is lost or becomes unsynchronized.

There are three BUSY bits in the HW\_PXP\_DITHER\_CTRL register, one for each Dither Engine instance that software can poll to discover if the engine is busy or idle.

### 13.7.7.4 Initialization of Dedicated Memories

The internal memories for the Dither Engine instances, including 2 error memories and 3 LUT memories can all be initialized through the register interface. This is done by configuring the HW\_PXP\_MEM\_CTRL register and then writing the initialization data into the HW\_PXP\_INIT\_MEM\_DATA register. This simple interface is used as follows. Write the HW\_PXP\_MEM\_CTRL.SELECT field with a value between 0-4 corresponding to the memory to be initialized. Write the HW\_PXP\_MEM\_CTRL.ADDR field with the starting memory address to be written. Set the HW\_PXP\_MEM\_CTRL.START field to begin the initialization operation. Note at all these fields can be set with a single write to the register. Then write the HW\_PXP\_MEM\_DATA register with the data to be written to the location at HW\_PXP\_MEM\_CTRL.ADDR. Each write to the data register increments and value of address so repeated writes to this register will put the data into sequential memory locations beginning with the offset in the ADDR field. The LUT memories are 8 bits wide. When 32 bit DATA writes occur with one of those memories selected, the lower 8 bits are written. To fill these memories 256 writes to the HW\_PXP\_MEM\_DATA register are required. The error memories are 32 bits wide so all 32 bits are data are used to fill each location and they are 2048 locations deep. Note that initialization for these memories are not necessary.

### 13.7.7.5 Register Configuration Interface

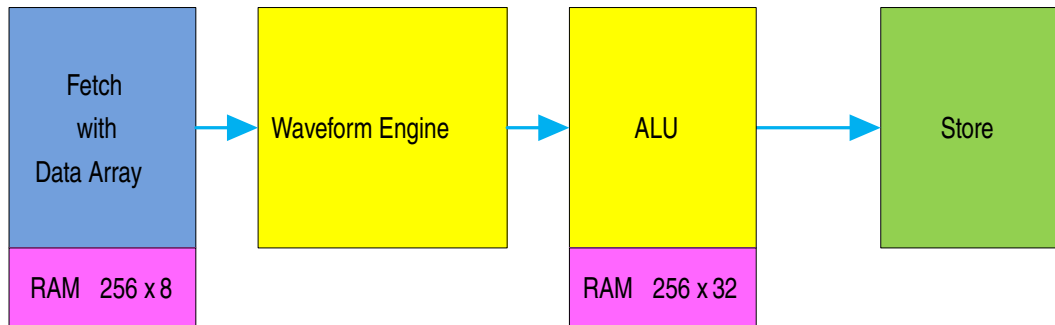

The HW\_PXP\_DITHER\_CTRL register control fields to be set for each operation are included in the following table.

Signal or Group	Description
ENABLE	The hardware signal enables the dither block to function.
DITHER_MODE	Dither mode 0: passthrough, 1: Floyd-Steinberg, 2: Atkinson, 3: Ordered, 4: no dithering quantization only, 5,6,7: Reserved. There is on field for each Dither Engine instance.
NUM_QUANT_BIT	How many bits to quantize to. Valid values are 7 down to 1.
LUT_MODE	Configures a LUT operation from local memory. The options are either pre-dither, post-dither or off. This setting affects all three Dither Engine instances.
IDX_MATRIXx_SIZE	These fields, one per instance, specifies the dimension (the matrix is square) of the Index Matrix used in Ordered dither mode.
FINAL_LUT_ENABLE	This field is only applicable to instance 0 of the three Dither Engines and enables/disables the final register based LUT of the output pixel just before outputting it to the Store Engine.

## 13.7.8 Waveform Engines

### 13.7.8.1 Overview

The WFE (Waveform Engine) is a very flexible, programable engine that can be used to implement various algorithms to transform the incoming data to the output. It is always used in connection with the Fetch Engine on the input side and a Store Engine on the output. These three sub-blocks work as a unit. There is an optional ALU block between the WFE and Store engines that can be used to make further modifications to the WFE output before storing the output. See the figure below.

**Figure 13-113. Block Diagram**

The WFE can process one pixel and associated data per clock.

The Fetch Engine fetches and formats the input pixel data streams according to the requirements and programming of the WFE. The WFE takes in the data from the Fetch Engine through a standard valid/ready signalling interface.

Inside the WFE the data passes through a 3 stage pipeline. Each stage consists of various programmable logic elements including muxes, lookup tables, comparitors, ALU's and registers. The output information calculated in the WFE is output to the Store Engine also using a standard valid/ready signalling interface.

The Store Engine reads the data from the WFE in the programmed format reformats the data according to working buffer pixel formats and stores the frame and associated data to memory.

### 13.7.8.2 Functionality

There are two WFE instances arranged serially in the PXP standard flow, WFE-A and WFE-B.

In the standard usecase WFE-A is used for pixel collision detection and also to compute grayscale color transition information used later in the REGL/D algorithm.

In the standard usecase the WFE-B engine takes in pixel information and the results of WFE-A processing and implements the REAGL/D algorithm on the data. The output results in all the information necessary for the EPDC block to update the E-INK panel.

The definitions, functionality and programming of the logical elements within the WFE is Freescale, Inc. proprietary information. The register programming necessary for any given function required will be supplied by Freescale to the customer.

The WFE block can be independently held in reset by setting the HW\_PXP\_WFE\_x\_CTRL.SW\_RESET bit to 1. This bit should only be set when the HW\_PXP\_WFE\_x\_CTRL.ENABLE bit is 0.

## 13.7.9 PXP Store Engine Block Description

### 13.7.9.1 Overview

The essential function of the Store Engine is to store input data from the input sub-block to memory or directly output to next sub-block. The input source is 32 bits per channel per valid clock. There are 4 instances of the Store Engine in the PXP. Please refer to the PXP block diagram for details. The main supported features are:

- Two DMA controllers thus it can work on two channel data storage at the output at the same time. If there is only one stream data input, store engine should use channel 0 but not channel1.
- Accepts as input up to 8 bytes data (two channels, 32 bits each) and 8 bits flag input. After shift operation it can store up to 64bpp per valid clock to memory.
- Data fill function for initialization. It can fill a fixed 32 bit data value to a specified memory buffer.
- Handshake mode with a downstream connected data Fetch Engine. It supports 1 scanline handshake with and 1 line, 3 lines and 5 lines array handshake modes. In handshake mode, the Store Engine signals to the Fetch Engine when data is available for processing thus eliminating the need for software intervention through interrupt service routines.

- Bypass mode which directly outputs the data to the downstream connected Fetch Engine after shift operation. This is done through a valid/ready data interface.
- Support for 8x8 and 16x16 block mode and scanline mode.
- Support for 8, 16 and 32 bpp input data format.

### 13.7.9.2 Top-level architecture

The PXP consist of several pipelined blocks that perform the video source frame scaling, color space conversion, alpha-blending/color key algorithm, secondary CSC, pixel correction , input and/or output rotation, dithering and waveform processing. It is also capable of fetching data from and storing data to memory.

The legacy blocks operate within the requirements of the legacy PXP architecture, and perform operations on either 8x8 or 16x16 pixel blocks in the representative source buffers. The legacy pipeline operate within the context of two iteration counters that iterate through the appropriate grid of input blocks to produce the rotated output grid blocks in scan-line order. The dither blocks and the waveform processing engines (WFE) will operate in a scan line format based on the active size. The input fetch and store engines can work on either on a block by block basis or in the scan line format.

[Figure 13-87](#) shows the high-level architecture of the scaling, color space conversion, blending, pixel correction , rotation engines, dithering, waveform processing, histogram along with four sets of fetch and store engines. The Alpha Surface Engine fetches one RGB graphics plane alpha surface (AS). The scaling engine fetches a single processed surface (PS), which can be blended with the AS surface. The scaling engine also supports an alpha channel for the PS image. Although the legacy PXP processes NxN pixel macro blocks, each of the AS or PS surfaces can have any pixel alignment within the output buffer. There are no restrictions and any pixel coordinates within the output buffer are valid. The upper left origin of the output buffer is defined as pixel 0,0. The upper left and lower right coordinates for each of the AS and PS are inclusive within the output buffer.

[Figure 13-88](#) represents a sample output buffer configuration with both an AS and PS included. The alignment of each AS and PS within the output buffer can be at any arbitrary pixel locations. For example, the PS has an upper left coordinate (ULC) of 2,2 and a lower right coordinate (LRC) at pixel 13,13. The maximum value for the ULC and LRC for each of the AS and PS is bounded by the LRC of the output buffer, 15,15 for this example.

**Figure 13-114. Sample output buffer configuration**

The AS engine supports RGB pixel formats, and the PS engine supports ARGB, RGB, YUV, and YCbCr pixel formats. The CSC1 can be used to convert to RGB pixel formats so that the PS surface can be blended with the AS surfaces in the compositing engine in the RGB color space. There are two rotate engines in the PXP pipeline. Rotation can occur after image composition, at the output of the PS engine, or both. In the first scenario, all the data produced by the AS and PS engines is rotated. When the rotation module is programmed to rotate only PS images, the AS is not rotated, and AS pixels are combined with rotated PS surfaces. The Rotate engine at the input can also be used with the input fetch engine. For this, the fetch engine needs to be programmed in the block mode to fetch a block of size 8x8. The CSC2 unit can convert to any RGB, YUV, or YCbCr color spaces for final output. Pixels can be corrected using a programmable LUT resource to achieve any desired pixels effects. For detailed information, please refer to [Output Modes](#) to [RGBW4444CFA](#). The dither engine supports 3 dithering modes in addition to the standard quantization and pass-through modes. The dithering algorithms supported are: Ordered, Floyd-Steinberg and Atkinson. The WFE is a programmable engine that can be programmed as required to process each pixel and pixel meta data. The Histogram sub-block collects statistics about the pixel data passing through it that is

useful to the EPDC in waveform selection and displaying the frame. The Histogram also contains mask and comparison functionality that can be used for collision detection and reporting of the collided area within an update area.

The PXP also supports two parallel image processing paths. The legacy flow can operate in parallel with the input fetch engine or the dithering or waveform processing engines. Please refer to HW\_PXP\_CTRL and HW\_PXP\_CTRL2 for details on how to enable each of the individual data flows. In addition to this, the CSC, Rotation 1 and LUT engines can be used as either part of the legacy flow or as a part of the second parallel data flow. These blocks can work in the scan line format or in block format. There are two separate blending engines for each flow.

### **13.7.9.3 Store Engine Design**

#### **13.7.9.3.1 Input Data Source**

##### **1. Fixed Data Input**

The Store Engine supports a fill function which writes a fixed value to a specific set of memory locations. The data received from the input is ignored. This function is usually used to initialize a memory buffer. The address of the buffer to fill is set in the HW\_PXP\_X\_STORE\_FILL\_DATA\_CH0 register. Also, this mode can only work through channel 0 and not channel 1.

In this mode HW\_PXP\_INPUT\_STORE\_CTRL\_CH0.FILL\_DATA\_EN=1. The fixed value is set in FILL\_DATA\_CH0 register. How many bits are valid from HW\_PXP\_INPUT\_STORE\_FILL\_DATA\_CH0 register is decided by HW\_PXP\_X\_STORE\_SHIFT\_CTRL\_CH0.OUTPUT\_ACTIVE\_BPP.

##### **2. Normal Data Input**

Store Engine supports two 32 bits wide data channels and 8 bits flag input. If there is only one channel of data input, the channel 0 must be used not channel 1. In this case, HW\_PXP\_INPUT\_STORE\_CTRL\_CH0.COMBINE\_2CHANNEL=0.

If both channels and 8 bits flag input contain valid data, then the COMBINE\_2CHANNEL bit should be set to 1. The Store Engine will then combine the two channels of data into 64 bits of data send them with the 8 bits of flags to the shift module. After shift, the Store Engine will choose the active bits from the 64 bit

output according to HW\_PXP\_x\_STORE\_SHIFT\_CTRL\_CHx.OUTPUT\_ACTIVE\_BPP and then pack them in preparation for output.

### 13.7.9.3.2 Store data shift operation

The data shift operation supports up to 8 data fields and 8 flag components to be shifted to any position within the 64 bit word. The data fields can be any width. This function is a way to reorder or reformat the component parts of the 64 bit word output. As data flows through the Store Engine each data word is processed the same way according to register configuration.

The following registers are used in shift operation. The pairs of {HW\_PXP\_x\_STORE\_D\_MASKx\_H\_CHx, HW\_PXP\_x\_STORE\_D\_MASKx\_L\_CHx} make up the 64 bits of mask for each MASKx component. There are a set of masks for each channel in each instance. The D\_SHIFT\_FLAG0 ~ D\_SHIFT\_FLAG7 fields in the HW\_PXP\_x\_STORE\_D/F\_SHIFT\_L/D\_CHx registers specify which direction to shift (0: right shift 1: left shift) each data component0 ~ component7 after the mask is applied. The D\_SHIFT\_WIDTH0 through D\_SHIFT\_WIDTH7 fields specify how many bits to right or left shift each data component 0 through7 after the mask is applied.

The shift function works the same for the 8 bits of flag data. There are analogous “F\_SHIFT” registers that contain the F\_MASKx, F\_SHIFT\_FLAGx and F\_SHIFT\_WIDTHx register fields for swizzling the input flags.

The figure below shows how the shift function works.

## Pixel Pipeline (PXP)

### 13.7.9.3.3 Data Packing

After data shift, the 64 bits of data can be divided to two 32bit words depending on the value of the HW\_PXP\_x\_STORE\_CTRL\_CHx.PACK\_IN\_SEL bits. If HW\_PXP\_x\_STORE\_CTRL\_CH0.PACK\_IN\_SEL = 0, it will select active bits from all 64 bits of data. If equal to 1, it will select active bits from the lower 32 bits data.

For channel 1, if HW\_PXP\_x\_STORE\_CTRL\_CH1.PACK\_IN\_SEL = 0, it will also select active bits from all 64 bits data and if equal to 1, it will select active bits from the higher 32 bits data.

Store Engine supports 8bpp, 16bpp, 32bpp and 64bpp active bits per pixel according to OUTPUT\_ACTIVE\_BPP register setting. When either channel's PACK\_IN\_SEL = 1 only 8bpp, 16bpp, 32bpp can be selected.

After shift and data output selection, the packing module will pack the data into a 64 bit string and store to a FIFO before writing out to memory.

Packing style according to active bpp is showed below.

OUTPUT_ACTIVE_BPP	Active bpp from 64 shift output data	Packed data
0	8 bits	{pix7, pix6, pix5, pix4, pix3, pix2, pix1, pix0}
1	16 bits	{pix3, pix2, pix1, pix0}
2	32 bits	{pix1, pix0}
3	64 bits	{pix0}

### 13.7.9.3.4 Data Store Format

- **Scanline mode**

When `HW_PXP_X_STORE_CTRL_CHx.BLOCK_EN=0`, the Store Engine will store data the line by line in scanline mode. The AXI burst length is set by the `HW_PXP_X_STORE_CTRL_CHx.WR_NUM_BYTES` register field. In Scanline mode, it can support 8, 16, 32 and 64 bytes in a burst.

- **Block mode**

When `HW_PXP_X_STORE_CTRL_CHx.BLOCK_EN=1`, the Store Engine support 8x8 and 16x16 block mode according to `HW_PXP_X_STORE_CTRL_CHx.BLOCK_16` register bit. When `BLOCK_16=1`, the block size is 16\*16 while if `BLOCK_16=0` the size is 8\*8 blocks. When `BLOCK_EN=1`, then `HW_PXP_X_STORE_SHIFT_CTRL_CHx.OUTPUT_ACTIVE_BPP` cannot be 3, that is, block mode can not work on a 64bpp data stream.

When the Store Engine is configured block mode, the upstream Fetch Engine should be configured in block mode and with the same block size as well.

When the total width or total height of image is no divisible by 8 or 16, the upstream Fetch Engine will fetch extra pixels or lines to fill out the final partial blocks. For example, if the size is 23\*23, and block mode is 8\*8, Fetch Engine will fetch 24\*24 data pixels and output to store engine. The Store Engine has a crop function for this. That is, the extra pixels or lines will not be stored to memory by the Store Engine. This is accomplished by the hardware using the AXI bus byte enables.

In block mode, the number of AXI bus write bytes is internally calculated from the `OUTPUT_ACTIVE_BPP` and `BLOCK_16` (block size) register fields rather than the `WR_NUM_BYTES` field.

One limitation exists with block mode configuration. No YUV422 output format is not supported. So

HW\_PXP\_x\_STORE\_SHIFT\_CTRL\_CHx.OUT\_YUV422\_1P\_EN and  
OUT\_YUV422\_2P\_EN must be disabled.

### 13.7.9.3.5 Output Format Modes

- **Normal mode**

If HW\_PXP\_x\_STORE\_CTRL\_CHx.STORE\_BYPASS\_EN = 0,

HW\_PXP\_x\_STORE\_CTRL\_CHx.STORE\_MEMORY\_EN=1 and

HW\_PXP\_x\_STORE\_CTRL\_CHx.HANDSHAKE\_EN=0, the Store Engine is working in normal mode.

In normal mode, the Store Engine will store the input data to memory frame by frame. The store frame start address is set in HW\_PXP\_x\_STORE\_ADDR\_x\_CHx. Two address registers exist for each channel. The second one is used for YUV422 2 plane mode.

The Store Engine will stop storing data when the frame of data is finished. Another pxp\_start signal will trigger the next frame operation. The frame size is specified by the HW\_PXP\_x\_STORE\_SIZE\_CHx registers. The values should be set up for each channel in use. If both channels are being used, the height and width values in the HW\_PXP\_x\_STORE\_SIZE\_CH0 and HW\_PXP\_x\_STORE\_SIZE\_CH1 registers may be different but the total number of pixels in the frame must be the same. The only exception to this is when both channels are being used and the Store Engine is outputting data in handshake mode. In handshake mode the width and height must be set the same in both channel size registers.

If the data shift mode is set to YUV422 single plane or 2 plane, two pixels, 64 bits, are read in and 32 bits are written. If the YUV data is coming from the upstream Fetch Engine it will be in YUV444 format as {8'h0, Y0, U0, V0, 8'h0, Y1, U1, V1}. Even though the YUV422 mode is set, the shift function must be set to shift the components into their proper position. For instance, for 1p mode, the shift MASK, FLAG and WIDTH parameters need to be set up on the 64 bits of pixel data to format each 32 bits (2 pixels) to be written out as {Y0, U0, Y1, V0}. Likewise in 2p mode, the ch0 data would be shifted to yield {Y0, Y1} with ch1 as {U0, V0} for the first two pixels.

- **Bypass mode**

If STORE\_BYPASS\_EN=1, STORE\_MEMORY\_EN=0, The Store Engine will output the input data, after the shift function, directly to the downstream Fetch Engine instead of storing to memory. The AXI bus is inactive in this case. The data is output using the valid/ready external interface to the downstream connected Fetch Engine.

In bypass mode, if HW\_PXP\_x\_STORE\_CTRL\_CH0.CH\_EN=1, it will output the lower 32 bits of data. If HW\_PXP\_x\_STORE\_CTRL\_CH1.CH\_EN=1, it will output the high 32 bits of data.

- **Dual mode**

If STORE\_BYPASS\_EN = 1 and HW\_PXP\_x\_STORE\_CTRL\_CHx.STORE\_MEMORY\_EN = 1, the Store Engine is configured in Dual mode. That is, the Store Engine supports bypassing the data and also storing it to memory at the same time.

- **Handshake mode**

The Store Engine supports a 1 scanline handshake configuration and 1 line, 3 lines and 5 lines array handshake configurations with next Fetch Engine. The 1 scanline mode is used for Store Engines connected to the Input\_Fetch and Dither\_Fetch instances. The array handshake modes are used in cases where the Store Engine is connected to the WFE\_A\_Fetch or WFE\_B\_Fetch instances. When HW\_PXP\_x\_STORE\_CTRL\_CHx.HANDSHAKE\_EN = 1, ARRAY\_EN = 1 and STORE\_MEMORY\_EN = 1, the Store Engine is in handshake mode(1 scanline handshake configuration is identical to 1 line array handshake configuration so the following sections will only discuss array handshake modes).

The array handshake is used in cases where the Fetch Engine is in array mode. One line handshake config indicates that the Fetch Engine is working on 1x1 array mode. The 3 line handshake indicates the Fetch Engine work is in 3x3 array while 5 line handshake indicates 5x5 array mode.

To accomplish the buffer sharing, Store Engine and the attached Fetch Engine will maintain buffer status using a pair of handshake signals. When a buffer is filled by the Store Engine, it will assert the handshake\_bx\_ready (where x is 0 or 1) signal to indicate to the fetch engine that the buffer has valid data. The prefetch engine will then release the buffer by asserting the handshake\_bx\_done signal.

The basic protocol and timing is shown in the diagram below:

## Pixel Pipeline (PXP)

Unlike scanline handshake, there is only 1 buffer in memory. The buffer size is  $(array\_line + 1)$ .

- 1 line array handshake

When  $HW\_PXP\_x\_STORE\_CTRL\_CHx.ARRAY\_LINE\_NUM = 0$ , the configuration is 1 line handshake mode. The buffer size is  $2 * OUT\_PITCH$  (2 lines). The first ready occurs when the Store Engine finishes writing 1 line.

- 3 line array handshake

When  $ARRAY\_LINE\_NUM = 1$ , the configuration is 3 line handshake mode. The buffer size is  $4 * OUT\_PITCH$ . The first ready occurs when the Store Engine finishes writing 2 lines.

- 5 line array handshake

When  $ARRAY\_LINE\_NUM=2$ , the configuration is 5 line handshake mode. The buffer size is  $6 * OUT\_PITCH$ . The first ready occurs when store engine finishes writing 3 lines.

### 13.7.9.3.6 Limitations

When both channels are active, they should be configured to work in the same mode. For example, if channel 0 is configured for bypass mode then channel 1 must also be configured the same way. In the case of the input Fetch and Store instances, see overall block diagram, if the path between them includes the LUT processing block then the Fetch and Store Engines must be in block mode. The LUT will not function correctly in scanline mode.

## 13.7.10 PXP Fetch Engine Block Description

### 13.7.10.1 Overview

The main function of Fetch Engine is to fetch data from memory or directly from the input bypass channel and output to another downstream module as 32 bits per pixel per valid clock.

The Fetch Engine has two channel DMA controllers and thus can fetch two memory data buffers at the same time. The Fetch Engine supports an expansion and shift function on the fetched data and then output as 32 bits per pixel according to different data format. It supports 8x8 or 16x16 block mode and scanline mode. The block also supports rotation function with rotation module when in block mode. It can support vertical flip, horizontal flip, 90/180/270 degree rotation angle. Using the expansion function, the user can read in rgb555, rgb565, rgb444, argb1555, argb4444, yuv422\_2p or yuv422\_1p input data format and convert to argb8888, rgb888 or yuv444 format at the output. The Fetch Engine can interface with a connected Store Engine block directly in one of two ways, handshake mode and bypass mode as described further below. In handshake mode 1 line, 8 line and 16 line configurations are possible. In bypass mode memory accesses are bypassed altogether and data passes directly from a Store Engine to its connected Fetch. Input formats of 8bpp, 16bpp, 32bpp, 64bpp are supported.

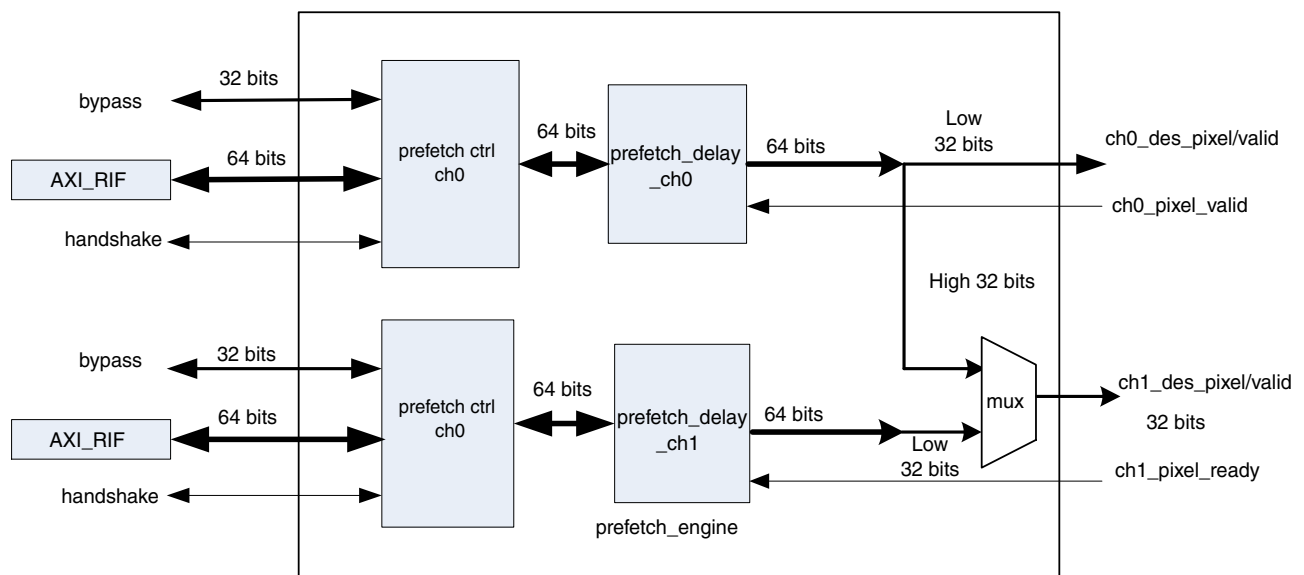

Figure 13-115. High level block diagram

The following diagram shows the internal structure of the Fetch\_ctrl engine.

**Figure 13-116. Fetch Control block diagram**

### 13.7.10.2 Fetch Data formats

The Fetch Engine supports input 8bpp, 16bpp, 32bpp, 64bpp data format according to INPUT\_ACTIVE\_BPP register setting in the HW\_PXP\_x\_FETCH\_SHIFT\_CTRL\_CHx registers. (“x” is a wildcard that is replaced with the fetch module instance or the channel number. This notation is used because there are several instances with unique names and channels 0 and 1.)

When input data is 64bpp, since output data bus is 32 bits per channel, the Fetch Engine will need to be configured to use both output channels (32 bits each) to transmit the 64 bits of data at the output. Thus, when input data is 64bpp, the Fetch Engine supports only channel 0 data input but not channel 1 at the same time.

The Fetch Engine supports an expansion function. When you set EXPAND\_EN=1, the engine will change the input format to a unified YUV444 or ARGB888/RGB888 format. Otherwise it will remain in the same format and output to an external module. Note the expand function is not available if the input data is YUV422 format, 1 plane or 2 plane data fetching is supported. When EXPAND\_FORMAT=7, prefetch\_engine will fetch YUV422 format data from two plane. One is for Y, the other is for UV. The start address of these two buffer planes are set by INPUT\_BASE\_ADDR\_0\_CHx (Y buffer) and

INPUT\_BASE\_ADDR\_1\_CHx (UV buffer) fields in the HW\_PXP\_x\_FETCH\_ADDR\_x\_CHx registers for that Fetch instance. Also, if input format is YUV422\_2P, the EXPAND\_EN must always be asserted. This combination is only used to transform YUV422\_2P to YUV444 format.

The data format in memory and output is shown in table below. For input formats that read multiple pixels within the 64 bit input word, there will be multiple output cycles for each input read to expand and output all the pixels in the input word.

X means this parameter is a “don’t care”.

INPUT_ACTIV E_BPP	Input data valid bits(bpp)	Data store in memory	EXPAND_EN	EXPAND_FOR MAT	After expanding(32 bit word)	Data output format in 32 bit bus
0	8 bits	{pix7, pix6, pix5, pix4, pix3, pix2, pix1, pix0}	0	Any value except 7	NA	{24'h0, pix0}
1	16bits	{pix3, pix2, pix1, pix0}	0	Any value except 7	NA	{16'h0,pix0}
2	32bits	{pix1, pix0}	0	Any value except 7	NA	{pix0}
3	64bits	{ pix0}	X	X	NA	Channel 0 bus output { pix0[31:0]} , Channel 1 bus output { pix0[63:32]}
1	16bits	{pix3, pix2, pix1, pix0}	1	0 (rgb565)	{8'h0,rgb888}	{pix0}
1	16bits	{pix3, pix2, pix1, pix0}	1	1 (rgb555)	{8'h0,rgb888}	{pix0}
1	16bits	{pix3, pix2, pix1, pix0}	1	2 (argb1555)	{8{a}},rgb888 }	{pix0}
1	16bits	{pix3, pix2, pix1, pix0}	1	3 (rgb444)	{8'h0,rgb888}	{pix0}
1	16bits	{pix3, pix2, pix1, pix0}	1	4 (argb4444)	{ {2{a}}, rgb888 }	{pix0}
1	16bits	{pix3, pix2, pix1, pix0}	1	5 (yuyv/yvyu)	{8'h0,yuv444} /{8'h0,yvu444}	{pix0}
1	16bits	{pix3, pix2, pix1, pix0}	1	6 (uyvy/vyuy)	{8'h0,yuv444} /{8'h0,yvu444}	{pix0}
x	x	Address0 {Y7,Y6,Y5,Y4,Y 3,Y2,Y1,Y0} Address1 {U6V6U4V4U2V 2U0V0}	1	7 (yuv422_2p)	{8'h0,yuv444}	{pix0}

Note that in 64 bpp mode, the expand and shift functions are not supported.

### 13.7.10.3 Data Fetching Format

- **Scanline mode**

When `HW_PXP_x_FETCH_CTRL_CHx.BLOCK_EN=0`, the Fetch Engine will fetch data line by line using scanline mode. The burst length can be set by `RD_NUM_BYTES` register bits. In Scanline mode, it can support 8, 16, 32 and 64 bytes for a burst. The values `RD_NUM_BYTES = 0,1,2,3` indicates 8,16,32,64 bytes per burst.

- **Block mode**

When `BLOCK_EN=1`, Fetch Engine support 8\*8 and 16\*16 block mode according to `BLOCK_16` register bit. When `BLOCK_16=1` the block size is 16\*16. When `BLOCK_16=0`, it is 8\*8 block mode. When `BLOCK_EN=1`, `INPUT_ACTIVE_BPP` cannot be 3, that is, block mode cannot work on a 64bpp data stream.

When the total width or total height of image is not divisible by 8 or 16 (according to block size) it will fetch extra pixels or lines to compensate to a complete block. For example, if the size is 23\*23, and block mode is 8\*8, Fetch Engine will fetch 24\*24 data pixels and output to store engine. Store engine has a crop function for this.

In block mode, AXI bus read number bytes is decided by input format and block size and overrides the `RD_NUM_BYTES` register field.

### 13.7.10.4 Fetch Data Shift Function

Fetch Engine supports a shift operation that will swizzle register defined data fields in the incoming data words. The post-shifted data is then output to the proper channel. Up to 4 component shift operations are supported.

The shift function can be disabled by asserting the `HW_PXP_x_FETCH_SHIFT_CTRL_CHx.SHIFT_BYPASS` bit. This function is bypassed by default.

The shift is configured with the `HW_PXP_x_FETCH_SHIFT_OFFSET_CHx.OFFSETx` and `HW_PXP_x_FETCH_SHIFT_WIDTH_CHx.WIDTHx` register fields. Each channel is controlled separately. The `OFFSETx` fields specify the starting position of the component fields in the incoming data word. The `WIDTHx` register fields specify the width of that component. There is register support for 4 component fields for each

channel. The specified fields are shifted in order and packed to the least significant part of the data word. The unspecified bits in the input word are discarded. If there are any unspecified bits in the most significant part of the output word they are zeroed out.

Not all fields must be specified. For example if field number three is not used then the WIDTH3 field should be left with a value of 0.

A few examples are shown in the figure below. In the example in figure, left, we are swizzling the data format of YVU444 to YUV444. The register fields should be set as follows:

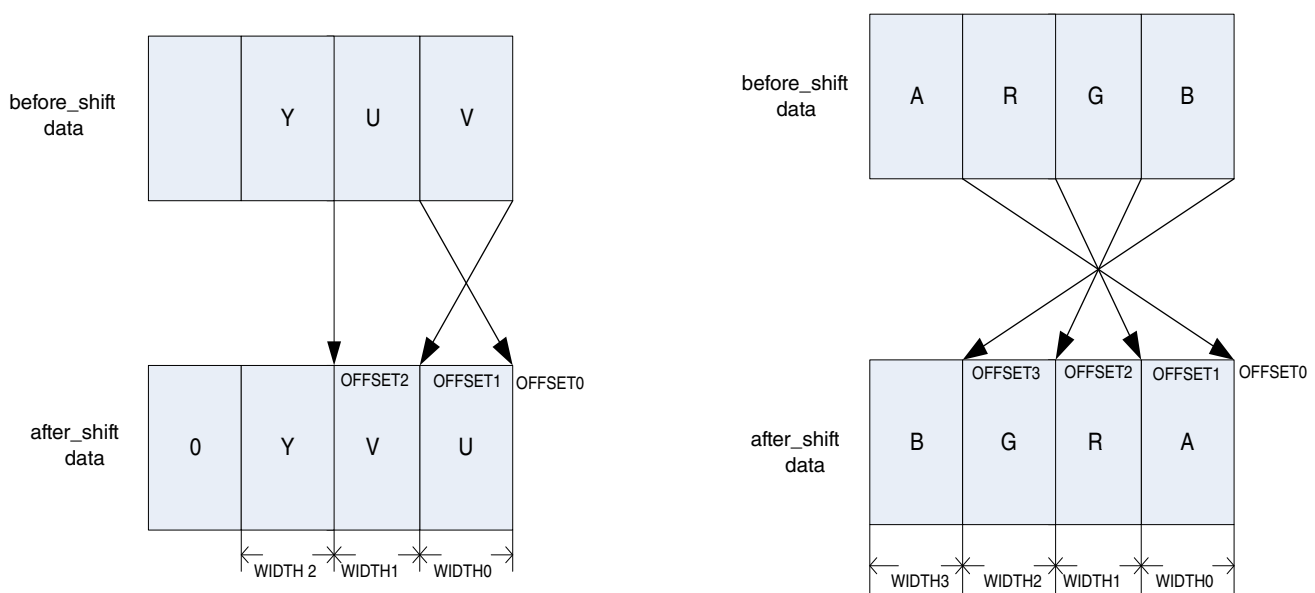

OFFSET0=8, WIDTH0=8, OFFSET1=0, WIDTH1=8, OFFSET2=16, WIDTH2=8, OFFSET3=0, WIDTH3=0

The result switches the position of the 8 bit U and V components. The Y component remains in the same place and the high byte remains unchanged.

In the example in figure, right, we are swizzling the data format of ARGB888 to BGRA888. The register settings are:

OFFSET0=24, WIDTH0=8, OFFSET1=16, WIDTH1=8, OFFSET2=8, WIDTH2=8, OFFSET3=0, WIDTH3=8

All the components are swizzled and packed to the right in order from component 0 to 3.

### 13.7.10.5 Fetch Interface Modes

- Normal mode

If HW\_PXP\_x\_FETCH\_CTRL\_CHx.BYPASS\_PIXEL\_EN=0 and HW\_PXP\_x\_FETCH\_CTRL\_CHx.HANDSHAKE\_EN=0, the Fetch Engine is working in the “normal” or default mode.

In normal mode, the Fetch engine will fetch data from output memory usually DDR frame by frame. The fetch frame start address is set in registers HW\_PXP\_DITHER\_FETCH\_ADDR\_x\_CH0.INPUT\_BASE\_ADDRx depending on which channel and plane format is used.

The Fetch Engine will stop to fetch data when one frame data is finished. Another pxp\_start signal will trigger another frame fetching work.

- **Bypass mode**

In the Fetch Engine, if HW\_PXP\_x\_FETCH\_CTRL\_CHx.BYPASS\_PIXEL\_EN=1 it will fetch data directly from the input pixel of the upstream Store Engine and not from memory. In this case the AXI bus is inactive.

In bypass mode, the pixel input will be 32 bits per pixel per valid cycle. The bypassed data will be stored to an internal FIFO first and then output to the next downstream block after the shift operation takes place.

When BYPASS\_EN=1, HANDSHAKE\_EN should be equal to 0. Bypass mode and Handshake mode can not be set at the same time.

- **Handshake mode**

If HW\_PXP\_x\_FETCH\_CTRL\_CHx.HANDSHAKE\_EN=1, the Fetch Engine is set to function in handshake mode.

The Fetch Engine supports 1 line/ 8line/16lines handshake with the Store Engine module according to HW\_PXP\_x\_FETCH\_CTRL\_CHx.HANDSHAKE\_SCAN\_LINE\_NUM register bits.

HANDSHAKE\_SCAN\_LINE\_NUM=0, 1, 2 indicates 1 line, 8 lines, 16 lines handshake mode separately.

One line handshake can only work in scanline mode, that is, under the condition of BLOCK\_EN = 0. Eight lines handshake can only work on block 8x8 mode -- BLOCK\_EN=1, BLOCK\_16=0.

Sixteen lines handshake configuration only works in block16x16 mode -- BLOCK\_EN=1, BLOCK\_16=1.

This is accomplished by creating two buffers in memory, where each correspond to 1/8/16-lines of the frame buffer. The buffers must be consecutive and allocated as a single block of data.

The storage required can be calculated for 1 line handshake as:

Storage = 1(line) \* 2(buffer) \* width \* bytes/pixel;

For 8 lines handshake config the requirements are:

Storage = 8(line) \* 2(buffer) \* width \* bytes/pixel;

For 16 lines handshake config:

Storage = 16(line) \* 2(buffer) \* width \* bytes/pixel;

To accomplish the buffer sharing, the Fetch Engine and store engine will maintain buffer status using a pair of handshake signals. When a buffer is filled by store engine, it will assert the `handshake_bx_ready` (where x is 0 or 1) signal to indicate to the Fetch Engine that the buffer has valid data. After reading it the Fetch Engine will then release the buffer by asserting the `handshake_bx_done` signal. The Store Engine is then free to refill it and assert the `handshake_bx_ready` again.

The 1 scanline mode is used when a Fetch Engine is connected to a Store Engine. An example would be the `Input_Store` communicating with the `Dither_Fetch`. The 8 and 16 scanline modes are used when the Output Buffer is communicating with the `Dither_Fetch`.

The basic protocol is shown in the diagram below:

## 13.7.11 Histogram

The histogram block collects statistics about the pixel data passing through it. Its primary function is to compare the value against programmed values representing the allowed values in different bpp (bits per pixel) modes or bins. A flag value of 1 is recorded if all the pixel values were a match for one of the values programmed for that bit per pixel mode or bin. If there is a mismatch for at least one pixel then the update is not completely contained within that bin and the output flag is 0. There are 5 bits reported. One for each of 1-5 bpp. The results for each bpp bin are always reported. These results are a necessary input to the EPDC for selecting the proper waveform for update to the panel. The pixel value and the compare values are always 6 bits wide although the max effective bpp is 5.

There is also a mask function that can be used to filter out update pixels and exclude them from histogram calculations. Its primary use-case is to collect and report collisions of the current update being processed through the WFE-A and report to software how many pixels collided with current live updates, if any, and the coordinates of the minimum rectangle within the update that contains all collided pixels.

There are two identical instances of the histogram block in the system. The first one can be programmed through a system mux to take data from the outbuf sub-block from the legacy flow, WFE-A or WFE-B. The second instance can take data only from WFE-A or WFE-B.

### 13.7.11.1 Basic Operation

The basic controls for each histogram engine are contained within their HW\_PXP\_HIST\_x\_CTRL and HW\_PXP\_HIST\_x\_MASK registers. We will use histogram A registers for explanation purposes in the description below.

The HW\_PXP\_HIST\_A\_CTRL.ENABLE bit turns on the histogram block to process pixels. It must be turned on and off manually. The HW\_PXP\_HIST\_A\_CTRL.CLEAR bit must be set to clear the histogram results. The bit is self-clearing. The input data (pixel) to the block is 72 bits wide. The comparison is done on 6 bits of pixel data. Any contiguous 6 bits in the 72 bit string can be chosen for comparison using the HW\_PXP\_HIST\_A\_CTRL.PIXEL\_OFFSET and HW\_PXP\_HIST\_A\_CTRL.PIXEL\_WIDTH fields. The offset specifies the starting bit position in the string and the width field specifies the width which should not be wider than 6 bits in the current implementation. The mode values for comparison are contained

in the HW\_PXP\_HIST<sub>x</sub>\_PARAM<sub>x</sub> register fields. Even though these fields are 6 bits wide, 5 bits is the effective width as the histogram can check for 32 unique pixel values in the largest mode, HIST32.

The result of which bpp modes were a match for all pixels since the output was cleared are continuously updated in the HW\_PXP\_HIST\_A\_CTRL.STATUS field. There is one bit for each bpp mode. All histogram bpp modes are checked simultaneously. The HW\_PXP\_HIST\_A\_BUF\_SIZE fields specify the height and width of the update area. This allows the histogram engine to keep track of the relative coordinates of each new pixel it receives. It assumes the pixels are fed to it in raster order, left to right and top to bottom.

### 13.7.11.2 Mask Functionality

There is also a mask function within the histogram engine that tests a specified string of bits from the input against values programmed into the mask register. The use-case for this is to report collision detection back to controlling software. If the mask test passes then the pixel is active and is processed in the engine and statistics collected. If the pixel is not active then it is discarded and not processed – does not contribute to the output results. Based on the outcome of this mask test, there are some additional results that are output to register fields. They are the number of active pixels, the coordinates of the smallest bounding box including all active pixels and an array of 64 bits where the offset of each bit corresponds to the pixel value of processed pixel. The bit is set for each valid pixel value processed.

The configuration of the mask function is contained in the HW\_PXP\_HIST\_x\_MASK register. The HW\_PXP\_HIST\_A\_MASK.MASK\_EN bit turns on the function. . The HW\_PXP\_HIST\_A\_CTRL.CLEAR bit clears the results. The HW\_PXP\_HIST\_A\_MASK.MASK\_MODE field specifies the logical operation for the test. The options are “equal”, “not equal”, “inside” or “outside.” The HW\_PXP\_HIST\_A\_MASK.MASK\_VALUE0 and HW\_PXP\_HIST\_A\_MASK.MASK\_VALUE1 are used for comparison with the incoming value depending on the mode chosen. The starting bit of mask field in the 72 bit input data is specified by the HW\_PXP\_HIST\_A\_MASK.MASK\_OFFSET register field and the width is given by HW\_PXP\_HIST\_A\_MASK.MASK\_WIDTH. The width of the mask is a maximum of 8 bits. If the mask mode test passes for a given input then the HW\_PXP\_HIST\_A\_TOTAL\_PIXEL read only value is incremented. The x and y coordinates of the pixel are used to calculate the minimum rectangle the will enclose all valid pixels. This information can be read from the HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_X and HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_Y registers. Also, the values of the valid pixels are recorded in the HW\_PXP\_HIST\_A\_RAW\_STAT0 and HW\_PXP\_HIST\_A\_RAW\_STAT0 registers.

These registers make up 64 one bit fields where the offsets of the bit that are set are the pixel values of the active pixels. (The values as specified by the HW\_PXP\_HIST\_A\_CTRL.PIXEL\_OFFSET and HW\_PXP\_HIST\_A\_CTRL.PIXEL\_WIDTH fields.)

### 13.7.11.3 Collision use-case Example

In this example, the histogram engine is used to test for and report collision information within the update. Refer to the figure below. With normal WFE-A processing, within the 72 bit output there will be a one bit collision flag that is assert to 1 if there was a collision on that update pixel. There will also be a 6 bit field that specifies the EPDC LUT number for that pixel in the working buffer. If there was a collision this LUT number identifies the unique colliding live update. To convey all this information to software using the histogram engine, the HW\_PXP\_HIST\_A\_CTRL.PIXEL\_OFFSET and HW\_PXP\_HIST\_A\_CTRL.PIXEL\_WIDTH should be set to point to the current LUT in the input bus. The HW\_PXP\_HIST\_A\_MASK.MASK\_OFFSET and HW\_PXP\_HIST\_A\_MASK.MASK\_WIDTH fields should be set to point to the collision bit. The HW\_PXP\_HIST\_A\_MASK.MASK\_MODE should be 0 or “equal” and the HW\_PXP\_HIST\_A\_MASK.MASK\_VALUE0 should be set to 1.

The figure above shows the processed results of our example. There is an update region, 499x449, offset within the 800x600 panel display. After enabling the histogram and processing the update, there is a collided region within the update region and 4 collided pixels were detected. The results are as follows.

The HW\_PXP\_HIST\_A\_TOTAL\_PIXEL register would equal to 4 showing that 4 pixels were found by the mask function to have their collision bits set.

The relative collision area are would be given in the HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_X and Y register as MIN\_X\_OFFSET = 50, MAX\_X\_OFFSET = 300, MIN\_Y\_OFFSET = 50, MAX\_Y\_OFFSET = 380.

If pixel A is being updated by LUT 1, pixel B and C are being updated LUT 5, and pixel D is being updated by LUT 12, then the LUT Collision Status = 0x00001022 (bit 1, 2, 12 are set). That is HW\_PXP\_HIST\_A\_RAW\_STAT0 would be equal to 0x00001022 and HW\_PXP\_HIST\_A\_RAW\_STAT1 would be 0x00000000.

## 13.7.12 PXP Memory Map/Register Definition

### PXP Hardware Register Format Summary

#### PXP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
3070_0000	Control Register 0 (PXP_HW_PXP_CTRL)	32	R/W	C700_8000h	<a href="#">13.7.12.1/4086</a>

### 13.7.12.1 Control Register 0 (PXP\_HW\_PXP\_CTRL)

The CTRL register contains controls for the PXP module.

HW\_PXP\_CTRL: 0x000

HW\_PXP\_CTRL\_SET: 0x004

HW\_PXP\_CTRL\_CLR: 0x008

HW\_PXP\_CTRL\_TOG: 0x00C

The Control register contains the primary controls for the PXP block.

#### EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 3070\_0000h base + 0h offset = 3070\_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R			RSVD4							RSVD1						
W																
Reset	1	1	0	0	0	1	1	1	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R										RSVD0						
W																
Reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_CTRL field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal PXP operation. Set this bit to one (default) to disable clocking with the PXP and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the PXP block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.

Table continues on the next page...

## PXP\_HW\_PXP\_CTRL field descriptions (continued)

Field	Description
29 RSVD4	Reserved, always set to zero.
28 EN_REPEAT	Enable the PXP to run continuously. When this bit is set, the PXP will repeat based on the current configuration register settings. If this bit is not set, the PXP will complete the process and enter the idle state ready to accept the next frame to be processed. This bit should be set when the LCDIF handshake mode is enabled so that the next frame is automatically generated for the next screen refresh cycle. If it not set and the handshake mode is enabled, the CPU will have to initiate the PXP for the next refresh cycle. When the PXP NEXT feature is used, it has priority over the REPEAT mode, in that the new register settings are fetched first, and then the next PXP operation will continue.
27 ENABLE_ROTATE1	Enable the ROTATE1 engine in the PXP primary processing flow.
26 ENABLE_ROTATE0	Enable the ROTATE0 engine in the PXP primary processing flow.
25 ENABLE_LUT	Enable the LUT engine in the PXP primary processing flow.
24 ENABLE_CSC2	Enable the CSC2 engine in the PXP primary processing flow.
23 BLOCK_SIZE	Select the block size to process through the Rotate block. 0x0 <b>8X8</b> — Process 8x8 pixel blocks. 0x1 <b>16X16</b> — Process 16x16 pixel blocks.
22 RSVD1	Reserved, always set to zero.
21 ENABLE_ALPHA_B	Enable the Alpha-B engine in the PXP primary processing flow.
20 ENABLE_INPUT_FETCH_STORE	Enable the Input Fetch and Store engine in the PXP primary processing flow.
19 ENABLE_WFE_B	Enable the WFE-B engine in the PXP primary processing flow.
18 ENABLE_WFE_A	Enable the WFE-A engine in the PXP primary processing flow.
17 ENABLE_DITHER	Enable the Dithering engine in the PXP primary processing flow.
16 ENABLE_PS_AS_OUT	Enable the PS engine, AS engine, OUTBUF in the PXP primary processing flow.
15 VFLIP1	Indicates that the input should be flipped vertically (effect applied before rotation).
14 HFLIP1	Indicates that the input should be flipped horizontally (effect applied before rotation).
13–12 ROTATE1	Indicates the clockwise rotation to be applied at the input buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation.

*Table continues on the next page...*

## PXP\_HW\_PXP\_CTRL field descriptions (continued)

Field	Description
	0x0 <b>ROT_0</b> — 0x1 <b>ROT_90</b> — 0x2 <b>ROT_180</b> — 0x3 <b>ROT_270</b> —
11 VFLIPO	Indicates that the output buffer should be flipped vertically (effect applied before rotation).
10 HFLIPO	Indicates that the output buffer should be flipped horizontally (effect applied before rotation).
9–8 ROTATE0	Indicates the clockwise rotation to be applied at the output buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation.  0x0 <b>ROT_0</b> — 0x1 <b>ROT_90</b> — 0x2 <b>ROT_180</b> — 0x3 <b>ROT_270</b> —
7–6 RSVD0	Reserved, always set to zero.
5 HANDSHAKE_ ABORT_SKIP	When skip is enable, even the abort asserted, pxp will not assert the ready directly but wait for whole block line complete.
4 ENABLE_LCD0_ HANDSHAKE	Enable handshake with LCD0 controller. When this is set, the PXP will not process an entire framebuffer, but will instead process rows of NxN blocks in a double-buffer handshake with the LCDIF. This enables the use of the onboard SRAM for a partial frame buffer.
3 LUT_DMA_IRQ_ ENABLE	LUT DMA interrupt enable. When set, the PXP will issue an interrupt when the LUT DMA has finished transferring data.
2 NEXT_IRQ_ ENABLE	Next command interrupt enable. When set, the PXP will issue an interrupt when a queued command initiated by a write to the PXP_NEXT register has been loaded into the PXP's registers. This interrupt also indicates that a new command may now be queued.
1 IRQ_ENABLE	Interrupt enable. NOTE: When using the HW_PXP_NEXT functionality to reprogram the PXP, the new value of this bit will be used and may therefore enable or disable an interrupt unintentionally.
0 ENABLE	Enables PXP operation with specified parameters. The ENABLE bit will remain set while the PXP is active and will be cleared once the current operation completes. Software should use the IRQ bit in the HW_PXP_STAT when polling for PXP completion.

### 13.7.12.2 Status Register (PXP\_HW\_PXP\_STAT)

The PXP Interrupt Status register provides interrupt status information.

HW\_PXP\_STAT: 0x010

HW\_PXP\_STAT\_SET: 0x014

HW\_PXP\_STAT\_CLR: 0x018

HW\_PXP\_STAT\_TOG: 0x01C

## Pixel Pipeline (PXP)

This register provides PXP interrupt status and the current X/Y block coordinate that is being processed.

### EXAMPLE

```
REG_STAT_CLR(BM_PXP_STAT_IRQ); // clear CSC interrupt
```

Address: 3070\_0000h base + 10h offset = 3070\_0010h

### PXP\_HW\_PXP\_STAT field descriptions

Field	Description
31–24 BLOCKX	Indicates the X coordinate of the block currently being rendered.
23–16 BLOCKY	Indicates the Y coordinate of the block currently being rendered.
15–12 AXI_ERROR_ID_ 1	Indicates the AXI1 ID of the failing bus operation.
11 RSVD2	Reserved, always set to zero.
10 AXI_READ_ ERROR_1	Indicates PXP encountered an AXI read error and processing has been terminated.
9 AXI_WRITE_ ERROR_1	Indicates PXP encountered an AXI write error and processing has been terminated.
8 LUT_DMA_ LOAD_DONE_ IRQ	Indicates that the LUT DMA transfer has completed.
7–4 AXI_ERROR_ID_ 0	Indicates the AXI0 ID of the failing bus operation.
3 NEXT_IRQ	Indicates that a command issued with the "Next Command" functionality has been issued and that a new command may be initiated with a write to the PXP_NEXT register.
2 AXI_READ_ ERROR_0	Indicates PXP encountered an AXI read error and processing has been terminated.
1 AXI_WRITE_ ERROR_0	Indicates PXP encountered an AXI write error and processing has been terminated.
0 IRQ0	Indicates current PXP interrupt status. The IRQ is routed through the pxp_irq when the IRQ_ENABLE bit in the control register is set.

#### 13.7.12.3 Output Buffer Control Register (PXP\_HW\_PXP\_OUT\_CTRL)

The OUT\_CTRL register contains controls for the Output Buffer.

HW\_PXP\_OUT\_CTRL: 0x020

HW\_PXP\_OUT\_CTRL\_SET: 0x024

HW\_PXP\_OUT\_CTRL\_CLR: 0x028

HW\_PXP\_OUT\_CTRL\_TOG: 0x02C

Control register to determine OUT buffer processing.

## Pixel Pipeline (PXP)

### EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 3070\_0000h base + 20h offset = 3070\_0020h

**PXP\_HW\_PXP\_OUT\_CTRL field descriptions**

Field	Description
31–24 ALPHA	When generating an output buffer with an alpha component, the value in this field will be used when enabled to override the alpha passed through the pixel data pipeline.
23 ALPHA_ OUTPUT	Indicates that alpha component in output buffer pixels should be overwritten by REG_OUT_CTRL[ALPHA] register. If 0, retain their alpha value from the computed alpha for that pixel.
22–10 RSVD1	Reserved, always set to zero.

*Table continues on the next page...*

### PXP\_HW\_PXP\_OUT\_CTRL field descriptions (continued)

Field	Description
9–8 INTERLACED_ OUTPUT	<p>Determines how the PXP writes its output data. Output interlacing should not be used in conjunction with input interlacing. Splitting frames into fields is most efficient using output interlacing. 2-plane output formats AND interlaced output is NOT supported.</p> <p>0x0 <b>PROGRESSIVE</b> — All data written in progressive format to the OUTBUF Pointer.</p> <p>0x1 <b>FIELD0</b> — Interlaced output: only data for field 0 is written to the OUTBUF Pointer.</p> <p>0x2 <b>FIELD1</b> — Interlaced output: only data for field 1 is written to the OUTBUF2 Pointer.</p> <p>0x3 <b>INTERLACED</b> — Interlaced output: data for field 0 is written to OUTBUF and data for field 1 is written to OUTBUF2.</p>
7–5 RSVD0	Reserved, always set to zero.
FORMAT	<p>Output framebuffer format. The UV byte lanes are synonymous with CbCr byte lanes for YUV output pixel formats. For example, the YUV2P420 format should be selected when the output is YCbCr 2-plane 420 output format.</p> <p>0x0 <b>ARGB8888</b> — 32-bit pixels</p> <p>0x4 <b>RGB888</b> — 32-bit pixels (unpacked 24-bit pixel in 32 bit DWORD.)</p> <p>0x5 <b>RGB888P</b> — 24-bit pixels (packed 24-bit format)</p> <p>0x8 <b>ARGB1555</b> — 16-bit pixels</p> <p>0x9 <b>ARGB4444</b> — 16-bit pixels</p> <p>0xC <b>RGB555</b> — 16-bit pixels</p> <p>0xD <b>RGB444</b> — 16-bit pixels</p> <p>0xE <b>RGB565</b> — 16-bit pixels</p> <p>0x10 <b>YUV1P444</b> — 32-bit pixels (1-plane XYUV unpacked)</p> <p>0x12 <b>UYVY1P422</b> — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes)</p> <p>0x13 <b>VYUY1P422</b> — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes)</p> <p>0x14 <b>Y8</b> — 8-bit monochrome pixels (1-plane Y luma output)</p> <p>0x15 <b>Y4</b> — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation)</p> <p>0x18 <b>YUV2P422</b> — 16-bit pixels (2-plane UV interleaved bytes)</p> <p>0x19 <b>YUV2P420</b> — 16-bit pixels (2-plane UV)</p> <p>0x1A <b>YVU2P422</b> — 16-bit pixels (2-plane VU interleaved bytes)</p> <p>0x1B <b>YVU2P420</b> — 16-bit pixels (2-plane VU)</p>

#### 13.7.12.4 Output Frame Buffer Pointer (PXP\_HW\_PXP\_OUT\_BUF)

Output Framebuffer Pointer. This register points to the beginning of the output frame buffer. This pointer is used for progressive format and field 0 when generating interlaced output.

This register is used by the logic to point to the current output location for the output frame buffer.

#### EXAMPLE

```
REG_OUT_BUF_WR( buffer );
```

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 30h offset = 3070\_0030h

### PXP\_HW\_PXP\_OUT\_BUF field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

## 13.7.12.5 Output Frame Buffer Pointer #2 (PXP\_HW\_PXP\_OUT\_BUF2)

Output Framebuffer Pointer #2. This register points to the beginning of the output frame buffer for either field 1 when generating interlaced output or for the UV buffer when in YUV 2-plane output modes. Both interlaced output AND 2-plane output modes are not supported in a single PXP operation. This register is NOT used as the pointer to the 2nd buffer when in LCDIF\_HANDSHAKE mode.

This register is used by the logic to point to the current output location for the field 1 or UV output frame buffer.

### EXAMPLE

```
REG_OUT_BUF_WR( field0 ); // buffer for interlaced field 0  
REG_OUT_BUF2_WR( field1 ); // buffer for interlaced field 1
```

Address: 3070\_0000h base + 40h offset = 3070\_0040h

### PXP\_HW\_PXP\_OUT\_BUF2 field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

## 13.7.12.6 Output Buffer Pitch (PXP\_HW\_PXP\_OUT\_PITCH)

This register contains the output buffer pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in output pixel address calculations.

### EXAMPLE

```
REG_OUT_PITCH_WR( 68 * 4 ); // The output buffer pitch is 68 pixels times 32 bits per pixel
```

Address: 3070\_0000h base + 50h offset = 3070\_0050h

#### PXP\_HW\_PXP\_OUT\_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

### 13.7.12.7 Output Surface Lower Right Coordinate (PXP\_HW\_PXP\_OUT\_LRC)

This register contains the size, or lower right coordinate, of the output buffer NOT rotated. It is implied that the upper left coordinate of the output surface is always [0,0]. When rotating the framebuffer, the PXP will automatically swap the X/Y, or WIDTH/HEIGHT, to accommodate the rotated size.

This register sets the size of the output frame buffer in pixels, not blocks. The frame buffer need not be a multiple of NxN pixels. Partial blocks will be written for output frame buffer sizes that are not divisible by N pixels in either dimension.

### EXAMPLE

```
REG_OUT_LRC[X]=319; // set width of output frame buffer to 320 pixels
REG_OUT_LRC[Y]=243; // set height of output frame buffer to 244 pixels which is not
divisible by block size N
```

```
REG_OUT_LRC_WR( BF_PXP_OUT_LRC_X(319) | BF_PXP_OUT_LRC_Y(243) );
```

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 60h offset = 3070\_0060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1															
W			X													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0															
W			Y													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_OUT\_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	Indicates number of horizontal PIXELS in the output surface (non-rotated). The output buffer pixel width minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.
15–14 RSVD0	Reserved, always set to zero.
Y	Indicates the number of vertical PIXELS in the output surface (non-rotated). The output buffer pixel height minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.

### 13.7.12.8 Processed Surface Upper Left Coordinate (PXP\_HW\_PXP\_OUT\_PS\_ULC)

This register contains the upper left pixel coordinate for the Processed Surface in the OUTPUT buffer.

This register contains the upper left coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the REG\_OUT\_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. If the value of the REG\_OUT\_PS\_ULC is greater than the REG\_OUT\_LRC, then no PS pixels will be fetched from memory, but only REG\_PS\_BACKGROUND pixels will be processed by the PS engine. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the REG\_OUT\_LRC extents will use the PS to render pixels into the output buffer.

#### EXAMPLE

```
REG_OUT_PS_ULC_WR(0,0x0002_0002); // Processed Surface upper left coordinate at (X,Y) = 2,2. The PS surface will not effect pixels in the first and second row and column of the output buffer.
```

Address: 3070\_0000h base + 70h offset = 3070\_0070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1															
W			X													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0															
W			Y													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_OUT\_PS\_ULC field descriptions**

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the processed surface (PS) in the output buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the processed surface in the output buffer.

**13.7.12.9 Processed Surface Lower Right Coordinate (PXP\_HW\_PXP\_OUT\_PS\_LRC)**

This register contains the lower right extent for the Processed Surface in the OUTPUT buffer.

This register contains the lower right coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the REG\_OUT\_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the REG\_OUT\_LRC extents will use the PS to render pixels into the output buffer.

**EXAMPLE**

```
REG_OUT_PS_ULC_WR(0,0x03FF_03FF); // With this UL/LR pair of pixel coordinates, only one
pixel at OUT[X,Y]=1023,1023 will use the PS to contribute to its value.
REG_OUT_PS_LRC_WR(0,0x03FF_03FF);
```

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 80h offset = 3070\_0080h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	RSVD1																
W				X

### PXP\_HW\_PXP\_OUT\_PS\_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the processed surface (PS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the processed surface in the output frame buffer.

### 13.7.12.10 Alpha Surface Upper Left Coordinate (PXP\_HW\_PXP\_OUT\_AS\_ULC)

This register contains the upper left location for the Alpha Surface in the output buffer.

This register contains the upper left coordinate of AS in the output frame buffer (in pixels). Values that are within the REG\_OUT\_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the upper left coordinates will use the AS to render pixels in the output buffer.

#### EXAMPLE

```
REG_OUT_AS_ULC_WR(0,0x0001_0001); // Alpha Surface upper left coordinate at (X,Y) = 1,1.
The AS surface will not effect pixels in the first row or first column of the output buffer.
```

Address: 3070\_0000h base + 90h offset = 3070\_0090h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

### PXP\_HW\_PXP\_OUT\_AS\_ULC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

### 13.7.12.11 Alpha Surface Lower Right Coordinate (PXP\_HW\_PXP\_OUT\_AS\_LRC)

This register contains the lower right extent for Alpha Surface in the output buffer.

This register contains the lower right coordinate of AS in the output frame buffer (in pixels). Values that are within the REG\_OUT\_LRC[X,Y] extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are less than or equal to the lower right coordinates will use the AS to render pixels in the output buffer.

#### EXAMPLE

```
REG_AS_LRC_WR(0,0x03FF_03FF); // Alpha Surface lower right coordinate at (X,Y) = 1023,1023.
```

Address: 3070\_0000h base + A0h offset = 3070\_00A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1				X

**PXP\_HW\_PXP\_OUT\_AS\_LRC field descriptions**

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

**13.7.12.12 Processed Surface (PS) Control Register (PXP\_HW\_PXP\_PS\_CTRL)**

The PS\_CTRL register contains controls for the Processed Surface Buffer.

HW\_PXP\_PS\_CTRL: 0x0B0

HW\_PXP\_PS\_CTRL\_SET: 0x0b4

HW\_PXP\_PS\_CTRL\_CLR: 0x0B8

HW\_PXP\_PS\_CTRL\_TOG: 0x0BC

Control register to determine PS buffer processing.

**EXAMPLE**

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 3070\_0000h base + B0h offset = 3070\_00B0h

PXP\_HW\_PXP\_PS\_CTRL field descriptions

Field	Description
31–12 RSVD1	Reserved, always set to zero.
11–10 DECX	Horizontal pre decimation filter control. 0x0 <b>DISABLE</b> — Disable pre-decimation filter. 0x1 <b>DECX2</b> — Decimate PS by 2. 0x2 <b>DECX4</b> — Decimate PS by 4. 0x3 <b>DECX8</b> — Decimate PS by 8.
9–8 DECY	Verticle pre decimation filter control. 0x0 <b>DISABLE</b> — Disable pre-decimation filter. 0x1 <b>DECY2</b> — Decimate PS by 2. 0x2 <b>DECY4</b> — Decimate PS by 4. 0x3 <b>DECY8</b> — Decimate PS by 8.
7 RSVD0	Reserved, always set to zero.
6 WB_SWAP	Swap bytes in words. For each 16 bit word, the two bytes will be swapped.
FORMAT	PS buffer format. To select between YUV and YCbCr formats, see bit 31 of the CSC1_COEF0 register. 0x4 <b>RGB888</b> — 32-bit pixels (unpacked 24-bit format) 0xC <b>RGB555</b> — 16-bit pixels 0xD <b>RGB444</b> — 16-bit pixels 0xE <b>RGB565</b> — 16-bit pixels 0x10 <b>YUV1P444</b> — 32-bit pixels (1-plane XYUV unpacked) 0x12 <b>UYVY1P422</b> — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 <b>VYUY1P422</b> — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 <b>Y8</b> — 8-bit monochrome pixels (1-plane Y luma output) 0x15 <b>Y4</b> — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 <b>YUV2P422</b> — 16-bit pixels (2-plane UV interleaved bytes) 0x19 <b>YUV2P420</b> — 16-bit pixels (2-plane UV)

Table continues on the next page...

**PXP\_HW\_PXP\_PS\_CTRL field descriptions (continued)**

Field	Description
0x1A	<b>YVU2P422</b> — 16-bit pixels (2-plane VU interleaved bytes)
0x1B	<b>YVU2P420</b> — 16-bit pixels (2-plane VU)
0x1E	<b>YUV422</b> — 16-bit pixels (3-plane format)
0x1F	<b>YUV420</b> — 16-bit pixels (3-plane format)

**13.7.12.13 PS Input Buffer Address (PXP\_HW\_PXP\_PS\_BUF)**

PS Input Buffer Address. This should be programmed to the starting address of the RGB data or Y (luma) data for the PS plane.

This register contains the pointer to the Luma/RGB buffer. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

**EXAMPLE**

```
REG_PS_BUF_WR(image_rgb); // RGB image
REG_PS_BUF_WR(image_y); // Y (luma) image data
REG_PS_UBUF_WR(image_u); // U (Cb) image data
REG_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 3070\_0000h base + C0h offset = 3070\_00C0h

**PXP\_HW\_PXP\_PS\_BUF field descriptions**

Field	Description
ADDR	Address pointer for the PS RGB or Y (luma) input buffer.

**13.7.12.14 PS U/Cb or 2 Plane UV Input Buffer Address (PXP\_HW\_PXP\_PS\_UBUF)**

PS Chroma (U/Cb/UV) Input Buffer Address. This register points to the beginning of the PS U/Cb input buffer. In two plane operation, this register points to the beginning of the PS UV chroma input buffer.

This register contains the pointer to the Chroma U/Cb or 2 plane UV buffer. This register is unused when processing 1-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

### EXAMPLE

```
REG_PS_BUF_WR(image_y); // Y (luma) image data
REG_PS_UBUF_WR(image_u); // U (Cb) image data
REG_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 3070\_0000h base + D0h offset = 3070\_00D0h

### PXP\_HW\_PXP\_PS\_UBUF field descriptions

Field	Description
ADDR	Address pointer for the PS U/Cb or 2 plane UV Chroma input buffer.

### 13.7.12.15 PS V/Cr Input Buffer Address (PXP\_HW\_PXP\_PS\_VBUF)

PS Chroma (V/Cr) Input Buffer Address. This register points to the beginning of the PS V/Cr input buffer. In one or two plane operation, this register is not used. In monochrome modes Y8 and Y4, the low 16 bits are used as the U/V data in the datapath instead of sourcing U/V data from external buffers. In this case, it represents a fixed value for U/V data.

This register contains the pointer to the Chroma V/Cr buffer. For Y8/Y4 modes, the low 16 bits are used as the monochrome U and V values in the data path. Bits [15:8] represent the U data byte, and bits [7:0] represent the V data byte. Other than with Y8/Y4 input buffer formats, this register is unused when processing 1 or 2-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

### EXAMPLE

```
REG_PS_BUF_WR(image_y); // Y (luma) image data
REG_PS_UBUF_WR(image_u); // U (Cb) image data
REG_PS_VBUF_WR(image_v); // V (Cr) image data
```

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + E0h offset = 3070\_00E0h

### PXP\_HW\_PXP\_PS\_VBUF field descriptions

Field	Description
ADDR	Address pointer for the PS V/Cr Chroma input buffer.

## 13.7.12.16 Processed Surface Pitch (PXP\_HW\_PXP\_PS\_PITCH)

This register contains the processed surface pitch in bytes.

Any byte value will indicate the vertical pitch of the PS source frame buffer. This value will be used in PS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input PS surface. For multi-plane formats, the Y buffer pitch should be programmed. For 2-plane YUV422, the UV pitch is the same as the Y pitch. For 3-plane YUV422, the U and V pitch is 1/2 the Y pitch. For 2-plane YUV420, the UV pitch is 1/2 the Y pitch. For 3-plane YUV420, the U and V pitch is 1/4 the Y pitch. All source buffers should comply with these U and V resolution reductions with respect to their Y source buffers.

### EXAMPLE

```
REG_PS_PITCH_WR( 64 * 4 ); // The output buffer pitch is 64 pixels times 32 bits per pixel
```

Address: 3070\_0000h base + F0h offset = 3070\_00F0h

### PXP\_HW\_PXP\_PS\_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

### 13.7.12.17 PS Background Color (PXP\_HW\_PXP\_PS\_BACKGROUND\_0)

PS Background Pixel Color. This register provides a pixel value used when processing pixels outside of the region specified by the PS Coordinate registers. This value can effectively be used to set the color of the letterboxing region around the PS image. This value is used by the Alpha A block.

This register contains a pixel value to be used for any PS pixels that fall outside the PS extents. This is effectively a background or letterbox color. The CSC1 control and datapath pixel format should be considered when selecting the background color.

#### EXAMPLE

```
REG_PS_BACKGROUND_WR(0x00000000); // letterbox is black
REG_PS_BACKGROUND_WR(0x00800000); // letterbox is dark red
REG_PS_BACKGROUND_WR(0x00008000); // letterbox is dark green
REG_PS_BACKGROUND_WR(0x00000080); // letterbox is dark blue
```

Address: 3070\_0000h base + 100h offset = 3070\_0100h

#### PXP\_HW\_PXP\_PS\_BACKGROUND\_0 field descriptions

Field	Description
31–24 RSVD	Reserved, always set to zero.
COLOR	Background color (in 24bpp format) for any pixels not within the buffer range specified by the PS ULC/LRC.

### 13.7.12.18 PS Scale Factor Register (PXP\_HW\_PXP\_PS\_SCALE)

PS Scale Factor. This register provides the scale factor for the PS buffer.

The maximum down scaling factor is 1/2 such that the output image in either axis is 1/2 the size of the source. The maximum up scaling factor is 2<sup>12</sup> for either axis. The reciprocal of the scale factor should be loaded into this register. To reduce the PS buffer by a factor of two in the output frame buffer, a value of 10.0000\_0000\_0000 should be

## Pixel Pipeline (PXP)

loaded into this register. To scale up by a factor of 4, the value of 1/4, or 00.0100\_0000\_0000, should be loaded into this register. To scale up by 8/5, the value of 00.1010\_0000\_0000 should be loaded.

### EXAMPLE

```
REG_PS_SCALE_WR(0x10001000); // 1:1 scaling (0x1.000)
REG_PS_SCALE_WR(0x08000800); // 2x scaling (0x0.800)
REG_PS_SCALE_WR(0x20002000); // 1/2x scaling (0x2.000)
```

Address: 3070\_0000h base + 110h offset = 3070\_0110h

### PXP\_HW\_PXP\_PS\_SCALE field descriptions

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 YSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the Y scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.
15 RSVD1	Reserved, always set to zero.

*Table continues on the next page...*

## PXP\_HW\_PXP\_PS\_SCALE field descriptions (continued)

Field	Description
XSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the X scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.

## 13.7.12.19 PS Scale Offset Register (PXP\_HW\_PXP\_PS\_OFFSET)

PS Scale Offset. This register provides the initial scale offset for the PS buffer.

The X and Y offset provides the ability to access the source image with a per sub-pixel granularity. This provides the capability to use all source pixels to effect the output PS image. The fixed offset values can be used for sub-pixel adjustments in the bilinear scaling filter. For example, when scaling an image down by a factor of 2, an initial offset of 0x0 would result in sub-sampling every other pixel. If a fixed offset of 0x800 (1/2), all pixels are used in scaling the final output pixel value. In this case, the first output pixel would be the sum of  $(1/2 * P0) + (1/2 * P1)$ . This fixed offset is applied after the decimation filter stage, and before the bilinear filter stage.

## EXAMPLE

```
REG_PS_SCALE_WR(0x2000_2000); // 1/2x scaling (0x2.000)
REG_PS_OFFSET_WR(0x0800_0800); // half-pixel offset in both X and Y to ensure averaging
versus pixel decimation
```

Address: 3070\_0000h base + 120h offset = 3070\_0120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD2				YOFFSET												RSVD1				XOFFSET											
W	0				0												0				0											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## PXP\_HW\_PXP\_PS\_OFFSET field descriptions

Field	Description
31–28 RSVD2	Reserved, always set to zero.
27–16 YOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the Y scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.
15–12 RSVD1	Reserved, always set to zero.
XOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the X scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.

### 13.7.12.20 PS Color Key Low (PXP\_HW\_PXP\_PS\_CLRKEYLOW\_0)

This register contains the color key low value for the PS buffer. This value is used by the Alpha A block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG\_PS\_CLRKEYLOW and REG\_PS\_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG\_PS\_BACKGROUND color is passed down the pixel pipeline.

#### EXAMPLE

```

// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green
    
```

Address: 3070\_0000h base + 130h offset = 3070\_0130h

**PXP\_HW\_PXP\_PS\_CLRKEYLOW\_0 field descriptions**

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

### 13.7.12.21 PS Color Key High (PXP\_HW\_PXP\_PS\_CLRKEYHIGH\_0)

This register contains the color key high value for the PS buffer. This value is used by the Alpha A block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG\_PS\_CLRKEYLOW and REG\_PS\_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG\_PS\_BACKGROUND color is passed down the pixel pipeline.

#### EXAMPLE

```

// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green

```

Address: 3070\_0000h base + 140h offset = 3070\_0140h

### PXP\_HW\_PXP\_PS\_CLRKEYHIGH\_0 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

## 13.7.12.22 Alpha Surface Control (PXP\_HW\_PXP\_AS\_CTRL)

This register contains buffer control for the Alpha Surface 0 input buffer.

Control register to determine AS buffer processing.

### EXAMPLE

```

u32 asparam;
    asparam = BF_PXP_ASPARAM_ENABLE      (1);
    asparam |= BF_PXP_ASPARAM_ALPHA_CTRL(BV_PXP_ASPARAM_ALPHA_CTRL__ROPS);
    asparam |= BF_PXP_ASPARAM_FORMAT     (BV_PXP_ASPARAM_FORMAT__ARGB8888);
    asparam |= BF_PXP_ASPARAM_ROP        (BV_PXP_ASPARAM_ROP__XORAS);
REG_ASPARAM_WR(0,asparam); // enable alpha surface to perform XOR ROP using RGB8888 AS
pixel format

```

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 150h offset = 3070\_0150h

### PXP\_HW\_PXP\_AS\_CTRL field descriptions

Field	Description
31–22 RSVD1	Reserved, always set to zero.
21 ALPHA1_ INVERT	Setting this bit to logic 0 will not alter the alpha1 value. A logic 1 will invert the alpha1 value and apply (1-alpha) for image composition.
20 ALPHA0_ INVERT	Setting this bit to logic 0 will not alter the alpha0 value. A logic 1 will invert the alpha0 value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field.  0x0 <b>MASKAS</b> — AS AND PS

Table continues on the next page...

## PXP\_HW\_PXP\_AS\_CTRL field descriptions (continued)

Field	Description
	0x1 <b>MASKNOTAS</b> — nAS AND PS 0x2 <b>MASKASNOT</b> — AS AND nPS 0x3 <b>MERGEAS</b> — AS OR PS 0x4 <b>MERGENOTAS</b> — nAS OR PS 0x5 <b>MERGEASNOT</b> — AS OR nPS 0x6 <b>NOTCOPYAS</b> — nAS 0x7 <b>NOT</b> — nPS 0x8 <b>NOTMASKAS</b> — AS NAND PS 0x9 <b>NOTMERGEAS</b> — AS NOR PS 0xA <b>XORAS</b> — AS XOR PS 0xB <b>NOTXORAS</b> — AS XNOR PS
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS.  0x0 <b>ARGB8888</b> — 32-bit pixels with alpha 0x1 <b>RGBA8888</b> — 32-bit pixels with alpha 0x4 <b>RGB888</b> — 32-bit pixels without alpha (unpacked 24-bit format) 0x8 <b>ARGB1555</b> — 16-bit pixels with alpha 0x9 <b>ARGB4444</b> — 16-bit pixels with alpha 0xC <b>RGB555</b> — 16-bit pixels without alpha 0xD <b>RGB444</b> — 16-bit pixels without alpha 0xE <b>RGB565</b> — 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels.  0x0 <b>Embedded</b> — Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. 0x1 <b>Override</b> — Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. 0x2 <b>Multiply</b> — Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. 0x3 <b>ROPs</b> — Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 RSVD0	Reserved, always set to zero.

### 13.7.12.23 Alpha Surface Buffer Pointer (PXP\_HW\_PXP\_AS\_BUF)

Alpha Surface 0 Buffer Address Pointer. This register points to the beginning of the Alpha Surface 0 input buffer.

This register is used to indicate the base address of the AS buffer.

**Pixel Pipeline (PXP)**

**EXAMPLE**

```
u32* alpha_ptr;
REG_ASn_WR(0,alpha_ptr);
```

Address: 3070\_0000h base + 160h offset = 3070\_0160h

**PXP\_HW\_PXP\_AS\_BUF field descriptions**

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

**13.7.12.24 Alpha Surface Pitch (PXP\_HW\_PXP\_AS\_PITCH)**

This register contains the alpha surface pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in AS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input AS surface.

**EXAMPLE**

```
REG_AS_PITCH_WR( 1920 * 4 ); // The output buffer pitch is HD resolution at 32 bits per pixel
```

Address: 3070\_0000h base + 170h offset = 3070\_0170h

**PXP\_HW\_PXP\_AS\_PITCH field descriptions**

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

### 13.7.12.25 Overlay Color Key Low (PXP\_HW\_PXP\_AS\_CLRKEYLOW\_0)

This register contains the color key low value for the AS buffer. This value is used by the Alpha A block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

#### EXAMPLE

```
// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red
```

Address: 3070\_0000h base + 180h offset = 3070\_0180h

#### PXP\_HW\_PXP\_AS\_CLRKEYLOW\_0 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

### 13.7.12.26 Overlay Color Key High (PXP\_HW\_PXP\_AS\_CLRKEYHIGH\_0)

This register contains the color key high value for the AS buffer. This value is used by the Alpha A block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

## Pixel Pipeline (PXP)

### EXAMPLE

```

// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red

```

Address: 3070\_0000h base + 190h offset = 3070\_0190h

#### PXP\_HW\_PXP\_AS\_CLRKEYHIGH\_0 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

### 13.7.12.27 Color Space Conversion Coefficient Register 0 (PXP\_HW\_PXP\_CSC1\_COEF0)

This register contains color space conversion coefficients in two's complement notation.

The Coefficient 0 register contains coefficients used in the color space conversion algorithm. The Y and UV offsets are added to the source buffer to normalize them before the conversion. C0 is the coefficient that is used to multiply the luma component of the data for all three RGB components.

### EXAMPLE

```

// The equations used for Colorspace conversion are:
//   R = C0*(Y+YOFFSET) + C1(V+UV_OFFSET)
//   G = C0*(Y+YOFFSET) + C3(U+UV_OFFSET) + C2(V+UV_OFFSET)
//   B = C0*(Y+YOFFSET) + C4(U+UV_OFFSET)

REG_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
REG_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
REG_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3

```

Address: 3070\_0000h base + 1A0h offset = 3070\_01A0h

**PXP\_HW\_PXP\_CSC1\_COEF0 field descriptions**

Field	Description
31 YCBCR_MODE	Set to 1 when performing YCbCr conversion to RGB. Set to 0 when converting YUV to RGB data. This bit changes the behavior of the scaler when performing U/V scaling.
30 BYPASS	Bypass the CSC unit in the scaling engine. When set to logic 1, bypass is enabled and the output pixels will be in the YUV/YCbCr color space. When set to logic 0, the CSC unit is enabled and the pixels will be converted based on the programmed coefficients.
29 RSVD1	Reserved, always set to zero.
28–18 C0	Two's compliment Y multiplier coefficient. YUV=0x100 (1.000) YCbCr=0x12A (1.164)
17–9 UV_OFFSET	Two's compliment phase offset implicit for CbCr data. Generally used for YCbCr to RGB conversion. YCbCr=0x180, YUV=0x000 (typically -128 or 0x180 to indicate normalized -0.5 to 0.5 range)
Y_OFFSET	Two's compliment amplitude offset implicit in the Y data. For YUV, this is typically 0 and for YCbCr, this is typically -16 (0x1F0)

### 13.7.12.28 Color Space Conversion Coefficient Register 1 (PXP\_HW\_PXP\_CSC1\_COEF1)

This register contains color space conversion coefficients in two's complement notation.

The Coefficient 1 register contains coefficients used in the color space conversion algorithm. C1 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the red component. C4 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the blue component. Both values should be coded as a two's complement fixed point number with 8 bits right of the decimal.

#### EXAMPLE

```
REG_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
REG_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
REG_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 3070\_0000h base + 1B0h offset = 3070\_01B0h

PXP\_HW\_PXP\_CSC1\_COEF1 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C1	Two's compliment Red V/Cr multiplier coefficient. YUV=0x123 (1.140) YCbCr=0x198 (1.596)
15–11 RSVD0	Reserved, always set to zero.
C4	Two's compliment Blue U/Cb multiplier coefficient. YUV=0x208 (2.032) YCbCr=0x204 (2.017)

### 13.7.12.29 Color Space Conversion Coefficient Register 2 (PXP\_HW\_PXP\_CSC1\_COEF2)

This register contains color space conversion coefficients in two's complement notation.

The Coefficient 2 register contains coefficients used in the color space conversion algorithm. C2 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the green component. C3 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the green component. Both values should be coded as a two's complement fixed point number with 8 bits right of the decimal.

### EXAMPLE

// NOTE: The default values for the CSCCOEF2 register are incorrect. C2 should be 0x76B and C3 should be 0x79C for proper operation.

```
REG_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UYoffset
REG_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
REG_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 3070\_0000h base + 1C0h offset = 3070\_01C0h

#### PXP\_HW\_PXP\_CSC1\_COEF2 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's complement Green V/Cr multiplier coefficient. YUV=0x76B (-0.581) YCbCr=0x730 (-0.813)
15–11 RSVD0	Reserved, always set to zero.
C3	Two's complement Green U/Cb multiplier coefficient. YUV=0x79C (-0.394) YCbCr=0x79C (-0.392)

### 13.7.12.30 Color Space Conversion Control Register. (PXP\_HW\_PXP\_CSC2\_CTRL)

This register contains the control registers to configure the CSC module.

The CSC control register will configure the CSC module to perform color space conversion between the RGB/YUV/YCbCr color spaces.

### EXAMPLE

```
//Converting from YUV/YCbCr color spaces to the RGB color space uses the
//following equation structure:
//
// R = A1(Y-D1) + A2(U-D2) + A3(V-D3)
// G = B1(Y-D1) + B2(U-D2) + B3(V-D3)
```

## Pixel Pipeline (PXP)

```
// B = C1(Y-D1) + C2(U-D2) + C3(V-D3)
//
//Converting from the RGB color space to YUV/YCbCr color spaces uses the
//following equation structure:
//
// Y = A1*R + A2*G + A3*B + D1
// U = B1*R + B2*G + B3*B + D2
// V = C1*R + C2*G + C3*B + D3
//
//All math is signed, so all coefficients come in as two's comp numbers
//
```

Address: 3070\_0000h base + 1D0h offset = 3070\_01D0h

### PXP\_HW\_PXP\_CSC2\_CTRL field descriptions

Field	Description
31–3 RSVD	Reserved, always set to zero.
2–1 CSC_MODE	This field controls how the CSC unit operates on pixels when the CSC is not bypassed. 0x0 <b>YUV2RGB</b> — Convert from YUV to RGB. 0x1 <b>YCbCr2RGB</b> — Convert from YCbCr to RGB. 0x2 <b>RGB2YUV</b> — Convert from RGB to YUV. 0x3 <b>RGB2YCbCr</b> — Convert from RGB to YCbCr.
0 BYPASS	This bit controls whether the pixels entering the CSC2 unit get converted or not. When BYPASS is set, no operations occur on the pixels. When BYPASS is cleared, the selected CSC operation takes place.

### 13.7.12.31 Color Space Conversion Coefficient Register 0 (PXP\_HW\_PXP\_CSC2\_COEF0)

This register contains color space conversion coefficients in two's complement notation.

Address: 3070\_0000h base + 1E0h offset = 3070\_01E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_CSC2\_COEF1 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 B1	Two's complement coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

Table continues on the next page...

**PXP\_HW\_PXP\_CSC2\_COEF1 field descriptions (continued)**

Field	Description
15–11 RSVD0	Reserved, always set to zero.
A3	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

**13.7.12.33 Color Space Conversion Coefficient Register 2 (PXP\_HW\_PXP\_CSC2\_COEF2)**

This register contains color space conversion coefficients in two's compliment notation.

Address: 3070\_0000h base + 200h offset = 3070\_0200h

**PXP\_HW\_PXP\_CSC2\_COEF2 field descriptions**

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 B3	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
B2	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

**13.7.12.34 Color Space Conversion Coefficient Register 3 (PXP\_HW\_PXP\_CSC2\_COEF3)**

This register contains color space conversion coefficients in two's compliment notation.

Address: 3070\_0000h base + 210h offset = 3070\_0210h

### PXP\_HW\_PXP\_CSC2\_COEF3 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.
15–11 RSVD0	Reserved, always set to zero.
C1	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

### 13.7.12.35 Color Space Conversion Coefficient Register 4 (PXP\_HW\_PXP\_CSC2\_COEF4)

This register contains color space conversion coefficients in two's compliment notation.

Address: 3070\_0000h base + 220h offset = 3070\_0220h

### PXP\_HW\_PXP\_CSC2\_COEF4 field descriptions

Field	Description
31–25 RSVD1	Reserved, always set to zero.
24–16 D1	Two's compliment coefficient integer offset to be added.
15–11 RSVD0	Reserved, always set to zero.
C3	Two's compliment coefficient offset. This coefficient has a sign bit, 2 bits integer, and 8 bits of fraction as ###.####_####.

### 13.7.12.36 Color Space Conversion Coefficient Register 5 (PXP\_HW\_PXP\_CSC2\_COEF5)

This register contains color space conversion coefficients in two's compliment notation.

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 230h offset = 3070\_0230h

### PXP\_HW\_PXP\_CSC2\_COEF5 field descriptions

Field	Description
31–25 RSVD1	Reserved, always set to zero.
24–16 D3	Two's compliment coefficient integer offset to be added.
15–9 RSVD0	Reserved, always set to zero.
D2	Two's compliment D1 coefficient integer offset to be added.

### 13.7.12.37 Lookup Table Control Register. (PXP\_HW\_PXP\_LUT\_CTRL)

This register is used to access/control the Monochrome Lookup table.

The Y8 LUT input mode will take the high order data path byte and transform it using the LUT memory. This is an 8-bit to 8-bit transformation. The two low order bytes bypass the LUT and are not transformed, but bypassed without modification. This option can be used for monochrome gamma correction. The Direct Lookup mode will use the high nibble of each data byte and truncate the low nibble to generate the lookup address, i.e.  $R[7:0]G[7:0]B[7:0] \rightarrow R[7:4]G[7:4]B[7:4]$ . 4K pixels (12-bit address) with 2 bytes per pixel is supported in this mode. Cached Lookup mode will use the high order bits,  $R[7:3], G[7:2], B[7:3]$  or RGB565, to address the cached LUT memory. 64KB LUT tables, using 16KB of internal LUT memory, can be indirectly transformed to 16-bit output pixels (as in RGBW4444/RGB565). This is used for 16bpp gamma correction or EPD color panel support. Cache misses are internally managed by the PXP LUT Cache controller.

Address: 3070\_0000h base + 240h offset = 3070\_0240h

### PXP\_HW\_PXP\_LUT\_CTRL field descriptions

Field	Description
31 BYPASS	Setting this bit will bypass the LUT memory resource completely. No pixel transformations will occur at this stage of the PXP pixel processing pipeline.
30–26 RSVD3	Reserved, always set to zero.
25–24 LOOKUP_MODE	Configure the input address for the 16KB LUT memory. The address into the LUT uses different parts of the pixel data path bytes. The data path is defined as three bytes, conceptually as RGB/YUV/YCbCr[23:0]. Also referred to as R/Y[7:0],G/U[7:0],B/V[7:0]  0x0 <b>CACHE_RGB565</b> — LUT ADDR = R[7:3],G[7:2],B[7:3]. Use all 16KB of LUT for indirect cached 128KB lookup. 0x1 <b>DIRECT_Y8</b> — LUT ADDR = 16'b0,Y[7:0]. Use only the first 256 bytes of LUT. Only the Y, or third data path byte, is transformed. 0x2 <b>DIRECT_RGB444</b> — LUT ADDR = R[7:4],G[7:4],B[7:4]. Use one 8KB bank of LUT selected by SEL_8KB. 0x3 <b>DIRECT_RGB454</b> — LUT ADDR = R[7:4],G[7:3],B[7:4]. Use all 16KB of LUT.
23–18 RSVD2	Reserved, always set to zero.

Table continues on the next page...

## PXP\_HW\_PXP\_LUT\_CTRL field descriptions (continued)

Field	Description
17–16 OUT_MODE	Select the output mode of operation for the LUT resource. There are four bytes [3-0] in the data path at the output of the LUT resource. Byte lane 3 is always bypassed and usually contains an alpha value. The LUT can be programmed to transform bytes 2,1,0 according to the options available in this field.  0x0 <b>RESERVED</b> — Reserved, not valid when using the LUT to transform pixels. 0x1 <b>Y8</b> — R/Y byte lane 2 lookup, bytes 1,0 bypassed. 0x2 <b>RGBW4444CFA</b> — Byte lane 2 = CFA_Y8, byte lane 1,0 = RGBW4444. 0x3 <b>RGB888</b> — RGB565->RGB888 conversion for Gamma correction.
15–11 RSVD1	Reserved, always set to zero.
10 SEL_8KB	Selects which 8KB bank of memory to use for direct 12bpp lookup modes. Logic 0 indicates first 8KB, logic 1 indicates second 8KB. Two direct LUT arrays can be stored and one can be selected for a given PXP operation.
9 LRU_UPD	Least Recently Used Policy Update Control: 1=> block LRU update for hit after miss. 0=> update LRU for all hits including hit after miss.
8 INVALID	Invalidate the cache LRU and valid bits. This bit will automatically reset when set to a logic 1.
7–1 RSVD0	Reserved, always set to zero.
0 DMA_START	Setting this bit will result in the DMA operation to load the PXP LUT memory based on REG_LUT_ADDR_NUM_BYTES, REG_LUT_ADDR_ADDR, and REG_LUT_MEM_ADDR.  This bit will automatically reset when set to a logic 1. Note: The LOOKUP_MODE must not be set to CACHE_RGB565 when starting and performing DMA transfers.

### 13.7.12.38 Lookup Table Control Register. (PXP\_HW\_PXP\_LUT\_ADDR)

This register is used to access/control the Monochrome Lookup table.

The Y8 LUT input mode will take the high order data path byte and transform it using the LUT memory. This is an 8-bit to 8-bit transformation. The two low order bytes bypass the LUT and are not transformed, but bypassed without modification. This option can be used for monochrome gamma correction. The Direct Lookup mode will use the high nibble of each data byte and truncate the low nibble to generate the lookup address, i.e. R[7:0]G[7:0]B[7:0] -> R[7:4]G[7:4]B[7:4]. 4K pixels (12-bit address) with 2 bytes per pixel is supported in this mode. Cached Lookup mode will use the high order bits, R[7:3],G[7:2],B[7:3] or RGB565, to address the cached LUT memory. 64KB LUT tables, using 16KB of internal LUT memory, can be indirectly transformed to 16-bit output

pixels (as in RGBW4444/RGB565). This is used for 16bpp gamma correction or EPD color panel support. Cache misses are internally managed by the PXP LUT Cache controller.

Address: 3070\_0000h base + 250h offset = 3070\_0250h

### PXP\_HW\_PXP\_LUT\_ADDR field descriptions

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 NUM_BYTES	Indicates the number of bytes to load via a DMA operation. This field must be divisible by 8 and the least significant 3 bits must be 0. The value 8 indicates load 8 bytes from the external address indicated by REG_LUT_MEM_ADDR to the LUT memory location indicated by REG_LUT_CTRL_ADDR.
15–14 RSVD1	Reserved, always set to zero.
ADDR	LUT indexed address pointer. This address into the LUT memory is always four byte aligned for PIO access, and eight byte aligned for DMA access.  The least two significant bits are not used to drive the LUT memory array. For PIO LUT access, when the LUT data register is written, the contents of the LUT at the address specified by this address field will be loaded with a 32-bit DWORD. This address pointer will be incremented after the LUT data is written. This will provide recursive writes to the LUT data register to initialize the entire LUT array with recursive writes to the LUT data register. For DMA access, this register indicates the LUT memory address of the 8 byte QWORD to be loaded. When using the NUM_BYTES field to load more than 8 bytes, the register should be programmed with the first LUT memory location to be filled and each load of the LUT memory will increment this address field until NUM_BYTES has been loaded.

### 13.7.12.39 Lookup Table Data Register. (PXP\_HW\_PXP\_LUT\_DATA)

This register is used to load data into the lookup table.

Address: 3070\_0000h base + 260h offset = 3070\_0260h

#### PXP\_HW\_PXP\_LUT\_DATA field descriptions

Field	Description
DATA	Writing this field will load 4 bytes, aligned to four byte boundaries, of data indexed by the ADDR field of the REG_LUT_CTRL register.

### 13.7.12.40 Lookup Table External Memory Address Register. (PXP\_HW\_PXP\_LUT\_EXTMEM)

This register is used as the external memory base address for LUT data transfers.

For DMA LUT memory loads, this is the base address from which data will be sourced to store into the LUT memory array. For Cached LUT memory pixel transformations, this register will store the base address of the full 64K pixel LUT translation table.

Address: 3070\_0000h base + 270h offset = 3070\_0270h

#### PXP\_HW\_PXP\_LUT\_EXTMEM field descriptions

Field	Description
ADDR	This register contains the external memory address used for LUT memory operation.

### 13.7.12.41 Color Filter Array Register. (PXP\_HW\_PXP\_CFA)

This register contains the pattern of the CFA mapping within PXP macro blocks.

There are sixteen 2 bit values in this register each mapping a selected component to the output pixel. The two bit values are defined as 0=>R, 1=>G, 2=>B, and 3=>W. The first byte represents the repetitive pattern of RGBW pixels in the CFA for the first line

segment of each processed PXP block. The second byte represents the pattern in the second line segment of the block, and so on. The first byte repeats two times for 8x8 macro block mode, and repeats four times for 16x16 block mode.

Address: 3070\_0000h base + 280h offset = 3070\_0280h

**PXP\_HW\_PXP\_CFA field descriptions**

Field	Description
DATA	This register contains the Color Filter Array pattern for decimation of RGBW4444 16 bit pixels to individual R, G, B, W values. The pattern represents a replicated 4x4 color filter array for the entire output frame buffer.

**13.7.12.42 PXP Alpha Engine A Control Register. (PXP\_HW\_PXP\_ALPHA\_A\_CTRL)**

This register controls alpha blending function in PXP.

Address: 3070\_0000h base + 290h offset = 3070\_0290h

## Pixel Pipeline (PXP)

**PXP\_HW\_PXP\_ALPHA\_A\_CTRL field descriptions**

Field	Description
31–24 S1_GLOBAL_ALPHA	s1 global alpha
23–16 S0_GLOBAL_ALPHA	s0 global alpha
15–14 RSVD0	Reserved, always set to zero.
13 S1_COLOR_MODE	s1 color mode 0x0 0 — straight mode for s1 color 0x1 1 — multiply mode for s1 color
12 S1_ALPHA_MODE	s1 alpha mode 0x0 0 — straight mode for s1 alpha 0x1 1 — inversed mode for s1 alpha
11–10 S1_GLOBAL_ALPHA_MODE	s1 global alpha mode 0x0 0 — using global alpha. 0x0 1 — using local alpha. 0x0 2 — using scaled alpha. 0x0 3 — using scaled alpha.
9–8 S1_S0_FACTOR_MODE	s1 to s0 factor mode 0x0 0 — using 1.

Table continues on the next page...

**PXP\_HW\_PXP\_ALPHA\_A\_CTRL field descriptions (continued)**

Field	Description
	0x1 <b>1</b> — using 0. 0x2 <b>2</b> — using straight alpha. 0x3 <b>3</b> — using inverse alpha.
7 RSVD1	Reserved, always set to zero.
6 S0_COLOR_ MODE	s0 color mode 0x0 <b>0</b> — straight mode for s0 color 0x1 <b>1</b> — multiply mode for s0 color
5 S0_ALPHA_ MODE	s0 alpha mode 0x0 <b>0</b> — straight mode for s0 alpha 0x1 <b>1</b> — inversed mode for s0 alpha
4–3 S0_GLOBAL_ ALPHA_MODE	s0 global alpha mode 0x0 <b>0</b> — using global alpha. 0x1 <b>1</b> — using local alpha. 0x2 <b>2</b> — using scaled alpha. 0x3 <b>3</b> — using scaled alpha.
2–1 S0_S1_ FACTOR_MODE	s0 to s1 factor mode 0x0 <b>0</b> — using 1. 0x1 <b>1</b> — using 0. 0x2 <b>2</b> — using straight alpha. 0x3 <b>3</b> — using inverse alpha.
0 POTER_DUFF_ ENABLE	poter_duff enable 0x0 <b>0</b> — porter duff disable. 0x1 <b>1</b> — porter duff enable.

**13.7.12.43 PXP Alpha Engine B Control Register.  
(PXP\_HW\_PXP\_ALPHA\_B\_CTRL)**

This register controls alpha blending function in PXP.

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 2A0h offset = 3070\_02A0h

**PXP\_HW\_PXP\_ALPHA\_B\_CTRL field descriptions**

Field	Description
31–24 S1_GLOBAL_ALPHA	s1 global alpha
23–16 S0_GLOBAL_ALPHA	s0 global alpha
15–14 RSVD0	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_ALPHA\_B\_CTRL field descriptions (continued)**

<b>Field</b>	<b>Description</b>
13 S1_COLOR_MODE	s1 color mode 0x0 0 — straight mode for s1 color 0x1 1 — multiply mode for s1 color
12 S1_ALPHA_MODE	s1 alpha mode 0x0 0 — straight mode for s1 alpha 0x1 1 — inversed mode for s1 alpha
11–10 S1_GLOBAL_ALPHA_MODE	s1 global alpha mode 0x0 0 — using global alpha. 0x1 1 — using local alpha. 0x2 2 — using scaled alpha. 0x3 3 — using scaled alpha.
9–8 S1_S0_FACTOR_MODE	s1 to s0 factor mode 0x0 0 — using 1. 0x1 1 — using 0. 0x2 2 — using straight alpha. 0x3 3 — using inverse alpha.
7 RSVD1	Reserved, always set to zero.
6 S0_COLOR_MODE	s0 color mode 0x0 0 — straight mode for s0 color 0x1 1 — multiply mode for s0 color
5 S0_ALPHA_MODE	s0 alpha mode 0x0 0 — straight mode for s0 alpha 0x1 1 — inversed mode for s0 alpha
4–3 S0_GLOBAL_ALPHA_MODE	s0 global alpha mode 0x0 0 — using global alpha. 0x1 1 — using local alpha. 0x2 2 — using scaled alpha. 0x3 3 — using scaled alpha.
2–1 S0_S1_FACTOR_MODE	s0 to s1 factor mode 0x0 0 — using 1. 0x1 1 — using 0. 0x2 2 — using straight alpha. 0x3 3 — using inverse alpha.
0 POTER_DUFF_ENABLE	poter_duff enable 0x0 0 — porter duff disable. 0x1 1 — porter duff enable.

### 13.7.12.44 PXP\_HW\_PXP\_ALPHA\_B\_CTRL\_1

This register defines software define pixels for alpha blending.

This register defines alpha1 legacy blending parameters.

#### EXAMPLE

Address: 3070\_0000h base + 2B0h offset = 3070\_02B0h

**PXP\_HW\_PXP\_ALPHA\_B\_CTRL\_1 field descriptions**

Field	Description
31–8 RSVD0	Reserved, always set to zero.
7–4 ROP	Indicates a raster operation to perform when enabled. 0x0 <b>MASKAS</b> — AS AND PS 0x1 <b>MASKNOTAS</b> — nAS AND PS 0x2 <b>MASKASNOT</b> — AS AND nPS

*Table continues on the next page...*

## PXP\_HW\_PXP\_ALPHA\_B\_CTRL\_1 field descriptions (continued)

Field	Description
0x3	<b>MERGEAS</b> — AS OR PS
0x4	<b>MERGENOTAS</b> — nAS OR PS
0x5	<b>MERGEASNOT</b> — AS OR nPS
0x6	<b>NOTCOPYAS</b> — nAS
0x7	<b>NOT</b> — nPS
0x8	<b>NOTMASKAS</b> — AS NAND PS
0x9	<b>NOTMERGEAS</b> — AS NOR PS
0xA	<b>XORAS</b> — AS XOR PS
0xB	<b>NOTXORAS</b> — AS XNOR PS
3–2 RSVD1	Reserved, always set to zero.
1 OL_CLRKEY_ ENABLE	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
0 ROP_ENABLE	ROP ENABLE

### 13.7.12.45 PS Background Color 1 (PXP\_HW\_PXP\_PS\_BACKGROUND\_1)

PS Background Pixel Color. This register provides a pixel value used when processing pixels outside of the region specified by the PS Coordinate registers. This value can effectively be used to set the color of the letterboxing region around the PS image. This value is used by the Alpha B block.

This register contains a pixel value to be used for any PS pixels that fall outside the PS extents. This is effectively a background or letterbox color. The CSC1 control and datapath pixel format should be considered when selecting the background color.

#### EXAMPLE

```
REG_PS_BACKGROUND_WR(0x00000000); // letterbox is black
REG_PS_BACKGROUND_WR(0x00800000); // letterbox is dark red
REG_PS_BACKGROUND_WR(0x00008000); // letterbox is dark green
REG_PS_BACKGROUND_WR(0x00000080); // letterbox is dark blue
```

Address: 3070\_0000h base + 2C0h offset = 3070\_02C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
R	RSVD								COLOR																											
W	RSVD								COLOR																											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0				

**PXP\_HW\_PXP\_PS\_BACKGROUND\_1 field descriptions**

Field	Description
31–24 RSVD	Reserved, always set to zero.
COLOR	Background color (in 24bpp format) for any pixels not within the buffer range specified by the PS ULC/LRC.

**13.7.12.46 PS Color Key Low 1 (PXP\_HW\_PXP\_PS\_CLRKEYLOW\_1)**

This register contains the color key low value for the PS buffer 1. This value is used by the Alpha B block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG\_PS\_CLRKEYLOW and REG\_PS\_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG\_PS\_BACKGROUND color is passed down the pixel pipeline.

**EXAMPLE**

```

// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green
    
```

Address: 3070\_0000h base + 2D0h offset = 3070\_02D0h

**PXP\_HW\_PXP\_PS\_CLRKEYLOW\_1 field descriptions**

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

**13.7.12.47 PS Color Key High 1 (PXP\_HW\_PXP\_PS\_CLRKEYHIGH\_1)**

This register contains the color key high value for the PS buffer. This value is used by the Alpha B block.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between REG\_PS\_CLRKEYLOW and REG\_PS\_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the REG\_PS\_BACKGROUND color is passed down the pixel pipeline.

### EXAMPLE

```
// colorkey values between
REG_PS_CLRKEYLOW_WR (0x008000); // medium green and
REG_PS_CLRKEYHIGH_WR(0x00FF00); // light green
```

Address: 3070\_0000h base + 2E0h offset = 3070\_02E0h

#### PXP\_HW\_PXP\_PS\_CLRKEYHIGH\_1 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

### 13.7.12.48 Overlay Color Key Low (PXP\_HW\_PXP\_AS\_CLRKEYLOW\_1)

This register contains the color key low value for the AS buffer. This value is used by the Alpha B block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

### EXAMPLE

```
// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red
```

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 2F0h offset = 3070\_02F0h

### PXP\_HW\_PXP\_AS\_CLRKEYLOW\_1 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

## 13.7.12.49 Overlay Color Key High (PXP\_HW\_PXP\_AS\_CLRKEYHIGH\_1)

This register contains the color key high value for the AS buffer. This value is used by the Alpha B block.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

### EXAMPLE

```

// colorkey values between
REG_AS_CLRKEYLOW_WR (0x000000); // black and
REG_AS_CLRKEYHIGH_WR(0x800000); // medium red

```

Address: 3070\_0000h base + 300h offset = 3070\_0300h

### PXP\_HW\_PXP\_AS\_CLRKEYHIGH\_1 field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

### 13.7.12.50 Control Register 2 (PXP\_HW\_PXP\_CTRL2)

The CTRL register contains controls for the secondary processing flow in PXP module.

HW\_PXP\_CTRL2: 0x310

HW\_PXP\_CTRL2\_SET: 0x314

HW\_PXP\_CTRL2\_CLR: 0x318

HW\_PXP\_CTRL2\_TOG: 0x31C

The Control register contains the controls for the secondary data flow in PXP block.

#### EXAMPLE

```
REG_CTRL_SET(BM_PXP_CTRL_SFTRST);
REG_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 3070\_0000h base + 310h offset = 3070\_0310h

## Pixel Pipeline (PXP)

### PXP\_HW\_PXP\_CTRL2 field descriptions

Field	Description
31–28 RSVD3	Reserved, always set to zero.
27 ENABLE_ ROTATE1	Enable the ROTATE1 engine in the PXP secondary processing flow.
26 ENABLE_ ROTATE0	Enable the ROTATE0 engine in the PXP secondary processing flow.
25 ENABLE_ LUT	Enable the LUT engine in the PXP secondary processing flow.
24 ENABLE_ CSC2	Enable the CSC2 engine in the PXP secondary processing flow.
23 BLOCK_SIZE	Select the block size to process through the Rotate block. 0x0 <b>8X8</b> — Process 8x8 pixel blocks. 0x1 <b>16X16</b> — Process 16x16 pixel blocks.
22 RSVD2	Reserved, always set to zero.
21 ENABLE_ ALPHA_B	Enable the Alpha-B engine in the PXP secondary processing flow.
20 ENABLE_ INPUT_FETCH_ STORE	Enable the Input Fetch and Store engine in the PXP secondary processing flow.
19 ENABLE_ WFE_B	Enable the WFE-B engine in the PXP secondary processing flow.
18 ENABLE_ WFE_A	Enable the WFE-A engine in the PXP secondary processing flow.

Table continues on the next page...

## PXP\_HW\_PXP\_CTRL2 field descriptions (continued)

Field	Description
17 ENABLE_DITHER	Enable the Dithering engine in the PXP secondary processing flow.
16 RSVD1	Reserved, always set to zero.
15 VFLIP1	Indicates that the input should be flipped vertically (effect applied before rotation).
14 HFLIP1	Indicates that the input should be flipped horizontally (effect applied before rotation).
13–12 ROTATE1	Indicates the clockwise rotation to be applied at the input buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation.  0x0 <b>ROT_0</b> — 0x1 <b>ROT_90</b> — 0x2 <b>ROT_180</b> — 0x3 <b>ROT_270</b> —
11 VFLIP0	Indicates that the output buffer should be flipped vertically (effect applied before rotation).
10 HFLIP0	Indicates that the output buffer should be flipped horizontally (effect applied before rotation).
9–8 ROTATE0	Indicates the clockwise rotation to be applied at the output buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation.  0x0 <b>ROT_0</b> — 0x1 <b>ROT_90</b> — 0x2 <b>ROT_180</b> — 0x3 <b>ROT_270</b> —
7–1 RSVD0	Reserved, always set to zero.
0 ENABLE	Enables PXP secondary data processing flow with specified parameters. The ENABLE bit will remain set while the PXP is active and will be cleared once the current operation completes. Software should use the IRQ bit in the HW_PXP_STAT when polling for PXP completion.

### 13.7.12.51 PXP Power Control Register. (PXP\_HW\_PXP\_POWER\_REG0)

This register controls power states for PXP memories.

Address: 3070\_0000h base + 320h offset = 3070\_0320h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																	ROTO_		LUT_LP_		LUT_LP_		LUT_LP_									
W	CTRL																MEM_		STATE_		STATE_		STATE_									
																	LP_		WAY1_		WAY0_		WAY0_									
																	STATE		BANKN		BANKN		BANK0									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**PXP\_HW\_PXP\_POWER\_REG0 field descriptions**

Field	Description
31–12 CTRL	This register contains power control for the PXP.
11–9 ROTO_MEM_LP_STATE	Select the low power state of the ROT 0 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
8–6 LUT_LP_STATE_WAY1_BANKN	Select the low power state of the LUT's WAY0-BANK0,1,2,3 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
5–3 LUT_LP_STATE_WAY0_BANKN	Select the low power state of the LUT's WAY0-BANK1,2,3 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
LUT_LP_STATE_WAY0_BANK0	Select the low power state of the LUT's WAY0-BANK0 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.

**13.7.12.52 PXP Power Control Register 1. (PXP\_HW\_PXP\_POWER\_REG1)**

This register controls power states for PXP memories.

Address: 3070\_0000h base + 330h offset = 3070\_0330h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD0								ALU_B_MEM_LP_STATE			ALU_A_MEM_LP_STATE			DITH2_LUT_MEM_LP_STATE	
W	0								0			0			0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DITH2_LUT_MEM_LP_STATE	DITH1_LUT_MEM_LP_STATE				DITH0_ERR1_MEM_LP_STATE			DITH0_ERR0_MEM_LP_STATE			DITH0_LUT_MEM_LP_STATE		ROT1_MEM_LP_STATE		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_POWER\_REG1 field descriptions

Field	Description
31–24 RSVD0	This register contains power control for the PXP.
23–21 ALU_B_MEM_LP_STATE	Select the low power state of the ALU B memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
20–18 ALU_A_MEM_LP_STATE	Select the low power state of the ALU A memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
17–15 DITH2_LUT_MEM_LP_STATE	Select the low power state of the dither2 LUT memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
14–12 DITH1_LUT_MEM_LP_STATE	Select the low power state of the dither1 LUT memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
11–9 DITH0_ERR1_MEM_LP_STATE	Select the low power state of the dither0 ERR1 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
8–6 DITH0_ERR0_MEM_LP_STATE	Select the low power state of the dither0 ERR0 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.

Table continues on the next page...

**PXP\_HW\_PXP\_POWER\_REG1 field descriptions (continued)**

Field	Description
5-3 DITH0_LUT_ MEM_LP_STATE	Select the low power state of the dither0 LUT memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
ROT1_MEM_LP_ STATE	Select the low power state of the ROT 1 memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.

**13.7.12.53 PXP\_HW\_PXP\_DATA\_PATH\_CTRL1**

This register helps decide the data path gthrough the PXP.

HW\_PXP\_DATA\_PATH\_CTRL1: 0x350

HW\_PXP\_DATA\_PATH\_CTRL1\_SET: 0x354

HW\_PXP\_DATA\_PATH\_CTRL1\_CLR: 0x358

HW\_PXP\_DATA\_PATH\_CTRL1\_TOG: 0x35C

The Control register contains the control bits for the data path through the PXP.

**EXAMPLE**

Address: 3070\_0000h base + 350h offset = 3070\_0350h

### PXP\_HW\_PXP\_DATA\_PATH\_CTRL1 field descriptions

Field	Description
31–4 RSVD0	Reserved. This field always reads 0.
3–2 MUX17_SEL	This field chooses the data path through MUX 17. 0x0 <b>0</b> — Output of ALU A 0x1 <b>1</b> — Output of ALU B 0x2 <b>2</b> — No output 0x3 <b>3</b> — No Output
MUX16_SEL	This mux chooses the data path through MUX 16. 0x0 <b>0</b> — Output of ALU A Engine 0x1 <b>1</b> — histogram_pixel output from output 0x2 <b>2</b> — Output of ALU B Engine 0x3 <b>3</b> — No output

#### 13.7.12.54 Initialize memory buffer control Register (PXP\_HW\_PXP\_INIT\_MEM\_CTRL)

Controls initializing/writing to dither and ALU memory buffers.

HW\_PXP\_INIT\_MEM\_CTRL: 0x360

HW\_PXP\_INIT\_MEM\_CTRL\_SET: 0x364

HW\_PXP\_INIT\_MEM\_CTRL\_CLR: 0x368

HW\_PXP\_INIT\_MEM\_CTRL\_TOG: 0x36C

This register controls IRQ the intializing of internal pxp rams.

#### EXAMPLE

Address: 3070\_0000h base + 360h offset = 3070\_0360h

## Pixel Pipeline (PXP)

### PXP\_HW\_PXP\_INIT\_MEM\_CTRL field descriptions

Field	Description
31 START	Enable writing to the memory.
30–27 SELECT	Select which memory to write. 0x0 <b>DITHER0_LUT</b> — Select the LUT memory for access 0x1 <b>DITHER0_ERR0</b> — Select the ERR0 memory for access 0x2 <b>DITHER0_ERR1</b> — Select the ERR1 memory for access 0x3 <b>DITHER1_LUT</b> — Select the LUT memory for access 0x4 <b>DITHER2_LUT</b> — Select the LUT memory for access 0x5 <b>ALU_A</b> — Select the ALU instr memory for access 0x6 <b>ALU_B</b> — Select the ALU instr memory for access 0x7 <b>WFE_A_FETCH</b> — Select the WFE-A fetch memory for access 0x8 <b>WFE_B_FETCH</b> — Select the WFE-B fetch memory for access
26–16 RSVD0	Reserved.
ADDR	Base address to start writing. The control logic will increment the address value internally each time the data register is written.

### 13.7.12.55 Write data Register (PXP\_HW\_PXP\_INIT\_MEM\_DATA)

Write data for initializing/writing to dither, ALU and fetch memory buffers.

This register holds the data word to initialize internal pxp rams.

#### EXAMPLE

Address: 3070\_0000h base + 370h offset = 3070\_0370h

**PXP\_HW\_PXP\_INIT\_MEM\_DATA field descriptions**

Field	Description
DATA	Data value to be written to the memory. A write to this register kicks off a write cycle to the memory selected.

**13.7.12.56 Write data Register (PXP\_HW\_PXP\_INIT\_MEM\_DATA\_HIGH)**

Write data for initializing/writing to the most significant 32 bits of the fetch memory buffers.

This register holds the upper data word to initialize internal pxp fetch rams.

**EXAMPLE**

Address: 3070\_0000h base + 380h offset = 3070\_0380h

**PXP\_HW\_PXP\_INIT\_MEM\_DATA\_HIGH field descriptions**

Field	Description
DATA	Data value to be written to the most significant 32 bits of the fetch memories. this register must be written before the HW_PXP_INIT_MEM_DATA as that register triggers the write cycle to memory.

**13.7.12.57 PXP IRQ Mask Register (PXP\_HW\_PXP\_IRQ\_MASK)**

Controls masking for all PXP interrupts

HW\_PXP\_IRQ\_MASK: 0x390

HW\_PXP\_IRQ\_MASK\_SET: 0x394

HW\_PXP\_IRQ\_MASK\_CLR: 0x398

HW\_PXP\_IRQ\_MASK\_TOG: 0x39C

This register controls IRQ masks for all PXP interrupts

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 390h offset = 3070\_0390h

### PXP\_HW\_PXP\_IRQ\_MASK field descriptions

Field	Description
31 COMPRESS_ DONE_IRQ_EN	Enable compression done interrupt detection.
30–16 RSVD1	Reserved.
15 WFE_B_ STORE_IRQ_EN	Enable WFE B store engine interrupt detection.

Table continues on the next page...

**PXP\_HW\_PXP\_IRQ\_MASK field descriptions (continued)**

<b>Field</b>	<b>Description</b>
14 WFE_A_ STORE_IRQ_EN	Enable WFE A store engine interrupt detection.
13 DITHER_ STORE_IRQ_EN	Enable dither store engine interrupt detection.
12 FIRST_STORE_ IRQ_EN	Enable First store engine interrupt detection
11 WFE_B_CH1_ STORE_IRQ_EN	Enable WFE B ch1 store engine interrupt detection.
10 WFE_B_CH0_ STORE_IRQ_EN	Enable WFE B ch0 store engine interrupt detection.
9 WFE_A_CH1_ STORE_IRQ_EN	Enable WFE A ch1 store engine interrupt detection.
8 WFE_A_CH0_ STORE_IRQ_EN	Enable WFE A ch0 store engine interrupt detection.
7 DITHER_CH1_ STORE_IRQ_EN	Enable dither ch1 store engine interrupt detection.
6 DITHER_CH0_ STORE_IRQ_EN	Enable dither ch0 store engine interrupt detection.
5 DITHER_CH1_ PREFETCH_ IRQ_EN	Enable Dither ch1 prefetch engine interrupt detection
4 DITHER_CH0_ PREFETCH_ IRQ_EN	Enable Dither ch0 prefetch engine interrupt detection
3 FIRST_CH1_ STORE_IRQ_EN	Enable First ch1 store engine interrupt detection
2 FIRST_CH0_ STORE_IRQ_EN	Enable First ch0 store engine interrupt detection
1 FIRST_CH1_ PREFETCH_ IRQ_EN	Enable First ch1 prefetch engine interrupt detection
0 FIRST_CH0_ PREFETCH_ IRQ_EN	Enable First ch0 prefetch engine interrupt detection

### 13.7.12.58 PXP Interrupt Register (PXP\_HW\_PXP\_IRQ)

PXP Fetch and Store engine IRQs. Each interrupt has a corresponding mask register in HW\_EPDC\_IRQ\_MASK

HW\_PXP\_IRQ: 0x3A0

HW\_PXP\_IRQ\_SET: 0x3A4

HW\_PXP\_IRQ\_CLR: 0x3a8

HW\_PXP\_IRQ\_TOG: 0x3AC

This register houses the interrupt bits for the Prefetch and Store Engines

#### EXAMPLE

Address: 3070\_0000h base + 3A0h offset = 3070\_03A0h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	WFE_B_STORE_IRQ	WFE_A_STORE_IRQ	DITHER_STORE_IRQ	FIRST_STORE_IRQ	WFE_B_CH1_STORE_IRQ	WFE_B_CH0_STORE_IRQ	WFE_A_CH1_STORE_IRQ	WFE_A_CH0_STORE_IRQ	DITHER_CH1_STORE_IRQ	DITHER_CH0_STORE_IRQ	DITHER_CH1_PREFETCH_IRQ	DITHER_CH0_PREFETCH_IRQ	FIRST_CH1_STORE_IRQ	FIRST_CH0_STORE_IRQ	FIRST_CH1_PREFETCH_IRQ	FIRST_CH0_PREFETCH_IRQ

### PXP\_HW\_PXP\_IRQ field descriptions

Field	Description
31 COMPRESS_ DONE_IRQ	compression done Interrupt
30–16 RSVD1	Reserved.
15 WFE_B_ STORE_IRQ	WFE B store engine Interrupt
14 WFE_A_ STORE_IRQ	WFE A store engine Interrupt.
13 DITHER_ STORE_IRQ	Dither store engine Interrupt
12 FIRST_STORE_ IRQ	Initial store engine interrupt
11 WFE_B_CH1_ STORE_IRQ	WFE B ch1 store engine Interrupt
10 WFE_B_CH0_ STORE_IRQ	WFE B ch0 store engine Interrupt
9 WFE_A_CH1_ STORE_IRQ	WFE A ch1 store engine Interrupt.
8 WFE_A_CH0_ STORE_IRQ	WFE A ch0 store engine Interrupt.

Table continues on the next page...

**PXP\_HW\_PXP\_IRQ field descriptions (continued)**

Field	Description
7 DITHER_CH1_STORE_IRQ	Dither ch1 store engine Interrupt
6 DITHER_CH0_STORE_IRQ	Dither ch0 store engine Interrupt
5 DITHER_CH1_PREFETCH_IRQ	Dither ch1 prefetch engine interrupt
4 DITHER_CH0_PREFETCH_IRQ	Dither ch0 prefetch engine interrupt
3 FIRST_CH1_STORE_IRQ	Initial ch1 store engine interrupt
2 FIRST_CH0_STORE_IRQ	Initial ch0 store engine interrupt
1 FIRST_CH1_PREFETCH_IRQ	Initial ch1 prefetch engine interrupt
0 FIRST_CH0_PREFETCH_IRQ	Initial ch0 prefetch engine interrupt

**13.7.12.59 Next Frame Pointer (PXP\_HW\_PXP\_NEXT)**

This register contains a pointer to a data structure used to reload the PXP registers at the end of the current frame.

To enable this functionality, software must write this register while the PXP is processing the current data frame (if the PXP is currently idle, this will also initiate an immediate load of registers from the pointer). The process of writing this register (WRITE operation) will set a semaphore in hardware to notify the control logic that a register reload operation must be performed when the current frame processing is complete. At the end of a frame, the PXP will fetch the register settings from this location, signal an interrupt to software, then proceed with rendering the next frame of data. Software may cancel the reload operation by issuing a CLEAR operation to this register. SET and TOGGLE operations should not be used when addressing this register. All registers will be reloaded with the exception of the following: STAT, CSCCOEFn, NEXT, VERSION. All other registers will be loaded in the order they appear in the register map. Once the pointer's contents have been loaded into the PXP's registers, the NEXT\_IRQ interrupt will be issued (see the PXP\_STATUS register).

**EXAMPLE**

```

// create register command structure in memory
u32* pxp_commands0[48], pxp_commands1;
u32 rc;

// initialize control structure for frame 0
pxp_commands0[0] = ...; // CTRL
pxp_commands0[1] = ...; // OUT Buffer
...
pxp_commands0[47] = ..; // Overlay7 param2

// initialize control structure for frame 1
pxp_commands1[0] = ...; // CTRL
pxp_commands1[1] = ...; // OUT Buffer
...
pxp_commands1[47] = ..; // Overlay7 param2

// poll until a command isn't queued
while (rc=REG_NEXT_RD() & BM_PXP_NEXT_ENABLED );
REG_NEXT_WR(pxp_commands0); // enable PXP operation 0 via command pointer

// poll until first command clears
while (rc=REG_NEXT_RD() & BM_PXP_NEXT_ENABLED );
REG_NEXT_WR(pxp_commands1); // enable PXP operation 1 via command pointer

```

Address: 3070\_0000h base + 400h offset = 3070\_0400h

**PXP\_HW\_PXP\_NEXT field descriptions**

Field	Description
31–2 POINTER	A pointer to a data structure containing register values to be used when processing the next frame. The pointer must be 32-bit aligned and should reside in on-chip or off-chip memory.
1 RSVD	Reserved, always set to zero.
0 ENABLED	Indicates that the "next frame" functionality has been enabled. This bit reflects the status of the hardware semaphore indicating that a reload operation is pending at the end of the current frame.

**13.7.12.60 Pre-fetch engine Control Channel 0 Register (PXP\_HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0)**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0: 0x450

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0\_SET: 0x454

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0\_CLR: 0x458

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0\_TOG: 0x45C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 450h offset = 3070\_0450h

### PXP\_HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0 field descriptions

Field	Description
31 ARBIT_EN	Enables Arbitration 0x0 <b>0</b> — Arbitration disable. If using 2 channels, will output 2 axi bus sets. 0x1 <b>1</b> — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_SCAN_LINE_NUM	scan handshake line number 0x0 <b>0</b> — 1 line. 0x1 <b>1</b> — 8 lines 0x2 <b>2</b> — 16 lines 0x3 <b>3</b> — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_BYTES	Bytes in a read burst 0x0 <b>8_bytes</b> — 8 bytes. 0x1 <b>16_bytes</b> — 16 bytes. 0x2 <b>32_bytes</b> — 32 bytes. 0x3 <b>64_bytes</b> — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.

Table continues on the next page...

## PXP\_HW\_PXP\_INPUT\_FETCH\_CTRL\_CH0 field descriptions (continued)

Field	Description
13–12 ROTATION_ANGLE	0x0 <b>ROT_0</b> — Rotate image by 0 degrees. 0x1 <b>ROT_90</b> — Rotate image by 90 degrees. 0x2 <b>ROT_180</b> — Rotate image by 180 degrees. 0x3 <b>ROT_270</b> — Rotate image by 270 degrees.
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 <b>0</b> — VFLIP disable 0x1 <b>1</b> — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 <b>0</b> — HFLIP disable 0x1 <b>1</b> — VFLIP enable
8–6 RSVD4	Reserved, always set to zero.
5 HIGH_BYTE	channel 0 high byte selection 0x0 <b>0</b> — In 64 bit mode, the output high byte will use channel1. 0x1 <b>1</b> — In 64 bit mode, the output high byte will use channel0
4 BYPASS_PIXEL_EN	Selects Channel 0 pixel source 0x0 <b>0</b> — Channel 0 is from memory 0x1 <b>1</b> — Channel 0 is from previous process engine
3 HANDSHAKE_EN	Enable bit for handshake with the store engine. 0x0 <b>0</b> — Handshake with the store engine is disabled 0x1 <b>1</b> — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16
1 BLOCK_EN	Choses the prefetch mode. 0x0 <b>0</b> — Prefetch in scan mode 0x1 <b>1</b> — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 <b>0</b> — Prefetch function is disable 0x1 <b>1</b> — Prefetch function is enable

### 13.7.12.61 Pre-fetch engine Control Channel 1 Register (PXP\_HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1)

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1: 0x460

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1\_SET: 0x464

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1\_CLR: 0x468

HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1\_TOG: 0x46C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 460h offset = 3070\_0460h

## Pixel Pipeline (PXP)

**PXP\_HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1 field descriptions**

Field	Description
31–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_SCAN_LINE_NUM	scan handshake line number 0x0 <b>0</b> — 1 line. 0x1 <b>1</b> — 8 lines 0x2 <b>2</b> — 16 lines 0x3 <b>3</b> — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_BYTES	Bytes in a read burst 0x0 <b>8_bytes</b> — 8 bytes. 0x1 <b>16_bytes</b> — 16 bytes. 0x2 <b>32_bytes</b> — 32 bytes. 0x3 <b>64_bytes</b> — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.
13–12 ROTATION_ANGLE	0x0 <b>ROT_0</b> — Rotate image by 0 degrees. 0x1 <b>ROT_90</b> — Rotate image by 90 degrees. 0x2 <b>ROT_180</b> — Rotate image by 180 degrees. 0x3 <b>ROT_270</b> — Rotate image by 270 degrees.

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_FETCH\_CTRL\_CH1 field descriptions (continued)**

Field	Description
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 <b>0</b> — VFLIP disable 0x1 <b>1</b> — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 <b>0</b> — HFLIP disable 0x1 <b>1</b> — VFLIP enable
8–5 RSVD4	Reserved, always set to zero.
4 BYPASS_ PIXEL_EN	Selects Channel 1 pixel source 0x0 <b>0</b> — Channel 1 is from memory 0x1 <b>1</b> — Channel 1 is from previous process engine
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 <b>0</b> — Handshake with the store engine is disabled 0x1 <b>1</b> — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16
1 BLOCK_EN	Choses the prefetch mode. 0x0 <b>0</b> — Prefetch in scan mode 0x1 <b>1</b> — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 <b>0</b> — prefetch function is disable 0x1 <b>1</b> — prefetch function is enable

**13.7.12.62 Pre-fetch engine status Channel 0 Register (PXP\_HW\_PXP\_INPUT\_FETCH\_STATUS\_CH0)**

This register defines the status bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 470h offset = 3070\_0470h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																									
W	[Shaded]																																									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_INPUT\_FETCH\_STATUS\_CH0 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

## 13.7.12.63 Store engine status Channel 1 Register (PXP\_HW\_PXP\_INPUT\_FETCH\_STATUS\_CH1)

This register defines the status bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 480h offset = 3070\_0480h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0											
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																										
W	[Shaded]																																										
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_INPUT\_FETCH\_STATUS\_CH1 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

## 13.7.12.64 PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_ULC\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 490h offset = 3070\_0490h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	ACTIVE_SIZE_ULC_Y																ACTIVE_SIZE_ULC_X																
W																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_ULC\_CH0 field descriptions**

Field	Description
31–16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.65 PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_LRC\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 4A0h offset = 3070\_04A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ACTIVE_SIZE_LRC_Y																ACTIVE_SIZE_LRC_X															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_LRC\_CH0 field descriptions**

Field	Description
31–16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.66 PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_ULC\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 4B0h offset = 3070\_04B0h

**PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_ULC\_CH1 field descriptions**

Field	Description
31-16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.67 PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_LRC\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 4C0h offset = 3070\_04C0h

**PXP\_HW\_PXP\_INPUT\_FETCH\_ACTIVE\_SIZE\_LRC\_CH1 field descriptions**

Field	Description
31-16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.68 PXP\_HW\_PXP\_INPUT\_FETCH\_SIZE\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 4D0h offset = 3070\_04D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	INPUT_TOTAL_HEIGHT																INPUT_TOTAL_WIDTH															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_FETCH\_SIZE\_CH0 field descriptions**

Field	Description
31–16 INPUT_TOTAL_HEIGHT	actual total height - 1
INPUT_TOTAL_WIDTH	actual total width -1

**13.7.12.69 PXP\_HW\_PXP\_INPUT\_FETCH\_SIZE\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 4E0h offset = 3070\_04E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	INPUT_TOTAL_HEIGHT																INPUT_TOTAL_WIDTH															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_FETCH\_SIZE\_CH1 field descriptions**

Field	Description
31–16 INPUT_TOTAL_HEIGHT	actual total height -1
INPUT_TOTAL_WIDTH	actual total width -1

**13.7.12.70 PXP\_HW\_PXP\_INPUT\_FETCH\_BACKGROUND\_COLOR\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 4F0h offset = 3070\_04F0h

**PXP\_HW\_PXP\_INPUT\_FETCH\_BACKGROUND\_COLOR\_CH0 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

**13.7.12.71 PXP\_HW\_PXP\_INPUT\_FETCH\_BACKGROUND\_COLOR\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 500h offset = 3070\_0500h

**PXP\_HW\_PXP\_INPUT\_FETCH\_BACKGROUND\_COLOR\_CH1 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

**13.7.12.72 PXP\_HW\_PXP\_INPUT\_FETCH\_PITCH**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 510h offset = 3070\_0510h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CH1_INPUT_PITCH																CH0_INPUT_PITCH															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_INPUT\_FETCH\_PITCH field descriptions

Field	Description
31–16 CH1_INPUT_PITCH	This field indicates the channel 1 input pitch
CH0_INPUT_PITCH	This field indicates the channel 0 input pitch

### 13.7.12.73 PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH0: 0x520

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH0\_SET: 0x524

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH0\_CLR: 0x528

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH0\_TOG: 0x52C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 520h offset = 3070\_0520h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## Pixel Pipeline (PXP)

### PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH0 field descriptions

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 0 — channel0 data will do shift function 0x1 1 — channel0 will bypass shift function
11 EXPAND_EN	0x0 0 — channel0 format expanding disable 0x1 1 — channel0 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 0 — RGB 565 0x1 1 — RGB 555 0x2 2 — ARGB 1555 0x3 3 — RGB 444 0x4 4 — ARGB 4444 0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7–2 RSVD1	Reserved, always set to zero.
INPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits

### 13.7.12.74 PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1: 0x530

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1\_SET: 0x534

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1\_CLR: 0x538

HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1\_TOG: 0x53C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 530h offset = 3070\_0530h

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1 field descriptions**

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 <b>0</b> — channel1 data will do shift function 0x1 <b>1</b> — channel1 will bypass shift function
11 EXPAND_EN	0x0 <b>0</b> — channel1 format expanding disable 0x1 <b>1</b> — channel1 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 <b>0</b> — RGB 565 0x1 <b>1</b> — RGB 555 0x2 <b>2</b> — ARGB 1555 0x3 <b>3</b> — RGB 444 0x4 <b>4</b> — ARGB 4444

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_CTRL\_CH1 field descriptions (continued)**

Field	Description
	0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7-2 RSVD1	Reserved, always set to zero.
INPUT_ACTIVE_ BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits

**13.7.12.75 PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0: 0x540

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0\_SET: 0x544

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0\_CLR: 0x548

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0\_TOG: 0x54C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 540h offset = 3070\_0540h

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0 field descriptions**

Field	Description
31-29 RSVD0	Reserved, always set to zero.
28-24 OFFSET3	Shift Offset for channel 0 component 3.
23-21 RSVD1	Reserved, always set to zero.
20-16 OFFSET2	Shift Offset for channel 0 component 2.

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH0 field descriptions (continued)**

Field	Description
15–13 RSVD2	Reserved, always set to zero.
12–8 OFFSET1	Shift Offset for channel 0 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 0 component 0.

**13.7.12.76 PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1: 0x550

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1\_SET: 0x554

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1\_CLR: 0x558

HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1\_TOG: 0x55C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 550h offset = 3070\_0550h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
R	RSVD0			OFFSET3				RSVD1			OFFSET2				RSVD2			OFFSET1				RSVD3			OFFSET0										
W	■							■							■							■													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1 field descriptions**

Field	Description
31–29 RSVD0	Reserved, always set to zero.
28–24 OFFSET3	Shift Offset for channel 1 component 3.
23–21 RSVD1	Reserved, always set to zero.
20–16 OFFSET2	Shift Offset for channel 1 component 2.
15–13 RSVD2	Reserved, always set to zero.

*Table continues on the next page...*

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_OFFSET\_CH1 field descriptions (continued)**

Field	Description
12–8 OFFSET1	Shift Offset for channel 1 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 1 component 0.

**13.7.12.77 PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH0: 0x560

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH0\_SET: 0x564

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH0\_CLR: 0x568

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH0\_TOG: 0x56C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 560h offset = 3070\_0560h

**PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH0 field descriptions**

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 0 component 3.
11–8 WIDTH2	Shift Width for channel 0 component 2.
7–4 WIDTH1	Shift Width for channel 0 component 1.
WIDTH0	Shift Width for channel 0 component 0.

### 13.7.12.78 PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH1

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH1: 0x570

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH1\_SET: 0x574

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH1\_CLR: 0x578

HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH1\_TOG: 0x57C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 570h offset = 3070\_0570h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0																WIDTH3			WIDTH2			WIDTH1			WIDTH0						
W	[Shaded]																[Shaded]			[Shaded]			[Shaded]			[Shaded]						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0

#### PXP\_HW\_PXP\_INPUT\_FETCH\_SHIFT\_WIDTH\_CH1 field descriptions

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 1 component 3.
11–8 WIDTH2	Shift Width for channel 1 component 2.
7–4 WIDTH1	Shift Width for channel 1 component 1.
WIDTH0	Shift Width for channel 1 component 0.

### 13.7.12.79 PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_0\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

#### EXAMPLE

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 580h offset = 3070\_0580h

### PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_0\_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

## 13.7.12.80 PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_1\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 590h offset = 3070\_0590h

### PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_1\_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

## 13.7.12.81 PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_0\_CH1

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 5A0h offset = 3070\_05A0h

**PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_0\_CH1 field descriptions**

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

**13.7.12.82 PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_1\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 5B0h offset = 3070\_05B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R																																																
W																																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_FETCH\_ADDR\_1\_CH1 field descriptions**

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

**13.7.12.83 Store engine Control Channel 0 Register (PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH0)**

This register defines the control bits for the pxp store\_engine sub-block.

HW\_PXP\_INPUT\_STORE\_CTRL\_CH0: 0x5C0

HW\_PXP\_INPUT\_STORE\_CTRL\_CH0\_SET: 0x5C4

HW\_PXP\_INPUT\_STORE\_CTRL\_CH0\_CLR: 0x5C8

HW\_PXP\_INPUT\_STORE\_CTRL\_CH0\_TOG: 0x5CC

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 5C0h offset = 3070\_05C0h

### PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH0 field descriptions

Field	Description
31 ARBIT_EN	Arbitration Enable  0x0 <b>0</b> — Arbitration disable. If using 2 channels, will output 2 axi bus sets 0x1 <b>1</b> — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–25 RSVD0	Reserved, always set to zero.
24 COMBINE_2CHANNEL	Combine 2 channel Enable

Table continues on the next page...

## PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH0 field descriptions (continued)

Field	Description
	0x0 <b>0</b> — combine 2 channel disable 0x1 <b>1</b> — combine 2 channel enable
23–18 RSVD1	Reserved, always set to zero.
17–16 WR_NUM_ BYTES	Bytes in a write burst 0x0 <b>8_bytes</b> — 8 bytes 0x1 <b>16_bytes</b> — 16 bytes 0x2 <b>32_bytes</b> — 32 bytes 0x3 <b>64_bytes</b> — 64 bytes
15–12 RSVD2	Reserved, always set to zero.
11 FILL_DATA_EN	fill data enable 0x0 <b>0</b> — Fill data mode disable. 0x1 <b>1</b> — Fill data mode enable. When using fill_data mode, store_engine will store fixed data defined in fill_data register
10 PACK_IN_SEL	pack_in_sel 0x0 <b>0</b> — select 64 shift out data to pack 0x1 <b>1</b> — select low 32 bit shift out data to pack
9 STORE_ MEMORY_EN	store memory enable 0x0 <b>0</b> — store memory mode disable. 0x1 <b>1</b> — store memory mode enable. Data will store to memory
8 STORE_ BYPASS_EN	store bypass enable 0x0 <b>0</b> — store bypass mode disable. 0x1 <b>1</b> — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_ NUM	Selects Array Size 0x0 <b>0</b> — Using 1x1 Array 0x1 <b>1</b> — Using 3x3 Array 0x2 <b>2</b> — Using 5x5 Array 0x3 <b>3</b> — Using 5x5 Array
4 ARRAY_EN	0x0 <b>0</b> — Array Handshake Disabled 0x1 <b>1</b> — Array Handshake Enabled
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 <b>0</b> — Handshake with the prefetch engine is disabled 0x1 <b>1</b> — Handshake with the prefetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH0 field descriptions (continued)**

Field	Description
1 BLOCK_EN	Choses the store mode. 0x0 0 — Store in scan mode 0x1 1 — Store in block mode
0 CH_EN	Channel enable. 0x0 0 — Store function is disable 0x1 1 — Store function is enable

**13.7.12.84 Store engine Control Channel 1 Register (PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH1)**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_INPUT\_STORE\_CTRL\_CH1: 0x5D0

HW\_PXP\_INPUT\_STORE\_CTRL\_CH1\_SET: 0x5D4

HW\_PXP\_INPUT\_STORE\_CTRL\_CH1\_CLR: 0x5D8

HW\_PXP\_INPUT\_STORE\_CTRL\_CH1\_TOG: 0x5DC

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 5D0h offset = 3070\_05D0h

PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH1 field descriptions

Field	Description
31–18 RSVD0	Reserved, always set to zero.
17–16 WR_NUM_Bytes	Bytes in a write burst 0x0 <b>8_bytes</b> — 8 bytes 0x1 <b>16_bytes</b> — 16 bytes 0x2 <b>32_bytes</b> — 32 bytes 0x3 <b>64_bytes</b> — 64 bytes
15–11 RSVD1	Reserved, always set to zero.
10 PACK_IN_SEL	pack_in_sel 0x0 <b>0</b> — select 64 shift out data to pack 0x1 <b>1</b> — select channel 0 high 32 bit shift out data to pack
9 STORE_MEMORY_EN	store memory enable 0x0 <b>0</b> — store memory mode disable. 0x1 <b>1</b> — store memory mode enable. Data will store to memory.
8 STORE_BYPASS_EN	enable bit for store bypass 0x0 <b>0</b> — store bypass mode disable. 0x1 <b>1</b> — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_NUM	Selects Array Size 0x0 <b>0</b> — Using 1x1 Array

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_STORE\_CTRL\_CH1 field descriptions (continued)**

Field	Description
	0x1 <b>1</b> — Using 3x3 Array 0x2 <b>2</b> — Using 5x5 Array 0x3 <b>3</b> — Using 5x5 Array
4 ARRAY_EN	0x0 <b>0</b> — Array Handshake Disabled 0x1 <b>1</b> — Array Handshake Enabled
3 HANDSHAKE_EN	Enable bit for handshake with the fetch engine. 0x0 <b>0</b> — Handshake with the fetch engine is disabled 0x1 <b>1</b> — Handshake with the fetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16
1 BLOCK_EN	Chooses the store mode. 0x0 <b>0</b> — Store in scan mode 0x1 <b>1</b> — Store in block mode
0 CH_EN	Channel enable. 0x0 <b>0</b> — Store function is disable 0x1 <b>1</b> — Store function is enable

**13.7.12.85 Store engine status Channel 0 Register (PXP\_HW\_PXP\_INPUT\_STORE\_STATUS\_CH0)**

This register defines the status bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 5E0h offset = 3070\_05E0h

**PXP\_HW\_PXP\_INPUT\_STORE\_STATUS\_CH0 field descriptions**

Field	Description
31–16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.

*Table continues on the next page...*

**PXP\_HW\_PXP\_INPUT\_STORE\_STATUS\_CH0 field descriptions (continued)**

Field	Description
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

**13.7.12.86 Store engine status Channel 1 Register (PXP\_HW\_PXP\_INPUT\_STORE\_STATUS\_CH1)**

This register defines the status bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 5F0h offset = 3070\_05F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STORE_BLOCK_Y																STORE_BLOCK_X															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_STORE\_STATUS\_CH1 field descriptions**

Field	Description
31–16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

**13.7.12.87 PXP\_HW\_PXP\_INPUT\_STORE\_SIZE\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 600h offset = 3070\_0600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_INPUT\_STORE\_SIZE\_CH0 field descriptions**

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

**13.7.12.88 PXP\_HW\_PXP\_INPUT\_STORE\_SIZE\_CH1**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 610h offset = 3070\_0610h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_INPUT\_STORE\_SIZE\_CH1 field descriptions**

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

**13.7.12.89 PXP\_HW\_PXP\_INPUT\_STORE\_PITCH**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 620h offset = 3070\_0620h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_INPUT\_STORE\_PITCH field descriptions**

Field	Description
31–16 CH1_OUT_ PITCH	This field indicates the channel 1 input pitch
CH0_OUT_ PITCH	This field indicates the channel 0 input pitch

**13.7.12.90 PXP\_HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH0: 0x630

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH0\_SET: 0x634

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH0\_CLR: 0x638

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH0\_TOG: 0x63C

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 630h offset = 3070\_0630h

## Pixel Pipeline (PXP)

**PXP\_HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH0 field descriptions**

Field	Description
31–8 RSVD0	Reserved, always set to zero.
7 SHIFT_BYPASS	CH0 shift bypass 0x0 <b>0</b> — data will do shift processing. 0x1 <b>1</b> — data will bypass shift module.
6 RSVD1	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane 0x0 <b>0</b> — YUYV422 2 plane disabled. 0x1 <b>1</b> — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 <b>0</b> — YUYV422 2 plane disabled. 0x1 <b>1</b> — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 <b>0</b> — 8 bits 0x1 <b>1</b> — 16 bits 0x2 <b>2</b> — 32 bits 0x3 <b>3</b> — 32 bits
RSVD2	Reserved, always set to zero.

### 13.7.12.91 PXP\_HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1

This register defines the control bits for the pxp store\_engine sub-block.

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1: 0x640

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1\_SET: 0x644

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1\_CLR: 0x648

HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1\_TOG: 0x64C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 640h offset = 3070\_0640h

**PXP\_HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1 field descriptions**

Field	Description
31–6 RSVD0	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane

*Table continues on the next page...*

**PXP\_HW\_PXP\_INPUT\_STORE\_SHIFT\_CTRL\_CH1 field descriptions (continued)**

Field	Description
	0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

**13.7.12.92 PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_0\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 690h offset = 3070\_0690h

**PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_0\_CH0 field descriptions**

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

**13.7.12.93 PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_1\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 6A0h offset = 3070\_06A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_1\_CH0 field descriptions

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

### 13.7.12.94 PXP\_HW\_PXP\_INPUT\_STORE\_FILL\_DATA\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 6B0h offset = 3070\_06B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_INPUT\_STORE\_FILL\_DATA\_CH0 field descriptions

Field	Description
FILL_DATA_CH0	when using fill_data mode,store engine channel0 will store the fill_data value defined here.

### 13.7.12.95 PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_0\_CH1

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 6C0h offset = 3070\_06C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_0\_CH1 field descriptions**

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

**13.7.12.96 PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_1\_CH1**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 6D0h offset = 3070\_06D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_INPUT\_STORE\_ADDR\_1\_CH1 field descriptions**

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

**13.7.12.97 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK0\_H\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 6E0h offset = 3070\_06E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK0\_H\_CH0 field descriptions**

Field	Description
D_MASK0_H_CH0	data mask0 high byte

### 13.7.12.98 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK0\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 6F0h offset = 3070\_06F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	D_MASK0_L_CH0																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK0\_L\_CH0 field descriptions

Field	Description
D_MASK0_L_CH0	data mask0 low byte

### 13.7.12.99 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK1\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 700h offset = 3070\_0700h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK1\_H\_CH0 field descriptions

Field	Description
D_MASK1_H_CH0	data mask1 high byte

### 13.7.12.100 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK1\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

## Pixel Pipeline (PXP)

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 710h offset = 3070\_0710h

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK1\_L\_CH0 field descriptions

Field	Description
D_MASK1_L_CH0	data mask1 low byte

### 13.7.12.101 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK2\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 720h offset = 3070\_0720h

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK2\_H\_CH0 field descriptions

Field	Description
D_MASK2_H_CH0	data mask2 high byte

### 13.7.12.102 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK2\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 730h offset = 3070\_0730h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK2\_L\_CH0 field descriptions

Field	Description
D_MASK2_L_CH0	data mask2 low byte

### 13.7.12.103 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK3\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 740h offset = 3070\_0740h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK3\_H\_CH0 field descriptions

Field	Description
D_MASK3_H_CH0	data mask3 high byte

### 13.7.12.104 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK3\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 750h offset = 3070\_0750h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK3\_L\_CH0 field descriptions**

Field	Description
D_MASK3_L_CH0	data mask3 low byte

**13.7.12.105 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK4\_H\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 760h offset = 3070\_0760h

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK4\_H\_CH0 field descriptions**

Field	Description
D_MASK4_H_CH0	data mask4 high byte

**13.7.12.106 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK4\_L\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 770h offset = 3070\_0770h

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK4\_L\_CH0 field descriptions**

Field	Description
D_MASK4_L_CH0	data mask4 low byte

### 13.7.12.107 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK5\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 780h offset = 3070\_0780h

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK5\_H\_CH0 field descriptions

Field	Description
D_MASK5_H_CH0	data mask5 high byte

### 13.7.12.108 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK5\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 790h offset = 3070\_0790h

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK5\_L\_CH0 field descriptions

Field	Description
D_MASK5_L_CH0	data mask5 low byte

### 13.7.12.109 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK6\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

## Pixel Pipeline (PXP)

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 7A0h offset = 3070\_07A0h

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK6\_H\_CH0 field descriptions

Field	Description
D_MASK6_H_CH0	data mask6 high byte

### 13.7.12.110 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK6\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 7B0h offset = 3070\_07B0h

#### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK6\_L\_CH0 field descriptions

Field	Description
D_MASK6_L_CH0	data mask6 low byte

### 13.7.12.111 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK7\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 7C0h offset = 3070\_07C0h

### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK7\_H\_CH0 field descriptions

Field	Description
D_MASK7_H_CH0	data mask7 high byte

### 13.7.12.112 PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK7\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 7E0h offset = 3070\_07E0h

### PXP\_HW\_PXP\_INPUT\_STORE\_D\_MASK7\_L\_CH0 field descriptions

Field	Description
D_MASK7_L_CH0	data mask7 low byte

### 13.7.12.113 PXP\_HW\_PXP\_INPUT\_STORE\_D\_SHIFT\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 7F0h offset = 3070\_07F0h

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_SHIFT\_L\_CH0 field descriptions**

Field	Description
31 D_SHIFT_FLAG3	data shift flag 3
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_SHIFT\_L\_CH0 field descriptions (continued)**

Field	Description
29–24 D_SHIFT_ WIDTH3	data shift width 3
23 D_SHIFT_FLAG2	data shift flag 2
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH2	data shift width 2
15 D_SHIFT_FLAG1	data shift flag 1
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH1	data shift width 1
7 D_SHIFT_FLAG0	data shift flag 0
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH0	data shift width 0

**13.7.12.114 PXP\_HW\_PXP\_INPUT\_STORE\_D\_SHIFT\_H\_CH0**

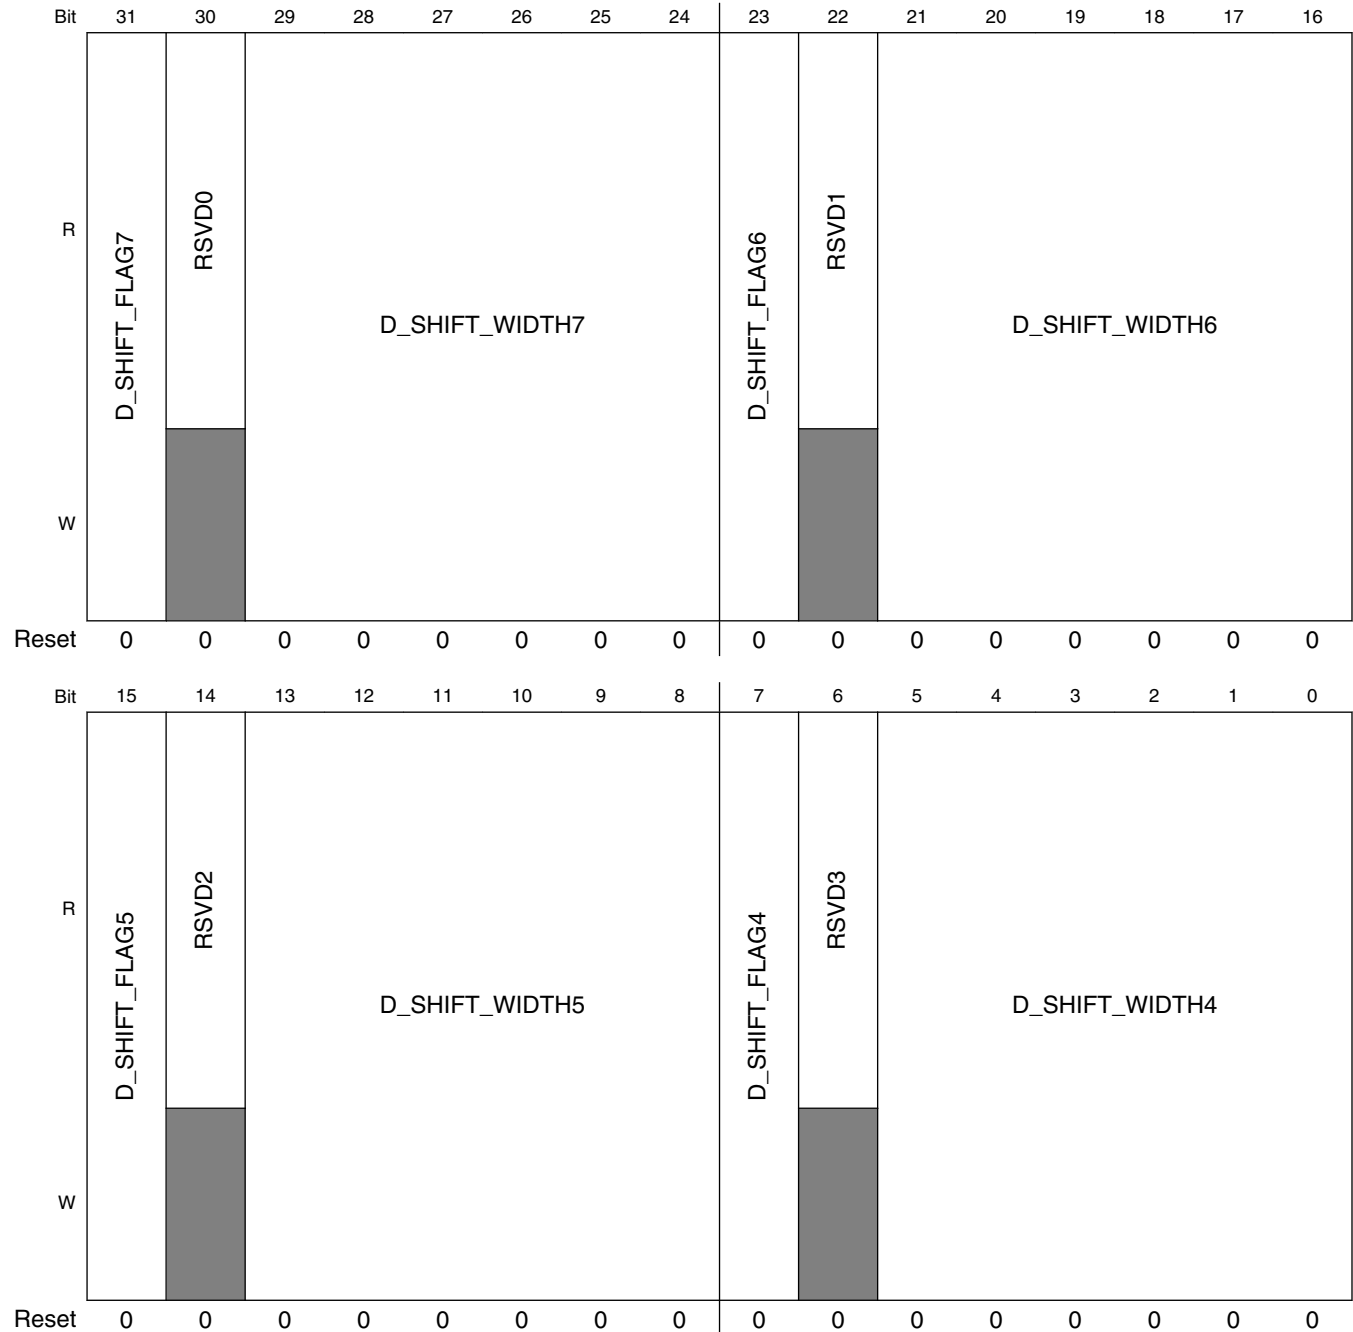

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 800h offset = 3070\_0800h

### PXP\_HW\_PXP\_INPUT\_STORE\_D\_SHIFT\_H\_CH0 field descriptions

Field	Description
31 D_SHIFT_FLAG7	data shift flag 7
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_STORE\_D\_SHIFT\_H\_CH0 field descriptions (continued)**

Field	Description
29–24 D_SHIFT_ WIDTH7	data shift width 3
23 D_SHIFT_FLAG6	data shift flag 6
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH6	data shift width 6
15 D_SHIFT_FLAG5	data shift flag 5
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH5	data shift width 5
7 D_SHIFT_FLAG4	data shift flag 4
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH4	data shift width 4

**13.7.12.115 PXP\_HW\_PXP\_INPUT\_STORE\_F\_SHIFT\_L\_CH0**

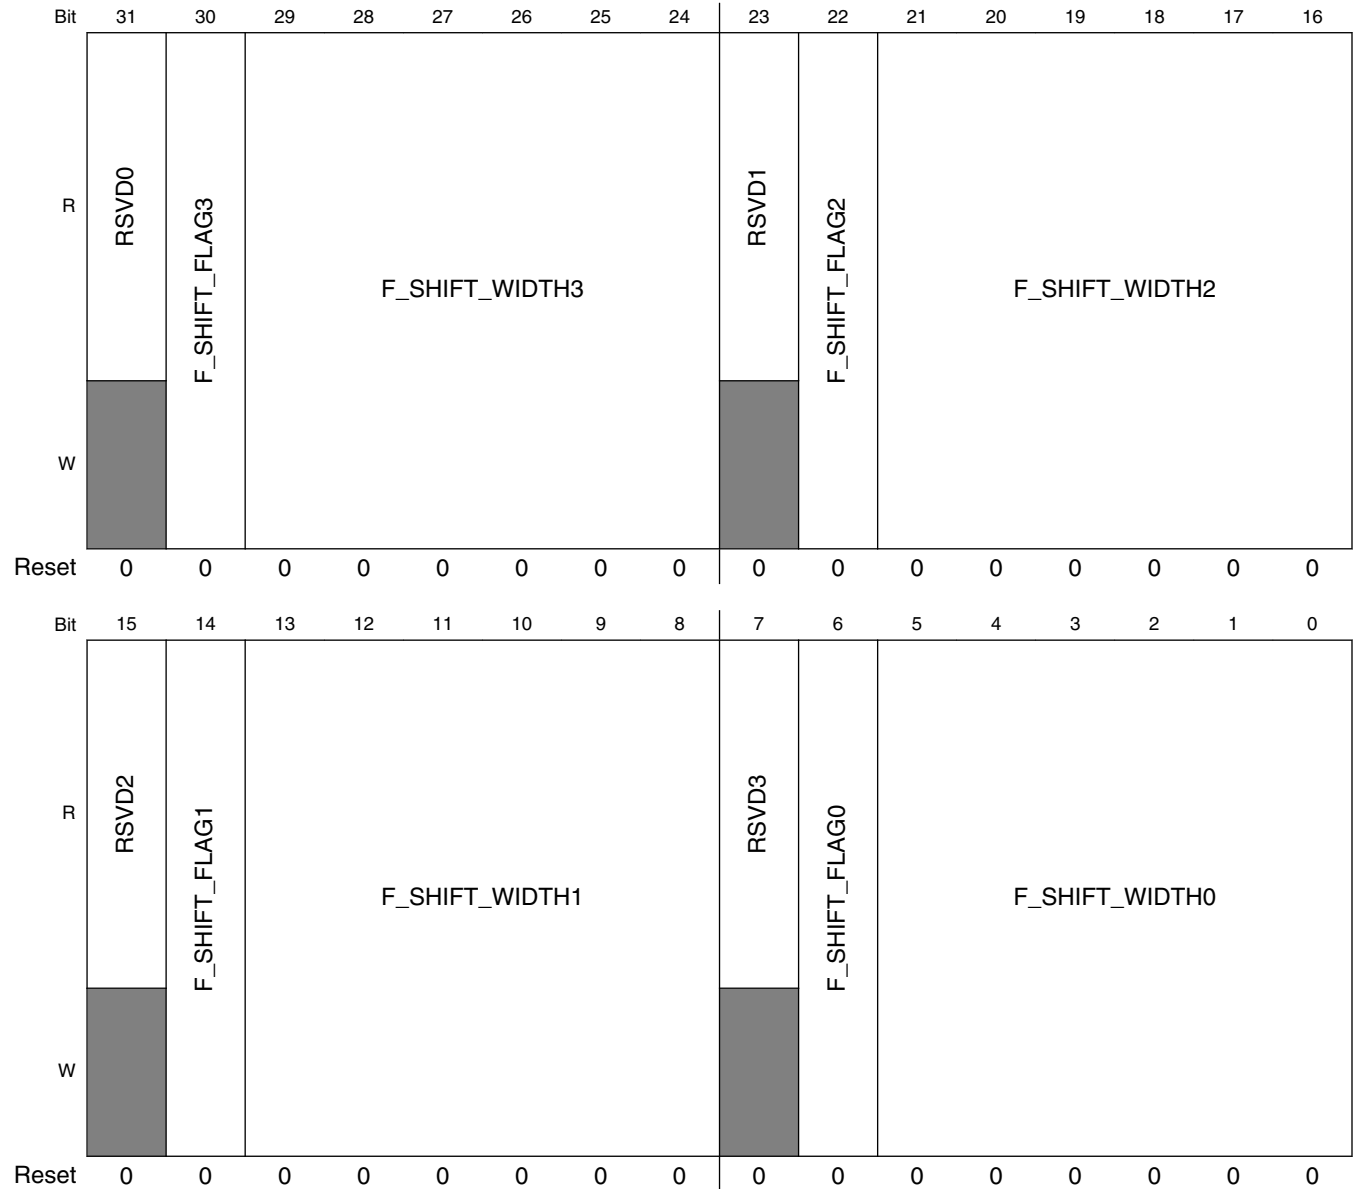

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 810h offset = 3070\_0810h

**PXP\_HW\_PXP\_INPUT\_STORE\_F\_SHIFT\_L\_CH0 field descriptions**

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG3	flag shift flag3
29-24 F_SHIFT_WIDTH3	flag shift width 3
23 RSVD1	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_INPUT\_STORE\_F\_SHIFT\_L\_CH0 field descriptions (continued)**

Field	Description
22 F_SHIFT_FLAG2	flag shift flag2
21–16 F_SHIFT_WIDTH2	flag shift width 2
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG1	flag shift flag1
13–8 F_SHIFT_WIDTH1	flag shift width 1
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG0	flag shift flag0
F_SHIFT_WIDTH0	flag shift width 0

**13.7.12.116 PXP\_HW\_PXP\_INPUT\_STORE\_F\_SHIFT\_H\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 820h offset = 3070\_0820h

## Pixel Pipeline (PXP)

### PXP\_HW\_PXP\_INPUT\_STORE\_F\_SHIFT\_H\_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG7	flag shift flag7
29–24 F_SHIFT_WIDTH7	flag shift width 7
23 RSVD1	Reserved, always set to zero.
22 F_SHIFT_FLAG6	flag shift flag6
21–16 F_SHIFT_WIDTH6	flag shift width 5
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG5	flag shift flag5
13–8 F_SHIFT_WIDTH5	flag shift width 5
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG4	flag shift flag4
F_SHIFT_WIDTH4	flag shift width 4

### 13.7.12.117 PXP\_HW\_PXP\_INPUT\_STORE\_F\_MASK\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 830h offset = 3070\_0830h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_INPUT\_STORE\_F\_MASK\_L\_CH0 field descriptions

Field	Description
31–24 F_MASK3	flag mask3
23–16 F_MASK2	flag mask2
15–8 F_MASK1	flag mask1
F_MASK0	flag mask0

### 13.7.12.118 PXP\_HW\_PXP\_INPUT\_STORE\_F\_MASK\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 840h offset = 3070\_0840h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_INPUT\_STORE\_F\_MASK\_H\_CH0 field descriptions

Field	Description
31–24 F_MASK7	flag mask7

*Table continues on the next page...*

**PXP\_HW\_PXP\_INPUT\_STORE\_F\_MASK\_H\_CH0 field descriptions (continued)**

Field	Description
23–16 F_MASK6	flag mask6
15–8 F_MASK5	flag mask5
F_MASK4	flag mask4

**13.7.12.119 Pre-fetch engine Control Channel 0 Register (PXP\_HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0)**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0: 0x850

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0\_SET: 0x854

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0\_CLR: 0x858

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0\_TOG: 0x85C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 850h offset = 3070\_0850h

### PXP\_HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0 field descriptions

Field	Description
31 ARBIT_EN	Enables Arbitration 0x0 <b>0</b> — Arbitration disable. If using 2 channels, will output 2 axi bus sets. 0x1 <b>1</b> — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_SCAN_LINE_NUM	scan handshake line number 0x0 <b>0</b> — 1 line. 0x1 <b>1</b> — 8 lines 0x2 <b>2</b> — 16 lines 0x3 <b>3</b> — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_BYTES	Bytes in a read burst 0x0 <b>8_bytes</b> — 8 bytes. 0x1 <b>16_bytes</b> — 16 bytes. 0x2 <b>32_bytes</b> — 32 bytes. 0x3 <b>64_bytes</b> — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.

Table continues on the next page...

## PXP\_HW\_PXP\_DITHER\_FETCH\_CTRL\_CH0 field descriptions (continued)

Field	Description
13–12 ROTATION_ANGLE	0x0 <b>ROT_0</b> — Rotate image by 0 degrees. 0x1 <b>ROT_90</b> — Rotate image by 90 degrees. 0x2 <b>ROT_180</b> — Rotate image by 180 degrees. 0x3 <b>ROT_270</b> — Rotate image by 270 degrees.
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 <b>0</b> — VFLIP disable 0x1 <b>1</b> — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 <b>0</b> — HFLIP disable 0x1 <b>1</b> — VFLIP enable
8–6 RSVD4	Reserved, always set to zero.
5 HIGH_BYTE	channel 0 high byte selection 0x0 <b>0</b> — In 64 bit mode, the output high byte will use channel1. 0x1 <b>1</b> — In 64 bit mode, the output high byte will use channel0
4 BYPASS_PIXEL_EN	Selects Channel 0 pixel source 0x0 <b>0</b> — Channel 0 is from memory 0x1 <b>1</b> — Channel 0 is from previous process engine
3 HANDSHAKE_EN	Enable bit for handshake with the store engine. 0x0 <b>0</b> — Handshake with the store engine is disabled 0x1 <b>1</b> — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16
1 BLOCK_EN	Choses the prefetch mode. 0x0 <b>0</b> — Prefetch in scan mode 0x1 <b>1</b> — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 <b>0</b> — Prefetch function is disable 0x1 <b>1</b> — Prefetch function is enable

### 13.7.12.120 Pre-fetch engine Control Channel 1 Register (PXP\_HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1)

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1: 0x860

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1\_SET: 0x864

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1\_CLR: 0x868

HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1\_TOG: 0x86C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 860h offset = 3070\_0860h

## Pixel Pipeline (PXP)

### PXP\_HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1 field descriptions

Field	Description
31–26 RSVD0	Reserved, always set to zero.
25–24 HANDSHAKE_SCAN_LINE_NUM	scan handshake line number 0x0 <b>0</b> — 1 line. 0x1 <b>1</b> — 8 lines 0x2 <b>2</b> — 16 lines 0x3 <b>3</b> — 16 lines
23–18 RSVD1	Reserved, always set to zero.
17–16 RD_NUM_BYTES	Bytes in a read burst 0x0 <b>8_bytes</b> — 8 bytes. 0x1 <b>16_bytes</b> — 16 bytes. 0x2 <b>32_bytes</b> — 32 bytes. 0x3 <b>64_bytes</b> — 64 bytes.
15–14 RSVD2	Reserved, always set to zero.
13–12 ROTATION_ANGLE	0x0 <b>ROT_0</b> — Rotate image by 0 degrees. 0x1 <b>ROT_90</b> — Rotate image by 90 degrees. 0x2 <b>ROT_180</b> — Rotate image by 180 degrees. 0x3 <b>ROT_270</b> — Rotate image by 270 degrees.

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_FETCH\_CTRL\_CH1 field descriptions (continued)**

Field	Description
11 RSVD3	Reserved, always set to zero.
10 VFLIP	Enables VFLIP 0x0 <b>0</b> — VFLIP disable 0x1 <b>1</b> — VFLIP enable
9 HFLIP	Enables HFLIP. 0x0 <b>0</b> — HFLIP disable 0x1 <b>1</b> — VFLIP enable
8–5 RSVD4	Reserved, always set to zero.
4 BYPASS_ PIXEL_EN	Selects Channel 1 pixel source 0x0 <b>0</b> — Channel 1 is from memory 0x1 <b>1</b> — Channel 1 is from previous process engine
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 <b>0</b> — Handshake with the store engine is disabled 0x1 <b>1</b> — Handshake with the store engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16
1 BLOCK_EN	Choses the prefetch mode. 0x0 <b>0</b> — Prefetch in scan mode 0x1 <b>1</b> — Prefetch in block mode
0 CH_EN	Channel enable. 0x0 <b>0</b> — Prefetch function is disable 0x1 <b>1</b> — Prefetch function is enable

**13.7.12.121 Pre-fetch engine status Channel 0 Register (PXP\_HW\_PXP\_DITHER\_FETCH\_STATUS\_CH0)**

This register defines the status bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 870h offset = 3070\_0870h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	[Shaded]																																				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_DITHER\_FETCH\_STATUS\_CH0 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

## 13.7.12.122 Store engine status Channel 1 Register (PXP\_HW\_PXP\_DITHER\_FETCH\_STATUS\_CH1)

This register defines the status bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 880h offset = 3070\_0880h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
R	PREFETCH_BLOCK_Y																PREFETCH_BLOCK_X																				
W	[Shaded]																																				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_DITHER\_FETCH\_STATUS\_CH1 field descriptions

Field	Description
31–16 PREFETCH_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
PREFETCH_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

## 13.7.12.123 PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_ULC\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 890h offset = 3070\_0890h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_ULC\_CH0 field descriptions**

Field	Description
31–16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.124 PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_LRC\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 8A0h offset = 3070\_08A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_LRC\_CH0 field descriptions**

Field	Description
31–16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.125 PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_ULC\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 8B0h offset = 3070\_08B0h

**PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_ULC\_CH1 field descriptions**

Field	Description
31-16 ACTIVE_SIZE_ULC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_ULC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.126 PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_LRC\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 8C0h offset = 3070\_08C0h

**PXP\_HW\_PXP\_DITHER\_FETCH\_ACTIVE\_SIZE\_LRC\_CH1 field descriptions**

Field	Description
31-16 ACTIVE_SIZE_LRC_Y	This field indicates the upper left Y-coordinate(in pixels) of the active surface of the total input memory
ACTIVE_SIZE_LRC_X	This field indicates the upper left X-coordinate(in pixels) of the active surface of the total input memory

**13.7.12.127 PXP\_HW\_PXP\_DITHER\_FETCH\_SIZE\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 8D0h offset = 3070\_08D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	INPUT_TOTAL_HEIGHT																INPUT_TOTAL_WIDTH

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_FETCH\_SIZE\_CH0 field descriptions**

Field	Description
31–16 INPUT_TOTAL_HEIGHT	actual total height -1
INPUT_TOTAL_WIDTH	actual total width -1

**13.7.12.128 PXP\_HW\_PXP\_DITHER\_FETCH\_SIZE\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 8E0h offset = 3070\_08E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	INPUT_TOTAL_HEIGHT																INPUT_TOTAL_WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_FETCH\_SIZE\_CH1 field descriptions**

Field	Description
31–16 INPUT_TOTAL_HEIGHT	actual total height -1
INPUT_TOTAL_WIDTH	actual_total_width -1

**13.7.12.129 PXP\_HW\_PXP\_DITHER\_FETCH\_BACKGROUND\_COLOR\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 8F0h offset = 3070\_08F0h

**PXP\_HW\_PXP\_DITHER\_FETCH\_BACKGROUND\_COLOR\_CH0 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

**13.7.12.130 PXP\_HW\_PXP\_DITHER\_FETCH\_BACKGROUND\_COLOR\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 900h offset = 3070\_0900h

**PXP\_HW\_PXP\_DITHER\_FETCH\_BACKGROUND\_COLOR\_CH1 field descriptions**

Field	Description
BACKGROUND_COLOR	background color(in 32bpp format) for any pixels not within the buffer range specified by the ULC/LRC

**13.7.12.131 PXP\_HW\_PXP\_DITHER\_FETCH\_PITCH**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 910h offset = 3070\_0910h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PXP\_HW\_PXP\_DITHER\_FETCH\_PITCH field descriptions

Field	Description
31–16 CH1_INPUT_PITCH	This field indicates the channel 1 input pitch
CH0_INPUT_PITCH	This field indicates the channel 0 input pitch

### 13.7.12.132 PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH0: 0x920

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH0\_SET: 0x924

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH0\_CLR: 0x928

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH0\_TOG: 0x92C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 920h offset = 3070\_0920h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD0															
W

## Pixel Pipeline (PXP)

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH0 field descriptions**

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 0 — channel0 data will do shift function 0x1 1 — channel0 will bypass shift function
11 EXPAND_EN	0x0 0 — channel0 format expanding disable 0x1 1 — channel0 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 0 — RGB 565 0x1 1 — RGB 555 0x2 2 — ARGB 1555 0x3 3 — RGB 444 0x4 4 — ARGB 4444 0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7–2 RSVD1	Reserved, always set to zero.
INPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits

### 13.7.12.133 PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1: 0x930

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1\_SET: 0x934

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1\_CLR: 0x938

HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1\_TOG: 0x93C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 930h offset = 3070\_0930h

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1 field descriptions**

Field	Description
31–13 RSVD0	Reserved, always set to zero.
12 SHIFT_BYPASS	0x0 <b>0</b> — channel1 data will do shift function 0x1 <b>1</b> — channel1 will bypass shift function
11 EXPAND_EN	0x0 <b>0</b> — channel1 format expanding disable 0x1 <b>1</b> — channel1 format expanding enable
10–8 EXPAND_FORMAT	Select Pixel format 0x0 <b>0</b> — RGB 565 0x1 <b>1</b> — RGB 555 0x2 <b>2</b> — ARGB 1555 0x3 <b>3</b> — RGB 444 0x4 <b>4</b> — ARGB 4444

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_CTRL\_CH1 field descriptions (continued)**

Field	Description
	0x5 5 — YUYV/YVYU 0x6 6 — UYVY/VYUY 0x7 7 — YUV422_2P
7-2 RSVD1	Reserved, always set to zero.
INPUT_ACTIVE_ BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits

**13.7.12.134 PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0: 0x940

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0\_SET: 0x944

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0\_CLR: 0x948

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0\_TOG: 0x94C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 940h offset = 3070\_0940h

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0 field descriptions**

Field	Description
31-29 RSVD0	Reserved, always set to zero.
28-24 OFFSET3	Shift Offset for channel 0 component 3.
23-21 RSVD1	Reserved, always set to zero.
20-16 OFFSET2	Shift Offset for channel 0 component 2.

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH0 field descriptions (continued)**

Field	Description
15–13 RSVD2	Reserved, always set to zero.
12–8 OFFSET1	Shift Offset for channel 0 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 0 component 0.

**13.7.12.135 PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1: 0x950

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1\_SET: 0x954

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1\_CLR: 0x958

HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1\_TOG: 0x95C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 950h offset = 3070\_0950h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0			OFFSET3				RSVD1			OFFSET2				RSVD2			OFFSET1				RSVD3			OFFSET0							
W	0																															
Reset	0																															

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1 field descriptions**

Field	Description
31–29 RSVD0	Reserved, always set to zero.
28–24 OFFSET3	Shift Offset for channel 1 component 3.
23–21 RSVD1	Reserved, always set to zero.
20–16 OFFSET2	Shift Offset for channel 1 component 2.
15–13 RSVD2	Reserved, always set to zero.

*Table continues on the next page...*

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_OFFSET\_CH1 field descriptions (continued)**

Field	Description
12–8 OFFSET1	Shift Offset for channel 1 component 1.
7–5 RSVD3	Reserved, always set to zero.
OFFSET0	Shift Offset for channel 1 component 0.

**13.7.12.136 PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH0**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH0: 0x960

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH0\_SET: 0x964

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH0\_CLR: 0x968

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH0\_TOG: 0x96C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 960h offset = 3070\_0960h

**PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH0 field descriptions**

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 0 component 3.
11–8 WIDTH2	Shift Width for channel 0 component 2.
7–4 WIDTH1	Shift Width for channel 0 component 1.
WIDTH0	Shift Width for channel 0 component 0.

### 13.7.12.137 PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH1

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH1: 0x970

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH1\_SET: 0x974

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH1\_CLR: 0x978

HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH1\_TOG: 0x97C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + 970h offset = 3070\_0970h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0																WIDTH3				WIDTH2				WIDTH1				WIDTH0			
W	[Shaded]																[Shaded]				[Shaded]				[Shaded]							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0

#### PXP\_HW\_PXP\_DITHER\_FETCH\_SHIFT\_WIDTH\_CH1 field descriptions

Field	Description
31–16 RSVD0	Reserved, always set to zero.
15–12 WIDTH3	Shift Width for channel 1 component 3.
11–8 WIDTH2	Shift Width for channel 1 component 2.
7–4 WIDTH1	Shift Width for channel 1 component 1.
WIDTH0	Shift Width for channel 1 component 0.

### 13.7.12.138 PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_0\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

#### EXAMPLE

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 980h offset = 3070\_0980h

### PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_0\_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

## 13.7.12.139 PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_1\_CH0

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 990h offset = 3070\_0990h

### PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_1\_CH0 field descriptions

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

## 13.7.12.140 PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_0\_CH1

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + 9A0h offset = 3070\_09A0h

**PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_0\_CH1 field descriptions**

Field	Description
INPUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

**13.7.12.141 PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_1\_CH1**

This register defines the control bits for the pxp prefetch\_engine sub-block.

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 9B0h offset = 3070\_09B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_FETCH\_ADDR\_1\_CH1 field descriptions**

Field	Description
INPUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

**13.7.12.142 Store engine Control Channel 0 Register (PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH0)**

This register defines the control bits for the pxp store\_engine sub-block.

HW\_PXP\_DITHER\_STORE\_CTRL\_CH0: 0x9C0

HW\_PXP\_DITHER\_STORE\_CTRL\_CH0\_SET: 0x9C4

HW\_PXP\_DITHER\_STORE\_CTRL\_CH0\_CLR: 0x9C8

HW\_PXP\_DITHER\_STORE\_CTRL\_CH0\_TOG: 0x9CC

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 9C0h offset = 3070\_09C0h

### PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH0 field descriptions

Field	Description
31 ARBIT_EN	Arbitration Enable 0x0 <b>0</b> — Arbitration disable. If using 2 channels, will output 2 axi bus sets 0x1 <b>1</b> — Arbitration enable. If using 2 channel, will only output 1 axi bus sets
30–25 RSVD0	Reserved, always set to zero.
24 COMBINE_2CHANNEL	Combine 2 channel Enable

Table continues on the next page...

## PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH0 field descriptions (continued)

Field	Description
	0x0 <b>0</b> — combine 2 channel disable 0x1 <b>1</b> — combine 2 channel enable
23–18 RSVD1	Reserved, always set to zero.
17–16 WR_NUM_ BYTES	Bytes in a write burst 0x0 <b>8_bytes</b> — 8 bytes 0x1 <b>16_bytes</b> — 16 bytes 0x2 <b>32_bytes</b> — 32 bytes 0x3 <b>64_bytes</b> — 64 bytes
15–12 RSVD2	Reserved, always set to zero.
11 FILL_DATA_EN	enable bit for fill data 0x0 <b>0</b> — Fill data mode disable. 0x1 <b>1</b> — Fill data mode enable. When using fill_data mode, store_engine will store fixed data defined in fill_data register
10 PACK_IN_SEL	pack_in_sel 0x0 <b>0</b> — select 64 shift out data to pack 0x1 <b>1</b> — select low 32 bit shift out data to pack
9 STORE_ MEMORY_EN	store memory enable 0x0 <b>0</b> — store memory mode disable. 0x1 <b>1</b> — store memory mode enable. Data will store to memory
8 STORE_ BYPASS_EN	enable bit for store bypass 0x0 <b>0</b> — store bypass mode disable. 0x1 <b>1</b> — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_ NUM	Selects Array Size 0x0 <b>0</b> — Using 1x1 Array 0x1 <b>1</b> — Using 3x3 Array 0x2 <b>2</b> — Using 5x5 Array 0x3 <b>3</b> — Using 5x5 Array
4 ARRAY_EN	0x0 <b>0</b> — Array Handshake Disabled 0x1 <b>1</b> — Array Handshake Enabled
3 HANDSHAKE_ EN	Enable bit for handshake with the store engine. 0x0 <b>0</b> — Handshake with the prefetch engine is disabled 0x1 <b>1</b> — Handshake with the prefetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH0 field descriptions (continued)**

Field	Description
1 BLOCK_EN	Choses the store mode. 0x0 0 — Store in scan mode 0x1 1 — Store in block mode
0 CH_EN	Channel enable. 0x0 0 — Store function is disable 0x1 1 — Store function is enable

**13.7.12.143 Store engine Control Channel 1 Register (PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH1)**

This register defines the control bits for the pxp prefetch\_engine sub-block.

HW\_PXP\_DITHER\_STORE\_CTRL\_CH1: 0x9D0

HW\_PXP\_DITHER\_STORE\_CTRL\_CH1\_SET: 0x9D4

HW\_PXP\_DITHER\_STORE\_CTRL\_CH1\_CLR: 0x9D8

HW\_PXP\_DITHER\_STORE\_CTRL\_CH1\_TOG: 0x9DC

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 9D0h offset = 3070\_09D0h

PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH1 field descriptions

Field	Description
31–18 RSVD0	Reserved, always set to zero.
17–16 WR_NUM_Bytes	Bytes in a write burst 0x0 <b>8_bytes</b> — 8 bytes 0x1 <b>16_bytes</b> — 16 bytes 0x2 <b>32_bytes</b> — 32 bytes 0x3 <b>64_bytes</b> — 64 bytes
15–11 RSVD1	Reserved, always set to zero.
10 PACK_IN_SEL	pack_in_sel 0x0 <b>0</b> — select 64 shift out data to pack 0x1 <b>1</b> — select channel 0 high 32 bit shift out data to pack
9 STORE_MEMORY_EN	store memory enable 0x0 <b>0</b> — store memory mode disable. 0x1 <b>1</b> — store memory mode enable. Data will store to memory
8 STORE_BYPASS_EN	enable bit for store bypass 0x0 <b>0</b> — store bypass mode disable. 0x1 <b>1</b> — store bypass mode enable. Data will bypass to store output.
7 RSVD3	Reserved, always set to zero.
6–5 ARRAY_LINE_NUM	Selects Array Size 0x0 <b>0</b> — Using 1x1 Array

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_STORE\_CTRL\_CH1 field descriptions (continued)**

Field	Description
	0x1 <b>1</b> — Using 3x3 Array 0x2 <b>2</b> — Using 5x5 Array 0x3 <b>3</b> — Using 5x5 Array
4 ARRAY_EN	0x0 <b>0</b> — Array Handshake Disabled 0x1 <b>1</b> — Array Handshake Enabled
3 HANDSHAKE_EN	Enable bit for handshake with the fetch engine. 0x0 <b>0</b> — Handshake with the fetch engine is disabled 0x1 <b>1</b> — Handshake with the fetch engine is enabled
2 BLOCK_16	Determines the block size. 0x0 <b>8x8</b> — Block size is 8x8 0x1 <b>16x16</b> — Block size is 16x16
1 BLOCK_EN	Chooses the store mode. 0x0 <b>0</b> — Store in scan mode 0x1 <b>1</b> — Store in block mode
0 CH_EN	Channel enable. 0x0 <b>0</b> — Store function is disable 0x1 <b>1</b> — Store function is enable

**13.7.12.144 Store engine status Channel 0 Register (PXP\_HW\_PXP\_DITHER\_STORE\_STATUS\_CH0)**

This register defines the status bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 9E0h offset = 3070\_09E0h

**PXP\_HW\_PXP\_DITHER\_STORE\_STATUS\_CH0 field descriptions**

Field	Description
31–16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.

*Table continues on the next page...*

**PXP\_HW\_PXP\_DITHER\_STORE\_STATUS\_CH0 field descriptions (continued)**

Field	Description
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

**13.7.12.145 Store engine status Channel 1 Register (PXP\_HW\_PXP\_DITHER\_STORE\_STATUS\_CH1)**

This register defines the status bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 9F0h offset = 3070\_09F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STORE_BLOCK_Y																STORE_BLOCK_X															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_STORE\_STATUS\_CH1 field descriptions**

Field	Description
31–16 STORE_BLOCK_Y	When in scan mode, this field indicates the current Y coordinate of the frame. In block mode, it indicates the Y coordinate of the block currently being rendered.
STORE_BLOCK_X	When in scan mode, this field is always 0. In block mode, it indicates the X coordinate of the block currently being rendered.

**13.7.12.146 PXP\_HW\_PXP\_DITHER\_STORE\_SIZE\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + A00h offset = 3070\_0A00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	OUT_HEIGHT																OUT_WIDTH															
W	[Shaded]

**PXP\_HW\_PXP\_DITHER\_STORE\_SIZE\_CH0 field descriptions**

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

**13.7.12.147 PXP\_HW\_PXP\_DITHER\_STORE\_SIZE\_CH1**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + A10h offset = 3070\_0A10h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	OUT_HEIGHT																OUT_WIDTH															
W	OUT_HEIGHT																OUT_WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_STORE\_SIZE\_CH1 field descriptions**

Field	Description
31–16 OUT_HEIGHT	actual output height -1
OUT_WIDTH	actual output width -1

**13.7.12.148 PXP\_HW\_PXP\_DITHER\_STORE\_PITCH**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + A20h offset = 3070\_0A20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CH1_OUT_PITCH																CH0_OUT_PITCH															
W	CH1_OUT_PITCH																CH0_OUT_PITCH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_STORE\_PITCH** field descriptions

Field	Description
31–16 CH1_OUT_ PITCH	This field indicates the channel 1 input pitch
CH0_OUT_ PITCH	This field indicates the channel 0 input pitch

**13.7.12.149 PXP\_HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH0: 0xA30

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH0\_SET: 0xA34

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH0\_CLR: 0xA38

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH0\_TOG: 0xA3C

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + A30h offset = 3070\_0A30h

## Pixel Pipeline (PXP)

**PXP\_HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH0 field descriptions**

Field	Description
31–8 RSVD0	Reserved, always set to zero.
7 SHIFT_BYPASS	CH0 shift bypass 0x0 0 — data will do shift processing. 0x1 1 — data will bypass shift module.
6 RSVD1	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3–2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

### 13.7.12.150 PXP\_HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1

This register defines the control bits for the ppx store\_engine sub-block.

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1: 0xA40

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1\_SET: 0xA44

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1\_CLR: 0xA48

HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1\_TOG: 0xA4C

The Control register contains the control bits for the pxp prefetch\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + A40h offset = 3070\_0A40h

### PXP\_HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1 field descriptions

Field	Description
31–6 RSVD0	Reserved, always set to zero.
5 OUT_YUV422_2P_EN	Enable for YUV422 2 plane

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_STORE\_SHIFT\_CTRL\_CH1 field descriptions (continued)**

Field	Description
	0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
4 OUT_YUV422_1P_EN	Enable for YUV422 1 plane 0x0 0 — YUYV422 2 plane disabled. 0x1 1 — YUYV422 2 plane enabled.
3-2 OUTPUT_ACTIVE_BPP	0x0 0 — 8 bits 0x1 1 — 16 bits 0x2 2 — 32 bits 0x3 3 — 32 bits
RSVD2	Reserved, always set to zero.

**13.7.12.151 PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_0\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + A90h offset = 3070\_0A90h

**PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_0\_CH0 field descriptions**

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

**13.7.12.152 PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_1\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + AA0h offset = 3070\_0AA0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W

### PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_1\_CH0 field descriptions

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

### 13.7.12.153 PXP\_HW\_PXP\_DITHER\_STORE\_FILL\_DATA\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + AB0h offset = 3070\_0AB0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_DITHER\_STORE\_FILL\_DATA\_CH0 field descriptions

Field	Description
FILL_DATA_CH0	when using fill_data mode,store engine channel0 will store the fill_data value defined here.

### 13.7.12.154 PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_0\_CH1

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + AC0h offset = 3070\_0AC0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_0\_CH1 field descriptions**

Field	Description
OUT_BASE_ADDR0	input base address0. For 2 channel, indicated the channel0 base address. For 1 channel and YUV422 2 plane, indicate the Y base address

**13.7.12.155 PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_1\_CH1**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + AD0h offset = 3070\_0AD0h

**PXP\_HW\_PXP\_DITHER\_STORE\_ADDR\_1\_CH1 field descriptions**

Field	Description
OUT_BASE_ADDR1	input base address1. For 2 channel, indicated the channel 1 base address. For 1 channel and YUV422 2 plane, indicate the UV base address

**13.7.12.156 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK0\_H\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + AE0h offset = 3070\_0AE0h

**PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK0\_H\_CH0 field descriptions**

Field	Description
D_MASK0_H_CH0	data mask0 high byte

### 13.7.12.157 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK0\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + AF0h offset = 3070\_0AF0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK1\_H\_CH0 field descriptions

Field	Description
D_MASK1_H_CH0	data mask1 high byte

### 13.7.12.159 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK1\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

## Pixel Pipeline (PXP)

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + B10h offset = 3070\_0B10h

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK1\_L\_CH0 field descriptions

Field	Description
D_MASK1_L_CH0	data mask1 low byte

### 13.7.12.160 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK2\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + B20h offset = 3070\_0B20h

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK2\_H\_CH0 field descriptions

Field	Description
D_MASK2_H_CH0	data mask2 high byte

### 13.7.12.161 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK2\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + B30h offset = 3070\_0B30h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK4\_L\_CH0 field descriptions**

Field	Description
D_MASK4_L_CH0	data mask4 low byte

### 13.7.12.166 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK5\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + B80h offset = 3070\_0B80h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK5\_H\_CH0 field descriptions

Field	Description
D_MASK5_H_CH0	data mask5 high byte

### 13.7.12.167 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK5\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + B90h offset = 3070\_0B90h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK5\_L\_CH0 field descriptions

Field	Description
D_MASK5_L_CH0	data mask5 low byte

### 13.7.12.168 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK6\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

## Pixel Pipeline (PXP)

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + BA0h offset = 3070\_0BA0h

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK6\_H\_CH0 field descriptions

Field	Description
D_MASK6_H_CH0	data mask6 high byte

### 13.7.12.169 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK6\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + BB0h offset = 3070\_0BB0h

#### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK6\_L\_CH0 field descriptions

Field	Description
D_MASK6_L_CH0	data mask6 low byte

### 13.7.12.170 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK7\_H\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

### EXAMPLE

Address: 3070\_0000h base + BC0h offset = 3070\_0BC0h

### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK7\_H\_CH0 field descriptions

Field	Description
D_MASK7_H_CH0	data mask7 high byte

### 13.7.12.171 PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK7\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + BD0h offset = 3070\_0BD0h

### PXP\_HW\_PXP\_DITHER\_STORE\_D\_MASK7\_L\_CH0 field descriptions

Field	Description
D_MASK7_L_CH0	data mask7 low byte

### 13.7.12.172 PXP\_HW\_PXP\_DITHER\_STORE\_D\_SHIFT\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + BE0h offset = 3070\_0BE0h

**PXP\_HW\_PXP\_DITHER\_STORE\_D\_SHIFT\_L\_CH0 field descriptions**

Field	Description
31 D_SHIFT_FLAG3	data shift flag 3
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_STORE\_D\_SHIFT\_L\_CH0 field descriptions (continued)**

Field	Description
29–24 D_SHIFT_ WIDTH3	data shift width 3
23 D_SHIFT_FLAG2	data shift flag 2
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH2	data shift width 2
15 D_SHIFT_FLAG1	data shift flag 1
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH1	data shift width 1
7 D_SHIFT_FLAG0	data shift flag 0
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH0	data shift width 0

**13.7.12.173 PXP\_HW\_PXP\_DITHER\_STORE\_D\_SHIFT\_H\_CH0**

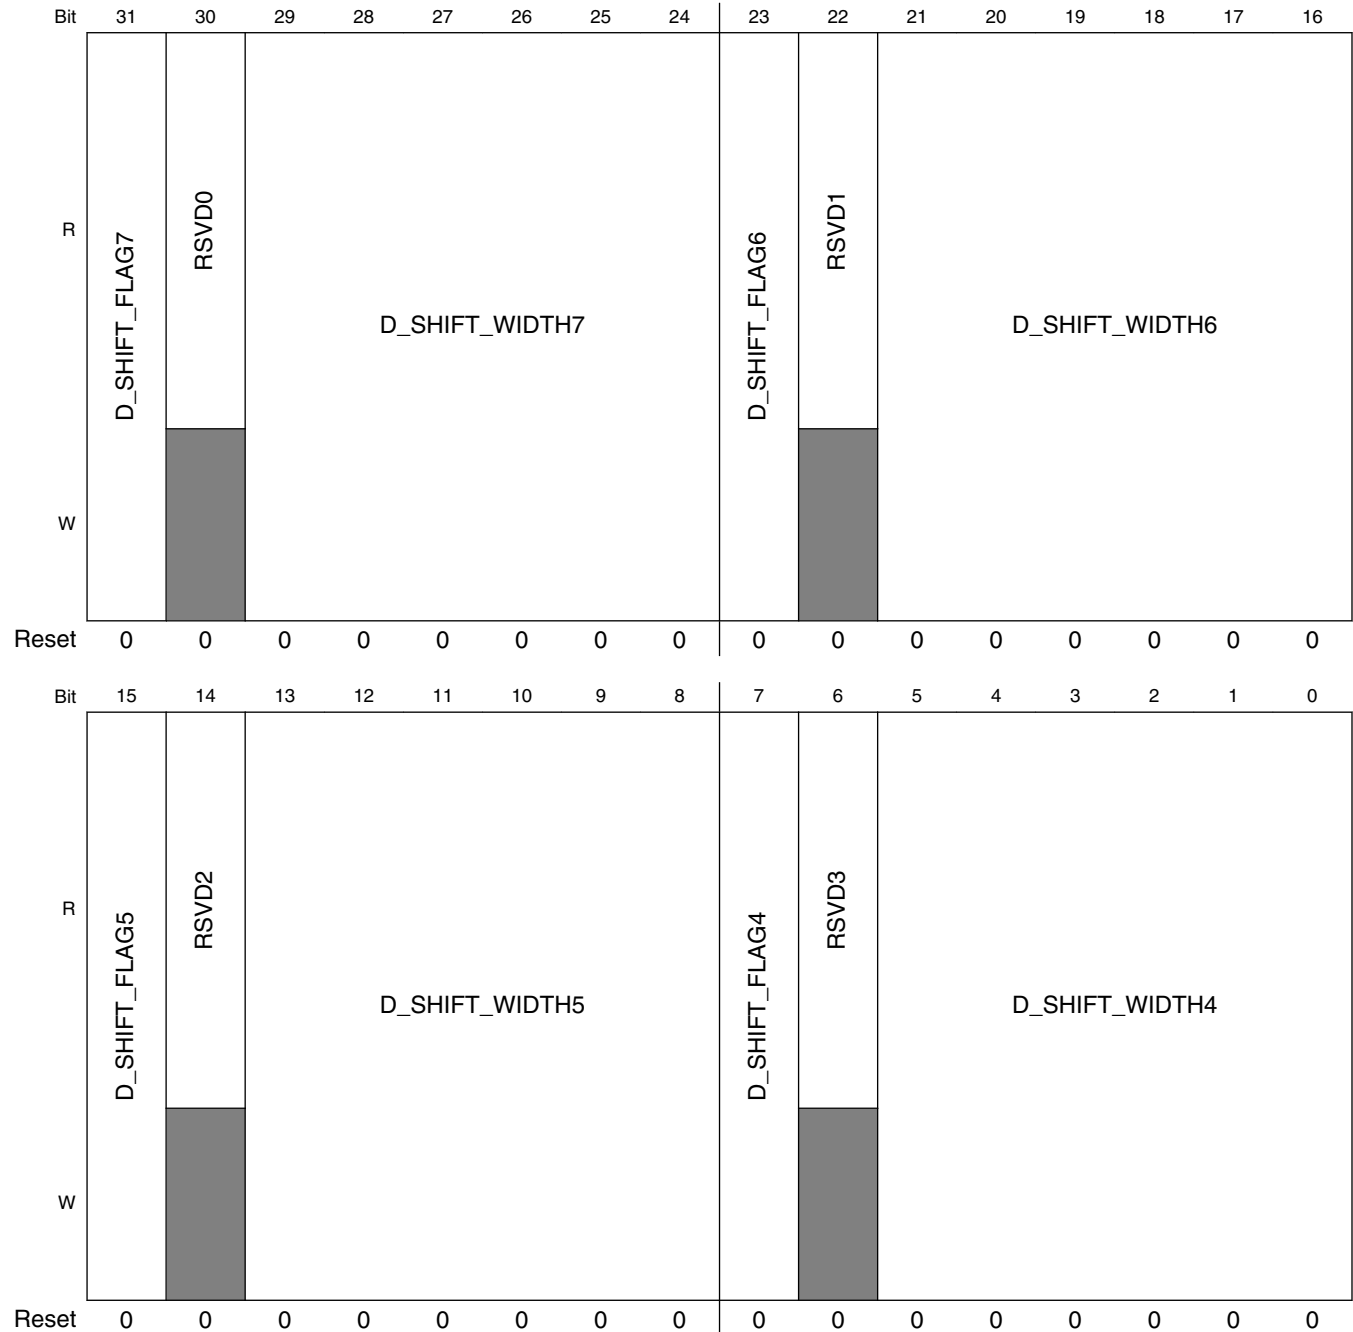

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + BF0h offset = 3070\_0BF0h

**PXP\_HW\_PXP\_DITHER\_STORE\_D\_SHIFT\_H\_CH0 field descriptions**

Field	Description
31 D_SHIFT_FLAG7	data shift flag 7
30 RSVD0	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_STORE\_D\_SHIFT\_H\_CH0 field descriptions (continued)**

Field	Description
29–24 D_SHIFT_ WIDTH7	data shift width 3
23 D_SHIFT_FLAG6	data shift flag 6
22 RSVD1	Reserved, always set to zero.
21–16 D_SHIFT_ WIDTH6	data shift width 6
15 D_SHIFT_FLAG5	data shift flag 5
14 RSVD2	Reserved, always set to zero.
13–8 D_SHIFT_ WIDTH5	data shift width 5
7 D_SHIFT_FLAG4	data shift flag 4
6 RSVD3	Reserved, always set to zero.
D_SHIFT_ WIDTH4	data shift width 4

**13.7.12.174 PXP\_HW\_PXP\_DITHER\_STORE\_F\_SHIFT\_L\_CH0**

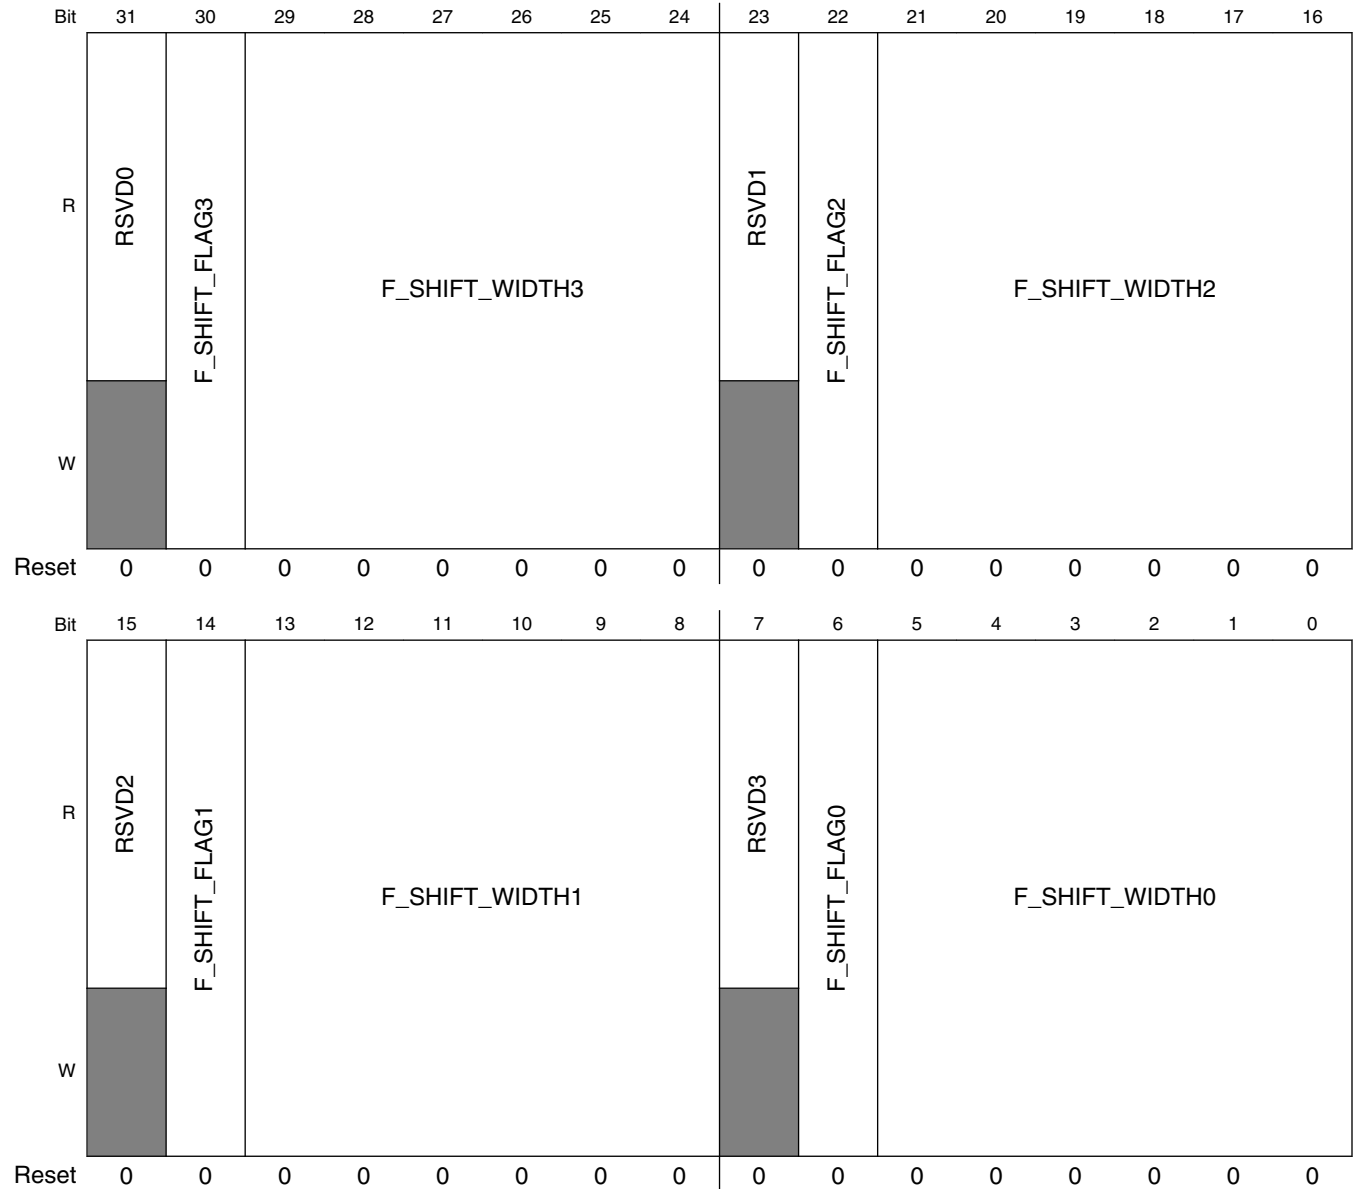

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + C00h offset = 3070\_0C00h

### PXP\_HW\_PXP\_DITHER\_STORE\_F\_SHIFT\_L\_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG3	flag shift flag3
29-24 F_SHIFT_WIDTH3	flag shift width 3
23 RSVD1	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_DITHER\_STORE\_F\_SHIFT\_L\_CH0 field descriptions (continued)**

Field	Description
22 F_SHIFT_FLAG2	flag shift flag2
21–16 F_SHIFT_WIDTH2	flag shift width 2
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG1	flag shift flag1
13–8 F_SHIFT_WIDTH1	flag shift width 1
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG0	flag shift flag0
F_SHIFT_WIDTH0	flag shift width 0

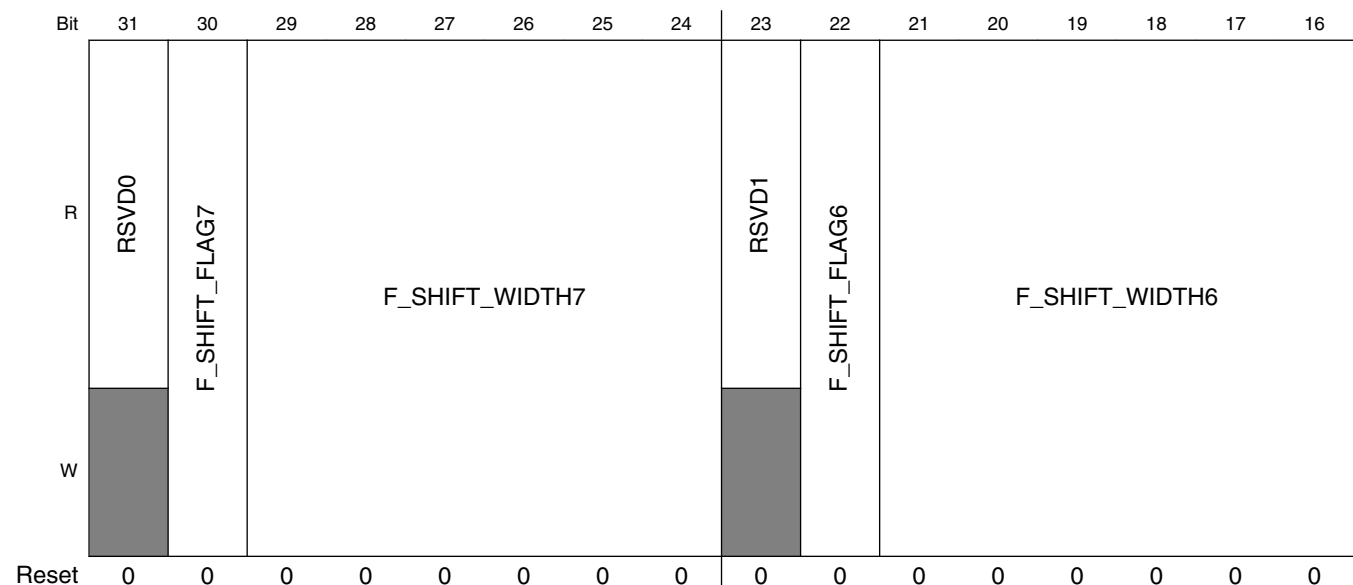

**13.7.12.175 PXP\_HW\_PXP\_DITHER\_STORE\_F\_SHIFT\_H\_CH0**

This register defines the control bits for the pxp store\_engine sub-block.

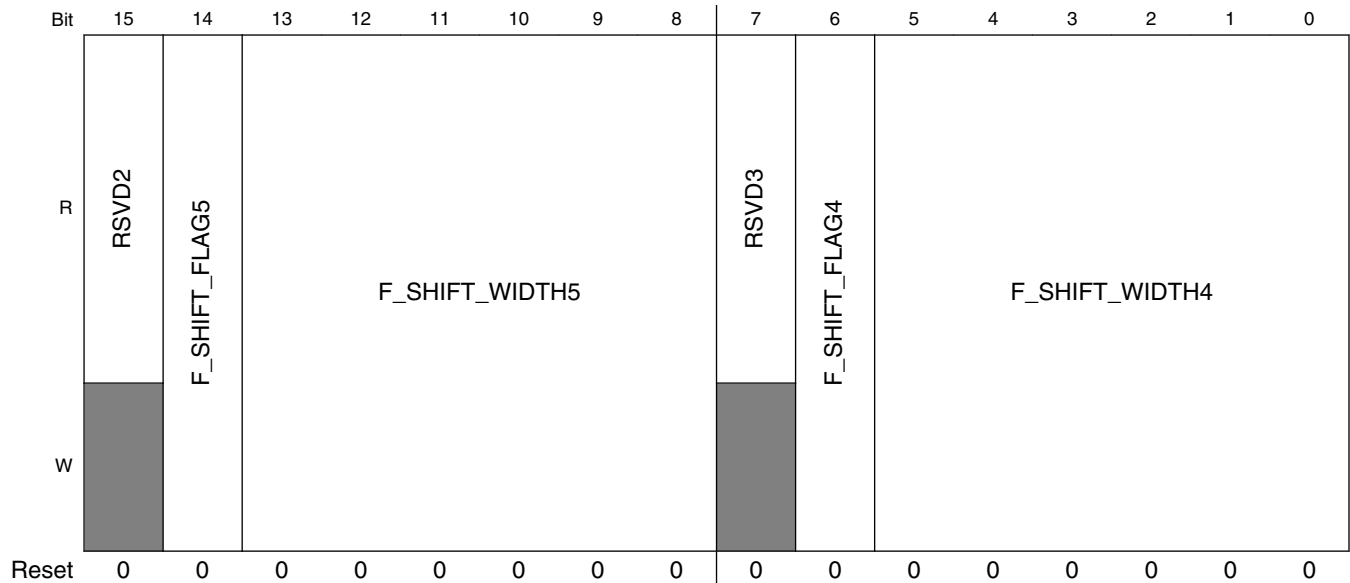

The Control register contains the control bits for the pxp store\_engine sub-block.

**EXAMPLE**

Address: 3070\_0000h base + C10h offset = 3070\_0C10h

## Pixel Pipeline (PXP)

### PXP\_HW\_PXP\_DITHER\_STORE\_F\_SHIFT\_H\_CH0 field descriptions

Field	Description
31 RSVD0	Reserved, always set to zero.
30 F_SHIFT_FLAG7	flag shift flag7
29–24 F_SHIFT_WIDTH7	flag shift width 7
23 RSVD1	Reserved, always set to zero.
22 F_SHIFT_FLAG6	flag shift flag6
21–16 F_SHIFT_WIDTH6	flag shift width 5
15 RSVD2	Reserved, always set to zero.
14 F_SHIFT_FLAG5	flag shift flag5
13–8 F_SHIFT_WIDTH5	flag shift width 5
7 RSVD3	Reserved, always set to zero.
6 F_SHIFT_FLAG4	flag shift flag4
F_SHIFT_WIDTH4	flag shift width 4

### 13.7.12.176 PXP\_HW\_PXP\_DITHER\_STORE\_F\_MASK\_L\_CH0

This register defines the control bits for the pxp store\_engine sub-block.

The Control register contains the control bits for the pxp store\_engine sub-block.

#### EXAMPLE

Address: 3070\_0000h base + C20h offset = 3070\_0C20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### PXP\_HW\_PXP\_DITHER\_STORE\_F\_MASK\_H\_CH0 field descriptions

Field	Description
31–24 F_MASK7	flag mask7

*Table continues on the next page...*

**PXP\_HW\_PXP\_DITHER\_STORE\_F\_MASK\_H\_CH0 field descriptions (continued)**

Field	Description
23–16 F_MASK6	flag mask6
15–8 F_MASK5	flag mask5
F_MASK4	flag mask4

**13.7.12.178 Dither Control Register 0 (PXP\_HW\_PXP\_DITHER\_CTRL)**

This register defines the control bits for the pxp dither sub-block.

HW\_PXP\_DITHER\_CTRL: 0x1670

HW\_PXP\_DITHER\_CTRL\_SET: 0x1674

HW\_PXP\_DITHER\_CTRL\_CLR: 0x1678

HW\_PXP\_DITHER\_CTRL\_TOG: 0x167C

The Control register contains the primary controls for the PXP block.

**EXAMPLE**

Address: 3070\_0000h base + 1670h offset = 3070\_1670h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W																
Reset	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	LUT_MODE	NUM_QUANT_BIT		DITHER_MODE2		DITHER_MODE1		DITHER_MODE0			ENABLE2	ENABLE1	ENABLE0			

### PXP\_HW\_PXP\_DITHER\_CTRL field descriptions

Field	Description
31 BUSY0	When set indicates if the dither engine 0 is busy -- started but not finished processing all of the pixels in the current frame.
30 BUSY1	When set indicates if the dither engine 1 is busy -- started but not finished processing all of the pixels in the current frame.
29 BUSY2	When set indicates if the dither engine 2 is busy -- started but not finished processing all of the pixels in the current frame.
28–25 RSVD0	Reserved, always set to zero.
24 ORDERED_ROUND_MODE	For test purposes. In ordered mode only, this field specifies to use rounding or truncation when calculating the output pixel. 0x0 <b>0</b> — Use truncation method. 0x1 <b>1</b> — Use rounding method.
23 FINAL_LUT_ENABLE	Enables a final stage register based LUT at the last stage before output. the lookup transform values come from register bits, not internal memory. Therefore they must be setup by the user by writing to the registers before processing. 0x0 <b>Disabled</b> — The dither engine 2 will not process any frames. 0x1 <b>Enabled</b> — The dither engine 2 is on and ready for processing
22–21 IDX_MATRIX2_SIZE	For Dither Engine 2. Specify dimension (assumed square) of the index matrix in the LUT memory so proper indexing can occur. 0x0 <b>0</b> — 4x4 0x1 <b>1</b> — 8x8 0x2 <b>2</b> — 16x16 0x3 <b>3</b> — Input value of index
20–19 IDX_MATRIX1_SIZE	For Dither Engine 1. Specify dimension (assumed square) of the index matrix in the LUT memory so proper indexing can occur. 0x0 <b>0</b> — 4x4 0x1 <b>1</b> — 8x8

Table continues on the next page...

## PXP\_HW\_PXP\_DITHER\_CTRL field descriptions (continued)

Field	Description
	0x2 2 — 16x16 0x3 3 — Input value of index
18–17 IDX_MATRIX0_SIZE	For Dither Engine 0. Specify dimension (assumed square) of the index matrix in the LUT memory so proper indexing can occur.  0x0 0 — 4x4 0x1 1 — 8x8 0x2 2 — 16x16 0x3 3 — Input value of index
16–15 LUT_MODE	Specify to use memory lut to transform pixel. Lookup pre or post dithering cannot be used with Ordered dithering. This field only has reference to the internal memory based LUT function. There is a final stage LUT that is enabled through the FINAL_LUT_ENABLE field in this register. This final stage LUT can be enabled in any dither mode or LUT mode.  0x0 0 — LUT mode off. 0x1 1 — Use LUT at pre-dither stage. 0x2 2 — Use LUT at post-dither stage. 0x3 3 — Reserved`
14–12 NUM_QUANT_BIT	Number of bits to quantize down to. From 8 to (0-7).  0x0 0 — Reserved. 0x1 1 — Quantize down to 1 bit. 0x2 2 — Quantize down to 2 bits. 0x3 3 — Quantize down to 3 bits. 0x4 4 — Quantize down to 4 bits. 0x5 5 — Quantize down to 5 bits. 0x6 6 — Quantize down to 6 bits. 0x7 7 — Quantize down to 7 bits.
11–9 DITHER_MODE2	Dither mode.  0x0 0 — Pass through. 0x1 1 — Reserved. 0x2 2 — Reserved. 0x3 3 — Ordered. 0x4 4 — No Dithering, quantization only. 0x5 5 — Reserved. 0x6 6 — Reserved. 0x7 7 — Reserved.
8–6 DITHER_MODE1	Dither mode.  0x0 0 — Pass through. 0x1 1 — Reserved. 0x2 2 — Reserved 0x3 3 — Ordered. 0x4 4 — No Dithering, quantization only. 0x5 5 — Reserved. 0x6 6 — Reserved. 0x7 7 — Reserved.

Table continues on the next page...

## PXP\_HW\_PXP\_DITHER\_CTRL field descriptions (continued)

Field	Description
5–3 DITHER_MODE0	Dither mode. 0x0 <b>0</b> — Pass through. 0x1 <b>1</b> — Floyd-Steinberg. 0x2 <b>2</b> — Atkinson. 0x3 <b>3</b> — Ordered. 0x4 <b>4</b> — No Dithering, quantization only. 0x5 <b>5</b> — Reserved. 0x6 <b>6</b> — Reserved. 0x7 <b>7</b> — Reserved.
2 ENABLE2	Enables the dither engine 2 0x0 <b>Disabled</b> — The dither engine 2 will not process any frames. 0x1 <b>Enabled</b> — The dither engine 2 is on and ready for processing
1 ENABLE1	Enables the dither engine 1 0x0 <b>Disabled</b> — The dither engine 1 will not process any frames. 0x1 <b>Enabled</b> — The dither engine 1 is on and ready for processing
0 ENABLE0	Enables the dither engine 0 0x0 <b>Disabled</b> — The dither engine 0 will not process any frames. 0x1 <b>Enabled</b> — The dither engine 0 is on and ready for processing

### 13.7.12.179 Final stage lookup value Register (PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0)

8 bit data values for the final stage dither LUT.

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0: 0x1680

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0\_SET: 0x1684

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0\_CLR: 0x1688

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0\_TOG: 0x168C

This register contains lookup data values for the final stage register based dither LUT.

#### EXAMPLE

Address: 3070\_0000h base + 1680h offset = 3070\_1680h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R	DATA3								DATA2								DATA1								DATA0																							
W																																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA0 field descriptions**

Field	Description
31–24 DATA3	Final stage LUT data value.
23–16 DATA2	Final stage LUT data value.
15–8 DATA1	Final stage LUT data value.
DATA0	Final stage LUT data value.

**13.7.12.180 Final stage lookup value Register  
(PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA1)**

8 bit data values for the final stage dither LUT.

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA1: 0x1690

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA1\_SET: 0x1694

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA1\_CLR: 0x1698

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA1\_TOG: 0x169C

This register contains lookup data values for the final stage register based dither LUT.

**EXAMPLE**

Address: 3070\_0000h base + 1690h offset = 3070\_1690h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA1 field descriptions**

Field	Description
31–24 DATA7	Final stage LUT data value.
23–16 DATA6	Final stage LUT data value.
15–8 DATA5	Final stage LUT data value.
DATA4	Final stage LUT data value.

### 13.7.12.181 Final stage lookup value Register (PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA2)

8 bit data values for the final stage dither LUT.

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA2: 0x16A0

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA2\_SET: 0x16A4

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA2\_CLR: 0x16A8

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA2\_TOG: 0x16AC

This register contains lookup data values for the final stage register based dither LUT.

#### EXAMPLE

Address: 3070\_0000h base + 16A0h offset = 3070\_16A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R	DATA11								DATA10								DATA9								DATA8																							
W																																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA2 field descriptions

Field	Description
31–24 DATA11	Final stage LUT data value.
23–16 DATA10	Final stage LUT data value.
15–8 DATA9	Final stage LUT data value.
DATA8	Final stage LUT data value.

### 13.7.12.182 Final stage lookup value Register (PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA3)

8 bit data values for the final stage dither LUT.

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA3: 0x16B0

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA3\_SET: 0x16B4

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA3\_CLR: 0x16B8

HW\_PXP\_DITHER\_FINAL\_LUT\_DATA3\_TOG: 0x16BC

## Pixel Pipeline (PXP)

This register contains lookup data values for the final stage register based dither LUT.

### EXAMPLE

Address: 3070\_0000h base + 16B0h offset = 3070\_16B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DATA15								DATA14								DATA13								DATA12							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_HW\_PXP\_DITHER\_FINAL\_LUT\_DATA3 field descriptions

Field	Description
31–24 DATA15	Final stage LUT data value.
23–16 DATA14	Final stage LUT data value.
15–8 DATA13	Final stage LUT data value.
DATA12	Final stage LUT data value.

## 13.7.12.183 Histogram Control Register. (PXP\_HW\_PXP\_HIST\_A\_CTRL)

Provides control and status registers for the PXP's histogram classification algorithm.

Address: 3070\_0000h base + 2A00h offset = 3070\_2A00h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	RSVD4								RSVD3	PIXEL_OFFSET							
W																	
Reset	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0	

PXP\_HW\_PXP\_HIST\_A\_CTRL field descriptions

Field	Description
31–27 RSVD4	Reserved, always set to zero.
26–24 PIXEL_WIDTH	The width of the pixel to be used for histogram calculation
23 RSVD3	Reserved, always set to zero.
22–16 PIXEL_OFFSET	The offset of the pixel to be used for histogram calculation
15–13 RSVD2	Reserved, always set to zero.
12–8 STATUS	Indicates which histogram matched the processed bitmap. Bit[0] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST32 (5-bit grayscale) histogram.
7–5 RSVD1	Reserved, always set to zero.
4 CLEAR	Write 1 to clear the histogram result and will be self-clear after clear function finished
3–1 RSVD0	Reserved, always set to zero.
0 ENABLE	Enable the Histogram Engine

### 13.7.12.184 Histogram Pixel Mask Register. (PXP\_HW\_PXP\_HIST\_A\_MASK)

Provides control registers for the pixel masking in PXP's histogram.

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 2A10h offset = 3070\_2A10h

### PXP\_HW\_PXP\_HIST\_A\_MASK field descriptions

Field	Description
31–24 MASK_VALUE1	The value1 for mask condition checking
23–16 MASK_VALUE0	The value0 for mask condition checking
15–13 MASK_WIDTH	The width of the field to be checked against mask condition
12–6 MASK_OFFSET	The offset of the field to be checked against mask condition
5–4 MASK_MODE	Operation mode of pixel mask function 0x0 <b>EQUAL</b> — Run histogram for pixels equal to value0 0x1 <b>NOT_EQUAL</b> — Run histogram for pixels not equal to value0 0x2 <b>INSIDE</b> — Run histogram for pixels within the range of value0 to value1 0x3 <b>OUTSIDE</b> — Run histogram for pixels outside of the rang of value0 to value1
3–1 RSVD0	Reserved, always set to zero.
0 MASK_EN	Enable the Pixel Mask Function in Histogram

### 13.7.12.185 Histogram Pixel Buffer Size Register. (PXP\_HW\_PXP\_HIST\_A\_BUF\_SIZE)

This register defines the size of the buffer to be processed by the histogram engine.

Address: 3070\_0000h base + 2A20h offset = 3070\_2A20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0				HEIGHT												RSVD1				WIDTH											
W	[Shaded]				[Shaded]												[Shaded]				[Shaded]											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST\_A\_BUF\_SIZE field descriptions

Field	Description
31–28 RSVD0	Reserved. This field always reads 0.
27–16 HEIGHT	This indicate the buffer height in pixels
15–12 RSVD1	Reserved. This field always reads 0.
WIDTH	This indicate the buffer width in pixels

### 13.7.12.186 Total Number of Pixels Used by Histogram Engine. (PXP\_HW\_PXP\_HIST\_A\_TOTAL\_PIXEL)

This register shows the total number of pixels used by histogram engine

Address: 3070\_0000h base + 2A30h offset = 3070\_2A30h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0								TOTAL_PIXEL																							
W	[Shaded]								[Shaded]																							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST\_A\_TOTAL\_PIXEL field descriptions

Field	Description
31–24 RSVD0	Reserved. This field always reads 0.
TOTAL_PIXEL	Total number of pixels used by histogram engine, the pixels got masked will be skipped

### 13.7.12.187 The X Coordinate Offset for Active Area. (PXP\_HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_X)

This register shows the minimal and maximum X coordinate offset for the active area in histogram processing

Address: 3070\_0000h base + 2A40h offset = 3070\_2A40h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1				MAX_X_OFFSET								RSVD0				MIN_X_OFFSET															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_X field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.
27–16 MAX_X_OFFSET	Maximum X coordinate offset for the active area in histogram processing
15–12 RSVD0	Reserved. This field always reads 0.
MIN_X_OFFSET	Minimal X coordinate offset for the active area in histogram processing

### 13.7.12.188 The Y Coordinate Offset for Active Area. (PXP\_HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_Y)

This register shows the minimal and maximum Y coordinate offset for the active area in histogram processing

Address: 3070\_0000h base + 2A50h offset = 3070\_2A50h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1				MAX_Y_OFFSET								RSVD0				MIN_Y_OFFSET															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_Y field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.

Table continues on the next page...

**PXP\_HW\_PXP\_HIST\_A\_ACTIVE\_AREA\_Y field descriptions (continued)**

Field	Description
27–16 MAX_Y_OFFSET	Maximum Y coordinate offset for the active area in histogram processing
15–12 RSVD0	Reserved. This field always reads 0.
MIN_Y_OFFSET	Minimul Y coordinate offset for the active area in histogram processing

**13.7.12.189 Histogram Result Based on RAW Pixel Value.  
(PXP\_HW\_PXP\_HIST\_A\_RAW\_STAT0)**

This register shows the lower 32-bit of the histogram result based on raw pixel value

Address: 3070\_0000h base + 2A60h offset = 3070\_2A60h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STAT0																															
W	[Reserved]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_HIST\_A\_RAW\_STAT0 field descriptions**

Field	Description
STAT0	Lower 32-bit result fo the histogram calculation

**13.7.12.190 Histogram Result Based on RAW Pixel Value.  
(PXP\_HW\_PXP\_HIST\_A\_RAW\_STAT1)**

This register shows the higher 32-bit of the histogram result based on raw pixel value

Address: 3070\_0000h base + 2A70h offset = 3070\_2A70h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	STAT1																															
W	[Reserved]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_HIST\_A\_RAW\_STAT1 field descriptions**

Field	Description
STAT1	Higher 32-bit result fo the histogram calculation

### 13.7.12.191 Histogram Control Register. (PXP\_HW\_PXP\_HIST\_B\_CTRL)

Provides control and status registers for the PXP's histogram classification algorithm.

Address: 3070\_0000h base + 2A80h offset = 3070\_2A80h

**PXP\_HW\_PXP\_HIST\_B\_CTRL field descriptions**

Field	Description
31–27 RSVD4	Reserved, always set to zero.
26–24 PIXEL_WIDTH	The width of the pixel to be used for histogram calculation
23 RSVD3	Reserved, always set to zero.
22–16 PIXEL_OFFSET	The offset of the pixel to be used for histogram calculation
15–13 RSVD2	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_HIST\_B\_CTRL field descriptions (continued)**

Field	Description
12–8 STATUS	Indicates which histogram matched the processed bitmap. Bit[0] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST32 (5-bit grayscale) histogram.
7–5 RSVD1	Reserved, always set to zero.
4 CLEAR	Write 1 to clear the histogram result and will be self-clear after clear function finished
3–1 RSVD0	Reserved, always set to zero.
0 ENABLE	Enable the Histogram Engine

**13.7.12.192 Histogram Pixel Mask Register.  
(PXP\_HW\_PXP\_HIST\_B\_MASK)**

Provides control registers for the pixel masking in PXP's histogram.

Address: 3070\_0000h base + 2A90h offset = 3070\_2A90h

**PXP\_HW\_PXP\_HIST\_B\_MASK field descriptions**

Field	Description
31–24 MASK_VALUE1	The value1 for mask condition checking
23–16 MASK_VALUE0	The value0 for mask condition checking
15–13 MASK_WIDTH	The width of the field to be checked against mask condition
12–6 MASK_OFFSET	The offset of the field to be checked against mask condition
5–4 MASK_MODE	Operation mode of pixel mask function 0x0 <b>EQUAL</b> — Run histogram for pixels equal to value0 0x1 <b>NOT_EQUAL</b> — Run histogram for pixels not equal to value0 0x2 <b>INSIDE</b> — Run histogram for pixels within the range of value0 to value1 0x3 <b>OUTSIDE</b> — Run histogram for pixels outside of the rang of value0 to value1
3–1 RSVD0	Reserved, always set to zero.
0 MASK_EN	Enable the Pixel Mask Function in Histogram

**13.7.12.193 Histogram Pixel Buffer Size Register.  
(PXP\_HW\_PXP\_HIST\_B\_BUF\_SIZE)**

This register defines the size of the buffer to be processed by the histogram engine.

Address: 3070\_0000h base + 2AA0h offset = 3070\_2AA0h

**PXP\_HW\_PXP\_HIST\_B\_BUF\_SIZE field descriptions**

Field	Description
31–28 RSVD0	Reserved. This field always reads 0.
27–16 HEIGHT	This indicate the buffer height in pixels
15–12 RSVD1	Reserved. This field always reads 0.
WIDTH	This indicate the buffer width in pixels

### 13.7.12.194 Total Number of Pixels Used by Histogram Engine. (PXP\_HW\_PXP\_HIST\_B\_TOTAL\_PIXEL)

This register shows the total number of pixels used by histogram engine

Address: 3070\_0000h base + 2AB0h offset = 3070\_2AB0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	RSVD0								TOTAL_PIXEL																									
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST\_B\_TOTAL\_PIXEL field descriptions

Field	Description
31–24 RSVD0	Reserved. This field always reads 0.
TOTAL_PIXEL	Total number of pixels used by histogram engine, the pixels got masked will be skipped

### 13.7.12.195 The X Coordinate Offset for Active Area. (PXP\_HW\_PXP\_HIST\_B\_ACTIVE\_AREA\_X)

This register shows the minimal and maximum X coordinate offset for the active area in histogram processing

Address: 3070\_0000h base + 2AC0h offset = 3070\_2AC0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	RSVD1				MAX_X_OFFSET								RSVD0				MIN_X_OFFSET																	
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST\_B\_ACTIVE\_AREA\_X field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.
27–16 MAX_X_OFFSET	Maximum X coordinate offset for the active area in histogram processing
15–12 RSVD0	Reserved. This field always reads 0.
MIN_X_OFFSET	Minimal X coordinate offset for the active area in histogram processing

### 13.7.12.196 The Y Coordinate Offset for Active Area. (PXP\_HW\_PXP\_HIST\_B\_ACTIVE\_AREA\_Y)

This register shows the minimal and maximum Y coordinate offset for the active area in histogram processing

Address: 3070\_0000h base + 2AD0h offset = 3070\_2AD0h

#### PXP\_HW\_PXP\_HIST\_B\_ACTIVE\_AREA\_Y field descriptions

Field	Description
31–28 RSVD1	Reserved. This field always reads 0.
27–16 MAX_Y_OFFSET	Maximum Y coordinate offset for the active area in histogram processing
15–12 RSVD0	Reserved. This field always reads 0.
MIN_Y_OFFSET	Minimal Y coordinate offset for the active area in histogram processing

### 13.7.12.197 Histogram Result Based on RAW Pixel Value. (PXP\_HW\_PXP\_HIST\_B\_RAW\_STAT0)

This register shows the lower 32-bit of the histogram result based on raw pixel value

Address: 3070\_0000h base + 2AE0h offset = 3070\_2AE0h

#### PXP\_HW\_PXP\_HIST\_B\_RAW\_STAT0 field descriptions

Field	Description
STAT0	Lower 32-bit result fo the histogram calculation

### 13.7.12.198 Histogram Result Based on RAW Pixel Value. (PXP\_HW\_PXP\_HIST\_B\_RAW\_STAT1)

This register shows the higher 32-bit of the histogram result based on raw pixel value

Address: 3070\_0000h base + 2AF0h offset = 3070\_2AF0h

#### PXP\_HW\_PXP\_HIST\_B\_RAW\_STAT1 field descriptions

Field	Description
STAT1	Higher 32-bit result to the histogram calculation

### 13.7.12.199 2-level Histogram Parameter Register. (PXP\_HW\_PXP\_HIST2\_PARAM)

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match the 2-level histogram values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B00h offset = 3070\_2B00h

#### PXP\_HW\_PXP\_HIST2\_PARAM field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_HIST2\_PARAM field descriptions (continued)**

Field	Description
15–14 RSVD1	Reserved, always set to zero.
13–8 VALUE1	White value for 2-level histogram
7–6 RSVD0	Reserved, always set to zero.
VALUE0	Black value for 2-level histogram

**13.7.12.200 4-level Histogram Parameter Register.  
(PXP\_HW\_PXP\_HIST4\_PARAM)**

This register specifies the valid values for a 4-level histogram. If all pixels in a bitmap match the 4-level histogram values, STATUS[1] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B10h offset = 3070\_2B10h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD3		VALUE3						RSVD2		VALUE2					
W	[shaded]		[shaded]						[shaded]		[shaded]					
Reset	0	0	0	0	1	1	1	1	0	0	0	0	1	0	1	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1		VALUE1						RSVD0		VALUE0					
W	[shaded]		[shaded]						[shaded]		[shaded]					
Reset	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_HIST4\_PARAM field descriptions**

Field	Description
31–30 RSVD3	Reserved, always set to zero.
29–24 VALUE3	GRAY3 (White) value for 4-level histogram
23–22 RSVD2	Reserved, always set to zero.
21–16 VALUE2	GRAY2 value for 4-level histogram
15–14 RSVD1	Reserved, always set to zero.

Table continues on the next page...

**PXP\_HW\_PXP\_HIST4\_PARAM field descriptions (continued)**

Field	Description
13–8 VALUE1	GRAY1 value for 4-level histogram
7–6 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 4-level histogram

**13.7.12.201 8-level Histogram Parameter 0 Register.  
(PXP\_HW\_PXP\_HIST8\_PARAM0)**

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match the 8-level histogram values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B20h offset = 3070\_2B20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD3			VALUE3					RSVD2		VALUE2					
W	█								█							
Reset	0	0	0	0	0	1	1	0	0	0	0	0	0	1	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1			VALUE1					RSVD0		VALUE0					
W	█								█							
Reset	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

**PXP\_HW\_PXP\_HIST8\_PARAM0 field descriptions**

Field	Description
31–30 RSVD3	Reserved, always set to zero.
29–24 VALUE3	GRAY3 value for 8-level histogram
23–22 RSVD2	Reserved, always set to zero.
21–16 VALUE2	GRAY2 value for 8-level histogram
15–14 RSVD1	Reserved, always set to zero.
13–8 VALUE1	GRAY1 value for 8-level histogram

*Table continues on the next page...*

**PXP\_HW\_PXP\_HIST8\_PARAM0 field descriptions (continued)**

Field	Description
7–6 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 8-level histogram

**13.7.12.202 8-level Histogram Parameter 1 Register.  
(PXP\_HW\_PXP\_HIST8\_PARAM1)**

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match the 8-level histogram values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B30h offset = 3070\_2B30h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD7		VALUE7						RSVD6		VALUE6					
W	■		■						■		■					
Reset	0	0	0	0	1	1	1	1	0	0	0	0	1	1	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD5		VALUE5						RSVD4		VALUE4					
W	■		■						■		■					
Reset	0	0	0	0	1	0	1	1	0	0	0	0	1	0	0	1

**PXP\_HW\_PXP\_HIST8\_PARAM1 field descriptions**

Field	Description
31–30 RSVD7	Reserved, always set to zero.
29–24 VALUE7	GRAY7 (White) value for 8-level histogram
23–22 RSVD6	Reserved, always set to zero.
21–16 VALUE6	GRAY6 value for 8-level histogram
15–14 RSVD5	Reserved, always set to zero.
13–8 VALUE5	GRAY5 value for 8-level histogram
7–6 RSVD4	Reserved, always set to zero.
VALUE4	GRAY4 value for 8-level histogram

### 13.7.12.203 16-level Histogram Parameter 0 Register. (PXP\_HW\_PXP\_HIST16\_PARAM0)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match the 16-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B40h offset = 3070\_2B40h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD3			VALUE3					RSVD2		VALUE2

Reset	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1		VALUE1						RSVD0		VALUE0					
W	[Shaded]		[Shaded]						[Shaded]		[Shaded]					
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

#### PXP\_HW\_PXP\_HIST16\_PARAM0 field descriptions

Field	Description
31–30 RSVD3	Reserved, always set to zero.
29–24 VALUE3	GRAY3 value for 16-level histogram
23–22 RSVD2	Reserved, always set to zero.
21–16 VALUE2	GRAY2 value for 16-level histogram
15–14 RSVD1	Reserved, always set to zero.
13–8 VALUE1	GRAY1 value for 16-level histogram
7–6 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 16-level histogram

### 13.7.12.204 16-level Histogram Parameter 1 Register. (PXP\_HW\_PXP\_HIST16\_PARAM1)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match the 16-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B50h offset = 3070\_2B50h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD7			VALUE7					RSVD6		VALUE6					
W	[Shaded]			[Shaded]					[Shaded]		[Shaded]					
Reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD5		VALUE5						RSVD4		VALUE4					
W	[Shaded]		[Shaded]						[Shaded]		[Shaded]					
Reset	0	0	0	0	0	1	0	1	0	0	0	0	0	1	0	0

#### PXP\_HW\_PXP\_HIST16\_PARAM1 field descriptions

Field	Description
31–30 RSVD7	Reserved, always set to zero.
29–24 VALUE7	GRAY7 value for 16-level histogram
23–22 RSVD6	Reserved, always set to zero.
21–16 VALUE6	GRAY6 value for 16-level histogram
15–14 RSVD5	Reserved, always set to zero.
13–8 VALUE5	GRAY5 value for 16-level histogram
7–6 RSVD4	Reserved, always set to zero.
VALUE4	GRAY4 value for 16-level histogram

### 13.7.12.205 16-level Histogram Parameter 2 Register. (PXP\_HW\_PXP\_HIST16\_PARAM2)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match the 16-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B60h offset = 3070\_2B60h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD11			VALUE11					RSVD10		VALUE10

#### PXP\_HW\_PXP\_HIST16\_PARAM2 field descriptions

Field	Description
31–30 RSVD11	Reserved, always set to zero.
29–24 VALUE11	GRAY11 value for 16-level histogram
23–22 RSVD10	Reserved, always set to zero.
21–16 VALUE10	GRAY10 value for 16-level histogram
15–14 RSVD9	Reserved, always set to zero.
13–8 VALUE9	GRAY9 value for 16-level histogram
7–6 RSVD8	Reserved, always set to zero.
VALUE8	GRAY8 value for 16-level histogram

### 13.7.12.206 16-level Histogram Parameter 3 Register. (PXP\_HW\_PXP\_HIST16\_PARAM3)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match the 16-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B70h offset = 3070\_2B70h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

#### PXP\_HW\_PXP\_HIST16\_PARAM3 field descriptions

Field	Description
31–30 RSVD15	Reserved, always set to zero.
29–24 VALUE15	GRAY15 (White) value for 16-level histogram
23–22 RSVD14	Reserved, always set to zero.
21–16 VALUE14	GRAY14 value for 16-level histogram
15–14 RSVD13	Reserved, always set to zero.
13–8 VALUE13	GRAY13 value for 16-level histogram
7–6 RSVD12	Reserved, always set to zero.
VALUE12	GRAY12 value for 16-level histogram

### 13.7.12.207 32-level Histogram Parameter 0 Register. (PXP\_HW\_PXP\_HIST32\_PARAM0)

This register specifies four of the valid values for a 32-level histogram. If all pixels in a bitmap match the 32-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B80h offset = 3070\_2B80h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

#### PXP\_HW\_PXP\_HIST32\_PARAM0 field descriptions

Field	Description
31–30 RSVD3	Reserved, always set to zero.
29–24 VALUE3	GRAY3 value for 32-level histogram
23–22 RSVD2	Reserved, always set to zero.
21–16 VALUE2	GRAY2 value for 32-level histogram
15–14 RSVD1	Reserved, always set to zero.
13–8 VALUE1	GRAY1 value for 32-level histogram
7–6 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 32-level histogram

### 13.7.12.208 32-level Histogram Parameter 1 Register. (PXP\_HW\_PXP\_HIST32\_PARAM1)

This register specifies four of the valid values for a 32-level histogram. If all pixels in a bitmap match the 32-level histogram values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the PANEL\_MODE control field.

Address: 3070\_0000h base + 2B90h offset = 3070\_2B90h

#### PXP\_HW\_PXP\_HIST32\_PARAM7 field descriptions

Field	Description
31–30 RSVD15	Reserved, always set to zero.
29–24 VALUE31	GRAY31 (White) value for 32-level histogram
23–22 RSVD14	Reserved, always set to zero.
21–16 VALUE30	GRAY30 value for 32-level histogram
15–14 RSVD13	Reserved, always set to zero.
13–8 VALUE29	GRAY29 value for 32-level histogram
7–6 RSVD2	Reserved, always set to zero.
VALUE28	GRAY28 value for 32-level histogram

### 13.7.12.215 PXP\_HW\_PXP\_COMP\_CTRL

This register defines the control bits for the pxp compression sub-block.

HW\_PXP\_COMP\_CTRL: 0x2C00

HW\_PXP\_COMP\_CTRL\_SET: 0x2C04

HW\_PXP\_COMP\_CTRL\_CLR: 0x2C08

HW\_PXP\_COMP\_CTRL\_TOG: 0x2C0C

## EXAMPLE

Address: 3070\_0000h base + 2C00h offset = 3070\_2C00h

**PXP\_HW\_PXP\_COMP\_CTRL field descriptions**

Field	Description
31–9 RSVD0	Reserved. This field always reads 0.
8 SW_RESET	Write to 1 to do a software reset to the engine, self-clear.
7–1 RSVD1	Reserved. This field always reads 0.
0 START	Write to 1 to start operation, self-clear

### 13.7.12.216 PXP\_HW\_PXP\_COMP\_FORMAT0

This register defines the format bits for the pxp compression sub-block.

**Pixel Pipeline (PXP)**

HW\_PXP\_COMP\_FORMAT0: 0x2C10

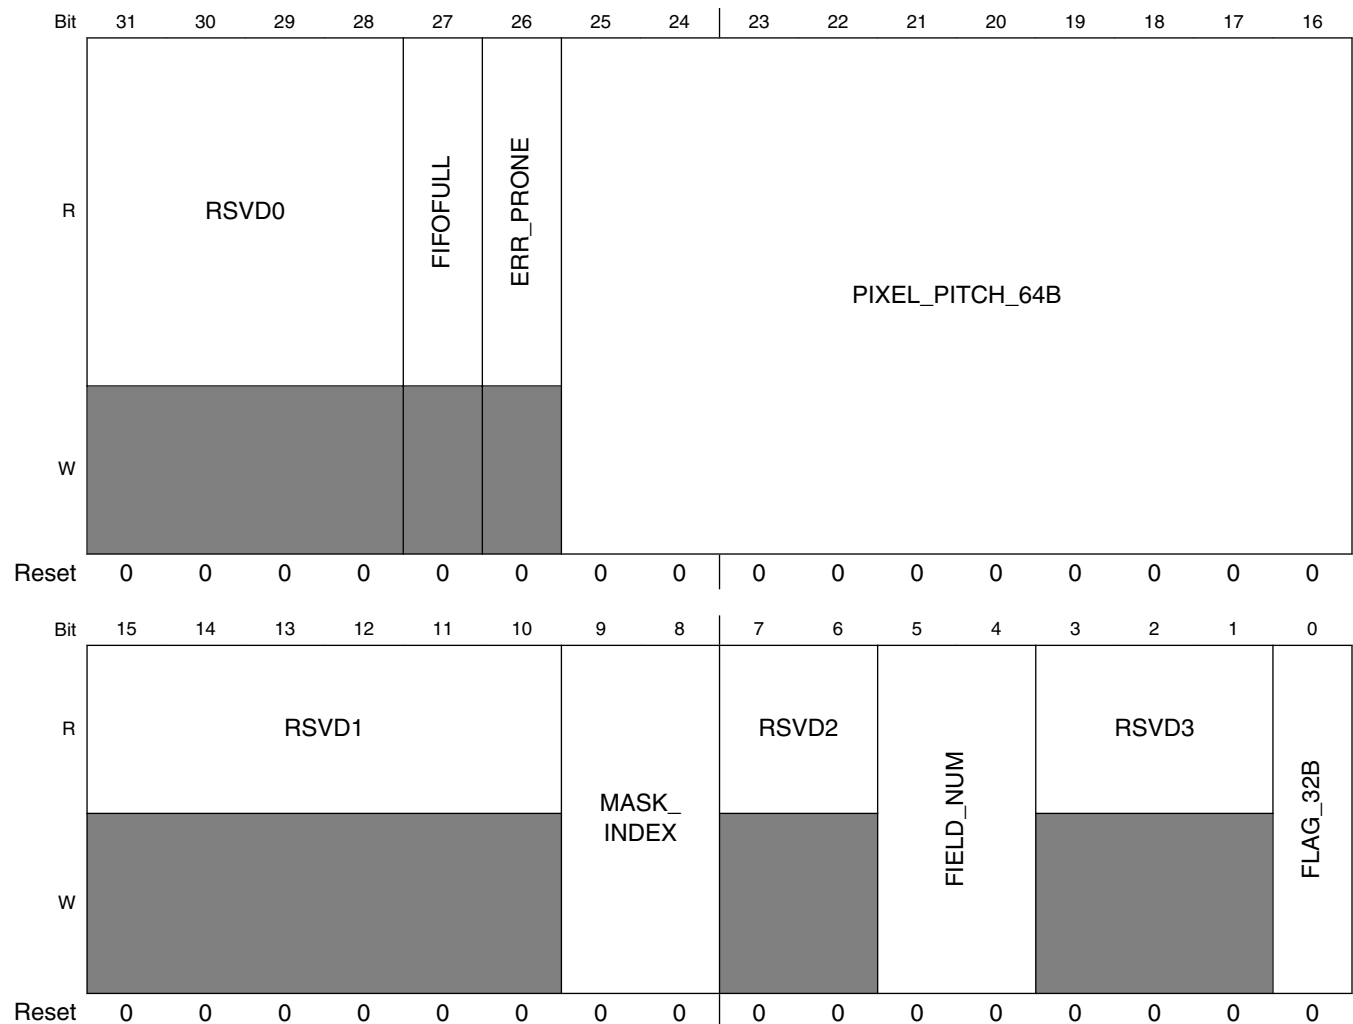

HW\_PXP\_COMP\_FORMAT0\_SET: 0x2C14

HW\_PXP\_COMP\_FORMAT0\_CLR: 0x2C18

HW\_PXP\_COMP\_FORMAT0\_TOG: 0x2C1C

**EXAMPLE**

Address: 3070\_0000h base + 2C10h offset = 3070\_2C10h

**PXP\_HW\_PXP\_COMP\_FORMAT0 field descriptions**

Field	Description
31–28 RSVD0	Reserved. This field always reads 0.
27 FIFOFULL	step1 write fifo full

*Table continues on the next page...*

**PXP\_HW\_PXP\_COMP\_FORMAT0 field descriptions (continued)**

Field	Description
26 ERR_PRONE	step1 write fifo full. If detected, this bit is 1, there is data error in current frame.
25–16 PIXEL_PITCH_64B	extend each line to be 64-bit aligned
15–10 RSVD1	Reserved. This field always reads 0.
9–8 MASK_INDEX	which field is the mask, 0 for A, 3 for D
7–6 RSVD2	Reserved. This field always reads 0.
5–4 FIELD_NUM	indicate how many fields in one pixel, 0 for only A; 3 for ABCD
3–1 RSVD3	Reserved. This field always reads 0.
0 FLAG_32B	1 indicate 32-bit for one pixel, 0 for 16-bit

**13.7.12.217 PXP\_HW\_PXP\_COMP\_FORMAT1**

This register defines the format bits for the pxp compression sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 2C20h offset = 3070\_2C20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

**PXP\_HW\_PXP\_COMP\_FORMAT1 field descriptions**

Field	Description
31–29 D_LEN	length of field D, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit
28–24 D_OFFSET	offset for field D, 0 means D start from bit0
23–21 C_LEN	length of field C, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit
20–16 C_OFFSET	offset for field C, 0 means C start from bit0
15–13 B_LEN	length of field B, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit

*Table continues on the next page...*

**PXP\_HW\_PXP\_COMP\_FORMAT1 field descriptions (continued)**

Field	Description
12-8 B_OFFSET	offset for field B, 0 means B start from bit0
7-5 A_LEN	length of field A, 0 for 1 byte, 7 for 8 bytes, length of the field plus the length of RLE(*_runlen) should not more than 16-bit
A_OFFSET	offset for field A, 0 means A start from bit0

**13.7.12.218 PXP\_HW\_PXP\_COMP\_FORMAT2**

This register defines the format bits for the pxp compression sub-block.

**EXAMPLE**

Address: 3070\_0000h base + 2C30h offset = 3070\_2C30h

**PXP\_HW\_PXP\_COMP\_FORMAT2 field descriptions**

Field	Description
31-16 RSVD	Reserved. This field always reads 0.
15-12 D_RUNLEN	length of the RLE for field D, 12-bit(4095) max
11-8 C_RUNLEN	length of the RLE for field C, 12-bit(4095) max
7-4 B_RUNLEN	length of the RLE for field B, 12-bit(4095) max
A_RUNLEN	length of the RLE for field A, 12-bit(4095) max

**13.7.12.219 PXP\_HW\_PXP\_COMP\_MASK0**

This register defines the format bits for the pxp compress mask configure.

**EXAMPLE**

Address: 3070\_0000h base + 2C40h offset = 3070\_2C40h

**PXP\_HW\_PXP\_COMP\_MASK0 field descriptions**

Field	Description
VLD_MASK_LOW	low 32bit of the valid mask, one of ABCD will be vld_flag, 1 left shifted by vld_flag anded with vld_mask will be used to check whether this pixel is valid

**13.7.12.220 PXP\_HW\_PXP\_COMP\_MASK1**

This register defines the format bits for the pxp compress mask configure.

**EXAMPLE**

Address: 3070\_0000h base + 2C50h offset = 3070\_2C50h

**PXP\_HW\_PXP\_COMP\_MASK1 field descriptions**

Field	Description
VLD_MASK_HIGH	high 32bit of the valid mask

**13.7.12.221 PXP\_HW\_PXP\_COMP\_BUFFER\_SIZE**

This register defines the format bits for the pxp compress mask configure.

**EXAMPLE**

Address: 3070\_0000h base + 2C60h offset = 3070\_2C60h

**PXP\_HW\_PXP\_COMP\_BUFFER\_SIZE field descriptions**

Field	Description
31–29 RSVD0	Reserved. This field always reads 0.
28–16 PIXEL_WIDTH	pixel width of the input frame, 4096 max
15–13 RSVD1	Reserved. This field always reads 0.
PIXEL_LENGTH	pixel length of the input frame, 4096 max

**13.7.12.222 PXP\_HW\_PXP\_COMP\_SOURCE**

This register defines the pxp compress source buffer address register.

**EXAMPLE**

Address: 3070\_0000h base + 2C70h offset = 3070\_2C70h

**PXP\_HW\_PXP\_COMP\_SOURCE field descriptions**

Field	Description
SOURCE_ADDR	source address of the input frame that located in the memory, should be 32-byte aligned

**13.7.12.223 PXP\_HW\_PXP\_COMP\_TARGET**

This register defines the pxp compress target buffer address register.

**EXAMPLE**

Address: 3070\_0000h base + 2C80h offset = 3070\_2C80h

**PXP\_HW\_PXP\_COMP\_TARGET field descriptions**

Field	Description
TARGET_ADDR	target address of the output frame that the pxp compress engine should write to the memory, should be 32-byte aligned

**13.7.12.224 PXP\_HW\_PXP\_COMP\_BUFFER\_A**

This register defines the pxp compress field A buffer address register.

**EXAMPLE**

Address: 3070\_0000h base + 2C90h offset = 3070\_2C90h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_COMP\_BUFFER\_A field descriptions**

Field	Description
A_SRAM_ADDR	sram address used for inter-data saving of A filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

**13.7.12.225 PXP\_HW\_PXP\_COMP\_BUFFER\_B**

This register defines the pxp compress field B buffer address register.

**EXAMPLE**

Address: 3070\_0000h base + 2CA0h offset = 3070\_2CA0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PXP\_HW\_PXP\_COMP\_BUFFER\_B field descriptions**

Field	Description
B_SRAM_ADDR	sram address used for inter-data saving of B filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

### 13.7.12.226 PXP\_HW\_PXP\_COMP\_BUFFER\_C

This register defines the pxp compress field C buffer address register.

#### EXAMPLE

Address: 3070\_0000h base + 2CB0h offset = 3070\_2CB0h

#### PXP\_HW\_PXP\_COMP\_BUFFER\_C field descriptions

Field	Description
C_SRAM_ADDR	sram address used for inter-data saving of C filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

### 13.7.12.227 PXP\_HW\_PXP\_COMP\_BUFFER\_D

This register defines the pxp compress field D buffer address register.

#### EXAMPLE

Address: 3070\_0000h base + 2CC0h offset = 3070\_2CC0h

#### PXP\_HW\_PXP\_COMP\_BUFFER\_D field descriptions

Field	Description
D_SRAM_ADDR	sram address used for inter-data saving of D filed,should be 32-bit aligned, SW should make sure the SRAM addr for 4 field will not overlap

### 13.7.12.228 PXP\_HW\_PXP\_COMP\_DEBUG

This register defines the pxp compress debug register.

#### EXAMPLE

Address: 3070\_0000h base + 2CD0h offset = 3070\_2CD0h

### PXP\_HW\_PXP\_COMP\_DEBUG field descriptions

Field	Description
31–8 DEBUG_VALUE	value of selected debug signal
DEBUG_SEL	debug selection

### 13.7.12.229 PXP\_HW\_PXP\_BUS\_MUX

This register defines the pxp subblock bus mux on top level.

#### EXAMPLE

Address: 3070\_0000h base + 2CE0h offset = 3070\_2CE0h

### PXP\_HW\_PXP\_BUS\_MUX field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
23–16 WR_SEL	Subblock BUS to AXI MUX, setting 0 to axi0 and setting 1 to axi1
15–8 RSVD0	Reserved, always set to zero.
RD_SEL	Subblock BUS to AXI MUX, setting 0 to axi0 and setting 1 to axi1

### 13.7.12.230 PXP\_HW\_PXP\_HANDSHAKE\_READY\_MUX0

This register defines the pxp subblock handshake signals ready mux on top level.

#### EXAMPLE

## Pixel Pipeline (PXP)

Address: 3070\_0000h base + 2CF0h offset = 3070\_2CF0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0 SW0_B0_ READY	PXP b0 buffer ready to CPU

## 13.8 Synchronous Audio Interface (SAI)

### 13.8.1 Overview

The synchronous audio interface (SAI) supports full-duplex serial interfaces with frame synchronization such as I<sup>2</sup>S, AC97, TDM, and codec/DSP interfaces.

#### 13.8.1.1 Features

Note that some of the features are not supported across all SAI instances; see the chip-specific information in the first section of this chapter.

- Transmitter with independent bit clock and frame sync supporting 1 data line
- Receiver with independent bit clock and frame sync supporting 1 data line
- Maximum Frame Size of 32 words
- Word size of between 8-bits and 32-bits
- Word size configured separately for first word and remaining words in frame
- Asynchronous 32 × 32-bit FIFO for each transmit and receive channel
- Supports graceful restart after FIFO error

#### 13.8.1.2 Block diagram

The following block diagram also shows the module clocks.

Figure 13-117. I<sup>2</sup>S/SAI block diagram

### 13.8.1.3 Modes of operation

The module operates in these power modes: Run mode, stop modes, and Debug mode.

#### 13.8.1.3.1 Run mode

In Run mode, the SAI transmitter and receiver operate normally.

#### 13.8.1.3.2 Stop modes

In Stop mode, the transmitter is disabled after completing the current transmit frame, and, the receiver is disabled after completing the current receive frame. Entry into Stop mode is prevented—not acknowledged—while waiting for the transmitter and receiver to be disabled at the end of the current frame.

#### 13.8.1.3.3 Debug mode

In Debug mode, the SAI transmitter and/or receiver can continue operating provided the Debug Enable bit is set. When TCSR[DBGE] or RCSR[DBGE] bit is clear and Debug mode is entered, the SAI is disabled after completing the current transmit or receive frame. The transmitter and receiver bit clocks are not affected by Debug mode.

## 13.8.2 External Signals

The following table describes the external signals of SAI:

**Table 13-44. SAI External Signals**

Signal	Description	Pad	Mode	Direction
SAI1_MCLK	Audio Master Clock. The master clock is an input when externally generated and an output when internally generated.	GPIO1_IO01	ALT3	IO
		SAI1_MCLK	ALT0	
SAI1_RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	ENET1_TXC	ALT2	IO
		SAI1_RXC	ALT0	
SAI1_RX_DATA	Receive Data. The receive data is sampled synchronously by the bit clock.	ENET1_TX_CLK	ALT2	I
		SAI1_RXD	ALT0	
SAI1_RX_SYNC	Receive Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	ENET1_TX_CTL	ALT2	IO
		SAI1_RXFS	ALT0	
SAI1_TX_BCLK	Transmit Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	ENET1_RX_CLK	ALT2	IO
		SAI1_TXC	ALT0	
SAI1_TX_DATA	Transmit Data. The transmit data is generated synchronously by the bit clock and is tristated whenever not transmitting a word.	ENET1_COL	ALT2	O
		SAI1_TXD	ALT0	
SAI1_TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	ENET1_CRCS	ALT2	IO
		SAI1_TXFS	ALT0	
SAI2_MCLK	Audio Master Clock. The master clock is an input when externally generated and an output when internally generated.	GPIO1_IO02	ALT3	IO
		SAI1_MCLK	ALT2	
		SD2_RESET_B	ALT1	
SAI2_RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	SAI1_RXC	ALT2	IO
		SD2_CMD	ALT1	
SAI2_RX_DATA	Receive Data. The receive data is sampled synchronously by the bit clock.	SAI2_RXD	ALT0	I
		SD2_DATA0	ALT1	
SAI2_RX_SYNC	Receive Frame Sync. The frame sync is an input sampled	SAI1_RXFS	ALT2	IO
		SD2_CLK	ALT1	

*Table continues on the next page...*

Table 13-44. SAI External Signals (continued)

Signal	Description	Pad	Mode	Direction
	synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.			
SAI2_TX_BCLK	Transmit Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	SAI2_TXC	ALT0	IO
		SD2_DATA1	ALT1	
SAI2_TX_DATA	Transmit Data. The transmit data is generated synchronously by the bit clock and is tristated whenever not transmitting a word.	SAI2_TXD	ALT0	O
		SD2_DATA3	ALT1	
SAI2_TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	SAI2_TXFS	ALT0	IO
		SD2_DATA2	ALT1	
SAI3_MCLK	Audio Master Clock. The master clock is an input when externally generated and an output when internally generated.	GPIO1_IO03	ALT3	IO
		SD1_RESET_B	ALT1	
		SD3_RESET_B	ALT3	
		UART1_TXD	ALT2	
SAI3_RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	SD1_CMD	ALT1	IO
		SD3_CMD	ALT3	
		UART2_RXD	ALT2	
SAI3_RX_DATA	Receive Data. The receive data is sampled synchronously by the bit clock.	SD1_DATA0	ALT1	I
		SD3_DATA0	ALT3	
		UART2_TXD	ALT2	
SAI3_RX_SYNC	Receive Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	SD1_CLK	ALT1	IO
		SD3_CLK	ALT3	
		UART3_RXD	ALT2	
SAI3_TX_BCLK	Transmit Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	SD1_DATA1	ALT1	IO
		SD3_DATA1	ALT3	
		UART3_TXD	ALT2	
SAI3_TX_DATA	Transmit Data. The transmit data is generated synchronously by the bit clock and is tristated whenever not transmitting a word.	SD1_DATA3	ALT1	O
		SD3_DATA3	ALT3	
		UART3_RTS	ALT2	
SAI3_TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	SD1_DATA2	ALT1	IO
		SD3_DATA2	ALT3	
		UART3_CTS	ALT2	

### 13.8.3 Functional description

This section provides a complete functional description of the block.

#### 13.8.3.1 SAI clocking

The SAI clocks include:

- The audio master clock
- The bit clock
- The bus clock

##### 13.8.3.1.1 Audio master clock

The audio master clock is used to generate the bit clock when the receiver or transmitter is configured for an internally generated bit clock. The transmitter and receiver can independently select between the bus clock and up to three audio master clocks to generate the bit clock.

The audio master clock generation and selection is chip-specific. Refer to chip-specific clocking information about how the audio master clocks are generated.

##### 13.8.3.1.2 Bit clock

The SAI transmitter and receiver support asynchronous free-running bit clocks that can be generated internally from an audio master clock or supplied externally. There is also the option for synchronous bit clock and frame sync operation between the receiver and transmitter.

Externally generated bit clocks must be:

- Enabled before the SAI transmitter or receiver is enabled
- Disabled after the SAI transmitter or receiver is disabled and completes its current frames

If the SAI transmitter or receiver is using an externally generated bit clock in asynchronous mode and that bit clock is generated by an SAI that is disabled in stop mode, then the transmitter or receiver should be disabled by software before entering stop mode. This issue does not apply when the transmitter or receiver is in a synchronous mode because all synchronous SAIs are enabled and disabled simultaneously.

### 13.8.3.1.3 Bus clock

The bus clock is used by the control and configuration registers and to generate synchronous interrupts and DMA requests.

#### NOTE

Although there is no specific minimum bus clock frequency specified, the bus clock frequency must be fast enough (relative to the bit clock frequency) to ensure that the FIFOs can be serviced, without generating either a transmitter FIFO underrun or receiver FIFO overflow condition.

### 13.8.3.2 SAI resets

The SAI is asynchronously reset on system reset. The SAI has a software reset and a FIFO reset.

#### 13.8.3.2.1 Software reset

The SAI transmitter includes a software reset that resets all transmitter internal logic, including the bit clock generation, status flags, and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

The SAI receiver includes a software reset that resets all receiver internal logic, including the bit clock generation, status flags and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

#### 13.8.3.2.2 FIFO reset

The SAI transmitter includes a FIFO reset that synchronizes the FIFO write pointer to the same value as the FIFO read pointer. This empties the FIFO contents and is to be used after TCSR[FEF] is set, and before the FIFO is re-initialized and TCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

The SAI receiver includes a FIFO reset that synchronizes the FIFO read pointer to the same value as the FIFO write pointer. This empties the FIFO contents and is to be used after the RCSR[FEF] is set and any remaining data has been read from the FIFO, and before the RCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

### 13.8.3.3 Synchronous modes

The SAI transmitter and receiver can operate synchronously to each other.

#### 13.8.3.3.1 Synchronous mode

The SAI transmitter and receiver can be configured to operate with synchronous bit clock and frame sync.

If the transmitter bit clock and frame sync are to be used by both the transmitter and receiver:

- The transmitter must be configured for asynchronous operation and the receiver for synchronous operation.
- In synchronous mode, the receiver is enabled only when both the transmitter and receiver are enabled.
- It is recommended that the transmitter is the last enabled and the first disabled.

If the receiver bit clock and frame sync are to be used by both the transmitter and receiver:

- The receiver must be configured for asynchronous operation and the transmitter for synchronous operation.
- In synchronous mode, the transmitter is enabled only when both the receiver and transmitter are both enabled.
- It is recommended that the receiver is the last enabled and the first disabled.

When operating in synchronous mode, only the bit clock, frame sync, and transmitter/receiver enable are shared. The transmitter and receiver otherwise operate independently, although configuration registers must be configured consistently across both the transmitter and receiver.

#### 13.8.3.4 Frame sync configuration

When enabled, the SAI continuously transmits and/or receives frames of data. Each frame consists of a fixed number of words and each word consists of a fixed number of bits. Within each frame, any given word can be masked causing the receiver to ignore that word and the transmitter to tri-state for the duration of that word.

The frame sync signal is used to indicate the start of each frame. A valid frame sync requires a rising edge (if active high) or falling edge (if active low) to be detected and the transmitter or receiver cannot be busy with a previous frame. A valid frame sync is also ignored (slave mode) or not generated (master mode) for the first four bit clock cycles after enabling the transmitter or receiver.

The transmitter and receiver frame sync can be configured independently with any of the following options:

- Externally generated or internally generated
- Active high or active low
- Assert with the first bit in frame or asserts one bit early
- Assert for a duration between 1 bit clock and the first word length
- Frame length from 1 to 32 words per frame
- Word length to support 8 to 32 bits per word
  - First word length and remaining word lengths can be configured separately
- Words can be configured to transmit/receive MSB first or LSB first

These configuration options cannot be changed after the SAI transmitter or receiver is enabled.

### 13.8.3.5 Data FIFO

Each transmit and receive channel includes a FIFO of size  $32 \times 32$ -bit. The FIFO data is accessed using the SAI Transmit/Receive Data Registers.

#### 13.8.3.5.1 Data alignment

Data in the FIFO can be aligned anywhere within the 32-bit wide register through the use of the First Bit Shifted configuration field, which selects the bit index (between 31 and 0) of the first bit shifted.

Examples of supported data alignment and the required First Bit Shifted configuration are illustrated in [Figure 13-118](#) for LSB First configurations and [Figure 13-119](#) for MSB First configurations.

Figure 13-118. SAI first bit shifted, LSB first

Figure 13-119. SAI first bit shifted, MSB first

### 13.8.3.5.2 FIFO pointers

When writing to a TDR, the WFP of the corresponding TFR increments after each valid write. The SAI supports 8-bit, 16-bit and 32-bit writes to the TDR and the FIFO pointer will increment after each individual write. Note that 8-bit writes should only be used when transmitting up to 8-bit data and 16-bit writes should only be used when transmitting up to 16-bit data.

Writes to a TDR are ignored if the corresponding bit of TCR3[TCE] is clear or if the FIFO is full. If the Transmit FIFO is empty, the TDR must be written at least three bit clocks before the start of the next unmasked word to avoid a FIFO underrun.

When reading an RDR, the RFP of the corresponding RFR increments after each valid read. The SAI supports 8-bit, 16-bit and 32-bit reads from the RDR and the FIFO pointer will increment after each individual read. Note that 8-bit reads should only be used when receiving up to 8-bit data and 16-bit reads should only be used when receiving up to 16-bit data.

Reads from an RDR are ignored if the corresponding bit of RCR3[RCE] is clear or if the FIFO is empty. If the Receive FIFO is full, the RDR must be read at least three bit clocks before the end of an unmasked word to avoid a FIFO overrun.

### 13.8.3.6 Word mask register

The SAI transmitter and receiver each contain a word mask register, namely TMR and RMR, that can be used to mask any word in the frame. Because the word mask register is double buffered, software can update it before the end of each frame to mask a particular word in the next frame.

The TMR causes the Transmit Data pin to be tri-stated for the length of each selected word and the transmit FIFO is not read for masked words.

The RMR causes the received data for each selected word to be discarded and not written to the receive FIFO.

### **13.8.3.7 Interrupts and DMA requests**

The SAI transmitter and receiver generate separate interrupts and separate DMA requests, but support the same status flags.

#### **13.8.3.7.1 FIFO request flag**

The FIFO request flag is set based on the number of entries in the FIFO and the FIFO watermark configuration.

The transmit FIFO request flag is set when the number of entries in any of the enabled transmit FIFOs is less than or equal to the transmit FIFO watermark configuration and is cleared when the number of entries in each enabled transmit FIFO is greater than the transmit FIFO watermark configuration.

The receive FIFO request flag is set when the number of entries in any of the enabled receive FIFOs is greater than the receive FIFO watermark configuration and is cleared when the number of entries in each enabled receive FIFO is less than or equal to the receive FIFO watermark configuration.

The FIFO request flag can generate an interrupt or a DMA request.

#### **13.8.3.7.2 FIFO warning flag**

The FIFO warning flag is set based on the number of entries in the FIFO.

The transmit warning flag is set when the number of entries in any of the enabled transmit FIFOs is empty and is cleared when the number of entries in each enabled transmit FIFO is not empty.

The receive warning flag is set when the number of entries in any of the enabled receive FIFOs is full and is cleared when the number of entries in each enabled receive FIFO is not full.

The FIFO warning flag can generate an Interrupt or a DMA request.

### 13.8.3.7.3 FIFO error flag

The transmit FIFO error flag is set when the any of the enabled transmit FIFOs underflow. After it is set, all enabled transmit channels repeat the last valid word read from the transmit FIFO until TCSR[FEF] is cleared and the next transmit frame starts. All enabled transmit FIFOs must be reset and initialized with new data before TCSR[FEF] is cleared.

RCSR[FEF] is set when the any of the enabled receive FIFOs overflow. After it is set, all enabled receive channels discard received data until RCSR[FEF] is cleared and the next next receive frame starts. All enabled receive FIFOs should be emptied before RCSR[FEF] is cleared.

The FIFO error flag can generate only an interrupt.

### 13.8.3.7.4 Sync error flag

The sync error flag, TCSR[SEF] or RCSR[SEF], is set when configured for an externally generated frame sync and the external frame sync asserts when the transmitter or receiver is busy with the previous frame. The external frame sync assertion is ignored and the sync error flag is set. When the sync error flag is set, the transmitter or receiver continues checking for frame sync assertion when idle or at the end of each frame.

The sync error flag can generate an interrupt only.

### 13.8.3.7.5 Word start flag

The word start flag is set at the start of the second bit clock for the selected word, as configured by the Word Flag register field.

The word start flag can generate an interrupt only.

## 13.8.4 Memory map and register definition

A read or write access to an address from offset and above will result in a bus error.

### I2S memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 13.8.4.1 SAI Transmit Control Register (I2Sx\_TCSR)

Address: Base address + 0h offset

I2Sx\_TCSR field descriptions

Field	Description
31 TE	<p>Transmitter Enable</p> <p>Enables/disables the transmitter. When software clears this field, the transmitter remains enabled, and this bit remains set, until the end of the current frame.</p> <p>0 Transmitter is disabled. 1 Transmitter is enabled, or transmitter has been disabled and has not yet reached end of frame.</p>
30 STOPE	<p>Stop Enable</p> <p>Configures transmitter operation in Stop mode. This field is ignored and the transmitter is disabled in all stop modes.</p> <p>0 Transmitter disabled in Stop mode. 1 Transmitter enabled in Stop mode.</p>
29 DBGE	<p>Debug Enable</p>

Table continues on the next page...

**I2Sx\_TCSR field descriptions (continued)**

Field	Description
	<p>Enables/disables transmitter operation in Debug mode. The transmit bit clock is not affected by debug mode.</p> <p>0 Transmitter is disabled in Debug mode, after completing the current frame. 1 Transmitter is enabled in Debug mode.</p>
28 BCE	<p>Bit Clock Enable</p> <p>Enables the transmit bit clock, separately from the TE. This field is automatically set whenever TE is set. When software clears this field, the transmit bit clock remains enabled, and this bit remains set, until the end of the current frame.</p> <p>0 Transmit bit clock is disabled. 1 Transmit bit clock is enabled.</p>
27–26 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
25 FR	<p>FIFO Reset</p> <p>Resets the FIFO pointers. Reading this field will always return zero. FIFO pointers should only be reset when the transmitter is disabled or the FIFO error flag is set.</p> <p>0 No effect. 1 FIFO reset.</p>
24 SR	<p>Software Reset</p> <p>When set, resets the internal transmitter logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers.</p> <p>0 No effect. 1 Software reset.</p>
23–21 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
20 WSF	<p>Word Start Flag</p> <p>Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag.</p> <p>0 Start of word not detected. 1 Start of word detected.</p>
19 SEF	<p>Sync Error Flag</p> <p>Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag.</p> <p>0 Sync error not detected. 1 Frame sync error detected.</p>
18 FEF	<p>FIFO Error Flag</p> <p>Indicates that an enabled transmit FIFO has underrun. Write a logic 1 to this field to clear this flag.</p> <p>0 Transmit underrun not detected. 1 Transmit underrun detected.</p>

*Table continues on the next page...*

## I2Sx\_TCSR field descriptions (continued)

Field	Description
17 FWF	FIFO Warning Flag Indicates that an enabled transmit FIFO is empty. 0 No enabled transmit FIFO is empty. 1 Enabled transmit FIFO is empty.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled transmit channel FIFO is less than or equal to the transmit FIFO watermark. 0 Transmit FIFO watermark has not been reached. 1 Transmit FIFO watermark has been reached.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0 Disables interrupt. 1 Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0 Disables interrupt. 1 Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable Enables/disables FIFO warning interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
8 FRIE	FIFO Request Interrupt Enable Enables/disables FIFO request interrupts. 0 Disables the interrupt. 1 Enables the interrupt.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FWDE	FIFO Warning DMA Enable

*Table continues on the next page...*

## I2Sx\_TCSR field descriptions (continued)

Field	Description
	Enables/disables DMA requests. 0 Disables the DMA request. 1 Enables the DMA request.
0 FRDE	FIFO Request DMA Enable Enables/disables DMA requests. 0 Disables the DMA request. 1 Enables the DMA request.

## 13.8.4.2 SAI Transmit Configuration 1 Register (I2Sx\_TCR1)

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

## I2Sx\_TCR1 field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFW	Transmit FIFO Watermark Configures the watermark level for all enabled transmit channels.

## 13.8.4.3 SAI Transmit Configuration 2 Register (I2Sx\_TCR2)

This register must not be altered when TCSR[TE] is set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0								0							
W	0								0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								DIV							
W	0								0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## I2Sx\_TCR2 field descriptions

Field	Description
31–30 SYNC	<p>Synchronous Mode</p> <p>Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the receiver must be configured for asynchronous operation.</p> <p>00 Asynchronous mode. 01 Synchronous with receiver.</p>
29 BCS	<p>Bit Clock Swap</p> <p>This field swaps the bit clock used by the transmitter. When the transmitter is configured in asynchronous mode and this bit is set, the transmitter is clocked by the receiver bit clock (SAI_RX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the transmitter continues to use the transmit frame sync (SAI_TX_SYNC).</p> <p>When the transmitter is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the transmitter bit clock (SAI_TX_BCLK) but use the receiver frame sync (SAI_RX_SYNC).</p> <p>0 Use the normal bit clock source. 1 Swap the bit clock source.</p>
28 BCI	<p>Bit Clock Input</p> <p>When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the transmitter is delayed by the pad output delay (the transmitter is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time.</p> <p>The slave mode timing from the datasheet should be used for the transmitter when this bit is set. In synchronous mode, this bit allows the transmitter to use the slave mode timing from the datasheet, while the receiver uses the master mode timing. This field has no effect when configured for an externally generated bit clock .</p> <p>0 No effect. 1 Internal logic is clocked as if bit clock was externally generated.</p>
27–26 MSEL	<p>MCLK Select</p> <p>Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock.</p> <p><b>NOTE:</b> Depending on the device, some Master Clock options might not be available. See the chip-specific information for the meaning of each option.</p> <p>00 Master Clock (MCLK) 1 option selected. 01 Master Clock (MCLK) 1 option selected. 10 Master Clock (MCLK) 2 option selected. 11 Master Clock (MCLK) 3 option selected.</p>
25 BCP	<p>Bit Clock Polarity</p> <p>Configures the polarity of the bit clock.</p> <p>0 Bit clock is active high with drive outputs on rising edge and sample inputs on falling edge. 1 Bit clock is active low with drive outputs on falling edge and sample inputs on rising edge.</p>
24 BCD	<p>Bit Clock Direction</p>

Table continues on the next page...

## I2Sx\_TCR2 field descriptions (continued)

Field	Description
	Configures the direction of the bit clock. 0 Bit clock is generated externally in Slave mode. 1 Bit clock is generated internally in Master mode.
23–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
DIV	Bit Clock Divide  Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is $(DIV + 1) * 2$ .

## 13.8.4.4 SAI Transmit Configuration 3 Register (I2Sx\_TCR3)

This register must not be altered when TCSR[TE] is set.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	0								0								TCE
W	[Shaded]																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	0								WDFL								
W	[Shaded]																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## I2Sx\_TCR3 field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 TCE	Transmit Channel Enable  Enables the corresponding data channel for transmit operation. A channel must be enabled before its FIFO is accessed.  0 Transmit data channel N is disabled. 1 Transmit data channel N is enabled.
15–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
WDFL	Word Flag Configuration

Table continues on the next page...

## I2Sx\_TCR3 field descriptions (continued)

Field	Description
	Configures which word sets the start of word flag. The value written must be one less than the word number. For example, writing 0 configures the first word in the frame. When configured to a value greater than TCR4[FRSZ], then the start of word flag is never set.

## 13.8.4.5 SAI Transmit Configuration 4 Register (I2Sx\_TCR4)

This register must not be altered when TCSR[TE] is set.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R		0		0		0		0		0		FRSZ				
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## I2Sx\_TCR4 field descriptions

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 FRSZ	Frame size Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 SYWD	Sync Width Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

## I2Sx\_TCR4 field descriptions (continued)

Field	Description
4 MF	MSB First Configures whether the LSB or the MSB is transmitted first. 0 LSB is transmitted first. 1 MSB is transmitted first.
3 FSE	Frame Sync Early 0 Frame sync asserts with the first bit of the frame. 1 Frame sync asserts one bit before the first bit of the frame.
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0 Frame sync is active high. 1 Frame sync is active low.
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0 Frame sync is generated externally in Slave mode. 1 Frame sync is generated internally in Master mode.

## 13.8.4.6 SAI Transmit Configuration 5 Register (I2Sx\_TCR5)

This register must not be altered when TCSR[TE] is set.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																0															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

## I2Sx\_TCR5 field descriptions

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28–24 WNW	Word N Width Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**I2Sx\_TCR5 field descriptions (continued)**

Field	Description
20–16 WOW	Word 0 Width  Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 FBT	First Bit Shifted  Configures the bit index for the first bit transmitted for each word in the frame. If configured for MSB First, the index of the next bit transmitted is one less than the current bit transmitted. If configured for LSB First, the index of the next bit transmitted is one more than the current bit transmitted. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

**13.8.4.7 SAI Transmit Data Register (I2Sx\_TDRn)**

Address: Base address + 20h offset + (4d × i), where i=0d to 0d

**I2Sx\_TDRn field descriptions**

Field	Description
TDR	Transmit Data Register  The corresponding TCR3[TCE] bit must be set before accessing the channel's transmit data register. Writes to this register when the transmit FIFO is not full will push the data written into the transmit data FIFO. Writes to this register when the transmit FIFO is full are ignored.

### 13.8.4.8 SAI Transmit FIFO Register (I2Sx\_TFRn)

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

Address: Base address + 40h offset + (4d × i), where i=0d to 0d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0	0						WFP								
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0						RFP									
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### I2Sx\_TFRn field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21–16 WFP	Write FIFO Pointer FIFO write pointer for transmit data channel.
15–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RFP	Read FIFO Pointer FIFO read pointer for transmit data channel.

### 13.8.4.9 SAI Transmit Mask Register (I2Sx\_TMR)

This register is double-buffered and updates:

1. When TCSR[TE] is first set
2. At the end of each frame.

This allows the masked words in each frame to change from frame to frame.

## Synchronous Audio Interface (SAI)

Address: Base address + 60h offset

### I2Sx\_TMR field descriptions

Field	Description
TWM	<p>Transmit Word Mask</p> <p>Configures whether the transmit word is masked (transmit data pin tristated and transmit data not read from FIFO) for the corresponding word in the frame.</p> <p>0 Word N is enabled. 1 Word N is masked. The transmit data pins are tri-stated when masked.</p>

## 13.8.4.10 SAI Receive Control Register (I2Sx\_RCSR)

Address: Base address + 80h offset

## I2Sx\_RCSR field descriptions

Field	Description
31 RE	<p>Receiver Enable</p> <p>Enables/disables the receiver. When software clears this field, the receiver remains enabled, and this bit remains set, until the end of the current frame.</p> <p>0 Receiver is disabled. 1 Receiver is enabled, or receiver has been disabled and has not yet reached end of frame.</p>
30 STOPE	<p>Stop Enable</p> <p>Configures receiver operation in Stop mode. This bit is ignored and the receiver is disabled in all stop modes.</p> <p>0 Receiver disabled in Stop mode. 1 Receiver enabled in Stop mode.</p>
29 DBGE	<p>Debug Enable</p> <p>Enables/disables receiver operation in Debug mode. The receive bit clock is not affected by Debug mode.</p> <p>0 Receiver is disabled in Debug mode, after completing the current frame. 1 Receiver is enabled in Debug mode.</p>
28 BCE	<p>Bit Clock Enable</p> <p>Enables the receive bit clock, separately from RE. This field is automatically set whenever RE is set. When software clears this field, the receive bit clock remains enabled, and this field remains set, until the end of the current frame.</p> <p>0 Receive bit clock is disabled. 1 Receive bit clock is enabled.</p>
27–26 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
25 FR	<p>FIFO Reset</p> <p>Resets the FIFO pointers. Reading this field will always return zero. FIFO pointers should only be reset when the receiver is disabled or the FIFO error flag is set.</p> <p>0 No effect. 1 FIFO reset.</p>
24 SR	<p>Software Reset</p> <p>Resets the internal receiver logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers.</p> <p>0 No effect. 1 Software reset.</p>
23–21 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
20 WSF	<p>Word Start Flag</p> <p>Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag.</p>

*Table continues on the next page...*

## I2Sx\_RCSR field descriptions (continued)

Field	Description
	0 Start of word not detected. 1 Start of word detected.
19 SEF	Sync Error Flag  Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag.  0 Sync error not detected. 1 Frame sync error detected.
18 FEF	FIFO Error Flag  Indicates that an enabled receive FIFO has overflowed. Write a logic 1 to this field to clear this flag.  0 Receive overflow not detected. 1 Receive overflow detected.
17 FWF	FIFO Warning Flag  Indicates that an enabled receive FIFO is full.  0 No enabled receive FIFO is full. 1 Enabled receive FIFO is full.
16 FRF	FIFO Request Flag  Indicates that the number of words in an enabled receive channel FIFO is greater than the receive FIFO watermark.  0 Receive FIFO watermark not reached. 1 Receive FIFO watermark has been reached.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12 WSIE	Word Start Interrupt Enable  Enables/disables word start interrupts.  0 Disables interrupt. 1 Enables interrupt.
11 SEIE	Sync Error Interrupt Enable  Enables/disables sync error interrupts.  0 Disables interrupt. 1 Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable  Enables/disables FIFO error interrupts.  0 Disables the interrupt. 1 Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable  Enables/disables FIFO warning interrupts.

*Table continues on the next page...*

**I2Sx\_RCSR field descriptions (continued)**

Field	Description
	0 Disables the interrupt. 1 Enables the interrupt.
8 FRIE	FIFO Request Interrupt Enable  Enables/disables FIFO request interrupts.  0 Disables the interrupt. 1 Enables the interrupt.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FWDE	FIFO Warning DMA Enable  Enables/disables DMA requests.  0 Disables the DMA request. 1 Enables the DMA request.
0 FRDE	FIFO Request DMA Enable  Enables/disables DMA requests.  0 Disables the DMA request. 1 Enables the DMA request.

**13.8.4.11 SAI Receive Configuration 1 Register (I2Sx\_RCR1)**

Address: Base address + 84h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### I2Sx\_RCR2 field descriptions

Field	Description
31–30 SYNC	<p>Synchronous Mode</p> <p>Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the transmitter must be configured for asynchronous operation.</p> <p>00 Asynchronous mode. 01 Synchronous with transmitter.</p>
29 BCS	<p>Bit Clock Swap</p> <p>This field swaps the bit clock used by the receiver. When the receiver is configured in asynchronous mode and this bit is set, the receiver is clocked by the transmitter bit clock (SAI_TX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the receiver continues to use the receiver frame sync (SAI_RX_SYNC).</p> <p>When the receiver is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the receiver bit clock (SAI_RX_BCLK) but use the transmitter frame sync (SAI_TX_SYNC).</p> <p>0 Use the normal bit clock source. 1 Swap the bit clock source.</p>
28 BCI	<p>Bit Clock Input</p> <p>When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the receiver is delayed by the pad output delay (the receiver is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time.</p> <p>The slave mode timing from the datasheet should be used for the receiver when this bit is set. In synchronous mode, this bit allows the receiver to use the slave mode timing from the datasheet, while the transmitter uses the master mode timing. This field has no effect when configured for an externally generated bit clock .</p> <p>0 No effect. 1 Internal logic is clocked as if bit clock was externally generated.</p>
27–26 MSEL	MCLK Select

Table continues on the next page...

## I2Sx\_RCR2 field descriptions (continued)

Field	Description
	<p>Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock.</p> <p><b>NOTE:</b> Depending on the device, some Master Clock options might not be available. See the chip-specific information for the availability and chip-specific meaning of each option.</p> <p>00 Bus Clock selected.            01 Master Clock (MCLK) 1 option selected.            10 Master Clock (MCLK) 2 option selected.            11 Master Clock (MCLK) 3 option selected.</p>
25 BCP	<p>Bit Clock Polarity</p> <p>Configures the polarity of the bit clock.</p> <p>0 Bit Clock is active high with drive outputs on rising edge and sample inputs on falling edge.            1 Bit Clock is active low with drive outputs on falling edge and sample inputs on rising edge.</p>
24 BCD	<p>Bit Clock Direction</p> <p>Configures the direction of the bit clock.</p> <p>0 Bit clock is generated externally in Slave mode.            1 Bit clock is generated internally in Master mode.</p>
23–8 Reserved	<p>This field is reserved.            This read-only field is reserved and always has the value 0.</p>
DIV	<p>Bit Clock Divide</p> <p>Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is <math>(DIV + 1) * 2</math>.</p>

## 13.8.4.13 SAI Receive Configuration 3 Register (I2Sx\_RCR3)

This register must not be altered when RCSR[RE] is set.

Address: Base address + 8Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	0								0								RCE
W	[Shaded]

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

## I2Sx\_RCR3 field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 RCE	Receive Channel Enable  Enables the corresponding data channel for receive operation. A channel must be enabled before its FIFO is accessed.  0 Receive data channel N is disabled. 1 Receive data channel N is enabled.
15–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
WDFL	Word Flag Configuration  Configures which word the start of word flag is set. The value written should be one less than the word number (for example, write zero to configure for the first word in the frame). When configured to a value greater than the Frame Size field, then the start of word flag is never set.

## 13.8.4.14 SAI Receive Configuration 4 Register (I2Sx\_RCR4)

This register must not be altered when RCSR[RE] is set.

Address: Base address + 90h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## I2Sx\_RCR4 field descriptions

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**I2Sx\_RCR4 field descriptions (continued)**

<b>Field</b>	<b>Description</b>
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 FRSZ	Frame Size  Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 SYWD	Sync Width  Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.
7–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4 MF	MSB First  Configures whether the LSB or the MSB is received first.  0 LSB is received first. 1 MSB is received first.
3 FSE	Frame Sync Early  0 Frame sync asserts with the first bit of the frame. 1 Frame sync asserts one bit before the first bit of the frame.
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 FSP	Frame Sync Polarity  Configures the polarity of the frame sync.  0 Frame sync is active high. 1 Frame sync is active low.
0 FSD	Frame Sync Direction  Configures the direction of the frame sync.  0 Frame Sync is generated externally in Slave mode. 1 Frame Sync is generated internally in Master mode.

### 13.8.4.15 SAI Receive Configuration 5 Register (I2Sx\_RCR5)

This register must not be altered when RCSR[RE] is set.

Address: Base address + 94h offset

#### I2Sx\_RCR5 field descriptions

Field	Description
31–29 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
28–24 WNW	Word N Width  Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 WOW	Word 0 Width  Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15–13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–8 FBT	First Bit Shifted  Configures the bit index for the first bit received for each word in the frame. If configured for MSB First, the index of the next bit received is one less than the current bit received. If configured for LSB First, the index of the next bit received is one more than the current bit received. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

### 13.8.4.16 SAI Receive Data Register (I2Sx\_RDRn)

Reading this register introduces one additional peripheral clock wait state on each read.

Address: Base address + A0h offset + (4d × i), where i=0d to 0d

## I2Sx\_RDRn field descriptions

Field	Description
RDR	<p>Receive Data Register</p> <p>The corresponding RCR3[RCE] bit must be set before accessing the channel's receive data register. Reads from this register when the receive FIFO is not empty will return the data from the top of the receive FIFO. Reads from this register when the receive FIFO is empty are ignored.</p>

## 13.8.4.17 SAI Receive FIFO Register (I2Sx\_RFRn)

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

Address: Base address + C0h offset + (4d × i), where i=0d to 0d

## I2Sx\_RFRn field descriptions

Field	Description
31–22 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
21–16 WFP	<p>Write FIFO Pointer</p> <p>FIFO write pointer for receive data channel.</p>
15 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
14–6 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
RFP	<p>Read FIFO Pointer</p> <p>FIFO read pointer for receive data channel.</p>

## 13.8.4.18 SAI Receive Mask Register (I2Sx\_RMR)

This register is double-buffered and updates:

## Medium Quality Sound (MQS)

1. When RCSR[RE] is first set
2. At the end of each frame

This allows the masked words in each frame to change from frame to frame.

Address: Base address + E0h offset

### I2Sx\_RMR field descriptions

Field	Description
RWM	Receive Word Mask  Configures whether the receive word is masked (received data ignored and not written to receive FIFO) for the corresponding word in the frame.  0 Word N is enabled. 1 Word N is masked.

## 13.9 Medium Quality Sound (MQS)

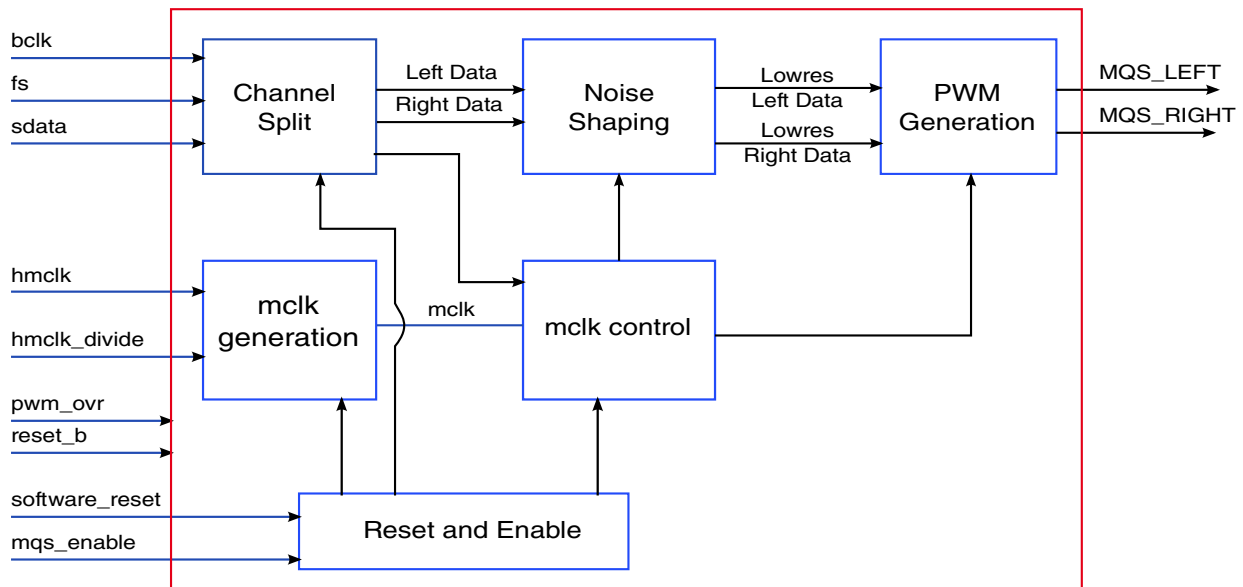

### 13.9.1 Overview

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

MQS accepts 2-channel, LSB-valid 16bit, MSB shift-out first; frame sync asserting with the first bit of the frame, data shifted with the posedge of bit clock, 44.1 kHz or 48 kHz signals from SAI1 in left\_justified format; and it provides the SNR target as no more than 20dB for the signals below 10 kHz. The signals above 10 kHz will have worse THD+N values.

MQS provides only simple audio reproduction. No internal pop, click or distortion artifact reduction methods are provided.

### 13.9.2 Block Diagram

**Figure 13-120. Block Diagram**

MQS has the following sub-modules:

1. Channel Split: Splits the I2S signals into separate left channel and right channel audio data.
2. Noise Shaping: Uses the sigma-delta algorithm to generate low-resolution, very high sampling audio, while the audio sampling rate is increased.
3. PWM generation: Generates the bit stream to the GPIO, which is then used to drive the amplifier and then to drive the external speakers or headphones.
4. mclk generation: Used to generate the master clock (mclk). The frequency of mclk is determined by the final bit duration of PWM generation module.
5. mclk control: Used as a metronome to co-ordinate the different functional blocks working synchronously.
6. Reset and Enable: Used to generate the reset and enable logic to different clock domains.

### 13.9.3 External Signals

The following table describes the external signals of MQS:

**Table 13-45. MQS External Signals**

Signal	Description	Pad	Mode	Direction
MQS_LEFT	Left signal output	SAI1_RXC	ALT6	O
		SD2_CMD	ALT2	

*Table continues on the next page...*

**Table 13-45. MQS External Signals (continued)**

Signal	Description	Pad	Mode	Direction
MQS_RIGHT	Right signal output	SAI1_RXFS	ALT6	O
		SD2_CLK	ALT2	

### 13.9.4 Programmability

MQS has no internal programmable registers. But it does have some programmability from IOMUXC\_GPR2.

Register Bits	Name	Description
IOMUXC_GPR2[26]	MQS_OVERSAMPLE	Used to control the PWM oversampling rate compared with mclk. 1—64, 0—32.
IOMUXC_GPR2[25]	MQS_EN	MQS enable. 1—Enable MQS, 0—Disable MQS
IOMUXC_GPR2[24]	MQS_SW_RST	MQS software reset. 1—Enable software reset for MQS 0—Exit software reset for MQS
IOMUXC_GPR2[23:16]	MQS_CLK_DIV[7:0]	Divider ration control for mclk from hmclk. 0—mclk frequency = hmclk frequency; 1—mclk frequency = 1/2*hmclk frequency; 2—mclk frequency = 1/3*hmclk frequency; ...; n—mclk frequency = 1/(n+1)*hmclk frequency

### 13.9.5 Usage Model

The user needs to program SAI1 to output 2-channel LSB-16bit active left justified signal, and then to program the related IOMUXC\_GPR2 bits.

Due to the different devices connected to MQS, and different high frequency behaviors of the connected analog circuits, customer need choose the appropriate MQS\_CLK\_DIV and MQS\_OVERSAMPLE values for the best audible effects.

# Chapter 14

## ADC and Temperature Monitor

### 14.1 Analog-to-Digital Converter (ADC)

#### 14.1.1 Overview

This block guide introduces the analog-to-digital converter (ADC). It discusses the architecture, functions and operating modes.

ADC is a 1.8 V 12-bit ADC with 16 channels analog input MUX and level-shifters for low-voltage digital interface. ADC supports conversion up to five logic groups (ChA / ChB / ChC / ChD / SW). Each group can select one channel from 0 - 15 physical channels.

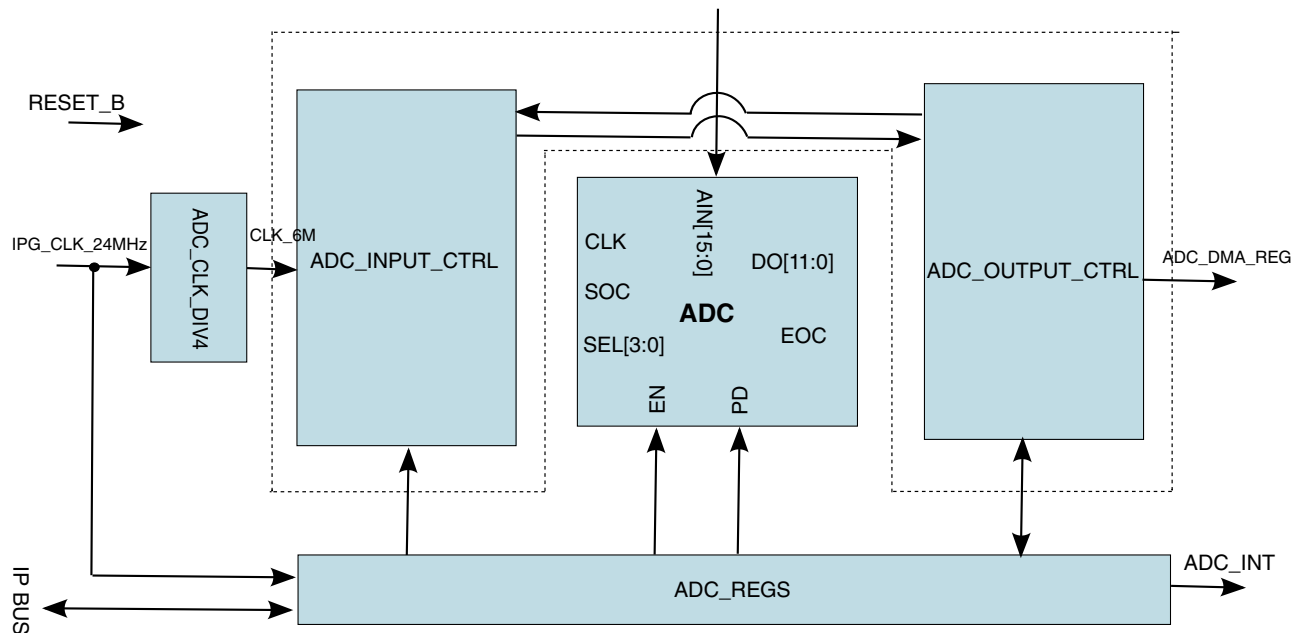

Figure 14-1. ADC Wrapper Hierarchy

### 14.1.1.1 Feature

The following list summarizes the key features of the ADC:

- Support up to 16 analog inputs
- Support five conversion pairs, can work simultaneously, with different conversion priority.
- Word size is 12-bits.
- Support Single and Continue conversion.
- Support Compare mode and channel auto disable if data match the requirement.
- Support Average conversion, Support flexible 4, 8, 16, 32 number of conversion data.
- Configurable sample time and conversion speed / power. The ADC core clock can vary from 300 kHz to 6 MHz, and the maximum sample rate is 1/6 ADC core clock.
- Conversion complete, hardware average complete, compare, DMA, time out flag and interrupt.
- Automatic compare with interrupt for less than, greater than, and equal to, within range, or out-of-range, programmable value.

### 14.1.2 Operation mode (ADC enable or disable)

By default, the ADC is in Disabled mode. In this state, no conversion or other actions occur. All of the ADC control registers are accessible in this state through an access bus interface. To enable the ADC, required configurations must be completed by programming the ADC configuration registers.

### 14.1.3 External signal description

The following table describes the external signals of ADC:

**Table 14-1. ADC External Signals**

Signal	Description	Pad	Mode	Direction
ADC1_IN0	Analog channel 1 input 0	ADC1_IN0	No muxing	I
ADC1_IN1	Analog channel 1 input 1	ADC1_IN1	No muxing	I
ADC1_IN2	Analog channel 1 input 2	ADC1_IN2	No muxing	I
ADC1_IN3	Analog channel 1 input 3	ADC1_IN3	No muxing	I
ADC1_VREFH	Voltage reference high	ADC1_VREFH	No muxing	I
ADC1_VREFL	Voltage reference low	ADC1_VREFL	No muxing	I

*Table continues on the next page...*

**Table 14-1. ADC External Signals (continued)**

Signal	Description	Pad	Mode	Direction
ADC2_IN0	Analog channel 2 input 0	ADC2_IN0	No muxing	I
ADC2_IN1	Analog channel 2 input 1	ADC2_IN1	No muxing	I
ADC2_IN2	Analog channel 2 input 2	ADC2_IN2	No muxing	I
ADC2_IN3	Analog channel 2 input 3	ADC2_IN3	No muxing	I
ADC2_VREFH	Voltage reference high	ADC2_VREFH	No muxing	I
ADC2_VREFL	Voltage reference low	ADC2_VREFL	No muxing	I

### 14.1.4 Clocks and timing

The following table describes the clock sources of ADC.

**Table 14-2. ADC Clock Sources**

Clock Name	Description
IPG_CLK_24MHZ	Global clock
IPG_CLK_24MHZ_S	Peripheral access clock

IPG\_CLK\_24MHZ can be divided by 4, 8, 16, 32, 64 or 128. Using the PRE\_DIV bits to obtain the ADC analogue core clock. The ADC analogue core clock is vary from 300 kHz to 6 MHz.

Figure 14-2. Timing

### 14.1.5 Functional description

This section provides a complete functional description of the ADC block.

#### 14.1.5.1 Data FIFO

The size of ADC FIFO is 32 × 32-bit. The FIFO data are accessed by using the ADC FIFO Data Registers. Each data in the FIFO contains two ADC conversion data; each data is right aligned within the 12-bit wide.

When writing FIFO with an odd number of data, 0x0fff will be written into FIFO[31:16].

Table 14-3. Data FIFO

3	3	2	2	2	2	2	2	2	2	2	2	1	1	1	1	1	1	1	1	1	1	1	1	1	1	9	8	7	6	5	4	3	2	1	0	
1	0	9	8	7	6	5	4	3	2	1	0	9	8	7	6	5	4	3	2	1	0															

### 14.1.5.1.1 FIFO pointers

When writing of data into DMA\_FIFO\_DAT, the FIFO pointer increments one after every two valid write. Writing data of the DMA\_FIFO\_DAT will be ignored if FIFO is full.

When reading data from DMA\_FIFO\_DAT, the read FIFO pointer increments after each valid read. Reads from DMA\_FIFO\_DAT will be ignored if the FIFO is empty.

### 14.1.5.2 Interrupts and DMA requests

ADC generates interrupts or DMA requests when meet corresponding condition.

#### 14.1.5.2.1 DMA requests

Only one channel can use DMA at a time. When more than one channel is enabled, it will be determined by its priority.

When the number of entries of ADC FIFO is less than or equal to the transmit FIFO watermark configuration, DMA request is generated. When the number of entries of FIFO is greater than FIFO watermark configuration, DMA request is cleared.

#### 14.1.5.2.2 Flag and interrupt

##### Compare Flag

if enable the compare flag, the compare flag is set when conversion result matches the compare region. If enable compare interrupt, corresponding interrupt is generated.

##### Conversion Flag

If enable conversion flag, the Conversion Flag is set when one ADC conversion completed. If enable conversion interrupt, corresponding interrupt is generated.

##### Time Out Flag

If enable time out flag, the time out flag is set when conversion time out. If enable time out interrupt, corresponding interrupt is generated.

##### FIFO Overrun and Underrun

If enable fifo overrun or underrun flag, the fifo overrun or underrun flag is set when fifo overrun or underrun happens. If enable fifo overrun or underrun interrupt, corresponding interrupt is set.

### 14.1.5.2.3 Operating modes

Different modes can be programmed by several bits in the ADC register.

#### 14.1.5.2.3.1 Single conversion

In Single conversion, ADC only starts a single conversion for enable channel. It stops when one conversion is finished.

#### 14.1.5.2.3.2 Continue conversion

If continuous conversion is enabled, a new conversion is automatically initiated after the completion of the current conversion.

#### 14.1.5.2.3.3 Average conversion

The hardware average function can be enabled ( $CH\_AVG\_EN = 1$ ) to perform a hardware average of multiple conversions. The number of conversions is determined by the  $CH\_AVG\_NUMBER$  bit, which can average 4, 8, 16 or 32 conversions. If hardware averaging is enabled, a new conversion is automatically initiated after the completion of the current conversion until the correct number of conversions is completed.

If continuous conversion is also enabled, a new set of conversions (to be averaged) are initiated following the last of the selected number of conversions.

#### 14.1.5.2.3.4 Compare mode

The compare function can be configured to check the result is less than, greater than, or equal to a single compare value, as well as the result falls within or outside a range determined by two compare values. The compare modes is determined by  $CH\_CMP\_MODE$ . In compare mode, once one conversion is finished. ADC compares conversion with  $LOW\_THRES$  and  $HIGH\_THRES$  value to check whether the conversion result meet the requirement.

The following table shows six kinds of compare modes.

**Table 14-4. Compare Modes**

$CH\_CFG[31:29]$	Compare Mode
X00	Disable compare
001	Compare true if the result is greater than $CHC\_LOW\_THRES$

*Table continues on the next page...*

**Table 14-4. Compare Modes (continued)**

CH*_CFG[31:29]	Compare Mode
010	Compare true if the result is less than or equal to <b>CHC_LOW_THRES</b>
011	Compare true if the result is greater than <b>CHC_LOW_THRES</b> and less than <b>CHC_HIGH_THRES</b>
101	Compare true if the result is greater than or equal to <b>CHC_HIGH_THRES</b>
110	Compare true if the result is less than <b>CHC_HIGH_THRES</b>
111	Compare true if the result is less than or equal to <b>CHC_LOW_THRES</b> , or Compare true if the result is greater than or equal to <b>CHC_HIGH_THRES</b>

If compare mode and auto disable are enabled, the compare condition true can result in conversions discarded or conversion auto disabled.

#### 14.1.5.2.3.5 Priority

When chA / chB / chC / chD / SW are all enabled, conflict may happen. To avoid this issue, ADC introduces priority mechanism. If chA / chB / chC / chD / SW start a conversion at the same time, chA will convert firstly, then ChB, ChC, chD, and SW at last. In worst condition, channel A blocks all chB / chC / chD / SW conversions.

The following table shows the priorities used in the conversion.

**Table 14-5. Priority**

Priority	Description
Highest	chA conversion
	chB conversion
	chC conversion
	chD conversion
Lowest	SW conversion

When ADC runs in Average and Priority mode simultaneously, ADC firstly consider the periodic, and then average time. When surplus timer between two chA conversion cannot complete a chB conversion, chB is blocked.

The same situation applies to other channels.

Constraints:

1. The conversion period of chA must be greater than total conversion time of chA + chB + chC + chD + SW. The conversion period of chB must be greater than total conversion time of chB + chC + chD + SW. The conversion period of channel with high priority must greater than total conversion time of low priority.

## 14.1.6 ADC Memory Map/Register Definition

ADC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
3061_0000	Channel A configuration 1 (ADC1_CH_A_CFG1)	32	R/W	0000_0000h	<a href="#">14.1.6.1/4346</a>

### 14.1.6.1 Channel A configuration 1 (ADCx\_CH\_A\_CFG1)

CH\_A\_CFG1 defines the functions of channel A. Channel A has the highest priority of all four channels.

Address: Base address + 0h offset

**ADCx\_CH\_A\_CFG1 field descriptions**

Field	Description
31 CHA_EN	Channel A Enable This bit controls the working mode of logical channel A. 1 Enable logical channel A. Logical channel A will work. 0 Disable logical channel A. Prevent logical channel A from working.
30 CHA_SINGLE	Channel A Signal Conversion

Table continues on the next page...

**ADCx\_CH\_A\_CFG1 field descriptions (continued)**

Field	Description
	<p>Start a single conversion from logical channel A. Switch between single and continuous conversion, it must disable CHA_EN first. When both CHA_EN and CHA_SINGLE are enabled, CHA_SIGNAL set CHA_EN to 0 and reset itself to 0.</p> <p>1 Start a single conversion. Continuous conversion must stop. 0 No single conversion. Continuous conversion can start.</p>
29 CHA_AVG_EN	<p>Channel A Average Enable</p> <p>If enable this bit, channel A will do average for each conversion.</p> <p>1 Enable average function. 0 Disable average function.</p>
28 Reserved	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27–24 CHA_SEL	<p>Channel A Select</p> <p>Select input channel (from 16 channels) for the logical channel A.</p> <p>0000 Channel 0 0001 Channel 1 0010 Channel 2 0011 Channel 3 0100 Channel 4 0101 Channel 5 0110 Channel 6 0111 Channel 7 1000 Channel 8 1001 Channel 9 1010 Channel 10 1011 Channel 11 1100 Channel 12 1101 Channel 13 1110 Channel 14 1111 Channel 15</p>
CHA_TIMER	<p>Channel A Timer</p> <p>This timer is for continuous conversion. The conversion rate = (CHA_TIMER + 1) times sample rate. 0x000 to 0xFFFF timer value, every CHA_TIMER + 1 times sample rate, the ADC converts one data.</p>

### 14.1.6.2 Channel A configuration 2 (ADCx\_CH\_A\_CFG2)

CH\_A\_CFG2 defines the function of channel A. Channel A has the highest priority of all four channels.

Address: Base address + 10h offset

**ADCx\_CH\_A\_CFG2 field descriptions**

Field	Description
31–29 CHA_CMP_MODE	Channel A Compare Mode Select which compare mode the conversion result will take for channel A. X00 Disable compare function.

*Table continues on the next page...*

## ADCx\_CH\_A\_CFG2 field descriptions (continued)

Field	Description
	<p>001 If channel A conversion result is greater than CHA_LOW_THRES, then an interrupt will be generated and the channel A flag will be set if they are enabled.</p> <p>010 If channel A conversion result is less than or equal to CHA_LOW_THRES, then an interrupt will be generated and channel A flag will be set if they are enabled.</p> <p>011 If channel A conversion result is greater than CHA_LOW_THRES and less than CHA_HIGH_THRES, then an interrupt will be generated and channel A flag will be set if they are enabled.</p> <p>101 If channel A conversion result is greater than or equal to CHA_HIGH_THRES, then an interrupt will be generated and channel A flag will be set if they are enabled.</p> <p>110 If channel A conversion result is less than CHA_HIGH_THRES, then an interrupt will be generated and channel A flag will be set if they are enabled.</p> <p>111 If channel A conversion result is less than or equal to CHA_LOW_THRES, and at the same time, greater than or equal to CHA_HIGH_THRES, then an interrupt will be generated and channel A flag will be set if they are enabled.</p>
28 Reserved1	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27–16 CHA_HIGH_THRES	<p>Channel A High Threshold Value</p> <p>Contains the high compare value to compare with the conversion result when a compare mode has been selected.</p>
15 CHA_AUTO_DIS	<p>Channel A Auto Disable</p> <p>During continuous conversion, if compare match a converted result, the ADC checks this bit. If CHA_AUTO_DIS = 1, then channel A stops continuous conversion, if CHA_AUTO_DIS = 0, then channel A keeps continuous working, and the conversion result overwrites the result registers. The default value is 1.</p>
14 Reserved2	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
13–12 CHA_AVG_NUMBER	<p>Channel A Average Number</p> <p>If enable average function, this bit contains channel A average number.</p> <p>00 Average number = 4</p> <p>01 Average number = 8</p> <p>10 Average number = 16</p> <p>11 Average number = 32</p>
CHA_LOW_THRES	<p>Channel A Low Threshold Value</p> <p>Contains the lower compare value to compare with the conversion result when a compare mode has been selected.</p>

### 14.1.6.3 ADCx\_CH\_B\_CFG1

CH\_B\_CFG1 defines the functions of channel B. Channel B has the second highest priority of all four channels.

Address: Base address + 20h offset

**ADCx\_CH\_B\_CFG1 field descriptions**

Field	Description
31 CHB_EN	Channel B Enable Controls the usable of logical channel B.  1 Enable logical channel B. Logical channel B will work. 0 Disable logical channel B. Prevent logical channel B from working.
30 CHB_SINGLE	Channel B Single Conversion

Table continues on the next page...

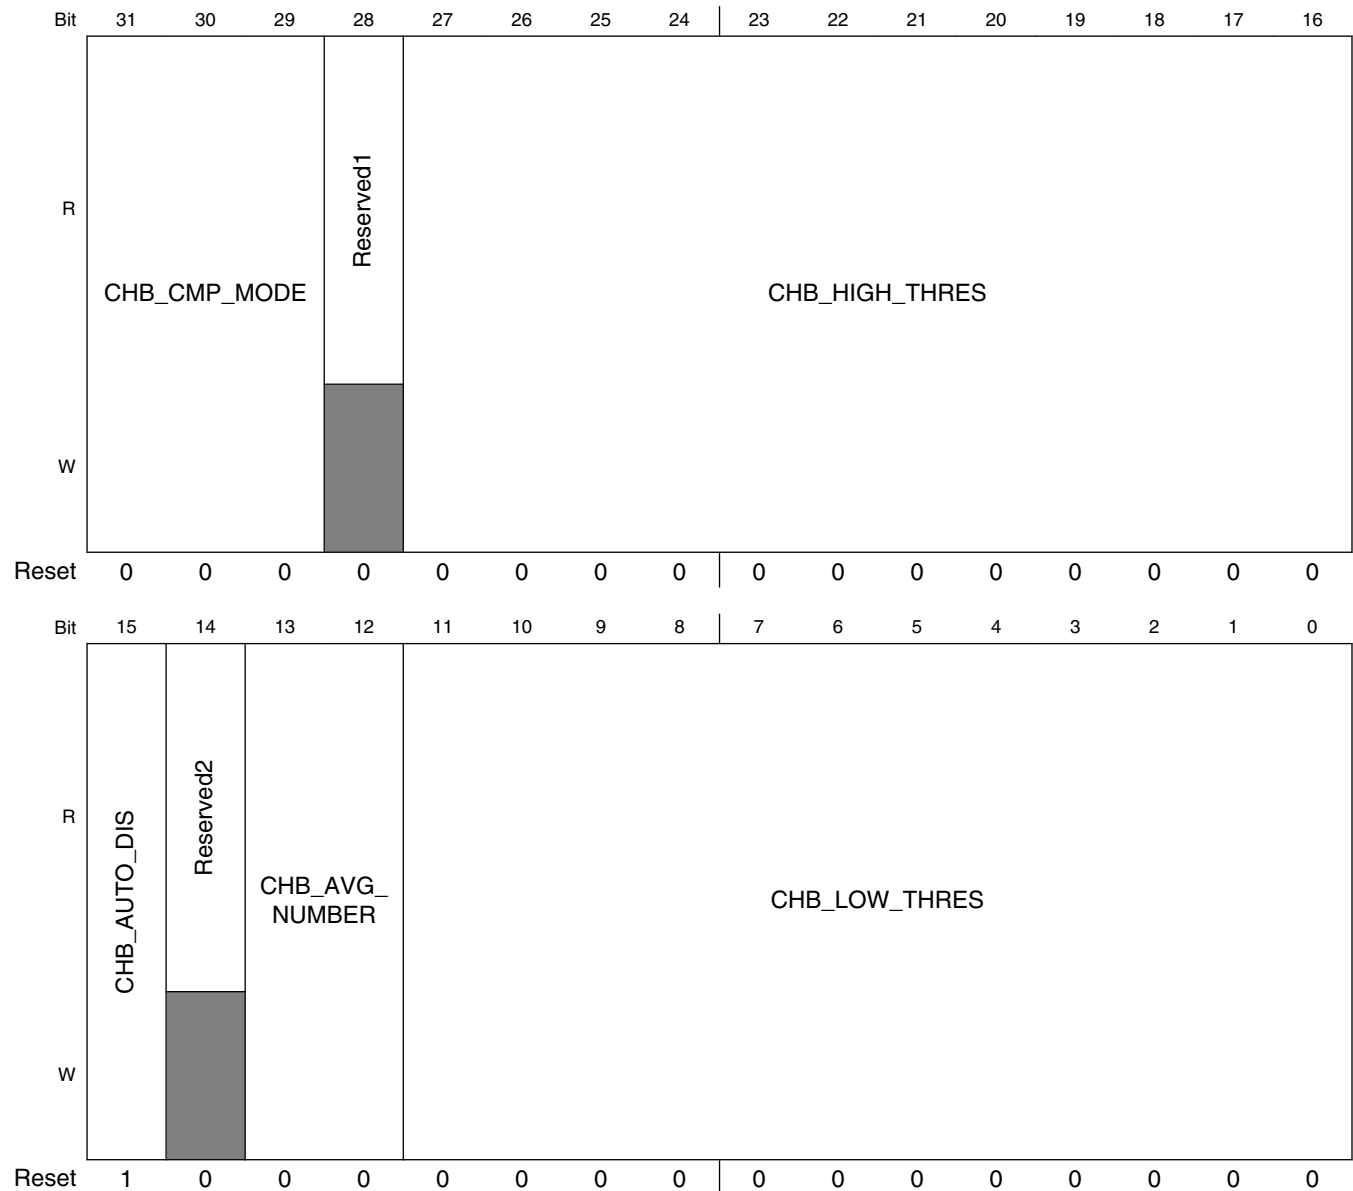

## ADCx\_CH\_B\_CFG1 field descriptions (continued)

Field	Description
	<p>Start a single conversion from logical channel B. Switch between single and continuous conversion, it must disable CHB_EN first. When both CHB_EN and CHB_SINGLE are enabled, CHB_SIGNAL set CHB_EN to 0 and reset itself to 0.</p> <p>1 Start a single conversion. Continuous conversion must stop. 0 No single conversion. Continuous conversion can start.</p>
29 CHB_AVG_EN	<p>Channel B Average Enable</p> <p>If enable this bit, channel B will do average for each conversion.</p> <p>1 Enable average function. 0 Disable average function.</p>
28 Reserved	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27–24 CHB_SEL	<p>Channel B Select</p> <p>Select input channel (from 16 channels) for the logical channel B.</p> <p>0000 Channel 0 0001 Channel 1 0010 Channel 2 0011 Channel 3 0100 Channel 4 0101 Channel 5 0110 Channel 6 0111 Channel 7 1000 Channel 8 1001 Channel 9 1010 Channel 10 1011 Channel 11 1100 Channel 12 1101 Channel 13 1110 Channel 14 1111 Channel 15</p>
CHB_TIMER	<p>Channel B Timer</p> <p>This timer is for continuous conversion. The conversion rate = (CHB_TIMER + 1) times sample rate + offset. Offset is due to channel B obtains lower priority than channel A. In worst condition, all channel B's conversions are blocked by channel A's.</p> <p>0x000 to 0xFFFF timer value, every CHB_TIMER + 1 times sample rate + offset, the ADC converts one data.</p>

### 14.1.6.4 Channel B Configuration 2 (ADCx\_CH\_B\_CFG2)

CH\_B\_CFG2 defines the functions of channel B. Channel B has the second highest priority of all four channels.

Address: Base address + 30h offset

**ADCx\_CH\_B\_CFG2 field descriptions**

Field	Description
31–29 CHB_CMP_MODE	Channel B Compare Mode Select which compare mode the conversion result will take for channel B. X00 Disable compare function

*Table continues on the next page...*

## ADCx\_CH\_B\_CFG2 field descriptions (continued)

Field	Description
	<p>001 If channel B conversion result is greater than CHB_LOW_THRES, then an interrupt will be generated and the channel B flag will be set if they are enabled.</p> <p>010 If channel B conversion result is less than or equal to CHB_LOW_THRES, then an interrupt will be generated and channel B flag will be set if they are enabled.</p> <p>011 If channel B conversion result is greater than CHB_LOW_THRES and less than CHB_HIGH_THRES, then an interrupt will be generated and channel B flag will be set if they are enabled.</p> <p>101 If channel B conversion result is greater than or equal to CHB_HIGH_THRES, then an interrupt will be generated and channel B flag will be set if they are enabled.</p> <p>110 If channel B conversion result is less than CHB_HIGH_THRES, then an interrupt will be generated and channel B flag will be set if they are enabled.</p> <p>111 If channel B conversion result is less than or equal to CHB_LOW_THRES, and at the same time, is greater than or equal to CHB_HIGH_THRES, then an interrupt will be generated and channel B flag will be set.</p>
28 Reserved1	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27–16 CHB_HIGH_THRES	<p>Channel B High Threshold Value</p> <p>Contains the bigger compare value to compare with the conversion result when a compare mode has been selected.</p>
15 CHB_AUTO_DIS	<p>Channel B Auto Disable</p> <p>During continuous conversion, if compare match a converted result, the ADC checks this bit. If CHB_AUTO_DIS = 1, then channel B stops continuous conversion, if CHB_AUTO_DIS = 0, then channel B keeps continuous working, and the conversion result overwrites the result registers. The default value is 1.</p>
14 Reserved2	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
13–12 CHB_AVG_NUMBER	<p>Channel B Average Number</p> <p>If enable average function, this bit contains channel B average number.</p> <p>00 Average number = 4</p> <p>01 Average number = 8</p> <p>10 Average number = 16</p> <p>11 Average number = 32</p>
CHB_LOW_THRES	<p>Channel B Low Threshold Value</p> <p>Contains the smaller compare value to compare with the conversion result when a compare mode has been selected.</p>

### 14.1.6.5 Channel C Configuration 1 (ADCx\_CH\_C\_CFG1)

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	CHC_EN	CHC_SINGLE	CHC_AVG_EN	Reserved	CHC_SEL				CHC_TIMER							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### ADCx\_CH\_C\_CFG1 field descriptions

Field	Description
31 CHC_EN	<p>Channel C Enable</p> <p>Controls the usable of logical channel C.</p> <p>1 Enable logical channel C. Logical channel C will work. 0 Disable logical channel C. Prevent logical channel C from working.</p>
30 CHC_SINGLE	<p>Channel C Single Conversion</p> <p>Start a single conversion from logical channel C. Switch between single and continuous conversion, it must disable CHC_EN. When both CHC_EN and CHC_SINGLE are enabled, CHC_SIGNAL set CHC_EN to 0 and reset itself to 0.</p> <p>Controls the usable of logical channel C.</p> <p>1 Start a single conversion. Continuous conversion must stop. 0 No single conversion. Continuous conversion can start.</p>
29 CHC_AVG_EN	<p>Channel C Average Enable</p> <p>If enable this bit, channel C will do average for each conversion.</p> <p>1 Enable average function. 0 Disable average function.</p>
28 Reserved	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27-24 CHC_SEL	<p>Channel C Select</p> <p>Select input channel (from 16 channels) for the logical channel C.</p>

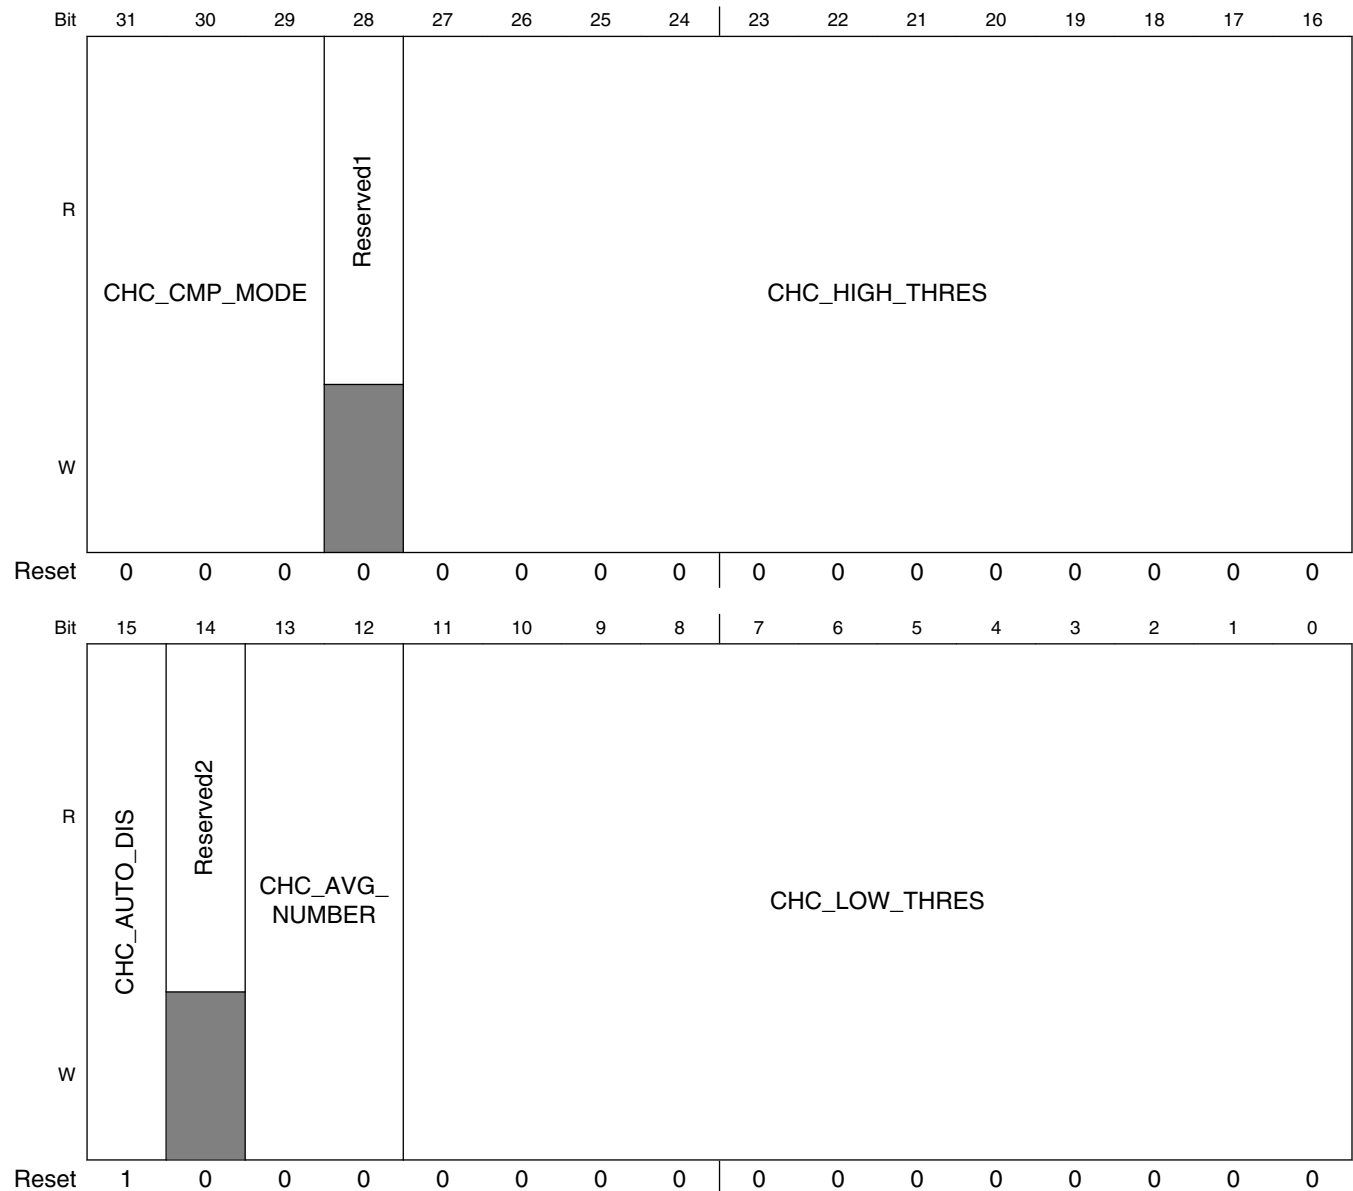

Table continues on the next page...

## ADCx\_CH\_C\_CFG1 field descriptions (continued)

Field	Description
	0000 Channel 0 0001 Channel 1 0010 Channel 2 0011 Channel 3 0100 Channel 4 0101 Channel 5 0110 Channel 6 0111 Channel 7 1000 Channel 8 1001 Channel 9 1010 Channel 10 1011 Channel 11 1100 Channel 12 1101 Channel 13 1110 Channel 14 1111 Channel 15
CHC_TIMER	Channel C Timer  This timer is for continuous conversion. The conversion rate = (CHC_TIMER + 1) times sample rate + offset. The offset is due to channel C has lower priority than channel A and channel B. In worst condition, all channel C conversions are blocked by channel A and channel B's.  0x000 to 0xFFF timer value, every CHC_TIMER + 1 times sample rate + offset, the ADC converts one data.

### 14.1.6.6 Channel C Configuration 2 (ADCx\_CH\_C\_CFG2)

Address: Base address + 50h offset

**ADCx\_CH\_C\_CFG2 field descriptions**

Field	Description
31–29 CHC_CMP_MODE	Channel C Compare Mode Select which compare mode the conversion result will take (for channel C).  X00 Disable compare function. 001 If channel C conversion result bigger than CHC_LOW_THRES, then an interrupt will be generated and the channel C flag will be set if they are enabled.

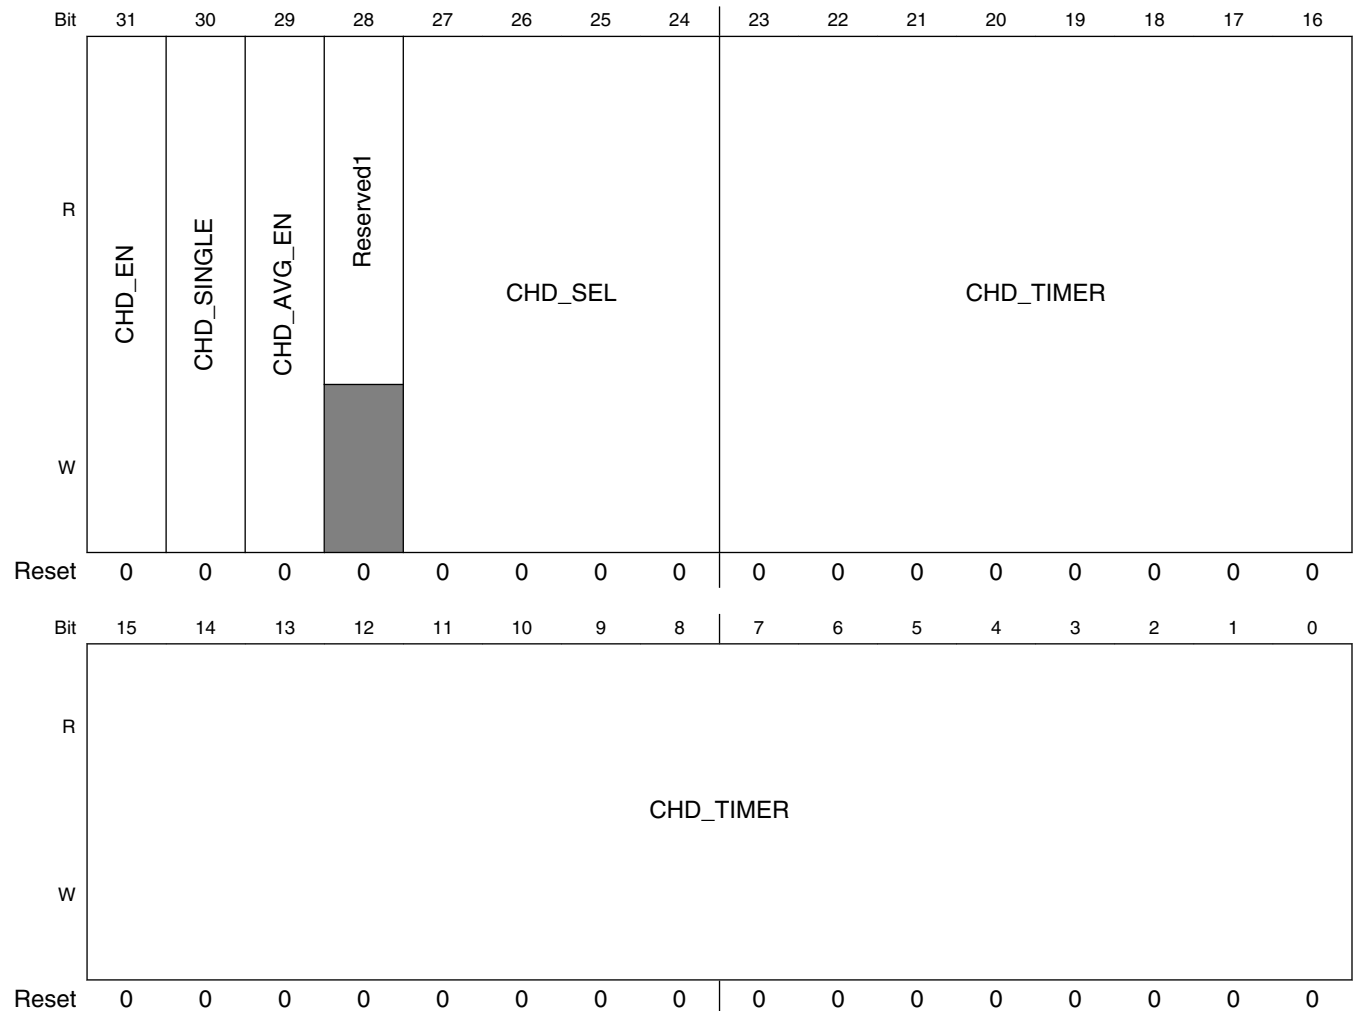

*Table continues on the next page...*

## ADCx\_CH\_C\_CFG2 field descriptions (continued)

Field	Description
	<p>010 If channel C conversion result smaller or equal to CHC_LOW_THRES, then an interrupt will be generated and channel C flag will be set if they are enabled.</p> <p>011 If channel C conversion result bigger than CHC_LOW_THRES and smaller than CHC_HIGH_THRES, then an interrupt will be generated and channel C flag will be set if they are enabled.</p> <p>101 If channel C conversion result bigger or equal to CHC_HIGH_THRES, then an interrupt will be generated and channel C flag will be set if they are enabled.</p> <p>110 If channel C conversion result smaller than CHC_HIGH_THRES, then an interrupt will be generated and channel C flag will be set if they are enabled.</p> <p>111 If channel C conversion result smaller or equal to CHC_LOW_THRES, and at the same time, bigger or equal to CHC_HIGH_THRES, then an interrupt will be generated and channel C flag will be set if they are enabled.</p>
28 Reserved1	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27–16 CHC_HIGH_THRES	<p>Channel C High Threshold Value</p> <p>Contains the bigger compare value to compare with the conversion result when a compare mode has been selected.</p>
15 CHC_AUTO_DIS	<p>Channel C Auto Disable</p> <p>During continuous conversion, if compare match a converted result, the ADC checks this bit. If CHC_AUTO_DIS = 1, then channel C stops continuous conversion, if CHC_AUTO_DIS = 0, then channel C keeps continuous working, and the conversion result overwrites the result registers. The default value is 1.</p>
14 Reserved2	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
13–12 CHC_AVG_NUMBER	<p>Channel C Average Number</p> <p>If enable average function, this bit contains channel C average number.</p> <p>00 Average number = 4</p> <p>01 Average number = 8</p> <p>10 Average number = 16</p> <p>11 Average number = 32</p>
CHC_LOW_THRES	<p>Channel C Low Threshold Value</p> <p>Contains the smaller compare value to compare with the conversion result when a compare mode has been selected.</p>

### 14.1.6.7 Channel D Configuration 1 (ADCx\_CH\_D\_CFG1)

Address: Base address + 60h offset

**ADCx\_CH\_D\_CFG1 field descriptions**

Field	Description
31 CHD_EN	<p>Channel D Enable</p> <p>Controls the usable of logical channel D.</p> <p>1 Enable logical channel D. Logical channel D will work. 0 Disable logical channel D. Prevent logical channel D from working.</p>
30 CHD_SINGLE	<p>Channel D Single Conversion</p> <p>Start a single conversion from logical channel D. Switch between single and continuous conversion, it must disable channel D first. When both CHD_EN and CHD_SINGLE are enabled, CHD_SIGNAL set CHD_EN to 0 and reset itself to 0.</p>

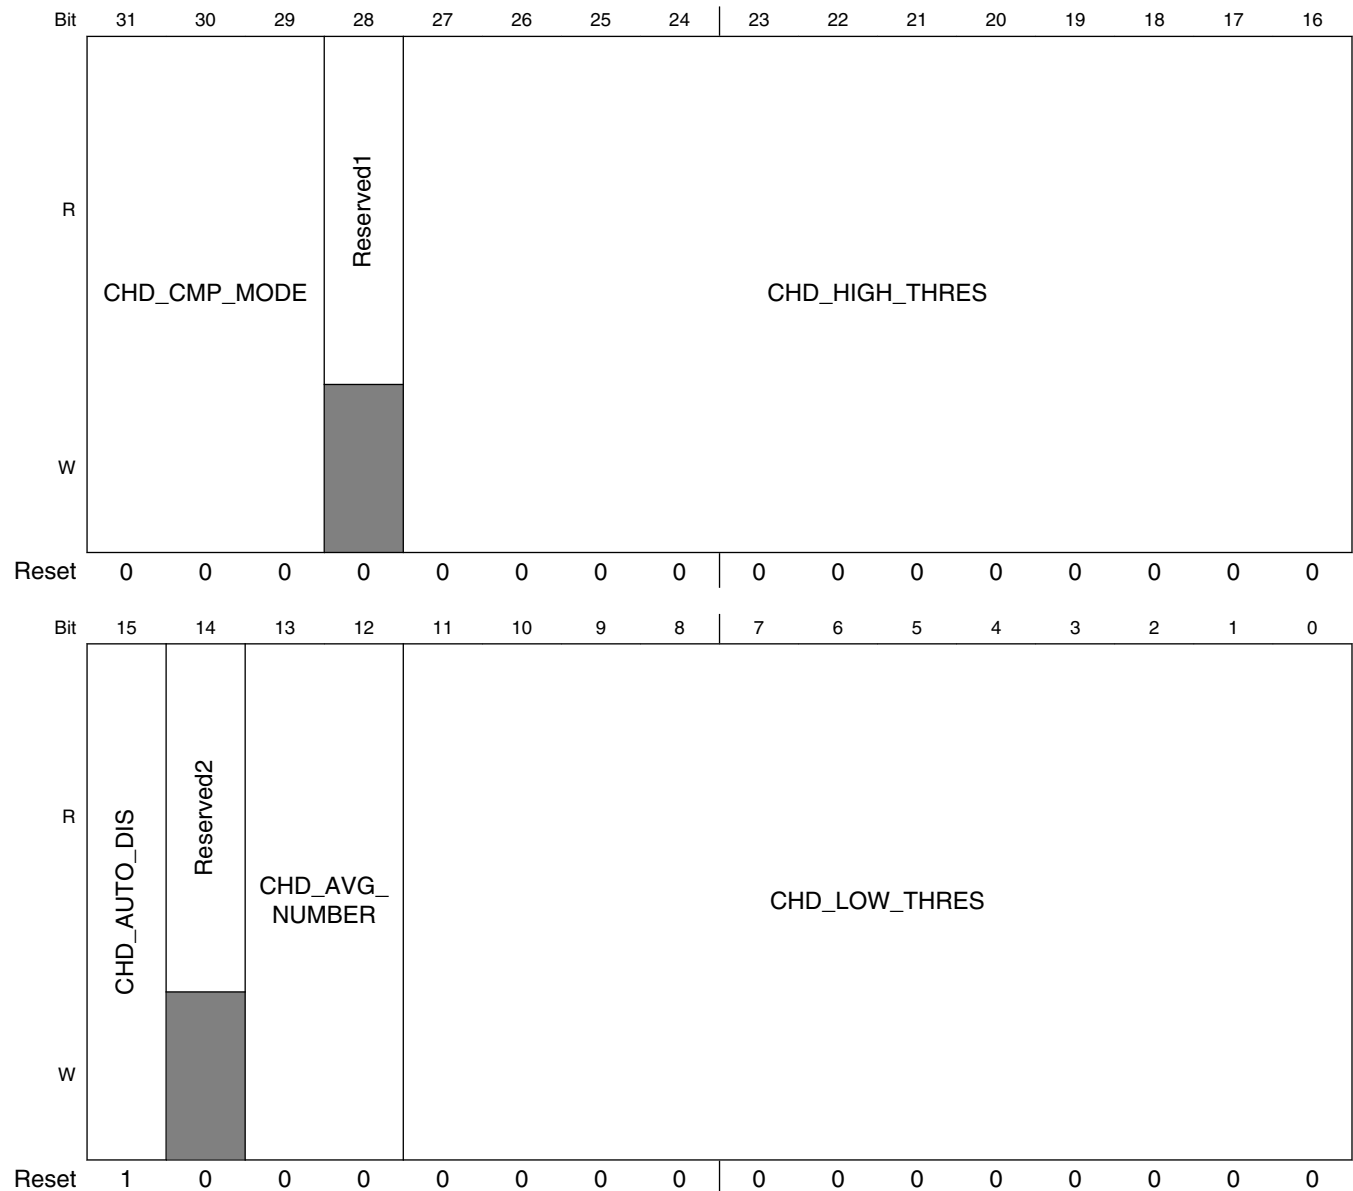

*Table continues on the next page...*

## ADCx\_CH\_D\_CFG1 field descriptions (continued)

Field	Description
	<p>1 Start a single conversion. Continuous conversion must stop.</p> <p>0 No single conversion. Continuous conversion can start.</p>
29 CHD_AVG_EN	<p>Channel D Average Enable</p> <p>If enable this bit, channel D will do average for each conversion.</p> <p>1 Enable average function.</p> <p>0 Disable average function.</p>
28 Reserved1	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27-24 CHD_SEL	<p>Channel D Select</p> <p>Select input channel (from 16 channels) for the logical channel D.</p> <p>0000 Channel 0</p> <p>0001 Channel 1</p> <p>0010 Channel 2</p> <p>0011 Channel 3</p> <p>0100 Channel 4</p> <p>0101 Channel 5</p> <p>0110 Channel 6</p> <p>0111 Channel 7</p> <p>1000 Channel 8</p> <p>1001 Channel 9</p> <p>1010 Channel 10</p> <p>1011 Channel 11</p> <p>1100 Channel 12</p> <p>1101 Channel 13</p> <p>1110 Channel 14</p> <p>1111 Channel 15</p>
CHD_TIMER	<p>Channel D Timer</p> <p>This timer is for continuous conversion. The conversion rate = (CHD_TIMER + 1) times sample rate + offset. The offset is due to channel D has lower priority than Channel A, B, and C. In worst case, all channel D's conversion are blocked by channel A, channel B and channel C's.</p> <p>0x000 to 0xFFFF timer value, every CHD_TIMER + 1 times sample rate + offset, the ADC converts one data.</p>

### 14.1.6.8 Channel D Configuration 2 (ADCx\_CH\_D\_CFG2)

Address: Base address + 70h offset

**ADCx\_CH\_D\_CFG2 field descriptions**

Field	Description
31–29 CHD_CMP_MODE	Channel D Compare Mode Select which compare mode the conversion result will take (for channel D).  X00 Disable compare function 001 If channel D conversion result bigger than CHD_LOW_THRES, then an interrupt will be generated and the channel D flag will be set if they are enabled.

*Table continues on the next page...*

**ADCx\_CH\_D\_CFG2 field descriptions (continued)**

Field	Description
	<p>010 If channel D conversion result smaller or equal to CHD_LOW_THRES, then an interrupt will be generated and channel D flag will be set if they are enabled.</p> <p>011 If channel D conversion result bigger than CHD_LOW_THRES and smaller than CHD_HIGH_THRES, then an interrupt will be generated and channel D flag will be set if they are enabled.</p> <p>101 If channel D conversion result bigger or equal to CHD_HIGH_THRES, then an interrupt will be generated and channel D flag will be set if they are enabled.</p> <p>110 If channel D conversion result smaller than CHD_HIGH_THRES, then an interrupt will be generated and channel D flag will be set if they are enabled.</p> <p>111 If channel D conversion result smaller or equal to CHD_LOW_THRES, and at the same time, bigger or equal to CHD_HIGH_THRES, then an interrupt will be generated and channel D flag will be set if they are enabled.</p>
28 Reserved1	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27–16 CHD_HIGH_THRES	<p>Channel D High Threshold Value</p> <p>Contains the bigger compare value to compare with the conversion result when a compare mode has been selected.</p>
15 CHD_AUTO_DIS	<p>Channel D Auto Disable</p> <p>During continuous conversion, if compare match a converted result, the ADC checks this bit. If CHD_AUTO_DIS = 1, then channel D stops continuous conversion, if CHD_AUTO_DIS = 0, then channel D keeps continuous working, and the conversion result overwrites the result registers. The default value is 1.</p>
14 Reserved2	<p>This field is reserved.</p> <p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
13–12 CHD_AVG_NUMBER	<p>Channel D Average Number</p> <p>If enable average function, this bit contains channel D average number.</p> <p>00 Average number = 4</p> <p>01 Average number = 8</p> <p>10 Average number = 16</p> <p>11 Average number = 32</p>
CHD_LOW_THRES	<p>Channel D Low Threshold Value</p> <p>Contains the smaller compare value to compare with the conversion result when a compare mode has been selected.</p>

### 14.1.6.9 Channel Software Configuration (ADCx\_CH\_SW\_CFG)

Address: Base address + 80h offset

**ADCx\_CH\_SW\_CFG field descriptions**

Field	Description
31 START_CONV	Start Software Trigger Conversion To start a software trigger, it must wait until the last software trigger finish. 0 Not start a new software trigger conversion. 1 Start a new software trigger conversion.
30–28 Reserved1	This field is reserved. This field is reserved. This read-only field is reserved and always has the value 0.
27–24 CH_SW_SEL	Software Trigger Channel Select Select 1 from 16 (physical) channels to be the software trigger channel.  0000 Channel 0

Table continues on the next page...

## ADCx\_CH\_SW\_CFG field descriptions (continued)

Field	Description
	0001 Channel 1 0010 Channel 2 0011 Channel 3 0100 Channel 4 0101 Channel 5 0110 Channel 6 0111 Channel 7 1000 Channel 8 1001 Channel 9 1010 Channel 10 1011 Channel 11 1100 Channel 12 1101 Channel 13 1110 Channel 14 1111 Channel 15
23 CH_SW_AVG_EN	Channel Software Average Enable If enable this bit, channel Software will do average for each conversion.  1 Enable average function. 0 Disable average function.
22–21 CH_SW_AVG_NUMBER	Channel Software Average Number If enable average function, this bit contains channel Software average number.  00 Average number = 4 01 Average number = 8 10 Average number = 16 11 Average number = 32
Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.

## 14.1.6.10 Timer Unit (ADCx\_TIMER\_UNIT)

Address: Base address + 90h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

## ADCx\_TIMER\_UNIT field descriptions

Field	Description
31–29 PRE_DIV	<p>Pre-divide</p> <p>The ADC analogue core clock can vary from 300 kHz to 6 MHz. This parameter defines ADC core clock (and sample rate). The ADC analogue clock is default 1/4 of ADC digital input clock. All pre-divide is 1/4 ADC digital input clock.</p> <p>Warning: Before set this parameter, make sure analogue clock is from 300 kHz to 6 MHz.</p> <p>000 No divide, analogue clock = 1/4 ADC digital input clock  001 Divide 2, analogue clock = 1/8 ADC digital input clock  010 Divide 4, analogue clock = 1/16 ADC digital input clock  011 Divide 8, analogue clock = 1/32 ADC digital input clock  100 Divide 16, analogue clock = 1/64 ADC digital input clock  101 Divide 32, analogue clock = 1/128 ADC digital input clock</p>
28–5 Reserved	<p>This field is reserved.</p> <p>This field is reserved.  This read-only field is reserved and always has the value 0.</p>
CORE_TIMER_UNIT	<p>Core_Timer_Unit</p> <p>This parameter defines sample rate. The maximum sample rate is 1/6 ADC analogue core clock. Sample rate = analogue core clock frequency (MHz) * 1 / ((CORE_TIMER_UNIT + 1) * 6). If changing SAMPLE_RATE, please disable logical channel A, B, C, and D. Otherwise, the first A, B, C, and D conversion after change the sample rate may not follow exact sample rate interval.</p>

### 14.1.6.11 DMA FIFO (ADCx\_DMA\_FIFO)

Address: Base address + A0h offset

**ADCx\_DMA\_FIFO field descriptions**

Field	Description
31–10 Reserved	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
9 DMA_RST	DMA Reset  This bit contains reset information. If reset, the DMA and DMA FIFO return to its reset value. The DMA FIFO data is lost.  0 Not reset 1 Reset
8 DMA_FIFO_EN	DMA FIFO Enable  If enable DMA_FIFO_EN, ADC conversion result can store into DMA FIFO. If disable, no ADC conversion result will store in DMA FIFO.  0 Disable DMA FIFO. 1 Enable DMA FIFO.

Table continues on the next page...

**ADCx\_DMA\_FIFO field descriptions (continued)**

Field	Description
7 DMA_EN	<p>DMA Enable</p> <p>This bit defines data in DMA FIFO is moved by SDMA or moved by CPU.</p> <p>0 Disable DMA, the data in DMA FIFO can only move by CPU.                      1 Enable DMA, the data in DMA FIFO should move by SDMA.</p>
6–5 DMA_CH_SEL	<p>DMA Channel Select</p> <p>Select DMA FIFO source from Channel A, Channel B, Channel C, and Channel D.</p> <p>00 Channel A                      01 Channel B                      10 Channel C                      11 Channel D</p>
DMA_WM_LVL	<p>DMA Water Mark Level</p> <p>Once the DMA FIFO data reach water mark level, a DMA request or interrupt is generated (if enabled), and transfer data through DMA or CPU.</p> <p>00000-11111 represents DMA water mark level value</p>

**14.1.6.12 FIFO Status (ADCx\_FIFO\_STATUS)**

Address: Base address + B0h offset

**ADCx\_FIFO\_STATUS field descriptions**

<b>Field</b>	<b>Description</b>
31–10 Reserved1	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
9 FIFO_FULL	This read-only bit represents the status of DMA FIFO. If FIFO is full, the DMA stop pushing data, set this bit, and generates an interrupt.  0 FIFO is not full. 1 FIFO is full.
8 FIFO_EMPTY	FIFO Empty This read-only bit represents the status of DMA FIFO. If FIFO is empty, the DMA stops pop data, set this bit, and generates an interrupt.  0 FIFO is not empty. 1 FIFO is empty.
7–6 Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
FIFO_ENTRIES	FIFO Entries  This read-only bit represents the numbers of data in DMA FIFO. 00000 to 11111 The numbers of data stored in DMA FIFO.

### 14.1.6.13 ADCx\_INT\_SIG\_EN

Address: Base address + C0h offset

## ADCx\_INT\_SIG\_EN field descriptions

Field	Description
31–22 Reserved1	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
21 LAST_FIFO_ DATA_READ_ SIG_EN	Last FIFO Data Read Signal Enable  Define whether enable flag when the last data read out of FIFO (the last of whole continuous result)  0 Disable last FIFO read signal enable 1 Enable last FIFO read signal enable
20 SW_CH_COV_ TO_INT_SIG_EN	Software Channel Conversion Time Out Interrupt Signal Enable  Define whether software channel conversion time out interrupt signal is enabled.  0 Disable software channel conversion time out interrupt signal. 1 Enable software channel conversion time out interrupt signal.
19 CHD_COV_TO_ INT_SIG_EN	Channel D Conversion Time Out Interrupt Signal Enable  Define whether logical channel D conversion time out interrupt signal is enabled.  0 Disable logical channel D conversion time out interrupt signal. 1 Enable logical channel D conversion time out interrupt signal.
18 CHC_COV_TO_ INT_SIG_EN	Channel C Conversion Time Out Interrupt Signal Enable  Define whether logical channel C conversion time out interrupt signal is enabled.  0 Disable logical channel C conversion time out interrupt signal. 1 Enable logical channel C conversion time out interrupt signal.
17 CHB_COV_TO_ INT_SIG_EN	Channel B Conversion Time Out Interrupt Signal Enable  Define whether logical channel B conversion time out interrupt signal is enabled.  0 Disable logical channel B conversion time out interrupt signal. 1 Enable logical channel B conversion time out interrupt signal.
16 CHA_COV_TO_ INT_SIG_EN	Channel A Conversion Time Out Interrupt Signal Enable  Define whether logical channel A conversion time out interrupt signal is enabled.  0 Disable logical channel A conversion time out interrupt signal. 1 Enable logical channel A conversion time out interrupt signal.
15–13 Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
12 SW_CH_COV_ INT_SIG_EN	Software Channel Conversion Interrupt Signal Enable  Define whether software trigger interrupt flag is enabled.  0 Disable software channel conversion signal interrupt flag. 1 Enable software channel conversion signal interrupt flag.
11 CHD_COV_INT_ SIG_EN	Channel D Conversion Interrupt Signal Enable

*Table continues on the next page...*

## ADCx\_INT\_SIG\_EN field descriptions (continued)

Field	Description
	<p>Define whether channel D conversion interrupt flag is enabled. If enable interrupt flag, an interrupt flag is set once Channel D finish a new conversion.</p> <p>0 Disable channel D conversion Interrupt flag. 1 Enable channel D conversion Interrupt flag.</p>
10 CHC_COV_INT_ SIG_EN	<p>Channel C Conversion Interrupt Signal Enable</p> <p>Define whether channel C conversion interrupt flag is enabled. If enable interrupt flag, an interrupt flag is set once Channel C finish a new conversion.</p> <p>0 Disable channel C conversion Interrupt flag. 1 Enable channel C conversion Interrupt flag.</p>
9 CHB_COV_INT_ SIG_EN	<p>Channel B Conversion Interrupt Signal Enable</p> <p>Define whether channel B conversion interrupt flag is enabled. If enable interrupt flag, an interrupt flag is generated once Channel B finish a new conversion.</p> <p>0 Disable channel B conversion Interrupt flag. 1 Enable channel B conversion Interrupt flag.</p>
8 CHA_COV_INT_ SIG_EN	<p>Channel A Conversion Interrupt Signal Enable</p> <p>Define whether channel A round conversion interrupt flag enable. If enable interrupt flag, an interrupt flag is generated once Channel A finish a new conversion.</p> <p>0 Disable channel A conversion Interrupt flag. 1 Enable channel A conversion Interrupt flag.</p>
7 FIFO_OVRRUN_ INT_SIG_EN	<p>FIFO overrun Interrupt Signal Enable</p> <p>Define whether DMA FIFO overrun interrupt flag is enabled. If DMA FIFO overrun interrupt flag enabled and DMA FIFO has overrun condition, then an interrupt flag is generated.</p> <p>0 Enable FIFO Interrupt flag. 1 Disable FIFO Interrupt flag.</p>
6 FIFO_ UNDERRUN_ INT_SIG_EN	<p>FIFO Underrun Interrupt Signal Enable</p> <p>Define whether DMA FIFO underrun interrupt flag is enabled. If DMA FIFO underrun interrupt flag is enabled and DMA FIFO has underrun condition, then an interrupt flag is generated.</p> <p>0 Enable FIFO underrun Interrupt flag 1 Disable FIFO underrun Interrupt flag</p>
5 DMA_REACH_ WM_INT_SIG_ EN	<p>DMA Reach Watermark Level Interrupt Signal (Flag) Enable</p> <p>Define whether the number of data in DMA FIFO is greater than DMA watermark level. If it is greater, then a flag is set.</p> <p>0 Enable DMA watermark level interrupt signal (flag). 1 Disable DMA watermark level interrupt signal (flag).</p>
4 Reserved2	<p>This field is reserved.</p> <p>This field is reserved. This read-only field is reserved and always has the value 0.</p>

Table continues on the next page...

**ADCx\_INT\_SIG\_EN field descriptions (continued)**

<b>Field</b>	<b>Description</b>
3 CHD_CMP_INT_ SIG_EN	<p>Channel D Compare Interrupt Signal Enable</p> <p>Define whether channel D compare interrupt flag is enabled. If enable the interrupt flag, an interrupt flag is set once channel D conversion result matches the compare region.</p> <p>0 Disable Channel D Compare Interrupt flag 1 Enable Channel D Compare Interrupt flag</p>
2 CHC_CMP_INT_ SIG_EN	<p>Channel C Compare Interrupt Signal Enable</p> <p>Define whether channel C compare interrupt flag is enabled. If enable the interrupt flag, an interrupt flag is set once channel C conversion result matches the compare region.</p> <p>0 Disable Channel C Compare Interrupt flag. 1 Enable Channel C Compare Interrupt flag.</p>
1 CHB_CMP_INT_ SIG_EN	<p>Channel B Compare Interrupt Signal Enable</p> <p>Define whether channel B compare interrupt flag is enabled. If enable the interrupt flag, an interrupt flag is set once channel B conversion result matches the compare region.</p> <p>0 Disable Channel B Compare Interrupt flag. 1 Enable Channel B Compare Interrupt flag.</p>
0 CHA_CMP_INT_ SIG_EN	<p>Channel A Compare Interrupt Signal Enable</p> <p>Define whether channel A compare interrupt flag is enabled. If enable the interrupt flag, an interrupt is set once channel A conversion result matches the compare region.</p> <p>0 Disable Channel A Compare Interrupt flag. 1 Enable Channel A Compare Interrupt flag.</p>

### 14.1.6.14 Interrupt Enable (ADCx\_INT\_EN)

Address: Base address + D0h offset

**ADCx\_INT\_EN field descriptions**

Field	Description
31–22 Reserved1	This field is reserved.

Table continues on the next page...

## ADCx\_INT\_EN field descriptions (continued)

Field	Description
	This field is reserved. This read-only field is reserved and always has the value 0.
21 LAST_FIFO_ DATA_READ_EN	Last FIFO Data Read Enable Define whether generate an interrupt when the last data read out of FIFO (the last of whole continuous result)  0 Disable last FIFO read enable 1 Enable last FIFO read enable
20 SW_CH_COV_ TO_INT_EN	Software Channel Conversion Time Out Interrupt Enable Define whether software channel conversion time out interrupt is enabled.  0 Disable software channel conversion time out interrupt. 1 Enable software channel conversion time out interrupt.
19 CHD_COV_TO_ INT_EN	Channel D Conversion Time Out Interrupt Enable Define whether logical channel D conversion time out interrupt is enabled.  0 Disable logical channel D conversion time out interrupt. 1 Enable logical channel D conversion time out interrupt.
18 CHC_COV_TO_ INT_EN	Channel C Conversion Time Out Interrupt Enable Define whether logical channel C conversion time out interrupt is enabled.  0 Disable logical channel C conversion time out interrupt. 1 Enable logical channel C conversion time out interrupt.
17 CHB_COV_TO_ INT_EN	Channel B Conversion Time Out Interrupt Enable Define whether logical channel B conversion time out interrupt is enabled.  0 Disable logical channel B conversion time out interrupt. 1 Enable logical channel B conversion time out interrupt.
16 CHA_COV_TO_ INT_EN	Channel A Conversion Time Out Interrupt Enable Define whether logical channel A conversion time out interrupt is enabled.  0 Disable logical channel A conversion time out interrupt. 1 Enable logical channel A conversion time out interrupt.
15–13 Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
12 SW_CH_COV_ INT_EN	Software Channel Conversion Interrupt Enable Define whether software trigger interrupt is enabled.  0 Disable software channel conversion interrupt. 1 Enable software channel conversion interrupt.
11 CHD_COV_INT_ EN	Channel D Conversion Interrupt Enable Define whether channel D conversion interrupt is enabled. If enable interrupt, an interrupt is generated once Channel D finish a new conversion.

*Table continues on the next page...*

## ADCx\_INT\_EN field descriptions (continued)

Field	Description
	0 Disable channel D conversion Interrupt. 1 Enable channel D conversion Interrupt.
10 CHC_COV_INT_EN	Channel C Conversion Interrupt Enable Define whether channel C conversion interrupt is enabled. If enable interrupt, an interrupt is generated once Channel C finish a new conversion. 0 Disable channel C conversion Interrupt. 1 Enable channel C conversion Interrupt.
9 CHB_COV_INT_EN	Channel B Conversion Interrupt Enable Define whether channel B conversion interrupt is enabled. If enable interrupt, an interrupt is generated once Channel B finish a new conversion. 0 Disable channel B conversion Interrupt. 1 Enable channel B conversion Interrupt.
8 CHA_COV_INT_EN	Channel A Conversion Interrupt Enable Define whether channel A conversion interrupt is enabled. If enable interrupt, an interrupt is generated once Channel A finish a new conversion. 0 Disable channel A conversion Interrupt. 1 Enable channel A conversion Interrupt.
7 FIFO_OVERRUN_INT_EN	FIFO overrun Interrupt Enable Define whether DMA FIFO overrun interrupt is enabled. If DMA FIFO overrun interrupt is enabled and DMA FIFO has overrun condition, then an interrupt is generated. 0 Enable FIFO Interrupt. 1 Disable FIFO Interrupt.
6 FIFO_UNDERRUN_INT_EN	FIFO underrun Interrupt Enable Define whether DMA FIFO underrun interrupt is enabled. If DMA FIFO underrun interrupt is enabled and DMA FIFO has underrun condition, then an interrupt is generated. 0 Enable FIFO underrun Interrupt. 1 Disable FIFO underrun Interrupt.
5 DMA_REACH_WM_INT_EN	DMA Reach Watermark Level Interrupt Enable Define whether DMA watermark level interrupt is enabled. If enable the interrupt, an interrupt is generated. <b>NOTE:</b> This signal is for software read DMA FIFO. If SDMA read data, turn off both interrupt enable and signal (flag) enable. 0 Enable DMA reach watermark level interrupt. 1 Disable DMA reach watermark level interrupt.
4 Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.

### 14.1.6.15 ADCx\_INT\_STATUS

Address: Base address + E0h offset

**ADCx\_INT\_STATUS field descriptions**

Field	Description
31–22 Reserved1	This field is reserved. This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**ADCx\_INT\_STATUS field descriptions (continued)**

Field	Description
21 LAST_FIFO_DATA_READ	Last FIFO Data Read Represents whether the last data read out of FIFO (the last of whole continuous result)  0 Last FIFO data has not been read out 1 Last FIFO data has been read out
20 SW_CH_COV_TO	Software Channel Conversion Time Out Represents whether software channel conversion time out exist.  0 Software channel conversion time out does not exist. 1 Exist software channel conversion time out. Software clear / clear signal enable.
19 CHD_COV_TO	Channel D Conversion Time Out Represent whether logical channel D conversion time out exist.  0 Logical channel D conversion time out does not exist. 1 Exist logical channel D conversion time out. Software clear / clear signal enable.
18 CHC_COV_TO	Channel C Conversion Time Out Represent whether logical channel C conversion time out exist.  0 Logical channel C conversion time out does not exist. 1 Exist logical channel C conversion time out. Software clear / clear signal enable.
17 CHB_COV_TO	Channel B Conversion Time Out Represent whether logical channel B conversion time out exist.  0 Logical channel B conversion time out exist. 1 Exist logical channel B conversion time out. Software clear/clear signal enable.
16 CHA_COV_TO	Channel A Conversion Time Out Represent whether logical channel A conversion time exist.  0 Logical channel A conversion time out does not exist. 1 Exist logical channel A conversion time out. Software clear / clear signal enable.
15–13 Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
12 SW_CH_COV	Software Channel Conversion (Flag) This is the flag of software trigger. If SW_CH_COV_INT_SIG_EN is enabled and software trigger ADC conversion is finished, the SW_CH_COV (flag) is set.  0 Disable software channel conversion (Flag). 1 Enable software channel conversion (Flag).
11 CHD_COV	Channel D Conversion (Flag) This is the flag of channel D conversion. If CHD_COV_INT_SIG_EN is enabled and channel D ADC conversion is finished, the CHD_COV (flag) is set.

*Table continues on the next page...*

## ADCx\_INT\_STATUS field descriptions (continued)

Field	Description
	0 Disable channel D conversion (Flag). 1 Enable channel D conversion (Flag).
10 CHC_COV	Channel C Conversion (Flag)  This is the flag of channel C conversion. If CHC_COV_INT_SIG_EN is enabled and channel C ADC conversion is finished, the CHC_COV (flag) is set.  0 Disable channel C conversion (Flag). 1 Enable channel C conversion (Flag).
9 CHB_COV	Channel B Conversion (Flag)  This is the flag of channel B conversion. If CHB_COV_INT_SIG_EN is enabled and channel B ADC conversion is finished, the CHB_COV (flag) is set.  0 Disable channel B conversion (Flag). 1 Enable channel B conversion (Flag).
8 CHA_COV	Channel A Conversion (Flag)  This is the flag of channel A conversion. If CHA_COV_INT_SIG_EN is enabled and channel A ADC conversion is finished, the CHA_CONV (flag) is set.  0 Disable channel A conversion (Flag). 1 Enable channel A conversion (Flag).
7 FIFO_OVERRUN	FIFO Overrun (Flag)  This is the flag of FIFO overrun. If FIFO_OVERRUN_INT_SIG_EN is enabled and FIFO overrun happens, the FIFO_OVERRUN (flag) is set.  0 Disable FIFO overrun (Flag). 1 Enable FIFO overrun (Flag).
6 FIFO_UNDERRUN	FIFO Underrun (Flag)  This is the flag of FIFO underrun. If FIFO_UNDERRUN_INT_SIG_EN is enabled and FIFO underrun happens, the FIFO_UNDERRUN (flag) is set.  0 Do not exist FIFO underrun (Flag). 1 Exist FIFO underrun (Flag). Software clear / clear signal enable.
5 DMA_REACH_WM	DMA Reach Watermark Level (Flag)  This is the flag of DMA reach watermark level. Setting this flag indicates the number of data in the DMA FIFO reach the watermark level.  <b>NOTE:</b> This bit is for software read DMA FIFO, if SDMA read DMA FIFO, please disable both interrupt and interrupt signal (flag).  0 The numbers of data in DMA FIFO has not reach the watermark level. 1 The numbers of data in DMA FIFO has reach the watermark level. Software clear / clear signal enable.
4 Reserved3	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**ADCx\_INT\_STATUS field descriptions (continued)**

Field	Description
3 CHD_CMP	Channel D Compare (Flag)  This is the flag of channel D compare. If CHD_CMP_INT_SIG_EN is enabled and channel D conversion result matches the compare region, the CHD_CMP (Flag) is set.  0 Disable Channel D Compare (Flag). 1 Enable Channel D Compare (Flag).
2 CHC_CMP	Channel C Compare (Flag)  This is the flag of channel C compare. If CHC_CMP_INT_SIG_EN is enabled and channel C conversion result matches the compare region, the CHC_CMP (Flag) is set.  0 Disable Channel C Compare (Flag). 1 Enable Channel C Compare (Flag).
1 CHB_CMP	Channel B Compare (Flag)  This is the flag of channel B compare. If CHB_CMP_INT_SIG_EN is enabled and channel B conversion result matches the compare region, the CHB_CMP (Flag) is set.  0 Disable Channel B Compare (Flag). 1 Enable Channel B Compare (Flag).
0 CBA_CMP	Channel A Compare (Flag)  This is the flag of channel A compare. If CHA_CMP_INT_SIG_EN is enabled and channel A conversion result matches the compare region, the CHA_CMP (Flag) is set.  0 Disable Channel A Compare (Flag). 1 Enable Channel A Compare (Flag).

DMA_FIFO_0	The even number of data is in this field. This field is read-only

**14.1.6.20 ADC Configuration (ADCx\_ADC\_CFG)**

Address: Base address + 130h offset

**ADCx\_ADC\_CFG field descriptions**

Field	Description
31 ADC_CLK_DOWN	ADC Clock Down  This bit is for low power design. Set this bit to stop all digital part power. Warning: Before set this bit, all conversion must be finished.

*Table continues on the next page...*

**ADCx\_ADC\_CFG field descriptions (continued)**

Field	Description
	0 Clock running. 1 Clock down, no clock.
30–8 Reserved1	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
7 ADC_PD_OK	ADC Power Down OK  This bit represents whether power down or to start conversion. After power up the ADC analogue core, system has to wait ADC_PD_OK = 1 before start a conversion or power down again. If violate this rule, the ADC may enter an unknown state. Clock cannot stop until this bit equals to 0. This bit will automatically set to 1 if ADC_PD = 0 and ADC_EN = 0 for the specific time period.  0 ADC has not power up completely. Cannot start a conversion. 1 ADC power up completely. Can start a conversion.
6–2 Reserved2	This field is reserved.  This field is reserved. This read-only field is reserved and always has the value 0.
1 ADC_PD	ADC Power Down  Power Down ADC analogue core. Before entering into stop-mode, power down ADC analogue core first.  0 Do not power down the ADC analogue core. 1 Power down the ADC analogue core.
0 ADC_EN	ADC Level Shifter Enable  The level shifter provides 1.8 V to 1.1 V converter. The level shifter is embedded in ADC analogue. The ADC analogue ports voltage level must same with ADC digital part ports voltage level. During low power mode, also reset this bit to 1'b0 to save power.  0 Disable level shifter, the ADC analogue core ports using 1.8 V voltage level. 1 Enable level shifter, the ADC analogue core ports using 1.1 V voltage level.

## 14.2 Temperature Monitor (TEMPMON)

### 14.2.1 Overview

The temperature sensor module implements a temperature sensor/conversion function based on a temperature-dependent voltage to time conversion.

The high-level implementation of the temperature sensor is shown in the figure below.

**Figure 14-3. High Level Temp Sensor System Diagram**

As shown in the figure above, the temperature sensor uses and assumes that the bandgap reference, 480MHz PLL and 32KHz RTC modules are properly programmed and fully settled for correct operation.

## 14.2.2 Software Usage Guidelines

During normal system operation software can use the temperature sensor counter output (TEMP\_CNT) in conjunction with the fused temperature calibration data to determine the on-die operational temperature or to set an over-temperature interrupt alarm to within a couple of °C.

Based on calibration, two sets of temperature and counter values will be available via fuses on the device. These data points will correspond to the points (N<sub>1</sub>, T<sub>1</sub>) and (N<sub>2</sub>, T<sub>2</sub>) in the curve below.

**Figure 14-4. Temperature Measurement Cycle**

After a temperature measurement cycle, software should use the calibration points in conjunction with the temperature code value in the TEMPMON\_TEMPSENSE0[TEMP\_CNT] bitfield to calculate the temperature for the device using the following equation:

$$T_{\text{meas}} = T_2 - (N_{\text{meas}} - N_2) * ((T_2 - T_1) / (N_1 - N_2))$$

Likewise, to determine the alarm counter value to be written in the TEMPMON\_TEMPSENSE0 register for a temperature based interrupt, the above equation can be solved for the N<sub>meas</sub> value that should be used based on the desired temperature trigger.

The temperature calibration point fuse values are available in the OCOTP\_ANA1 register. The temperature calibration values are fused individually for each part in the product testing process. The fields of this register are described in the following table.

**Table 14-6. OCOTP\_ANA1 Temperature Sensor Calibration Data**

Bit Range	Bit Mask	Name	Description
[31:20]	FFF0_0000h	ROOM_COUNT	Value of TEMPMON_TEMPSENSE0[TEMP_VALUE] after a measurement cycle at room temperature (25.0 °C).
[19:8]	000F_FF00h	HOT_COUNT	Value of TEMPMON_TEMPSENSE0[TEMP_VALUE] after a measurement cycle at the hot temperature, i.e. HOT_TEMP.
[7:0]	0000_00FFh	HOT_TEMP	The hot temperature test point. Each LSB equals 1 °C.

The points on the calibration curve are as follows.

- $(N_1, T_1) = (\text{ROOM\_COUNT}, 25.0)$
- $(N_2, T_2) = (\text{HOT\_COUNT}, \text{HOT\_TEMP})$
- $(N_{\text{meas}}, T_{\text{meas}}) = (\text{TEMP\_CNT}, T_{\text{meas}})$

Substituting the fields from OCOTP\_ANA1 into the earlier equation results in the following:

$$T_{\text{meas}} = \text{HOT\_TEMP} - (N_{\text{meas}} - \text{HOT\_COUNT}) * ((\text{HOT\_TEMP} - 25.0) / (\text{ROOM\_COUNT} - \text{HOT\_COUNT}))$$

### 14.2.3 TEMPMON Memory Map/Register Definition

#### TEMPMON memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

**14.2.3.1 Anadig Tempsensor Control Register 0 (TEMPMON\_HW\_ANADIG\_TEMPSENSE0n)**

This register defines the alarm and panic functions for the temperature sensor.

Address: 3036\_0000h base + 300h offset + (4d × i), where i=0d to 3d

**TEMPMON\_HW\_ANADIG\_TEMPSENSE0n field descriptions**

Field	Description
31–27 RSVD1	This bit field contains the last measured temperature.
26–18 PANIC_ALARM_VALUE	This bit field contains the temperature measurement that will cause a panic and reset the chip.
17–9 HIGH_ALARM_VALUE	This bit field contains the temperature measurement that will issue a high temperature interrupt
LOW_ALARM_VALUE	This bit field contains the temperature measurement that will issue a low temperature interrupt.

### 14.2.3.2 Anadig Tempensor Control Register 1 (TEMPMON\_HW\_ANADIG\_TEMPSENSE1n)

This register defines the automatic repeat time of the temperature sensor.

Address: 3036\_0000h base + 310h offset + (4d × i), where i=0d to 3d

**TEMPMON\_HW\_ANADIG\_TEMPSENSE1n field descriptions**

Field	Description
31–16 MEASURE_FREQ	This bits determines how many RTC clocks to wait before automatically repeating a temperature measurement. 0x0000 - defines a single measurement with no repeat. 0xFFFF determines a two second sample rate with a 32.768KHz RTC clock. Exact timings depend on the accuracy of the RTC clock.

*Table continues on the next page...*

**TEMPMON\_HW\_ANADIG\_TEMPSENSE1n field descriptions (continued)**

Field	Description
15–12 RSVD0	Always set to zero (0).
11 FINISHED	Indicates that the latest temp is valid. This bit should be cleared by the sensor after the start of each measurement.
10 MEASURE_ TEMP	Starts the measurement process. If the measurement frequency is zero in the tempsens_1 register. This results in a single conversion.
9 POWER_DOWN	This bit powers down the temperature sensor.
TEMP_VALUE	This bit field contains the temperature measurement.

**14.2.3.3 Anadig Tempsensor Trim Control Register (TEMPMON\_HW\_ANADIG\_TEMPSENSE\_TRIMn)**

This register defines the automatic repeat time of the temperature sensor.

Address: 3036\_0000h base + 320h offset + (4d × i), where i=0d to 3d

**TEMPMON\_HW\_ANADIG\_TEMPSENSE\_TRIM<sub>n</sub> field descriptions**

<b>Field</b>	<b>Description</b>
31–29 T_MUX_ADDR	Test MUX address setting bits. Only for de-bugging purpose. Default: 110 Other Values : TBD
28–24 RSVD2	Always set to zero (0).
23–20 T_BUF_SLOPE_SEL	Amplifier gain setting bits. Default: 1000 This value can be changed by BJT characteristics. It will be fixed after temperature test.
19–17 RSVD1	Always set to zero (0).
16–8 T_VREF_VBE_SEL	Reference voltage setting bits for the am-plier in the Positive-TC generator block. Default: 10000
7 T_EN_READ	Definition:TBD
6–5 RSVD0	Always set to zero (0).
T_BUF_VREF_SEL	Reference voltage setting bits for the am-plier in the Positive-TC generator block. Default: 10000

# Chapter 15

## Low Speed Communication and Interconnects

### 15.1 Flexible Controller Area Network (FLEXCAN)

#### 15.1.1 Overview

The Flexible Controller Area Network (FLEXCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.

The CAN protocol was primarily designed to be used as a vehicle serial data bus meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN module is a full implementation of the CAN protocol specification, which supports both standard and extended message frames. 64 Message Buffers are supported.

##### 15.1.1.1 Block Diagram

A general block diagram is shown in the figure below, which describes the main sub-blocks implemented in the FLEXCAN module, including the associated memory for storing Mailboxes, Rx Global Mask Registers, Rx Individual Mask Registers, Rx FIFO and Rx FIFO ID Filters.

Support for 64 Mailboxes and 6-deep Rx FIFO is provided. The functions of the sub-modules are described in subsequent sections.

Figure 15-1. FLEXCAN Block Diagram

### 15.1.1.2 FLEXCAN Module Features

The FLEXCAN module includes these distinctive legacy features:

- Version 2.0B
  - Standard data and remote frames
  - Extended data and remote frames
  - Zero to eight bytes data length
  - Programmable bit rate up to 1 Mb/sec
  - Content-related addressing
- Flexible Mailboxes of eight bytes data length
- Each Mailbox is configurable as Rx or Tx, all supporting standard and extended messages
- Individual Rx Mask Registers per Mailbox
- Full featured Rx FIFO with storage capacity for 6 frames and internal pointer handling
- Transmission abort capability
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard or 512 partial (8 bits) IDs, with up to 32 individual masking capability
- 100% backwards compatibility with previous FLEXCAN version
- Unused structures space can be used as general purpose RAM space
- Listen only mode capability
- Programmable loop-back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number or highest priority
- Time Stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts independent of the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wake up on bus activity
- Configurable Glitch filter width to filter the noise on CAN bus when waking up
- Remote request frames may be handled automatically or by software.
- ID filter configuration in Normal Mode
- CAN bit time settings and configuration bits can only be written in Freeze Mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- SYNC bit status to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Selectable priority between Mailboxes and Rx FIFO during matching process

### 15.1.1.3 Modes of Operation

The FLEXCAN module has four functional modes: Normal Mode (User and Supervisor), Freeze Mode, Listen-Only Mode and Loop-Back Mode. There are also two low power modes: Disable Mode and Stop Mode.

- Normal Mode (User or Supervisor):

In Normal Mode, the module operates receiving and/or transmitting message frames, errors are handled normally and all the CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze Mode:

It is enabled when the FRZ bit in the MCR Register is asserted. If enabled, Freeze Mode is entered when the HALT bit in MCR is set or when Debug Mode is requested at MCU level and the FRZ\_ACK bit in the MCR Register is asserted by the FlexCAN . In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See [Freeze Mode](#) for more information.

- Listen-Only Mode:

The module enters this mode when the LOM bit in the Control Register is asserted. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back Mode:

The module enters this mode when the LPB bit in the Control Register is asserted. In this mode, FLEXCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The FLEXCAN\_RX input pin is ignored and the FLEXCAN\_TX output goes to the recessive state (logic '1'). FLEXCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FLEXCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Module Disable Mode:

This low power mode is entered when the MDIS bit in the MCR Register is asserted and the LPM\_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. Exit from this mode is done by negating the MDIS bit in the MCR Register. See [Module Disable Mode](#) for more information.

- Stop Mode:

This low power mode is entered when Stop Mode is requested at ARM level and the LPM\_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the ARM that the clocks can be shut down globally. Exit from this mode happens when the Stop Mode request is removed or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See [Stop Mode](#) for more information.

## 15.1.2 External Signals

The FLEXCAN module has two I/O signals.

**Table 15-1. FLEXCAN External Signals**

Signal	Description	Pad	Mode	Direction
FLEXCAN1_RX	FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_RDATA2	ALT1	I
		GPIO1_IO12	ALT3	
		I2C1_SCL	ALT2	
		SAI1_RXD	ALT3	
		SD3_DATA7	ALT4	
FLEXCAN1_TX	FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_RDATA3	ALT1	O
		GPIO1_IO13	ALT3	
		I2C1_SDA	ALT2	
		SAI1_TXC	ALT3	
		SD3_DATA5	ALT4	
FLEXCAN2_RX	FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_TDATA2	ALT1	I
		GPIO1_IO14	ALT3	
		I2C3_SCL	ALT2	
		SAI1_TXFS	ALT3	
		SD3_DATA4	ALT4	
FLEXCAN2_TX	FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	ENET1_TDATA3	ALT1	O
		GPIO1_IO15	ALT3	
		I2C3_SDA	ALT2	
		SAI1_TXD	ALT3	
		SD3_DATA6	ALT4	

### 15.1.3 Clocks

The table found here describes the clock sources for FLEXCAN.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 15-2. FLEXCAN Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_chi	ipg_clk_root	CHI clock
ipg_clk_pe	can_clk_root	Protocol Engine clock
ipg_clk_pe_nogate	can_clk_root	Protocol Engine clock (no gating)
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_ram_CLK	ipg_clk_root	RAM clock

### 15.1.4 Message Buffer Structure

Message Buffer Address: Base + 0x0080-0x047C

The Message Buffer structure used by the FLEXCAN module is represented in the figure found here.

Both Extended and Standard Frames (29-bit Identifier and 11-bit Identifier, respectively) used in the CAN specification are represented.

**Table 15-3. Message Buffer Structure**

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0				CODE					S R R	I D E	R T R	DLC				TIME STAMP																
0x4				PRIO		ID Standard						ID Extended																				
0x8	DATA BYTE 0				DATA BYTE 1				DATA BYTE 2				DATA BYTE 3																			
0xC	DATA BYTE 4				DATA BYTE 5				DATA BYTE 6				DATA BYTE 7																			

CODE - Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FLEXCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in the following tables. See [Functional Description](#) for additional information.

**Table 15-4. Message Buffer Code for Rx buffers**

CODE Description	Rx Code BEFORE receive New Frame	SRV <sup>1</sup>	Rx Code AFTER successful reception <sup>2</sup>	RRS <sup>3</sup>	Comment
0b0000: INACTIVE- MB is not active.	INACTIVE	-	-	-	MB does not participate in the matching process.
0b0100: EMPTY - MB is active and empty.	EMPTY	-	FULL	-	When a frame is received successfully (after move-in process. Refer to <a href="#">Move-in</a> for details), the CODE field is automatically updated to FULL.
0b0010: FULL - MB is full.	FULL	Yes	FULL	-	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. Refer to <a href="#">Matching Process</a> for matching details related to FULL code.
		No	OVERRUN	-	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. Refer to <a href="#">Matching Process</a> for details about overrun behavior.
0b0110: OVERRUN - MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	-	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB, the code returns to FULL.
		No	OVERRUN	-	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. Refer to <a href="#">Matching Process</a> for details about overrun behavior.
0b1010: RANSWER <sup>4</sup> - A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return.	RANSWER	-	TANSWER(0b1110)	0	A Remote Answer was configured to recognize a remote request frame received, after that a MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). Refer to <a href="#">Matching Process</a> for details.  If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received.
			-	1	This code is ignored during matching and arbitration process. Refer to <a href="#">Matching Process</a> for details.

Table continues on the next page...

**Table 15-4. Message Buffer Code for Rx buffers (continued)**

CODE Description	Rx Code BEFORE receive New Frame	SRV <sup>1</sup>	Rx Code AFTER successful reception <sup>2</sup>	RRS <sup>3</sup>	Comment
CODE[0]=1b1: BUSY - FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY <sup>5</sup>	-	FULL	-	Indicates that the MB is being updated, it will be negated automatically and does not interfere on the next CODE.
			OVERRUN	-	

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered successful reception after the frame to be moved to MB (move-in process). Refer to [Move-in](#) for details)
3. Remote Request Stored bit from CTRL2 register. Refer to [CTRL2](#) for details.
4. Code 4'b1010 is not considered as a Tx and a MB with this code should not to be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

**Table 15-5. Message Buffer Code for Tx buffers**

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
0b1000: INACTIVE - MB is not active	INACTIVE	-	-	MB does not participate in the arbitration process.
0b1001: ABORT - MB is aborted	ABORT	-	-	MB does not participate in the arbitration process. .
0b1100: DATA - MB is a Tx Data Frame (MB RTR must be 0)	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state.
0b1100: REMOTE - MB is a Tx Remote Request Frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
0b1110: TANSWER - MB is a Tx Response Frame from an incoming Remote Request Frame	TANSWER	-	RANSWER	This is an intermediate code that is automatically written to the MB by the CHI as a result of match to a remote request frame. The remote response frame will be transmitted unconditionally once and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect.  The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. Refer to <a href="#">Matching Process</a> and <a href="#">Arbitration process</a> for details.

SRR - Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to '1' by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FLEXCAN receives this bit as dominant, then it is interpreted as arbitration loss.

1= Recessive value is compulsory for transmission in Extended Format frames

0= Dominant is not a valid value for transmission in Extended Format frames

#### IDE - ID Extended Bit

This bit identifies whether the frame format is standard or extended. It is also used as part of the reception filter.

1= Frame format is extended

0= Frame format is standard

#### RTR - Remote Transmission Request

This bit affects the behavior of Remote Frames and is part of the reception filter. Refer to the tables above and RRS bit in [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for additional details.

If FLEXCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FLEXCAN module treats it as bit error. If the value received matches the value transmitted, it is considered as a successful bit transmission.

1= Indicates the current MB has a Remote Frame to be transmitted if MB is Tx. If the MB is Rx then incoming Remote Request Frames may be stored.

0= Indicates the current MB has a Data Frame to be transmitted. In Rx MB it may be considered in matching processes.

#### DLC - Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x08 through 0x0F of the MB space (see the first table above). In reception, this field is written by the FLEXCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the ARM and corresponds to the DLC field value of the frame to be transmitted. When RTR=1, the Frame to be transmitted is a Remote Frame and does not include the data field, regardless of the Length field. The DLC field indicates which DATA BYTES are valid as shown in the table below.

#### TIME STAMP - Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

#### PRIO - Local priority

This 3-bit field is only used when MCR[LPRIO\_EN] bit is asserted and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See [Arbitration process](#).

#### ID - Frame Identifier

In Standard Frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In Extended Frame format, all bits are used for frame identification in both receive and transmit cases.

#### DATA BYTE 0-7 - Data Field

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (n) is valid only if *n* is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

**Table 15-6. DATA BYTEs validity**

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0-1
3	DATA BYTE 0-2
4	DATA BYTE 0-3
5	DATA BYTE 0-4
6	DATA BYTE 0-5
7	DATA BYTE 0-6
8	DATA BYTE 0-7

### 15.1.5 Rx FIFO Structure

When the MCR[RFEN] bit is set, the memory area from \$80 to \$DC (which is normally occupied by MBs 0 to 5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a Message Buffer. This output contains the oldest message received and not read yet. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, that starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6 up to 37) depending on the CTRL2[RFFN] field setting, contains the ID Filter Table (configurable from 8 to 128 memory positions) that specifies filtering criteria for accepting frames into the FIFO. Table 15-7 shows the Rx FIFO data structure.

Each ID Filter Table Element occupies an entire 32-bit word and can be compounded by one, two or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. Table 15-8, Table 15-9 and Table 15-10 show the IDAF indexation. Table 15-11 show the three different formats that the IDAF can assume, depending on the MCR[IDAM] field setting. Note that all elements of the table must have the same format. See Rx FIFO for more information.

Out of reset, the ID Filter Table flexible memory area defaults to 0xE0 and only extends to 0xFC, which corresponds to MBs 6 to 7 for RFFN=0.

**Table 15-7. Rx FIFO Structure**

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x80										S	I	R	DLC				TIME STAMP															
										R	D	T																				
										R	E	R																				
0x84										ID Standard						ID Extended																
0x88										Data Byte 0						Data Byte 1						Data Byte 2						Data Byte 3				
0x8C	Data Byte 4						Data Byte 5						Data Byte 6						Data Byte 7													
0x90 to 0xDC	Reserved																															
0xE0	ID Filter Table Element 0																															
0xE4	ID Filter Table Element 1																															
0xE8 to 0x2D 4	ID Filter Table Elements 2 through 125																															
0x2D 8	ID Filter Table Element 126																															
0x2D C	ID Filter Table Element 127																															

**Table 15-11. Identifier Acceptance Filter Format A,B and C**

(Std/Ext = 31-24)	(Std/Ext = 23-16)	(Std/Ext = 15-8)	(Std/Ext = 7-0)
-------------------	-------------------	------------------	-----------------

**RTR - Remote Frame**

This bit specifies whether Remote Request Frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is a Remote Request Frame or not.

1= Remote Frames can be accepted and data frames are rejected

0= Remote Frames are rejected and data frames can be accepted

**IDE - Extended Frame**

Specifies if either Extended or Standard Format frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is of the Extended or Standard Format.

1= Extended frames can be accepted and standard frames are rejected

0= Extended frames are rejected and standard frames can be accepted

**RXIDA - Rx Frame Identifier (Format A)**

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), only the 11 most significant bits (29 to 19 ) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all bits are used.

**RXIDB\_0, RXIDB\_1 - Rx Frame Identifier (Format B)**

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), the 11 most significant bits (29 to 19 and 13 to 3 ) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all 14 bits of the field are compared with the 14 most significant bits of the Identifier of the incoming frame. The 15 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

**RXIDC\_0, RXIDC\_1, RXIDC\_2, RXIDC\_3 - Rx Frame Identifier (Format C)**

Specifies an ID to be used as acceptance criteria for the FIFO. In both Standard Format and Extended Format, all 8 bits of the field are compared to the 8 most significant bits of the Identifier of the incoming frame. The 3 least significant bits of the Identifier of an incoming Standard Format frame and the 21 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

## 15.1.6 Functional Description

This section provides a complete functional description of the block.

### 15.1.6.1 Functional Overview

The FLEXCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames.

The mailbox system consists of a set of 64 Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see [Message Buffer Structure](#)). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a *matching* algorithm makes it possible to store received frames only into MBs that have the same ID. A masking scheme makes it possible to match the ID programmed on the MB with a range of Identifiers on received CAN frames. For transmission, an *arbitration* algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to [Table 15-4](#)). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to [Table 15-5](#)).

### 15.1.6.2 Transmit Process

In order to transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the procedure found here.

1. Check if the respective interruption bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see [Transmission Abort Mechanism](#)). If backwards compatibility is desired (MCR[AEN]

bit negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see [Message Buffer Inactivation](#)).

3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control and Code fields of the Control and Status word to activate the MB.

Once the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority.

At the end of the successful transmission, the value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the MB's Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB in step four (see [Table 15-4](#) and [Table 15-5](#) in [Message Buffer Structure](#))

When the Abort feature is enabled (MCR[AEN] bit is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until it negates the Interrupt Flag. It means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

### 15.1.6.3 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest Mailbox number and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value. See [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for details.
- During the error delimiter field of the CAN frame
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When ARM write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.
- When CHI is in Idle state and ARM writes to the C/S word of any MB.

- When FlexCAN exits Bus Off state
- Upon leaving Freeze Mode or Low Power Mode

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIO\_EN] bits settings.

### 15.1.6.3.1 Lowest Mailbox number first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIO\_EN] bit has no effect when CTRL1[LBUF] is asserted.

### 15.1.6.3.2 Highest Mailbox priority first

If CTRL1[LBUF] bit is negated then the arbitration process searches the active Tx Mailbox with the highest priority, and this Mailbox would have a higher probability to win the arbitration on CAN bus.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest priority Tx Mailbox is the one that has the least arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values the lowest Mailbox number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIO\_EN] bit setting.

#### 15.1.6.3.2.1 Local Priority disabled

If MCR[LPRIO\_EN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see [Table 15-12](#)) in such a way that the Local Priority is disabled.

**Table 15-12. Composition of the arbitration value when Local Priority is disabled**

Format	Mailbox Arbitration Value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	Extended ID[28:18 ] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0 ] (18 bits)	RTR (1 bit)

### 15.1.6.3.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIO\_EN] must be asserted.

In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the table below).

**Table 15-13. Composition of the arbitration value when Local Priority is enabled**

Format	Mailbox Arbitration Value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18 ](11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0 ] (18 bits)	RTR (1 bit)

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

Once the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called "move-out" and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze Mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the DLC (Data Length Code) field value is greater than that.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. Arbitration start point depends on instantiation parameters NUMBER\_OF\_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)) to optimize the arbitration start point.
- During CAN Bus Off state from TX\_ERR\_CNT=124 to 128. Arbitration start point depends on instantiation parameters NUMBER\_OF\_MB and T ASD. Additionally,

TASD value may be changed (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)) to optimize the arbitration start point.

- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze Mode. If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned.
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled.
- Arbitration winner inactivation or abort during any arbitration process.
- There was not enough time to finish Tx arbitration process. For instance, a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus.
- Low Power or Freeze Mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB which number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx Arbitration process in progress.
- Rx Match has just updated a Rx Code to Tx Code.
- Entering Bus off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- C/S write during arbitration if write is performed in a MB which number is higher than the Tx arbitration pointer.

#### 15.1.6.4 Receive Process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the steps listed here.

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see [Message Buffer Inactivation](#)), preferably with a *safe inactivation* (see [Transmission Abort Mechanism](#));
2. Write the ID word;
3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

Once the Mailbox is activated in the third step, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in process* (see [Move-in](#)) as follows:

1. The received Data field (8 bytes at most) is stored;
2. The received Identifier field is stored;
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox Time Stamp field;
4. The received SRR, IDE, RTR and DLC fields are stored;
5. The CODE field in the Control and Status word is updated. (see [Table 15-4](#) and [Table 15-5](#) in Section [Message Buffer Structure](#))
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU servicing (read) the frame received in a Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox;
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See [Message Buffer Lock Mechanism](#);
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See [Move-in](#);
4. Acknowledge the proper flag at IFLAG registers;
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the CODE field will not return to EMPTY. It will remain FULL. If the CPU tries to workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received message matching the filter of that Mailbox may be lost.

In summary: never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in a Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRX\_DIS] bit is not asserted. If MCR[SRX\_DIS] bit is asserted, FlexCAN will not store messages transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN messages through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze Mode (see [Rx FIFO](#)). Upon receiving the Frames Available in Rx FIFO interrupt (see [Interrupt Masks 1 Register \(FLEXCAN\\_IMASK1\)](#), bit IFLAG[BUF5I] - Frames available in Rx FIFO), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional - needed only if a mask was used for IDE and RTR bits);
2. Read the ID field (optional - needed only if a mask was used);
3. Read the Data field;
4. Read the RXFIR register (optional);
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory - releases the MB and allows the CPU to read the next Rx FIFO entry)

### **15.1.6.5 Matching Process**

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus.

If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- if the received frame is a remote frame, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame;

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. Please, refer to the following table for details.

**Table 15-14. Matching architecture**

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID] <sup>1</sup>	MB[CODE]
Mailbox	0	-	0	cmp <sup>2</sup>	no_cmp <sup>3</sup>	cmp_msk <sup>4</sup>	EMPTY or FULL or OVERRUN
Mailbox	0	-	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	-	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
FIFO <sup>5</sup>	-	-	-	cmp_msk	cmp_msk	cmp_msk	-

1. For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). In case of SMB[IDE] to be negated, the ID is only 11 bits (ID Standard). Please, refer to [Message Buffer Structure](#) for ID details. For FIFO structure, the ID depends on IDAM. Please, refer to [Rx FIFO Structure](#) for IDAM details.
2. cmp: Compares the SMB contents with the MB contents regardless the masks.
3. no\_cmp: The SMB contents are not compared with the MB contents.
4. cmp\_msk: Compares the SMB contents with MB contents taking into account the masks.
5. SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- the CODE field of the Mailbox is EMPTY;
- the CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the ARM and unlocked as described in [Message Buffer Lock Mechanism](#));

- the CODE field of the Mailbox is either FULL or OVERRUN and an inactivation is performed. (see [Message Buffer Inactivation](#))
- the Rx FIFO is not full.

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- if the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes;
- otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above.

If the selected priority is Mailboxes first:

- if a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO;
- if no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO;
- if both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
  - if MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox;
  - if MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox.

Please, refer to the table below for a summary of matching possibilities.

If a non-safe Mailbox inactivation (see [Message Buffer Inactivation](#)) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor

restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

**Table 15-15. Matching Possibilities and Resulting Reception Structures**

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
No FIFO, only MB, match is always MB first						
0	0	X <sup>1</sup>	None <sup>2</sup>	-. <sup>3</sup>	None	Frame lost by no match
0	0	X	Free <sup>4</sup>	-	FirstMB	
0	1	X	None	-	None	Frame lost by no match
0	1	X	Free	-	FirstMB	
0	1	X	NotFree	-	LastMB	Overrun
FIFO enabled, no match in FIFO is as if FIFO does not exist						
1	0	X	None	None <sup>5</sup>	None	Frame lost by no match
1	0	X	Free	None	FirstMB	
1	1	X	None	None	None	Frame lost by no match
1	1	X	Free	None	FirstMB	
1	1	X	NotFree	None	LastMB	Overrun
FIFO enabled, Queue disabled						
1	0	0	X	NotFull <sup>6</sup>	FIFO	
1	0	0	None	Full <sup>7</sup>	None	Frame lost by FIFO full (FIFO Overflow)
1	0	0	Free	Full	FirstMB	
1	0	0	NotFree	Full	FirstMB	
1	0	1	None	NotFull	FIFO	
1	0	1	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	0	1	Free	X	FirstMB	
1	0	1	NotFree	X	FirtsMB	Overrun
FIFO enabled, Queue enabled						
1	1	0	X	NotFull	FIFO	
1	1	0	None	Full	None	Frame lost by FIFO full (FIFO Overflow)

Table continues on the next page...

**Table 15-15. Matching Possibilities and Resulting Reception Structures (continued)**

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
1	1	0	Free	Full	FirstMB	
1	1	0	NotFree	Full	LastMB	Overrun
1	1	1	None	NotFull	FIFO	
1	1	1	Free	X	FirstMB	
1	1	1	NotFree	NotFull	FIFO	
1	1	1	NotFree	Full	LastMB	Overrun

1. It is a don't care condition.
2. Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).
3. It is a forbidden condition.
4. Matched in MB "Free" means that the frame matched at least one MB free-to-receive regardless it has matched MBs non-free-to-receive.
5. Matched in FIFO "None" means that the frame has not matched any filter in FIFO. It is as the FIFO didn't exist (CTRL2[RFEN]=0).
6. Matched in FIFO "NotFull" means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO "Full" means that the frame has matched a FIFO filter but couldn't store it because it has no empty slots to receive it.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for ARM to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. ARM can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Please refer to [Rx Mailboxes Global Mask Register \(FLEXCAN\\_RXMGMASK\)](#). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze Mode, otherwise they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RGXMASK, RX14MASK, RX15MASK and RXFGMASK) for backward compatibility. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

### 15.1.6.6 Move Process

There are two types of move process, namely move-in and move-out.

### 15.1.6.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead.

The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see [Matching Process](#)) and all of the following conditions are true:

- the CAN bus has reached or let past either:
  - the second bit of Intermission field next to the frame that carried the message that is in the Rx SMB;
  - the first bit of an overload frame next to the frame that carried the message that is in the Rx SMB;
- there is no ongoing matching process;
- the destination Mailbox is not locked by ARM;
- there is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the document and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- the destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished;
- there is a previous pending move-in to the same destination Mailbox.
- the Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled;
- any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters in Freeze or Low Power Mode. It only stays on hold waiting for exiting Low Power Mode and to be unlocked. If an MB is unlocked during Freeze Mode, the move-in happens immediately.

The move-in process consists of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;

5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field according to [Table 15-4](#).

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see [Message Buffer Inactivation](#)) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed in such a way that ARM beware that the Message Buffer content is temporarily incoherent.

#### **15.1.6.6.2 Move-out**

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see [Arbitration process](#)).

The move-out occurs in the following conditions:

- the first bit of Intermission field;
- during Bus off field when TX Error Counter is in the 124 to 128 range;
- during BusIdle field
- during Wait For Bus Idle field

The move-out process is not atomic. Only ARM has priority to access the memory concurrently out of BusIdle state. In BusIdle, the move-out has the lowest priority to the concurrent memory accesses.

#### **15.1.6.7 Data Coherence**

In order to maintain data coherency and FlexCAN proper operation, the ARM must obey the rules described in

Any form of ARM accessing an MB structure within FlexCAN other than those specified may cause FlexCAN to behave in an unpredictable way.

##### **15.1.6.7.1 Transmission Abort Mechanism**

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform ARM if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

In order to abort a transmission, ARM must write a specific abort code (0b1001) to the CODE field of the Control and Status word. The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze Mode
- The module enters in BusOff state
- There is an overload frame

If none of conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register and an interrupt to the ARM is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. In the other hand, if one of the above conditions is reached, the frame is not transmitted, therefore the abort code is written into the CODE field, the interrupt flag is set in the IFLAG and an interrupt is (optionally) generated to ARM.

If ARM writes the ABORT code before the transmission begins internally, then the write operation is not blocked, therefore the MB is updated and the interrupt flag is set. In this way ARM just needs to read the abort code to make sure the active MB was *safely inactivated*. Although the AEN bit is asserted and ARM wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

1. ARM checks the corresponding IFLAG and clears it, if asserted.
2. ARM writes 0b1001 into the CODE field of the C/S word.
3. ARM waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
4. ARM reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).
5. It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

### 15.1.6.7.2 Message Buffer Inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing ARM to rely on Mailbox data coherence after having updated it, even in Normal Mode.

If a Mailbox is inactivated it does not participate neither in the arbitration nor in the matching process until it is reactivated. See [Transmit Process](#) and [Receive Process](#) for more detailed instruction on how to inactivate and reactivate a Mailbox.

In order to inactivate a Mailbox ARM must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

As the user is not able to synchronize the CODE field update with the FlexCAN internal processes an inactivation can lead to undesirable results:

- a frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter;
- a frame containing the message within the inactivated Tx Mailbox may be transmitted without notice.

In order to eliminate such risk and perform a *safe inactivation* ARM must use the following mechanism along with the inactivation itself:

- for Tx Mailboxes, the Transmission Abort (see [Transmission Abort Mechanism](#));

The inactivation automatically unlocks the Mailbox (see [Message Buffer Lock Mechanism](#)).

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on FIFO region by FlexCAN. ARM must keep the data coherence into FIFO region when RFEN is asserted.

### 15.1.6.7.3 Message Buffer Lock Mechanism

Besides MB inactivation, FlexCAN has another data coherence mechanism for the receive process. When ARM reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that ARM wants to read the whole MB in an atomic operation, and thus it sets an internal lock flag for that MB. The lock is released when ARM reads the Free Running Timer (global unlock operation), or when it reads the Control and Status word of another MB regardless of its code or when ARM writes into C/S word from locked MB. The MB locking is done to prevent a new frame to be written into the MB while ARM is reading it.

The locking mechanism only applies to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY<sup>1</sup> (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the ARM decides to read MB number 5 and at the same time another message with the same ID is arriving. When ARM reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB. If the MB is not unlocked in time and yet another new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If ARM reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If ARM inactivates a locked Rx Mailbox, then its lock status is negated and the Mailbox is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the Mailbox. An MB is unlocked when ARM reads the Free Running Timer Register (see [Free Running Timer Register \(FLEXCAN\\_TIMER\)](#)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during any of the low power modes (see in [Modes of Operation](#) specific information on Module Disable or Stop modes) and it will take place only when the module resumes to Normal or Freeze modes.

### 15.1.6.8 Rx FIFO

The receive-only FIFO is enabled by asserting the RFEN bit in the MCR.

---

1. In previous FlexCAN versions, reading the C/S word locks the MB even if it is EMPTY. This behavior is maintained when the IRMQ bit is negated.

The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep, therefore when the FIFO is enabled, the memory region occupied by the first 6 Message Buffers is reserved for use of the FIFO engine (see [Rx FIFO Structure](#)). ARM can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, ARM can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to ARM. Otherwise, the flag remains negated. The output of the FIFO is only valid when the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until ARM clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the ARM clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, thus reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also [Rx FIFO Structure](#)):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid whilst

the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to thirty two elements of the ID Filter Table are individually affected by the Individual Mask Registers (RXIMR0 - RXIMR31), according to CTRL2[RFFN] setting (refer to [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)), allowing very powerful filtering criteria to be defined. If the MCR[IRMQ] bit is negated (or if the RXIMR are not available for the particular MCU), then the FIFO ID Filter Table is affected by RXFGMASK.

## 15.1.6.9 CAN Protocol Related Features

### 15.1.6.9.1 Remote Frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this mailbox will store the remote frame in the same fashion of a data frame. No

automatic remote response frame will be generated. The mask registers are used in the matching process.

- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the ARM. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

#### 15.1.6.9.2 Overload Frames

FLEXCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission
- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

#### 15.1.6.9.3 Time Stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

Note that the Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. Refer to TSYN description in [Control 1 Register \(FLEXCAN\\_CTRL1\)](#).

#### 15.1.6.9.4 Protocol Timing

The FLEXCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRES DIV, PROPSEG, PSEG1, PSEG2 and RJW. See [Control 1 Register \(FLEXCAN\\_CTRL1\)](#).

The PRES DIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{(\text{Prescaler value})}$$

A bit time is subdivided into three segments<sup>2</sup> (reference [Table 15-16](#)):

- SYNC\_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL Register so that their sum (plus 2) is in the range of 4 to 16 time quanta
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL Register (plus 1) to be 2 to 8 time quanta long

$$\text{Bit Rate} = \frac{f_{Tq}}{(\text{number of Time Quanta})}$$

2. For further explanation of the underlying concepts please refer to ISO/DIS 11519-1, Section 10.3. Reference also the Bosch CAN 2.0A/B protocol specification dated September 1991 for bit timing.

**Figure 15-2. Segments within the Bit Time**

Whenever CAN bit is used as a measure of duration (e.g. MCR[FRZ\_ACK] and MCR[LPM\_ACK] in [Module Configuration Register \(FLEXCAN\\_MCR\)](#)), the number of peripheral clocks in one CAN bit can be calculated as:

$$NCCP = \frac{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)}{f_{CANCLK}}$$

where:

NCCP is the number of peripheral clocks in one CAN bit;

$f_{CANCLK}$  is the Protocol Engine (PE) Clock in Hz;

$f_{SYS}$  is the frequency of operation of the system (CHI) clock, in Hz;

PSEG1 is the value in CTRL1[PSEG1] field;

PSEG2 is the value in CTRL1[PSEG2] field;

PROPSEG is the value in CTRL1[PROPSEG] field;

PRESDIV is the value in CTRL1[PRESDIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

Figure 15-2 gives an overview of the CAN compliant segment settings and the related parameter values.

**Table 15-16. Time Segment Syntax**

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
Transmit Point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample Point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

**Table 15-17. CAN Standard Compliant Bit Time Segment Settings**

Time Segment 1	Time Segment 2	Re-synchronization Jump Width
5 .. 10	2	1 .. 2
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

### 15.1.6.9.5 Arbitration and Matching Timing

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

**Figure 15-3. Matching and Move-In Time Windows**

**Figure 15-4. Arbitration and Move-Out Time Windows**

**Figure 15-5. Arbitration at the end of Bus Off and Move-Out Time Windows**

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time window. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in [Table 15-17](#)
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, i.e. the PLL can not be programmed to divide down the oscillator clock
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table.

**Table 15-18. Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate**

Number of Message Buffers	RFEN	Minimum Number of Peripheral Clocks per CAN bit
16 and 32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, so the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in [Table 15-18](#) can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRES DIV, PROPSEG, PSEG1, PSEG2). As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRES DIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

### 15.1.6.10 Modes of Operation Details

The FlexCAN module has four functional modes (Normal Mode, Freeze Mode, Listen-Only Mode and Loop-Back Mode) and two low power modes (Disable Mode and Stop Mode).

See in [Modes of Operation](#) an introductory description of all these modes of operation. The following sub-sections bring functional details on Freeze mode and the low power modes.

#### 15.1.6.10.1 Freeze Mode

This mode is requested by ARM through the assertion of the HALT bit in the MCR Register or when the MCU is put into Debug Mode . In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in any of the low power modes (Disable, Stop). The acknowledgement is obtained through the assertion by the FlexCAN of FRZ\_ACK bit in the same register. The ARM must only consider the FlexCAN in Freeze Mode when both request and acknowledgement conditions are satisfied.

When Freeze Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores the FLEXCAN\_RX input pin and drives the FLEXCAN\_TX pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT\_RDY and FRZ\_ACK bits in MCR

After requesting Freeze Mode, the user must wait for the FRZ\_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK\_SRC] bit that can be read but cannot be written.

Exiting Freeze Mode is done in one of the following ways:

- ARM negates the FRZ bit in the MCR Register
- The ARM is removed from Debug Mode and the HALT bit is negated

The FRZ\_ACK bit is negated after protocol engine recognizes the negation of freeze request. Once out of Freeze Mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

### 15.1.6.10.2 Module Disable Mode

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the ARM through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM\_ACK bit in the same register. The ARM must only consider the FlexCAN in Disable Mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze Mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM\_ACK bit and negates the FRZ\_ACK bit. The ability to shut down the clocks depends on how FlexCAN is integrated into the MCU. If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN\_RX input pin and drives its FLEXCAN\_TX pin as recessive

- May shut down the clocks to the PE and CHI sub-modules, depending on how FlexCAN is integrated into the MCU
- Sets the NOT\_RDY and LPM\_ACK bits in MCR

The Bus Interface Unit continues to operate, enabling the ARM to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode depending on how FlexCAN RAM is integrated into the ARM. Exiting from this mode is done by negating the MDIS bit by ARM, which make FlexCAN requests to resume the clocks and negates the LPM\_ACK bit after CAN protocol engine recognizes the negation of disable mode requested by ARM.

### 15.1.6.10.3 Stop Mode

This is a system low power mode in which system clocks can be stopped for maximum power savings.. To enter stop mode, the CPU should manually assert a global Stop Mode request (see the CAN1\_STOP\_REQ and CAN2\_STOP\_REQ bit in the register IOMUXC\_GPR4) and check the acknowledgement asserted by the FlexCAN (see the CAN1\_STOP\_ACK and CAN2\_STOP\_ACK in the register IOMUXC\_GPR4) . The CPU must only consider the FlexCAN in Stop Mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop Mode request during Freeze Mode, it sets the LPM\_ACK bit, negates the FRZ\_ACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally. If Stop Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN\_RX input pin and drives its FLEXCAN\_TX pin as recessive
- Sets the NOT\_RDY and LPM\_ACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Exiting Stop Mode is done in one of the following ways:

- ARM resuming the clocks and removing the Stop Mode request
- ARM resuming the clocks and Stop Mode request as a result of the Self Wake mechanism

In the Self Wake mechanism, if the SLF\_WAK bit in MCR Register was set at the time FlexCAN entered Stop Mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets the WAK\_INT bit in the ESR Register and, if enabled by the WAK\_MSK bit in MCR, generates a Wake Up interrupt to the ARM. Upon receiving the interrupt, the ARM should resume the clocks and remove the Stop Mode request manually. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the FLEXCAN\_RX input line while in Stop Mode. See the WAK\_SRC bit in [Module Configuration Register \(FLEXCAN\\_MCR\)](#) . This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments, the glitch filter width can be set in [Glitch Filter Width Register \(FLEXCAN\\_GFWR\)](#).

### **15.1.6.11 Interrupts**

The module can generate up to 70 interrupt sources (64 interrupts due to message buffers and 6 interrupts due to Ored interrupts from MBs, Bus Off, Error, Tx Warning, Rx Warning and Wake Up)).

The number of actual sources depends on the configured number of message buffers.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has assigned a flag bit in the IFLAG Registers. The bit is set when the corresponding buffer completes a successful transmission/reception and is cleared when the ARM writes it to '1' (unless another interrupt is generated at the same time).

If the Rx FIFO is enabled (bit RFEN on MCR set), the interrupts corresponding to MBs 0 to 7 have a different behavior. Bit 7 of the IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag" and bits 4-0 are unused. See [Interrupt Flags 1 Register \(FLEXCAN\\_IFLAG1\)](#) for more information.

A combined interrupt for all MBs is also generated by an Or of all the interrupt sources from MBs. This interrupt gets generated when any of the Mailboxes or FIFO generates an interrupt. The ARM must read the IFLAG Registers to determine which MB or FIFO caused the interrupt.

The other 5 interrupt sources (Bus Off, Error, Tx Warning, Rx Warning and Wake Up) generate interrupts like the MB ones, and can be read from both the Error and Status Register 1 and 2. The Bus Off, Error, Tx Warning and Rx Warning interrupt mask bits are located in the Control 1 Register and the Wake-Up interrupt mask bit is located in the MCR.

## 15.1.7 Initialization/Application Information

This section provides instructions for initializing the FLEXCAN module.

### 15.1.7.1 FLEXCAN Initialization Sequence

The FLEXCAN module may be reset in two ways:

- SOC level hard reset which resets all memory mapped registers asynchronously
- SOFT\_RST bit in MCR, which resets some of the memory mapped registers synchronously

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFT\_RST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in any of the low power modes. The low power mode should be exited and the clocks resumed before applying soft reset.

After the module is enabled (MDIS bit negated), FLEXCAN automatically goes to Freeze Mode. In Freeze Mode, FLEXCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZ\_ACK and NOT\_RDY bits in the MCR Register are set. The FLEXCAN\_TX pin is in recessive state and FLEXCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FLEXCAN is put into Freeze Mode. The following is a generic initialization sequence applicable to the FLEXCAN module:

- Initialize the Module Configuration Register
  - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
  - Enable the warning interrupts by setting the WRN\_EN bit
  - If required, disable frame self reception by setting the SRX\_DIS bit

- Enable the FIFO by setting the RFEN bit
- Enable the abort mechanism by setting the AEN bit
- Enable the local priority feature by setting the LPRIO\_EN bit
- Initialize the Control Register
  - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
  - Determine the bit rate by programming the PRESDIV field
  - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
  - The Control and Status word of all Message Buffers must be initialized
  - If FIFO was enabled, the 8-entry ID table must be initialized
  - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers
- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts), in CTRL Register (for Bus Off and Error interrupts) and in MCR Register for Wake-Up interrupt
- Negate the HALT bit in MCR

Starting with the last event, FLEXCAN attempts to synchronize to the CAN bus.

### 15.1.8 FLEXCAN Memory Map/Register Definition

The complete memory map for a FLEXCAN module with 64 MBs capability is shown in the following table. Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV bit in the MCR Register. The MCR register allows only Supervisor access regardless the SUPV bit state.

The FLEXCAN module stores CAN messages for transmission and reception using a Mailboxes and Rx FIFO structure.

## FLEXCANx\_MCR field descriptions

Field	Description
31 MDIS	<p>This bit controls whether FLEXCAN is enabled or not. When disabled, FLEXCAN shuts down the clocks to the CAN Protocol Interface and Message Buffer Management sub-modules. This is the only bit in MCR not affected by soft reset. See <a href="#">Module Disable Mode</a> for more information.</p> <p>1 Disable the FLEXCAN module 0 Enable the FLEXCAN module</p>
30 FRZ	<p>The FRZ bit specifies the FLEXCAN behavior when the HALT bit in the MCR Register is set or when Debug Mode is requested at ARM level. When FRZ is asserted, FLEXCAN is enabled to enter Freeze Mode. Negation of this bit field causes FLEXCAN to exit from Freeze Mode.</p> <p>1 Enabled to enter Freeze Mode 0 Not enabled to enter Freeze Mode</p>
29 RFEN	<p>This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 15-18</a> (see <a href="#">Arbitration and Matching Timing</a>). This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FIFO enabled 0 FIFO not enabled</p>
28 HALT	<p>Assertion of this bit puts the FLEXCAN module into Freeze Mode. The ARM should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FLEXCAN before this bit is cleared. Freeze Mode can not be entered while FLEXCAN is in any of the low power modes. See <a href="#">Freeze Mode</a> for more information.</p> <p>1 Enters Freeze Mode if the FRZ bit is asserted. 0 No Freeze Mode request.</p>
27 NOT_RDY	<p>This read-only bit indicates that FLEXCAN is either in Disable Mode, Stop Mode or Freeze Mode. It is negated once FLEXCAN has exited these modes.</p> <p>1 FLEXCAN module is either in Disable Mode, Stop Mode or Freeze Mode 0 FLEXCAN module is either in Normal Mode, Listen-Only Mode or Loop-Back Mode</p>
26 WAK_MSK	<p>This bit enables the Wake Up Interrupt generation.</p> <p>1 Wake Up Interrupt is enabled 0 Wake Up Interrupt is disabled</p>
25 SOFT_RST	<p>When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER, ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, RXIMR0_RXIMR63, RXGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR and all Message Buffers</p> <p>The SOFT_RST bit can be asserted directly by the ARM when it writes to the MCR Register. It may take some time to fully propagate its effect. The SOFT_RST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed.</p> <p>Soft reset cannot be applied while clocks are shut down in any of the low power modes. The module should be first removed from low power mode, and then soft reset can be applied.</p>

*Table continues on the next page...*

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
	1 Reset the registers 0 No reset request
24 FRZ_ACK	This read-only bit indicates that FLEXCAN is in Freeze Mode and its prescaler is stopped. The Freeze Mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZ_ACK bit to know when FLEXCAN has actually entered Freeze Mode. If Freeze Mode request is negated, then this bit is negated once the FLEXCAN prescaler is running again. If Freeze Mode is requested while FLEXCAN is in any of the low power modes, then the FRZ_ACK bit will only be set when the low power mode is exited. See <a href="#">Freeze Mode</a> for more information  1 FLEXCAN in Freeze Mode, prescaler stopped 0 FLEXCAN not in Freeze Mode, prescaler running
23 SUPV	This bit configures some of the FLEXCAN registers to be either in Supervisor or User Mode. Reset value of this bit is '1', so the affected registers start with Supervisor access allowance only. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.  1 FlexCAN is in Supervisor Mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location 0 FlexCAN is in User Mode. Affected registers allow both Supervisor and Unrestricted accesses
22 SLF_WAK	This bit enables the Self Wake Up feature when FLEXCAN is in Stop Mode. If this bit had been asserted by the time FLEXCAN entered Stop Mode, then FLEXCAN will look for a recessive to dominant transition on the bus during these modes. If a transition from recessive to dominant is detected during Stop Mode, then FLEXCAN generates, if enabled to do so, a Wake Up interrupt to the ARM so that it can resume the clocks globally and FlexCAN can request to resume the clocks. This bit can not be written while the module is in Stop Mode.  1 FLEXCAN Self Wake Up feature is enabled 0 FLEXCAN Self Wake Up feature is disabled
21 WRN_EN	When asserted, this bit enables the generation of the TWRN_INT and RWRN_INT flags in the Error and Status Register. If WRN_EN is negated, the TWRN_INT and RWRN_INT flags will always be zero, independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.  1 TWRN_INT and RWRN_INT bits are set when the respective error counter transition from <96 to ≥ 96. 0 TWRN_INT and RWRN_INT bits are zero, independent of the values in the error counters.
20 LPM_ACK	This read-only bit indicates that FLEXCAN is either in Disable Mode or Stop Mode. Either of these low power modes can not be entered until all current transmission or reception processes have finished, so the ARM can poll the LPM_ACK bit to know when FLEXCAN has actually entered low power mode. See <a href="#">Module Disable Mode</a> , and <a href="#">Stop Mode</a> for more information  1 FLEXCAN is either in Disable Mode, or Stop mode 0 FLEXCAN not in any of the low power modes
19 WAK_SRC	This bit defines whether the integrated low-pass filter is applied to protect the FLEXCAN_RX input from spurious wake up. See <a href="#">Stop Mode</a> for more information. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.  1 FLEXCAN uses the filtered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus 0 FLEXCAN uses the unfiltered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus.
18 -	This field is reserved. Reserved

Table continues on the next page...

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
17 SRX_DIS	<p>This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Self reception disabled 0 Self reception enabled</p>
16 IRMQ	<p>This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Individual Rx masking and queue feature are enabled. 0 Individual Rx masking and queue feature are disabled. For backward compatibility, the reading of C/S word locks the MB even if it is EMPTY.</p>
15–14 -	<p>This field is reserved. Reserved</p>
13 LPRIO_EN	<p>This bit is provided for backwards compatibility reasons. It controls whether the local priority feature is enabled or not. It is used to extend the ID used during the arbitration process. With this extended ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Local Priority enabled 0 Local Priority disabled</p>
12 AEN	<p>This bit is supplied for backwards compatibility reasons. When asserted, it enables the Tx abort feature. This feature guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. Write Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted.</p> <p>1 Abort enabled 0 Abort disabled</p>
11–10 -	<p>This field is reserved. Reserved</p>
9–8 IDAM	<p>This 2-bit field identifies the format of the elements of the Rx FIFO filter table, as shown below. Note that all elements of the table are configured at the same time by this field (they are all the same format). See <a href="#">Rx FIFO Structure</a>. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>00 Format A One full ID (standard or extended) per ID filter Table element. 01 Format B Two full standard IDs or two partial 14-bit extended IDs per ID filter Table element. 10 Format C Four partial 8-bit IDs (standard or extended) per ID filter Table element. 11 Format D All frames rejected.</p>
7 -	<p>This field is reserved. Reserved</p>
MAXMB	<p>This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to 16 MB configuration. This field can only be written in Freeze Mode as it is blocked by hardware in other modes</p> <p>Number of the last MB = MAXMB.</p>

*Table continues on the next page...*

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
	<b>NOTE:</b> Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN] MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 15-18</a> (see <a href="#">Arbitration and Matching Timing</a> ).

## 15.1.8.2 Control 1 Register (FLEXCANx\_CTRL1)

This register is defined for specific FLEXCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back Mode, Listen Only Mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

Address: Base address + 4h offset

## FLEXCANx\_CTRL1 field descriptions

Field	Description
31–24 PRESDIV	This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclck) frequency. The Sclck period defines the time quantum of the CAN protocol. For the reset value, the Sclck frequency is equal to the PE clock frequency. The Maximum value of this register is 0xFF, that gives a minimum Sclck frequency equal to the PE clock frequency divided by 256. For more information refer to <a href="#">Protocol Timing</a> . This field can only be written in Freeze mode as it is blocked by hardware in other modes.

Table continues on the next page...

## FLEXCANx\_CTRL1 field descriptions (continued)

Field	Description
	Sclock frequency = CPI clock frequency / (PRESDIV+1)
23–22 RJW	This 2-bit field defines the maximum number of time quanta <sup>1</sup> that a bit time can be changed by one re-synchronization. The valid programmable values are 0-3. This field can only be written in Freeze mode as it is blocked by hardware in other modes  Resync Jump Width = RJW + 1.
21–19 PSEG1	This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes  Phase Buffer Segment 1 = (PSEG1 + 1) x Time-Quanta.
18–16 PSEG2	This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time. The valid programmable values are 1-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes  Phase Buffer Segment 2 = (PSEG2 + 1) x Time-Quanta.
15 BOFF_MSK	This bit provides a mask for the Bus Off Interrupt.  1 Bus Off interrupt enabled 0 Bus Off interrupt disabled
14 ERR_MSK	This bit provides a mask for the Error Interrupt.  1 Error interrupt enabled 0 Error interrupt disabled
13 -	This field is reserved. Reserved
12 LPB	This bit configures FlexCAN to operate in Loop-Back Mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.  1 Loop Back enabled 0 Loop Back disabled
11 TWRN_MSK	This bit provides a mask for the Tx Warning Interrupt associated with the TWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted.  1 Tx Warning Interrupt enabled 0 Tx Warning Interrupt disabled
10 RWRN_MSK	This bit provides a mask for the Rx Warning Interrupt associated with the RWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted.  1 Rx Warning Interrupt enabled 0 Rx Warning Interrupt disabled
9–8 -	This field is reserved. Reserved
7 SMP	This bit defines the sampling mode of CAN bits at the FLEXCAN_RX. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.

Table continues on the next page...

**FLEXCANx\_CTRL1 field descriptions (continued)**

Field	Description
	<p>1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples, a majority rule is used</p> <p>0 Just one sample is used to determine the bit value</p>
6 BOFF_REC	<p>This bit defines how FLEXCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFF_REC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FLEXCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFF_REC bit can be re-asserted again during Bus Off, but it will only be effective the next time the module enters Bus Off. If BOFF_REC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery.</p> <p>1 Automatic recovering from Bus Off state disabled</p> <p>0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B</p>
5 TSYN	<p>This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FLEXCAN stations with a special "SYNC" message (i.e., global network time). If the RFEN bit in MCR is set (FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Timer Sync feature enabled</p> <p>0 Timer Sync feature disabled</p>
4 LBUF	<p>This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIO_EN bit does not affect the priority arbitration. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Lowest number buffer is transmitted first</p> <p>0 Buffer with highest priority is transmitted first</p>
3 LOM	<p>This bit configures FLEXCAN to operate in Listen Only Mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.</p> <p>Listen-Only Mode acknowledgement can be obtained by the state of ESR1[FLT_CONF] field which is Passive Error when Listen-Only Mode is entered. There can be some delay between the Listen-Only Mode request and acknowledge.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN module operates in Listen Only Mode</p> <p>0 Listen Only Mode is deactivated</p>
PROP_SEG	<p>This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes</p> <p>Propagation Segment Time = (PROPSEG + 1) * Time-Quanta.</p> <p>Time-Quantum = one Sclock period.</p>

1. One time quantum is equal to the Sclock period.

### 15.1.8.3 Free Running Timer Register (FLEXCANx\_TIMER)

This register represents a 16-bit free running counter that can be read and written by the ARM. The timer starts from \$0000 after Reset, counts linearly to \$FFFF, and wraps around.

The timer is clocked by the FLEXCAN bit-clock (which defines the baud rate on the CAN bus). During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. During Freeze Mode, disable, and stop mode, the timer is not incremented.

The timer value is captured at the beginning of the identifier field of any frame on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

ARM can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to [Message Buffer Lock Mechanism](#).

Address: Base address + 8h offset

Field	Description
31–16 -	This field is reserved. Reserved
TIMER	TIMER

### 15.1.8.4 Rx Mailboxes Global Mask Register (FLEXCANx\_RXMGMASK)

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

**Table 15-19. Rx Mailboxes Global Mask usage**

SMB[RTR] <sup>1</sup>	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	reserved
0	-	0	- Note <sup>2</sup>	- Note <sup>3</sup>	MG[28:0]	MG[31:29]
0	-	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	-	-	-	-	MG[31:0]
1	1	0	-	-	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

Address: Base address + 10h offset

### FLEXCANx\_RXMGMASK field descriptions

Field	Description
MG31_MG0	<p>These bits mask the Mailbox filter bits as shown in the figure above. Note that the alignment with the ID word of the Mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE which are located in the Control and Status word of the Mailbox. <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a> shows in detail which MG bits mask each Mailbox filter field.</p> <p>1 The corresponding bit in the filter is checked against the one received  0 the corresponding bit in the filter is "don't care"</p>

#### 15.1.8.5 Rx Buffer 14 Mask Register (FLEXCANx\_RX14MASK)

RX14MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX14MASK to have no effect on the module operation.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

## Flexible Controller Area Network (FLEXCAN)

Address: Base address + 14h offset

### FLEXCANx\_RX14MASK field descriptions

Field	Description
RX14M31_ RX14M0	<p>These bits mask Mailbox 14 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>)</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

### 15.1.8.6 Rx Buffer 15 Mask Register (FLEXCANx\_RX15MASK)

RX15MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX15MASK Register to have no effect on the module operation.

RX15MASK is used to mask the filter fields of Message Buffer 15.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 18h offset

### FLEXCANx\_RX15MASK field descriptions

Field	Description
RX15M31_ RX15M0	<p>These bits mask Mailbox 15 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>).</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

### 15.1.8.7 Error Counter Register (FLEXCANx\_ECR)

This register has 2 8-bit fields reflecting the value of two FLEXCAN error counters: Transmit Error Counter (Tx\_Err\_Counter field) and Receive Error Counter (Rx\_Err\_Counter field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FLEXCAN module. Both counters are read only except in Freeze Mode, where they can be written by the ARM.

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx\_Err\_Counter or Rx\_Err\_Counter increases to be greater than or equal to 128, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx\_Err\_Counter or Rx\_Err\_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx\_Err\_Counter increases to be greater than 255, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx\_Err\_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx\_Err\_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx\_Err\_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx\_Err\_Counter. When Tx\_Err\_Counter reaches the value of 128, the FLT\_CONF field in the Error and Status Register is updated to be 'Error Active' and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx\_Err\_Counter value.
- If during system start-up, only one node is operating, then its Tx\_Err\_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK\_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx\_Err\_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx\_Err\_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next

## Flexible Controller Area Network (FLEXCAN)

successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

Address: Base address + 1Ch offset

Tx_Err_Counter	Tx_Err_Counter

### 15.1.8.8 Error and Status 1 Register (FLEXCANx\_ESR1)

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the ARM.

The ARM read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the ARM read this register. Bits 9-3 are status bits.

Some bits in this register are read-only and some are not.

**Table 15-20. FlexCAN State**

SYNCH	IDLE	TX	RX	FlexCAN state
0	0	0	0	Not synchronized to CAN bus
1	1	x	x	Idle
1	0	1	0	Transmitting
1	0	0	1	Receiving
other combinations				Reserved

Address: Base address + 20h offset

**FLEXCANx\_ESR1 field descriptions**

Field	Description
31–19 -	This field is reserved. Reserved
18 SYNCH	This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. Refer to <a href="#">Table 15-20</a>  1 FlexCAN is synchronized to the CAN bus 0 FlexCAN is not synchronized to the CAN bus
17 TWRN_INT	If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode.  1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence

Table continues on the next page...

## FLEXCANx\_ESR1 field descriptions (continued)

Field	Description
16 RWRN_INT	<p>If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode.</p> <p>1 The Rx error counter transition from &lt; 96 to &gt;= 96 0 No such occurrence</p>
15 BIT1_ERR	<p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits.</p> <p>1 At least one bit sent as recessive is received as dominant 0 No such occurrence</p>
14 BIT0_ERR	<p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>1 At least one bit sent as dominant is received as recessive 0 No such occurrence</p>
13 ACK_ERR	<p>This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT.</p> <p>1 An ACK error occurred since last read of this register 0 No such occurrence</p>
12 CRC_ERR	<p>This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received.</p> <p>1 A CRC error occurred since last read of this register. 0 No such occurrence</p>
11 FRM_ERR	<p>This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit.</p> <p>1 A Form Error occurred since last read of this register 0 No such occurrence</p>
10 STF_ERR	<p>This bit indicates that a Stuffing Error has been detected.</p> <p>1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.</p>
9 TX_WRN	<p>This bit indicates when repetitive errors are occurring during message transmission.</p> <p>1 TX_Err_Counter ≥ 96 0 No such occurrence</p>
8 RX_WRN	<p>This bit indicates when repetitive errors are occurring during message reception.</p> <p>1 Rx_Err_Counter ≥ 96 0 No such occurrence</p>
7 IDLE	<p>This bit indicates when CAN bus is in IDLE state. Refer to <a href="#">Table 15-20</a>.</p>

Table continues on the next page...

## FLEXCANx\_ESR1 field descriptions (continued)

Field	Description
	<p>1 CAN bus is now IDLE</p> <p>0 No such occurrence</p>
6 TX	<p>This bit indicates if FLEXCAN is transmitting a message. Refer to <a href="#">Table 15-20</a>.</p> <p>1 FLEXCAN is transmitting a message</p> <p>0 FLEXCAN is receiving a message</p>
5-4 FLT_CONF	<p>If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the ARM. It may be necessary up to one CAN bit time to get them coherent again.</p> <p>Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted.</p> <p>This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below:</p> <p>00 Error Active</p> <p>01 Error Passive</p> <p>1x Bus off</p>
3 RX	<p>This bit indicates if FlexCAN is receiving a message. Refer to <a href="#">Table 15-20</a>.</p> <p>1 FLEXCAN is transmitting a message</p> <p>0 FLEXCAN is receiving a message</p>
2 BOFF_INT	<p>This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.</p> <p>1 FLEXCAN module entered 'Bus Off' state</p> <p>0 No such occurrence</p>
1 ERR_INT	<p>This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.</p> <p>1 Indicates setting of any Error Bit in the Error and Status Register</p> <p>0 No such occurrence</p>
0 WAK_INT	<p>When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect</p> <p>1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode</p> <p>0 No such occurrence</p>

### 15.1.8.9 Interrupt Masks 2 Register (FLEXCANx\_IMASK2)

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

Address: Base address + 24h offset

#### FLEXCANx\_IMASK2 field descriptions

Field	Description
BUF63M_ BUF32M	<p>Each bit enables or disables the respective FLEXCAN Message Buffer (MB32 to MB63) Interrupt.</p> <p>Setting or clearing a bit in the IMASK2 Register can assert or negate an interrupt request, if the corresponding IFLAG2 bit is set.</p> <p>1 The corresponding buffer Interrupt is enabled                      0 The corresponding buffer Interrupt is disabled</p>

### 15.1.8.10 Interrupt Masks 1 Register (FLEXCANx\_IMASK1)

This register allows to enable or disable any number of a range of 32 Message Buffer Interrupts. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e., when the corresponding IFLAG1 bit is set).

Address: Base address + 28h offset

#### FLEXCANx\_IMASK1 field descriptions

Field	Description
BUF31M_ BUF0M	<p>Each bit enables or disables the respective FLEXCAN Message Buffer (MB0 to MB31) Interrupt.</p> <p>Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set</p>

**FLEXCANx\_IMASK1 field descriptions (continued)**

Field	Description
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

**15.1.8.11 Interrupt Flags 2 Register (FLEXCANx\_IFLAG2)**

This register defines the flags for 32 Message Buffer interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect. Before updating MCR[MAXMB] field, ARM must treat the IFLAG2 bits which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 2Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**FLEXCANx\_IFLAG2 field descriptions**

Field	Description
BUF63I_BUF32I	Each bit flags the respective FLEXCAN Message Buffer (MB32 to MB63) interrupt.
1	The corresponding buffer has successfully completed transmission or reception
0	No such occurrence

**15.1.8.12 Interrupt Flags 1 Register (FLEXCANx\_IFLAG1)**

This register defines the flags for 32 Message Buffer interrupts and FIFO interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The Interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.

When the RFEN bit in the MCR is set (Rx FIFO enabled), the function of the 8 least significant interrupt flags (BUF7I - BUF0I) is changed to support the FIFO operation. BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, while BUF4I to BUF0I are not used. Before enabling the RFEN, ARM must service the IFLAGS asserted

in the Rx FIFO region (see [Rx FIFO](#)). Otherwise, these IFLAGS will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN is negated, the FIFO flags must be cleared. The same care must be taken when a RFFN value is selected extending Rx FIFO filters beyond MB7 (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, ARM must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 30h offset

**FLEXCANx\_IFLAG1 field descriptions**

Field	Description
31–8 BUF31I_BUF8I	Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt.  1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence
7 BUF7I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB7.  If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.  1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence
6 BUF6I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB6.  If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.

Table continues on the next page...

**FLEXCANx\_IFLAG1 field descriptions (continued)**

Field	Description
	1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence
5 BUF5I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.  1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence
BUF4I_BUF0I	If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4. If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations.  These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.  1 Corresponding MB completed transmission/reception 0 No such occurrence

**15.1.8.13 Control 2 Register (FLEXCANx\_CTRL2)**

This register contains control bits for CAN errors, FIFO features and mode selection.

**Table 15-21. Rx FIFO Filters**

RFFN[3:0]	Number of Rx FIFO filters	Message Buffers occupied by Rx FIFO and ID Filter Table	Remaining Available Mailboxes <sup>1</sup>	Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks <sup>2</sup>	Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask <sup>2</sup>

0xF	128	MB 0-37	MB 38-63	Elements 0-31	Elements 32-127

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.

2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(\text{SETUP\_MB} - 6) \times 4$$

where SETUP\_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$\text{SETUP\_MB} - 8 - (\text{RFFN} \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP\_MB value, the exceeding ones will not be functional. Unshaded regions in [Table 15-22](#) indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

**FLEXCANx\_CTRL2 field descriptions**

Field	Description
31 -	must be written as 0
30-29 -	This field is reserved. Reserved

Table continues on the next page...

## FLEXCANx\_CTRL2 field descriptions (continued)

Field	Description
28 WRMFRZ	<p>Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode.</p> <p>1 Enable unrestricted write access to FlexCAN memory 0 Keep the write access restricted in some regions of FlexCAN memory</p>
27–24 RFFN	<p>This 4-bit field defines the number of Rx FIFO filters according to <a href="#">Table 15-21</a>. The maximum selectable number of filters is determined by the ARM. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see <a href="#">Table 15-21</a>) that <b>may not exceed</b> the number of available Mailboxes present in module, defined by MCR[MAXMB]. Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see <a href="#">Module Configuration Register (FLEXCAN_MCR)</a>) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 15-18</a> (see <a href="#">Arbitration and Matching Timing</a>).</p>
23–19 TASD	<p>This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency.</p> <p>The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa.</p> <p>If TASD is 0 then the arbitration start is not delayed, thus ARM has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. In the other hand, if TASD is 24 then ARM can configure a Tx MB later and less time is reserved for arbitration.</p> <p>If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that ARM reconfigure some Tx MBs and the winner MB is not the best to be transmitted.</p> <p>The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate.</p> <p>The optimal configuration for TASD can be calculated as:</p>

*Table continues on the next page...*

## FLEXCANx\_CTRL2 field descriptions (continued)

Field	Description
	$TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{SYS} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)} \right\}$ <p>where:</p> <p><math>f_{CANCLK}</math> is the Protocol Engine (PE) Clock in Hz; PE clock is derived from CAN_CLK_ROOT in CCM. See <a href="#">Clock Root Generator</a></p> <p><math>f_{SYS}</math> is the peripheral clock in Hz;</p> <p>MAXMB is the value in CTRL1[MAXMB] field;</p> <p>RFEN is the value in CTRL1[RFEN] bit;</p> <p>RFFN is the value in CTRL2[RFFN] field;</p> <p>PSEG1 is the value in CTRL1[PSEG1] field;</p> <p>PSEG2 is the value in CTRL1[PSEG2] field;</p> <p>PROPSEG is the value in CTRL1[PROPSEG] field;</p> <p>PRES DIV is the value in CTRL1[PRES DIV] field.</p> <p>Please refer to <a href="#">Arbitration process</a> and <a href="#">Protocol Timing</a> for more details.</p>
18 MRP	<p>If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes</p>
17 RRS	<p>If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated.</p> <p>If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Remote Request Frame is stored 0 Remote Response Frame is generated</p>
16 EACEN	<p>This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.</p>
-	This field is reserved.

Table continues on the next page...

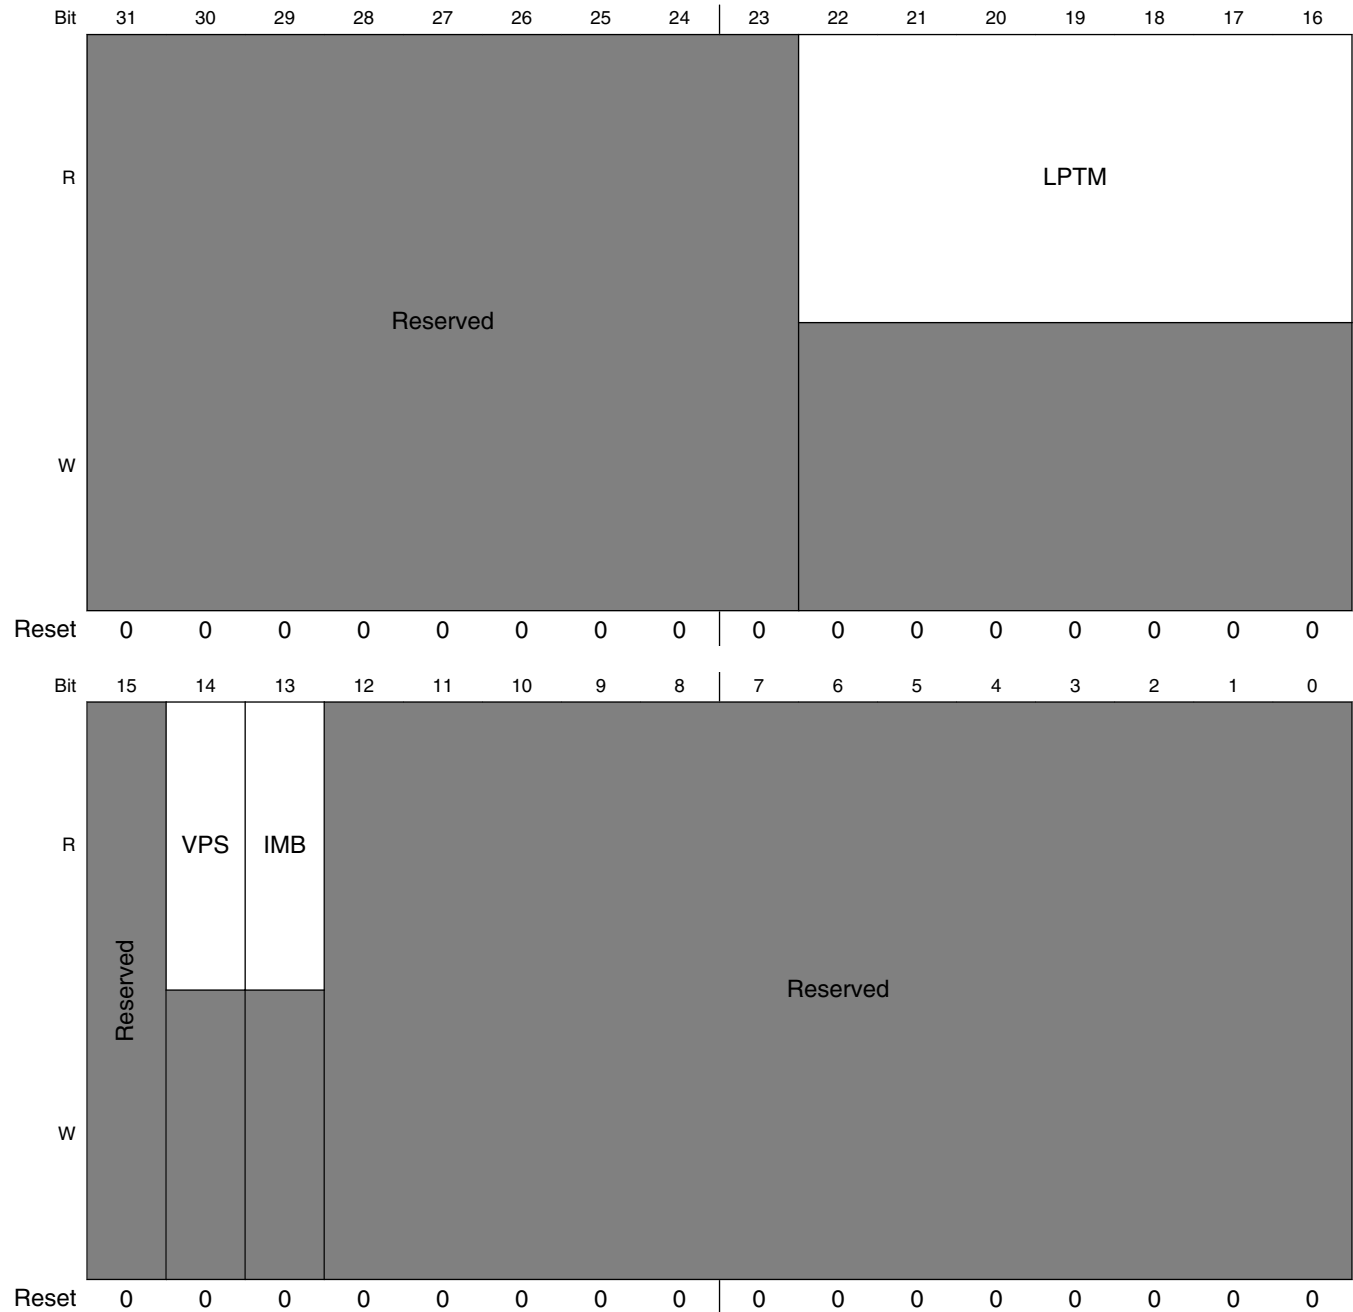

**FLEXCANx\_CTRL2 field descriptions (continued)**

Field	Description
	Reserved

### 15.1.8.14 Error and Status 2 Register (FLEXCANx\_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset

## FLEXCANx\_ESR2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 LPTM	If ESR2[VPS] is asserted, this 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value. If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see <a href="#">Highest Mailbox priority first</a> ). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
15 -	This field is reserved. Reserved
14 VPS	This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the ARM writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process. If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox. ESR2[VPS] is not affected by any ARM write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked.  1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid
13 IMB	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000).  This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see <a href="#">Arbitration process</a> ).  LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM].  1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox.
-	This field is reserved. Reserved

### 15.1.8.15 CRC Register (FLEXCANx\_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

**FLEXCANx\_CRCR field descriptions**

Field	Description
31–23 -	This field is reserved. Reserved
22–16 MBCRC	This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
15 -	This field is reserved. Reserved
TXCRC	This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

**15.1.8.16 Rx FIFO Global Mask Register (FLEXCANx\_RXFGMASK)**

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

**Table 15-23. Rx FIFO Global Mask usage**

Rx FIFO ID Filter Table Elements Format (MCR[IDAM])	Identifier Acceptance Filter fields					
	RTR	IDE	RXIDA	RXIDB	RXIDC	reserved
A	FGM[31]	FGM[30]	FGM[29:1]	-	-	FGM[0]
B	FGM[31] FGM[15]	FGM[30] FGM[14]	-	FGM[29:16] FGM[13:0] 1	-	-
C	-	-	-	-	FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] 2	-

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

Address: Base address + 48h offset

**FLEXCANx\_RXFGMASK field descriptions**

Field	Description
FGM31_FGM0	<p>These bits mask the ID Filter Table elements bits in a perfect alignment. <a href="#">Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK)</a> shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter.</p> <p>1 The corresponding bit in the filter is checked                      0 The corresponding bit in the filter is "don't care"</p>

**15.1.8.17 Rx FIFO Information Register (FLEXCANx\_RXFIR)**

RXFIR provides information on Rx FIFO.

This register is the port through which ARM accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to [Rx FIFO](#) to find instructions on reading this register.

Address: Base address + 4Ch offset

**FLEXCANx\_RXFIR field descriptions**

Field	Description
31–9 -	This field is reserved. Reserved
IDHIT	This 9-bit field indicates which Identifier Acceptance Filter (see <a href="#">Rx FIFO Structure</a> ) was hit by the received message that is in the output of the Rx FIFO. (refer to <a href="#">Rx FIFO</a> for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

### 15.1.8.18 Rx Individual Mask Registers (FLEXCANx\_RXIMR0\_RXIMR63)

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO. If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for details.

RXIMR can only be written by the ARM while the module is in Freeze Mode, otherwise they are blocked by hardware.

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: Base address + 880h offset

#### FLEXCANx\_RXIMR0\_RXIMR63 field descriptions

Field	Description
MI31_MIO	<p>These bits mask both Mailbox filter and Rx FIFO ID Filter Table element in distinct ways.</p> <p>For Mailbox filter refer to <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>.</p> <p>For Rx FIFO ID Filter Table element refer to <a href="#">Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK)</a>.</p> <p>1 The corresponding bit in the filter is checked                      0 the corresponding bit in the filter is "don't care"</p>

### 15.1.8.19 Glitch Filter Width Registers (FLEXCANx\_GFWR)

The Glitch Filter just takes effects when FLEXCAN enters the STOP mode.

Address: Base address + 9E0h offset

**FLEXCANx\_GFWR field descriptions**

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
GFWR	It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33 $\mu$ s when the oscillator is 24 MHz. Filter Pulse Width = [(GFWR FIELD + 1) x (1 / Osc. Frequency)]

## 15.2 I2C Controller (I2C)

### 15.2.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

**References:** This document assumes an understanding of the following document:

- *The I2C Bus Specification, Version 2.1*, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

#### NOTE

independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

**Figure 15-6. Connection of devices to I2C bus**

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

**Figure 15-7. I2C block diagram**

### 15.2.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

### 15.2.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

### 15.2.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn\_SCL and I2Cn\_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn\_SCL and I2Cn\_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADS are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

**Table 15-24. I2C External Signals**

Signal	Description	Pad	Mode	Direction
I2C1_SCL	Serial Clock	GPIO1_IO04	ALT4	IO
		I2C1_SCL	ALT0	
		UART1_RXD	ALT1	
I2C1_SDA	Serial Data	GPIO1_IO05	ALT4	IO
		I2C1_SDA	ALT0	
		UART1_TXD	ALT1	
I2C2_SCL	Serial Clock	GPIO1_IO06	ALT4	IO
		I2C2_SCL	ALT0	
		UART2_RXD	ALT1	
I2C2_SDA	Serial Data	GPIO1_IO07	ALT4	IO

*Table continues on the next page...*

**Table 15-24. I2C External Signals (continued)**

Signal	Description	Pad	Mode	Direction
		I2C2_SDA	ALT0	
		UART2_TXD	ALT1	
I2C3_SCL	Serial Clock	ENET1_RDATA0	ALT2	IO
		GPIO1_IO08	ALT4	
		I2C3_SCL	ALT0	
		LCD1_DATA20	ALT6	
		SD3_DATA3	ALT2	
I2C3_SDA	Serial Data	ENET1_RDATA1	ALT2	IO
		GPIO1_IO09	ALT4	
		I2C3_SDA	ALT0	
		LCD1_DATA21	ALT6	
		SD3_DATA2	ALT2	
I2C4_SCL	Serial Clock	ENET1_TDATA2	ALT3	IO
		GPIO1_IO10	ALT4	
		I2C4_SCL	ALT0	
		LCD1_DATA22	ALT6	
		SAI1_RXFS	ALT3	
I2C4_SDA	Serial Data	ENET1_TDATA3	ALT3	IO
		GPIO1_IO11	ALT4	
		I2C4_SDA	ALT0	
		LCD1_DATA23	ALT6	
		SAI1_RXC	ALT3	

### 15.2.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 15-25. I2C Clocks**

Clock name	Clock Root	Description
ipg_clk_patref	I2C_CLK_ROOT	Module clock
ipg_clk_s	I2C_CLK_ROOT	Peripheral access clock

- Peripheral clock: This clock is used for peripheral bus register read/writes.
- Module clock: This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

### 15.2.4 Functional description

This section provides a complete functional description of the block.

#### 15.2.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

#### NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

#### 15.2.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn\_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C\_I2SR[IAL] to indicate loss of arbitration).

### 15.2.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 15-8](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

**Figure 15-8. Synchronized clock SCL**

### 15.2.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

### 15.2.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

### 15.2.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

### 15.2.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

### 15.2.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C\_IADR and I2C\_IFDR registers) initiated by deasserting the I2C\_I2CR[IEN] bit

### 15.2.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C\_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

### 15.2.4.10 Byte order

The block only supports the Little-Endian mode.

## 15.2.5 Initialization

### NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

### 15.2.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C\_IFDR[IC]) to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C\_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C\_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C\_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

### 15.2.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C\_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C\_I2DR), before proceeding to load data into the data register (I2C\_I2DR).

### 15.2.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C\_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C\_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C\_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C\_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 15-10](#).

The data transferring bit (I2C\_I2SR[ICF]) is cleared either by reading from I2C\_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C\_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C\_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C\_I2CR[MTX] should be toggled and a dummy read of the I2C\_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C\_I2SR[IAAS] = 1), the slave read/write bit I2C\_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C\_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

### 15.2.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C\_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

### 15.2.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

### 15.2.5.6 Slave mode

In the slave interrupt service routine (see [Figure 15-10](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C\_I2CR[MTX]) according to the I2C\_I2SR[SRW]. Writing to the I2C\_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C\_I2DR for slave transmits, or read from I2C\_I2DR in Slave Receive mode. A dummy read of I2C\_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C\_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C\_I2DR) then releases SCL so the master can generate a Stop signal.

### 15.2.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to I2Cn\_SDA stops, but I2Cn\_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C\_I2SR[IAL] = 1), and the Slave mode is selected (I2C\_I2CR[MSTA] = 0).

See the flow chart in [Figure 15-10](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C\_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C\_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C\_I2SR[IAL] bit gets set only for I2Cn\_SDA=0, I2Cn\_SCL=0/1, I2Cn\_SDA=1, and I2Cn\_SCL=0; but not for I2Cn\_SDA=1 and I2Cn\_SCL=1, which is the equivalent of Bus Idle state.

Figure 15-9. I2C Programming state diagram

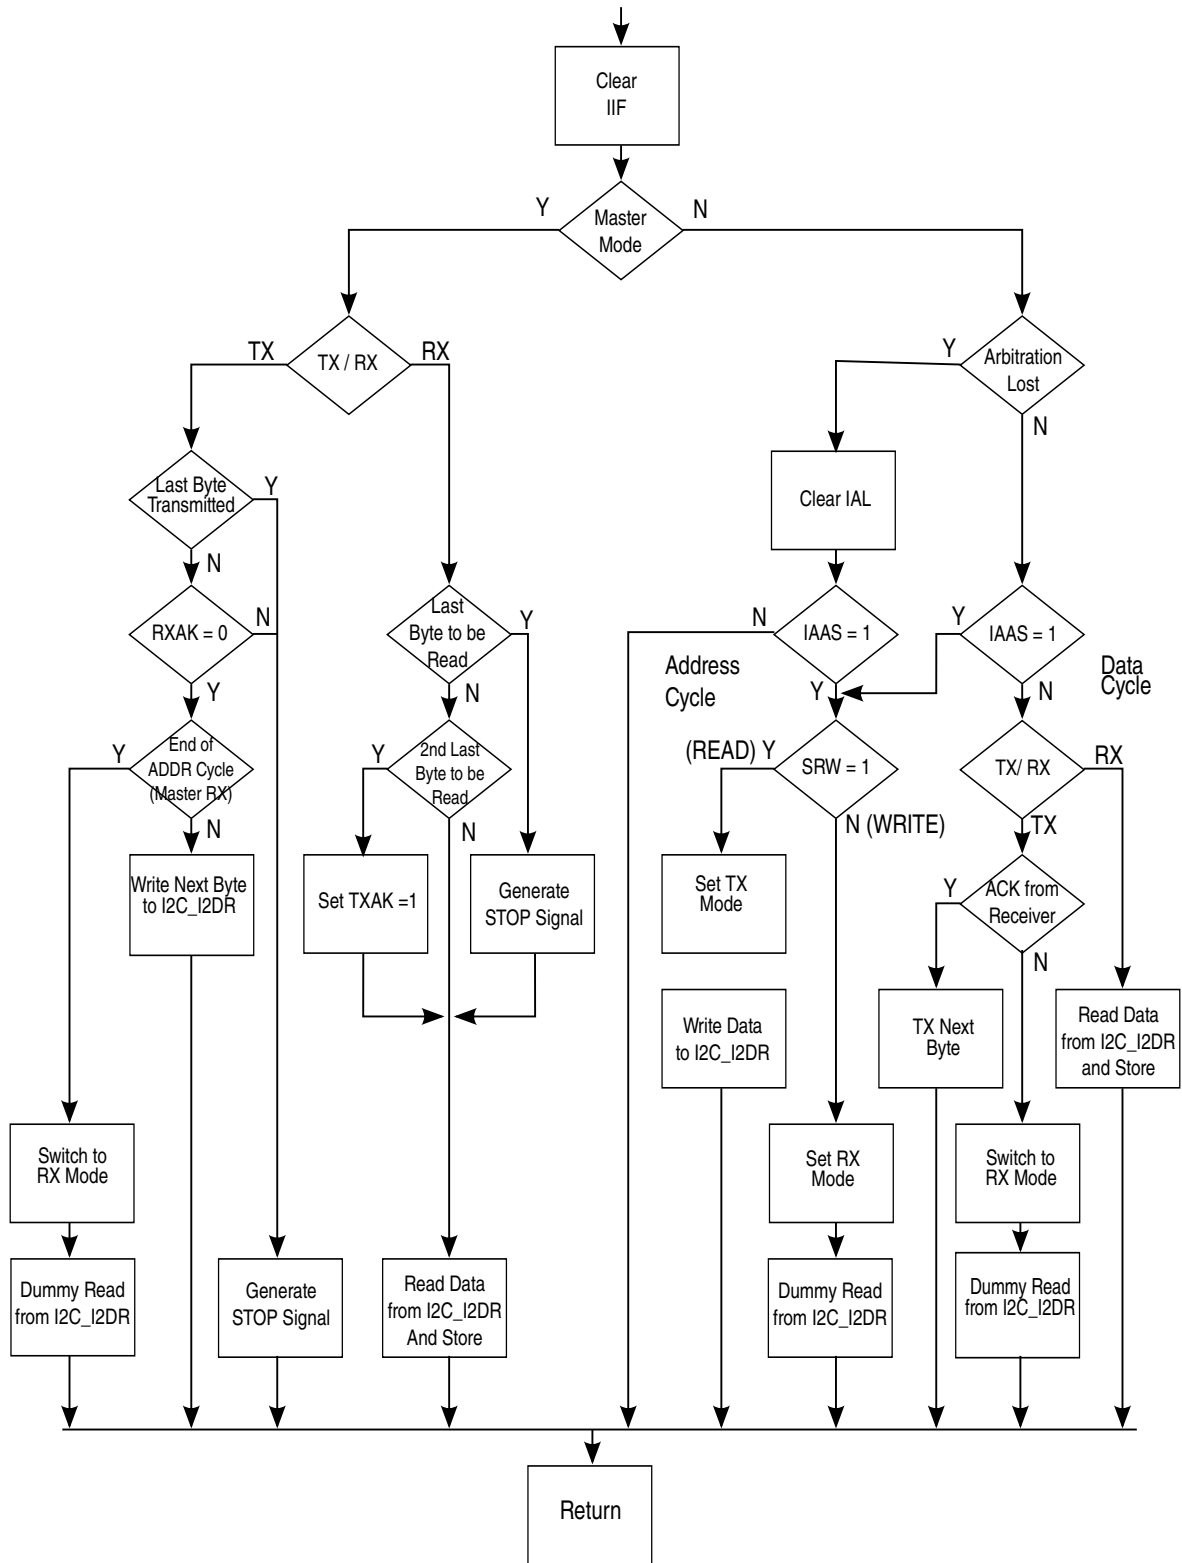

Figure 15-10. Flowchart of typical I2C interrupt routine

### **NOTE**

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C\_I2DR register should be performed so I2C can read the next receive data.

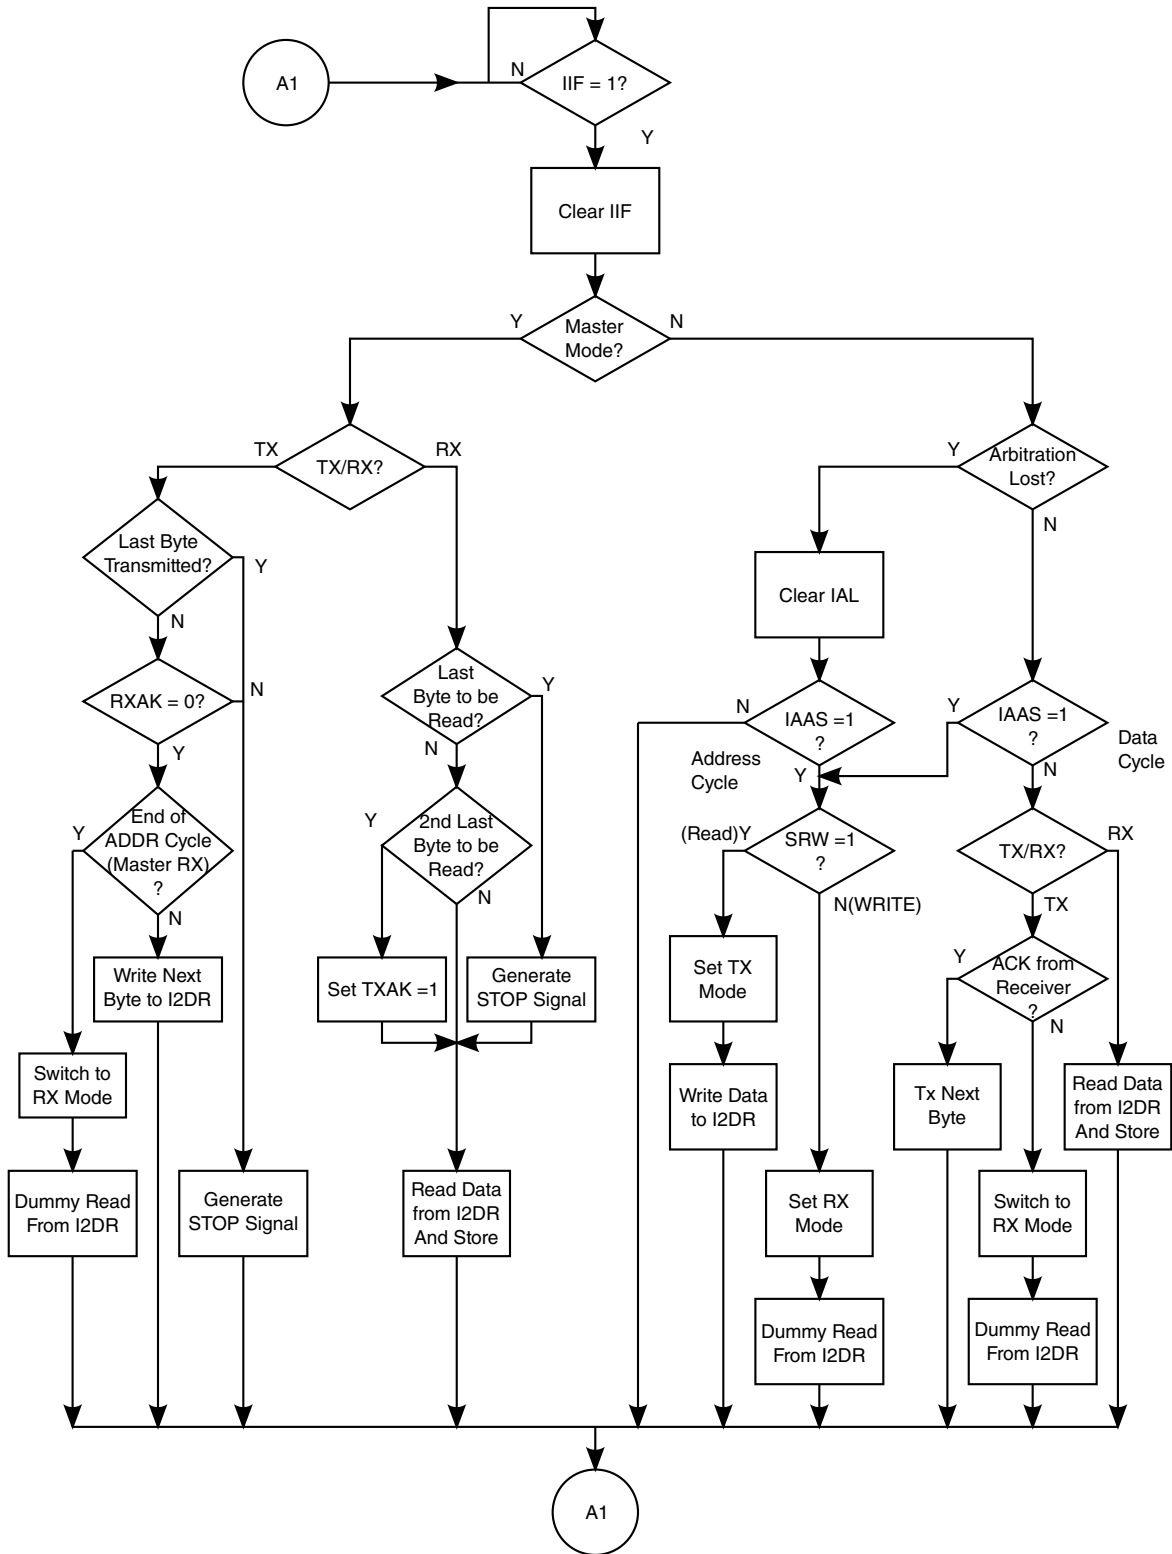

Figure 15-11. Flowchart for typical I2C polling routine

**NOTE**

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is  $T_{min} = 25 \mu s$  ( $=2.5 \times 10 \mu s$ ). This value can be calculated for any bus frequency. The formula is  $T_{min} = 10/F_{SCL}$ , where  $F_{SCL}$  is the frequency of the I2C clock (SCL).

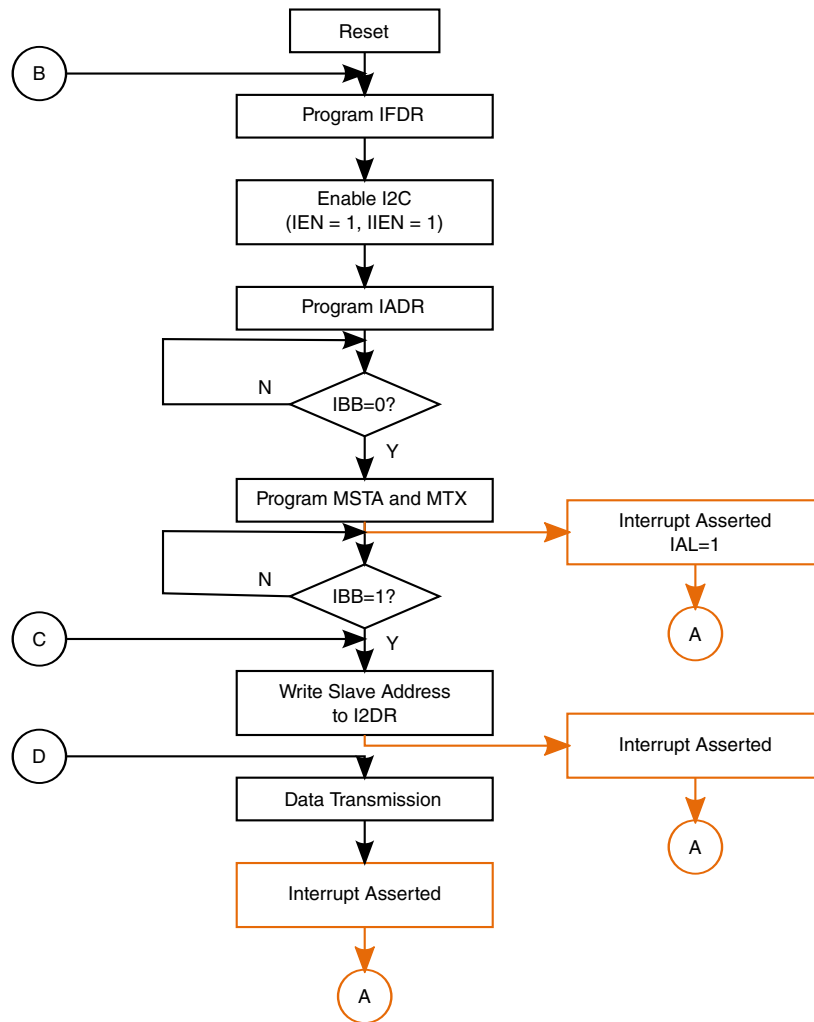

Figure 15-12. Detailed flowchart of a typical I2C Master Transmit mode, part 1

**Figure 15-13. Detailed flowchart of a typical I2C Master Transmit mode, part 2**

Figure 15-12 and Figure 15-13 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C\_I2CR register
- Perform the next data transfer by writing to the I2C\_I2DR register

#### NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

## 15.2.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C\_I2CR[RSTA] bit and before writing to the I2C\_I2DR register. The maximum possible clock period of the module clock is 78 ns.

## 15.2.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

### NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

### I2C memory map

## 15.2.7.1 I2C Address Register (I2Cx\_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								ADR							0
Write	0								0							0
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## I2Cx\_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus.  <b>NOTE:</b> The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

## 15.2.7.2 I2C Frequency Divider Register (I2Cx\_IFDR)

The I2C\_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

## I2C Controller (I2C)

The following table describes the divider and register values for the register field "IC."

**Table 15-26. I2C\_IFDR Register Field Values**

IC	Divider		IC	Divider		IC	Divider		IC	Divider
0x00	30		0x10	288		0x20	22		0x30	160
0x01	32		0x11	320		0x21	24		0x31	192
0x02	36		0x12	384		0x22	26		0x32	224
0x03	42		0x13	480		0x23	28		0x33	256
0x04	48		0x14	576		0x24	32		0x34	320
0x05	52		0x15	640		0x25	36		0x35	384

Read	0										IC					
Write	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### I2Cx\_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register.  <b>NOTE:</b> The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

### 15.2.7.3 I2C Control Register (I2Cx\_I2CR)

The I2C\_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	IEN	IEN	MSTA	MTX	TXAK	0	0	
Write						RSTA		
Reset	0	0	0	0	0	0	0	0

#### I2Cx\_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal.  0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 I2EN	I2C interrupt enable.  <b>NOTE:</b> If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written.  0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal.  <b>NOTE:</b> The module clock should be on for writing to the MSTA bit.  <b>NOTE:</b> The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

Table continues on the next page...

**I2Cx\_I2CR field descriptions (continued)**

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers.  0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit.  In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers.  <b>NOTE:</b> Writing TXAK applies only when the I2C bus is a receiver.  0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration.  0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

**15.2.7.4 I2C Status Register (I2Cx\_I2SR)**

The I2C\_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write	[Shaded]							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]
Reset	1	0	0	0	0	0	0	1

## I2Cx\_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[I IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. <b>NOTE:</b> When I2C is enabled (I2C_I2CR[I IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> <li>I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle.</li> <li>I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle.</li> </ul> For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. <ul style="list-style-type: none"> <li>A Start cycle is attempted when the bus is busy.</li> <li>A Repeated Start cycle is requested in Slave mode.</li> <li>A Stop condition is detected when the master did not request it.</li> </ul> <b>NOTE:</b> Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. <b>NOTE:</b> The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

*Table continues on the next page...*

**I2Cx\_I2SR field descriptions (continued)**

Field	Description
	<p>This causes a processor interrupt request (if the interrupt enable is asserted [I IEN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> <li>• One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).</li> <li>• An address is received that matches its own specific address in Slave Receive mode.</li> <li>• Arbitration is lost.</li> </ul>
0 RXAK	<p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.</p>

**15.2.7.5 I2C Data I/O Register (I2Cx\_I2DR)**

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

**I2Cx\_I2DR field descriptions**

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	<p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p><b>NOTE:</b> The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p>

## 15.3 Universal Asynchronous Receiver/Transmitter(UART)

### 15.3.1 Overview

Universal Asynchronous Receiver/Transmitter (UART) provides serial communication capability with external devices through a level converter and an RS-232 cable or through use of external circuitry that converts infrared signals to electrical signals (for reception) or transforms electrical signals to signals that drive an infrared LED (for transmission) to provide low speed IrDA compatibility.

UART supports NRZ encoding format , RS485 compatible 9 bit data format and IrDA-compatible infrared slow data rate (SIR) format.

[Figure 15-14](#) is the UART block diagram.

The "Module Clock" is the UART\_CLK which comes from CCM. The "Peripheral Clock" is the IPG\_CLK which comes from CCM.

Figure 15-14. UART Block Diagram

### 15.3.1.1 Features

The UART includes the following features:

- High-speed TIA/EIA-232-F compatible, up to Mbit/s
- Serial IR interface low-speed, IrDA-compatible (up to 115.2 Kbit/s)
- 9-bit or Multidrop mode (RS-485) support (automatic slave address detection)
- 7 or 8 data bits for RS-232 characters, or 9 bit RS-485 format
- 1 or 2 stop bits
- Programmable parity (even, odd, and no parity)
- Hardware flow control support for request to send (RTS\_B) and clear to send (CTS\_B) signals
- RS-485 driver direction control via CTS\_B signal
- Edge-selectable RTS\_B and edge-detect interrupts
- Status flags for various flow control and FIFO states
- Voting logic for improved noise immunity (16x oversampling)
- Transmitter FIFO empty interrupt suppression

- UART internal clocks enable/disable
- Auto baud rate detection (up to 115.2 Kbit/s)
- Receiver and transmitter enable/disable for power saving
- RX\_DATA input and TX\_DATA output can be inverted respectively in RS-232/RS-485 mode
- DCE/DTE capability
- RTS\_B, IrDA asynchronous wake (AIRINT), receive asynchronous wake (AWAKE) interrupts wake the processor from STOP mode
- Maskable interrupts
- Two DMA Requests (TxFIFO DMA Request and RxFIFO DMA Request)
- Escape character sequence detection
- Software reset (SRST\_B)
- Two independent, 32-entry FIFOs for transmit and receive
- The peripheral clock can be totally asynchronous with the module clock. The module clock determines baud rate. This allows frequency scaling on peripheral clock (such as during DVFS mode) while remaining the module clock frequency and baud rate.

### 15.3.1.2 Modes of operation

- Serial RS-232NRZ mode
- 9-bit RS-485 mode
- IrDA mode

To set UART in different modes, see the table below.

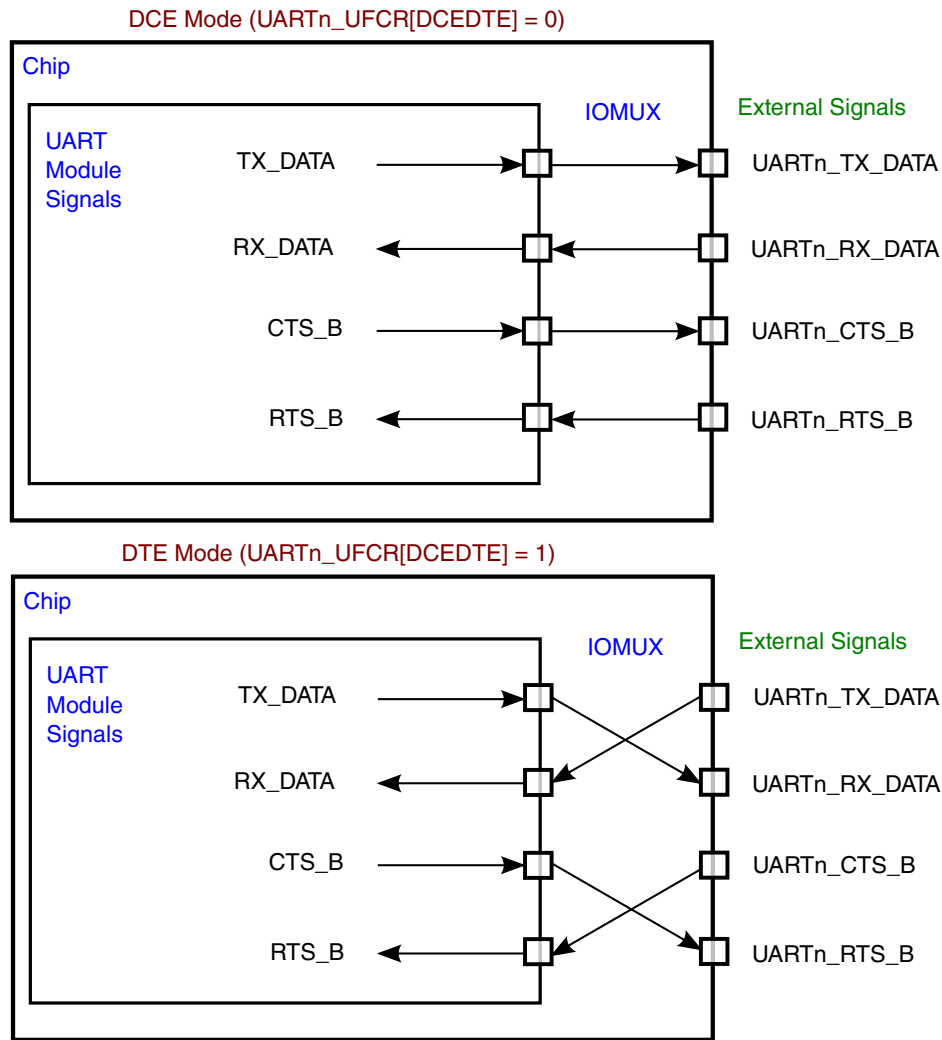

**Table 15-27. UART mode definition**

MDEN (UMCR[0])	IREN (UCR1[7])	UART Mode	Description
0	0	RS-232	RXD/TXD data is serial RS-232 NRZ format
0	1	IrDA (Interface)	RXD/TXD data is IrDA-compatible infrared slow data rate (SIR) format
1	0	RS-485	RXD/TXD data is RS485 compatible 9 bit data format
1	1	Undefined	Undefined

### 15.3.2 External Signals

The chip-level IOMUX modifies the direction and routing of the UART signals based on whether the UART is operating in DCE mode (UARTn\_UFCR[DCEDTE]=0) or DTE mode (UARTn\_UFCR[DCEDTE]=1). The routing of the external signals to the UART module is shown in the figure below.

## Universal Asynchronous Receiver/Transmitter(UART)

**Figure 15-15. UART external signals to module signals routing with respect to DCE/DTE mode**

The following table describes the external signals of UART:

**Table 15-28. UART External Signals**

Signal	Description	Pad	Mode	Direction
UART1_CTS_B	Clear to send	ENET1_RDATA0	ALT3	O
		SAI2_TXFS	ALT3	
UART1_RTS_B	Request to send	ENET1_RDATA1	ALT3	I
		SAI2_TXC	ALT3	
UART1_RX_DATA	Serial / infrared data receive	ENET1_RDATA2	ALT3	I
		UART1_RXD	ALT0	
UART1_TX_DATA	Serial / infrared data transmit	ENET1_RDATA3	ALT3	O
		UART1_TXD	ALT0	
UART2_CTS_B	Clear to send	LCD1_VSYNC	ALT4	O

*Table continues on the next page...*

**Table 15-28. UART External Signals (continued)**

Signal	Description	Pad	Mode	Direction
		SAI2_RXD	ALT3	
UART2_RTS_B	Request to send	LCD1_HSYNC	ALT4	I
		SAI2_TXD	ALT3	
UART2_RX_DATA	Serial / infrared data receive	LCD1_CLK	ALT4	I
		UART2_RXD	ALT0	
UART2_TX_DATA	Serial / infrared data transmit	LCD1_ENABLE	ALT4	O
		UART2_TXD	ALT0	
UART3_CTS_B	Clear to send	GPIO1_IO11	ALT3	O
		SD3_DATA7	ALT3

UART7_TX_DATA	Serial / infrared data transmit	SD1_DATA0	ALT2	O
		ECSPI2_MOSI	ALT1	
		EPDC1_DATA13	ALT3	
		SD1_DATA1	ALT2	

The user must configure the input path to the UART by properly configuring the DAISY bits in the IOMUXC\_UARTn\_RX\_DATA\_INPUT and the IOMUXC\_UARTn\_UART\_RTS\_B\_SELECT\_INPUT registers.

For IOMUXC\_UARTn\_UART\_RTS\_B\_SELECT\_INPUT[DAISY]:

- Configurations that select UARTn\_RTS\_B for the pad are only valid when UARTn\_UFCR[DCEDTE]=0 (DCE mode)
- Configurations that select UARTn\_CTS\_B for the pad are only valid when UARTn\_UFCR[DCEDTE]=1 (DTE mode)

For IOMUXC\_UARTn\_UART\_RX\_DATA\_B\_SELECT\_INPUT[DAISY]:

- Configurations that select UARTn\_RX\_DATA for the pad are only valid when UARTn\_UFCR[DCEDTE]=0 (DCE mode)
- Configurations that select UARTn\_TX\_DATA for the pad are only valid when UARTn\_UFCR[DCEDTE]=1 (DTE mode)

### 15.3.2.1 Detailed Signal Descriptions

#### 15.3.2.1.1 Interrupt Signals

##### 15.3.2.1.1.1 *interrupt\_uart* - UART Interrupt

Output interrupt request.

#### 15.3.2.1.2 DMA Request Signals

##### 15.3.2.1.2.1 *dma\_req\_rx* - Receiver DMA Request

Output DMA Request signal for receiver interface.

##### 15.3.2.1.2.2 *dma\_req\_tx* - Transmitter DMA Request

Output DMA Request signal for transmitter interface. Set at 0 when TXDMAEN (UCR1[3]) is at 1 and TRDY (USR1[13]) is also at 1.

#### 15.3.2.1.3 Special Signals

##### 15.3.2.1.3.1 *stop\_req* - Stop Mode

Input stop mode. Indicates to UART that ARM platform is going to enter in Stop Mode and clocks are going to stop running.

See [Low Power Modes](#) for more information about Stop Mode.

##### 15.3.2.1.3.2 *doze\_req* - Doze Mode

Input doze mode. ARM platform requests UART to switch in doze mode (power saving mode).

See [Low Power Modes](#) for more information about Doze Mode.

### 15.3.2.1.3.3 *debug\_req* - Debug Mode

Input debug mode. Indicates UART it has to enter in debug mode.

See [UART Operation in System Debug State](#), for more information about Debug Mode.

## 15.3.3 Clocks

The table found here describes the clock sources for UART.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 15-29. UART Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_perclk	uart_clk_root	Module clock

## 15.3.4 Functional Description

This section provides a complete functional description of the block.

### 15.3.4.1 Interrupts and DMA Requests

See the following table for the lists of all interrupt and DMA signals and associated interrupt and DMA sources of the UART. See register description section for explanation of interrupt/DMA enable and status.

**Table 15-30. Interrupts and DMA**

Interrupt/DMA Output	Interrupt/DMA Enable	Enable Register Location	Interrupt/DMA Flag	Flag Register Location
<i>interrupt_uart</i>	RRDYEN	UCR1 (bit 9)	RRDY	USR1 (bit 9)
	IDEN	UCR1 (bit 12)	IDLE	USR2 (bit 12)
	DREN	UCR4 (bit 0)	RDR	USR2 (bit 0)
	RXDSEN	UCR3 (bit 6)	RXDS	USR1 (bit 6)
	ATEN	UCR2 (bit 3)	AGTIM	USR1 (bit 8)
<i>interrupt_uart</i>	TXMPTYEN	UCR1 (bit 6)	TXFE	USR2 (bit 14)

*Table continues on the next page...*

Table 15-30. Interrupts and DMA (continued)

Interrupt/DMA Output	Interrupt/DMA Enable	Enable Register Location	Interrupt/DMA Flag	Flag Register Location
	TRDYEN	UCR1 (bit 13)	TRDY	USR1 (bit 13)
	TCEN	UCR4 (bit 3)	TXDC	USR2 (bit 3)
<i>interrupt_uart</i>	OREN	UCR4 (bit 1)	ORE	USR2 (bit 1)
	BKEN	UCR4 (bit 2)	BRCD	USR2 (bit 2)
	WKEN	UCR4 (bit 7)	WAKE	USR2 (bit 7)
	ADEN	UCR1 (bit 15)	ADET	USR2 (bit 15)
	ACIEN	UCR3 (bit 0)	ACST	USR2 (bit 11)
	ESCI	UCR2 (bit 15)	ESCF	USR1 (bit 11)
	ENIRI	UCR4 (bit 8)	IRINT	USR2 (bit 8)
	AIRINTEN	UCR3 (bit 5)	AIRINT	USR1 (bit 5)
	AWAKEN	UCR3 (bit 4)	AWAKE	USR1 (bit 4)
	FRAERREN	UCR3 (bit 11)	FRAERR	USR1 (bit 10)
	PARERREN	UCR3 (bit 12)	PARITYERR	USR1 (bit 15)
	RTSDEN	UCR1 (bit 5)	RTSD	USR1 (bit 12)
	RTSEN	UCR2 (bit 4)	RTSF	USR2 (bit 4)
	DTREN (DCE)	UCR3 (bit 13)	DTRF	USR2 (bit 13)
	RI (DTE)	UCR3 (bit 8)	RIDELT	USR2 (bit 10)
	DCD (DTE)	UCR3 (bit 9)	DCDDELTA	USR2 (bit 6)
	DTRDEN	UCR3 (bit 3)	DTRD	USR1 (bit 7)
	SADEN	UMCR (bit 3)	SAD	USR1 (bit 3)
<i>dma_req_rx</i>	RXDMAEN	UCR1 (bit 8)	RRDY	USR1 (bit 9)
	ATDMAEN	UCR1 (bit 2)	AGTIM	USR1 (bit 8)
	IDDMAEN	UCR4 (bit 6)	IDLE	USR2 (bit 12)
<i>dma_req_tx</i>	TXDMAEN	UCR1 (bit 3)	TRDY	USR1 (bit 13)

## 15.3.4.2 Clocks

This section describes clocks and special clocking requirements of the UART.

### 15.3.4.2.1 Clock requirements

UART module receives 2 clocks, *peripheral\_clock* and *module\_clock*. The *peripheral\_clock* is used as write clock of the TxFIFO, read clock of the RxFIFO and synchronization of the modem control input pins. It must always be running when UART is enabled. There is an exception in stop mode (see [Clocking in Low-Power Modes](#)).

The *module\_clock* is for all the state machines, writing RxFIFO, reading TxFIFO, etc. It must always be running when UART is sending or receiving characters. This clock is used in order to allow frequency scaling on *peripheral\_clock* without changing configuration of baud rate (*module\_clock* staying at a fixed frequency).

The constraints on *peripheral\_clock* and *module\_clock* are as follows:

- *peripheral\_clock* and *module\_clock* can totally be asynchronous. They can also be synchronous.
- Due to the 16x oversampling of the incoming characters, *module\_clock* frequency must always be greater or equal to 16x the maximum baud rate. For example, if max baud rate is 4 Mbit/s, *module\_clock* must be greater or equal to  $4 \text{ M} \times 16 = 64 \text{ MHz}$ .

### NOTE

The restriction that *peripheral\_clock* frequency must be higher or equal to 16x baud rate has been removed. There is no limitation on *peripheral\_clock* frequency to baud rate.

#### 15.3.4.2.2 Maximum Baud Rate

The max baud rate the UART can support is determined by the max frequency of the *module\_clock*.

For example, if the SoC can provide the fastest *module\_clock* 66.5 MHz, the UART can transmit and receive serial data with the maximum baud rate  $66.5\text{M}/16 = 4.15 \text{ Mbit/s}$ .

The UART supports serial IR interface low speed. In the low speed IrDA mode, the max baud rate is 115.2 Kbit/s. To support the 115.2 Kbit/s, *module\_clock* frequency must be higher or equal to 1.8432 MHz.

#### 15.3.4.2.3 Clocking in Low-Power Modes

The UART supports 2 low-power modes: DOZE and STOP.

In STOP mode (input pin *stop\_req* is at '1'), the UART doesn't need any clock. In this mode the UART can wake-up the ARM platform with the asynchronous interrupts (see [Low Power Modes](#)).

- If before entering in STOP mode the software has enabled RTSDEN interrupt, when RTS will change state (put at '0' by external device started to send), the asynchronous interrupt will wake-up the system, *peripheral\_clock* and *module\_clock* will be provided to the UART before first start bit, so that no data will be lost.
- If RTS doesn't change state (already at '0' before entering in STOP mode), then wake-up interrupt (AWAKE) will be sent at the arrival of first Start bit (on falling

edge). In this case, the UART must receive the *peripheral\_clock* and *module\_clock* during the first half of start bit to correctly receive this character (for example, at 115.2 Kbit/s, UART must receive *peripheral\_clock* and *module\_clock* at maximum 4.3 microseconds after falling edge of Start bit). If the UART receives *peripheral\_clock* and *module\_clock* too late, first character will be lost, and so should be dropped. Also, if autobaud detection is enabled, the first character won't be correctly received and another autobaud detection will need to be initiated.

In Doze mode, UART behavior is programmable through DOZE bit (UCR1[1]). If DOZE bit is set to '1', then UART is disabled in Doze mode, and in consequence, UART clocks can be switched-off (after being sure UART is not transmitting nor receiving). On the contrary, if DOZE bit is set to '0', UART is enabled and it must receive *peripheral\_clock* and *module\_clock* .

### 15.3.4.3 General UART Definitions

Definitions of terms that occurs the following discussions are given in this section.

- Bit Time-The period of time required to serially transmit or receive 1 bit of data (1 cycle of the baud rate frequency).
- Start bit-The bit time of a logic 0 that indicates the beginning of a data frame. A start bit begins with a 1-to-0 transition, and is preceded by at least 1 bit time of logic 1.
- Stop bit-1 bit time of logic 1 that indicates the end of a data frame.
- BREAK-A frame in which all of the data bits, including the stop bit, are logic 0. This type of frame is usually sent to signal the end of a message or the beginning of a new message.
- Mark - When no data is being sent, the serial port's transmit pin's voltage is 1 and is said to be in a MARK state.
- Space - The serial port can also be forced to keep the transmit pin at a 0 and is said to be the SPACE or BREAK state.
- Frame-A start bit followed by a specified number of data or information bits and terminated by a stop bit. The number of data or information bits depends on the format specified and must be the same for the transmitting device and the receiving device. The most common frame format is 1 start bit followed by 8 data bits (least significant bit first) and terminated by 1 stop bit. An additional stop bit and a parity bit also can be included.
- Framing Error-An error condition that occurs when the stop bit of a received frame is missing, usually when the frame boundaries in the received bit stream are not synchronized with the receiver bit counter. Framing errors can go undetected if a data bit in the expected stop bit time happens to be a logic 1. A framing error is always present on the receiver side when the transmitter is sending BREAKs. However,

when the UART is programmed to expect 2 stop bits and only the first stop bit is received, this is not a framing error by definition.

- Parity Error-An error condition that occurs when the calculated parity of the received data bits in a frame does not match the parity bit received on the RX\_DATA input. Parity error is calculated only after an entire frame is received.
- Idle-One in NRZ encoding format and selectable polarity in IrDA mode.
- Overrun Error-An error condition that occurs when the latest character received is ignored to prevent overwriting a character already present in the UART receive buffer (RxFIFO). An overrun error indicates that the software reading the buffer (RxFIFO) is not keeping up with the actual reception of characters on the RX\_DATA input.

#### **15.3.4.3.1 RTS\_B - UART Request To Send**

The UART Request To Send input controls the transmitter. The modem or other terminal equipment signals the UART when it is ready to receive by setting '0' on the RTS\_B pin.

Normally, the transmitter waits until this signal is active (low) before transmitting a character, however when the Ignore RTS (IRTS) bit is set, the transmitter sends a character as soon as it is ready to transmit. An interrupt (RTSD) can be posted on any transition of this pin and can wake the ARM platform from STOP mode on its assertion. When RTS\_B is set to '1' during a transmission, the UART transmitter finishes transmitting the current character and shuts off. The contents of the TxFIFO (characters to be transmitted) remain undisturbed. The operation of this input is the same regardless of whether the UART is in DTE or DCE mode.

#### **15.3.4.3.2 RTS Edge Triggered Interrupt**

The input to the RTS\_B pin can be programmed to generate an interrupt on a selectable edge.

See the table below for summary of the operation of the RTS edge triggered interrupt (RTSF).

To enable the RTS\_B pin to generate an interrupt, set the request to send interrupt enable (RTSEN) bit (UCR2[4]) to 1. Writing 1 to the RTS\_B edge triggered interrupt flag (RTSF) bit (USR2[4]) clears the interrupt flag. The interrupt can occur on the rising edge, falling edge, or either edge of the RTS\_B input. The request to send edge control (RTEC) field (UCR2[10:9]) programs the edge that generates the interrupt. When RTEC is set to 0x00 and RTSEN = 1, the interrupt occurs on the rising edge (default). When RTEC is set to 0x01 and RTSEN = 1, the interrupt occurs on the falling edge. When RTEC is set to 0x1X and RTSEN = 1, the interrupt occurs on either edge. This is a synchronous interrupt. The RTSF bit is cleared by writing 1 to it. Writing 0 to RTSF has no effect.

**Table 15-31. RTS\_B Edge Triggered Interrupt Truth Table**

RTS_B	RTSEN	RTEC [1]	RTEC [0]	RTSF	Interrupt Occurs On...	interrupt_uart
X	0	X	X	0	Interrupt disabled	1
1->0	1	0	0	0	Rising edge	1
0->1	1	0	0	1	Rising edge	0
1->0	1	0	1	1	Falling edge	0
0->1	1	0	1	0	Falling edge	1
1->0	1	1	X	1	Either edge	0
0->1	1	1	X	1	Either edge	0

There is another RTS\_B interrupt that is not programmable. The status bit RTSD asserts the *interrupt\_uart* interrupt when the RTS\_B delta interrupt enable = 1. This is an asynchronous interrupt. The RTSD bit is cleared by writing 1 to it. Writing 0 to the RTSD bit has no effect.

#### 15.3.4.3.3 CTS\_B - Clear To Send

This output pin serves two purposes. Normally, the receiver indicates that it is ready to receive data by asserting this pin (low). When the CTS\_B trigger level is programmed to trigger at 32 characters received and the receiver detects the valid start bit of the 33 character, it de-asserts this pin. The operation of this output is the same regardless of whether the UART is in DTE or DCE mode.

#### 15.3.4.3.4 Programmable CTS\_B Deassertion

The CTS\_B output can also be programmed to deassert when the RxFIFO reaches a certain level. Setting the CTS trigger level (UCR4[15:10]) at any value less than 32 deasserts the CTS\_B pin on detection of the valid start bit of the N + 1 character (where N is the trigger level setting). However, the receiver continues to receive characters until the RxFIFO is full.

#### 15.3.4.3.5 TX\_DATA - UART Transmit

This is the transmitter serial output. When operating in RS-232/RS-485 mode, NRZ encoded data is transmitted, and the data can be inverted (controlled by INVT (UCR3[1])) before transmitted. When operating in infrared mode, a 3/16 bit-period pulse is output for each 0 bit transmitted, and no pulse is output for each 1 bit transmitted.

For RS-232/RS-485 applications, this pin must be connected to an RS-232/RS-485 transmitter. The operation of this output is the same regardless of whether the UART is in DTE or DCE mode. See [Figure 15-16](#).

### 15.3.4.3.6 RX\_DATA - UART Receive

This is the receiver serial input. When operating in RS-232/RS-485 mode, NRZ encoded data is expected, and the data can be inverted (controlled by INVR (UCR4[9])) before sampled. When operating in infrared mode, a narrow pulse is expected for each 0 bit received and no pulse is expected for each 1 bit received.

External circuitry must convert the IR signal to an electrical signal. RS-232/RS-485 applications require an external RS-232/RS-485 receiver to convert voltage levels. The operation of this input is the same regardless of whether the UART is in DTE or DCE mode. See the figure below.

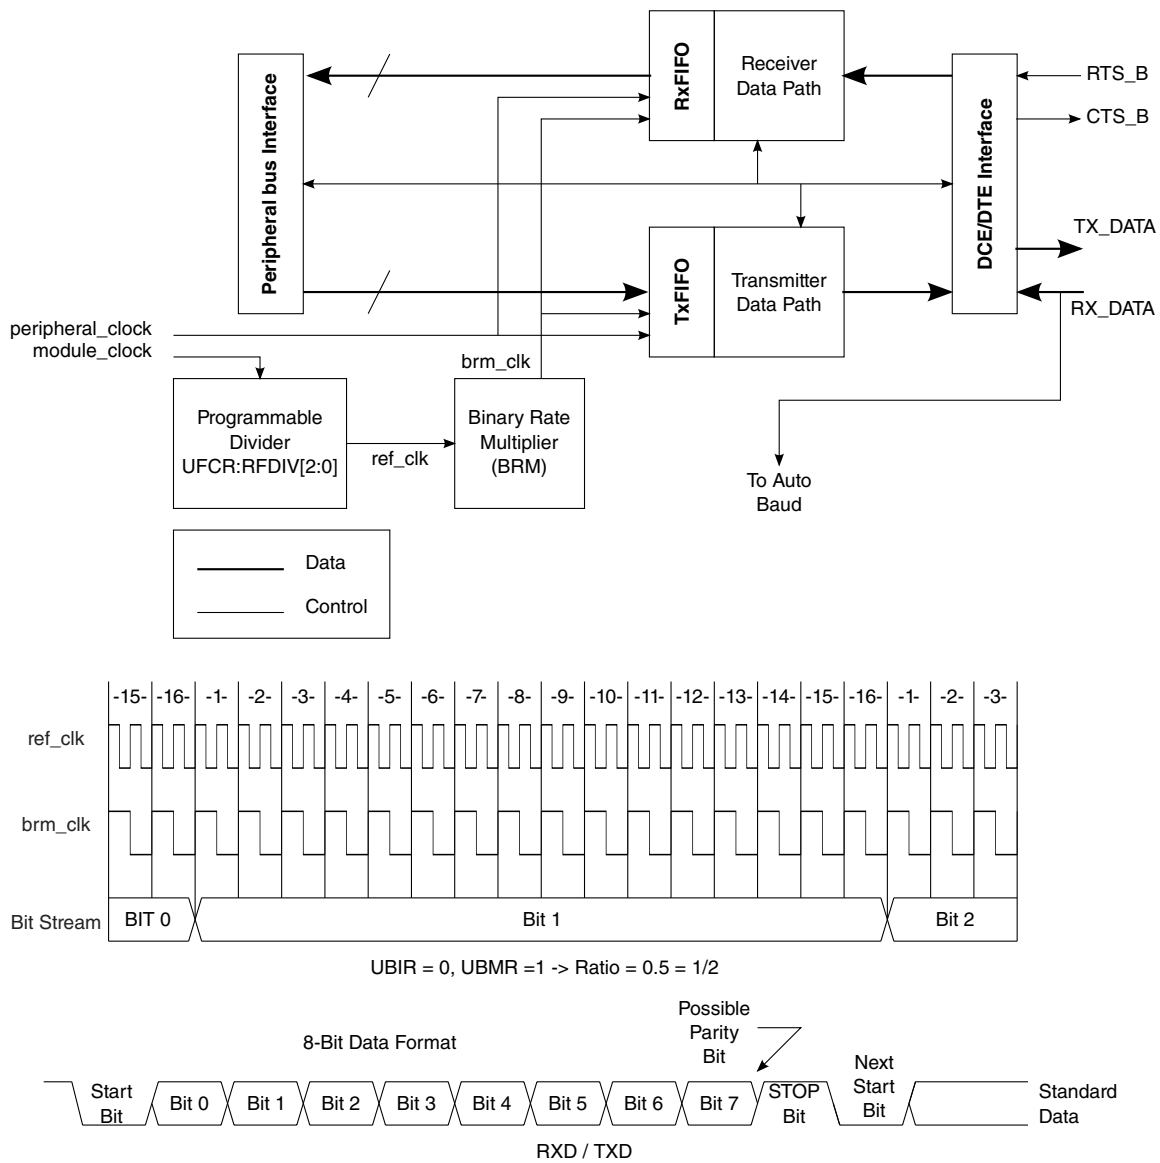

Figure 15-16. UART Simplified Block and Clock Generation Diagrams

### 15.3.4.4 UART Ports Mapping in DCE/DTE Mode

The table below shows UART signal mapping in DCE and DTE mode.

IO Pads Name	DCE mode		DTE mode	
	IO direction	Uart function port	IO direction	Uart function port
UART_CTS_B	O	CTS_B	I	RTS_B
UART_RTS_B	I	RTS_B	O	CTS_B
UART_TXD	O	TXD	I	RXD
UART_RXD	I	RXD	O	TXD

### 15.3.4.5 Transmitter

The transmitter accepts a parallel character from the ARM platform and transmits it serially. The start, stop, and parity (when enabled) bits are added to the character.

When the ignore RTS bit (IRTS) is set, the transmitter sends a character as soon as it is ready to transmit. RTS\_B can be used to provide flow-control of the serial data. When RTS\_B is set to '1', the transmitter finishes sending the character in progress (if any), stops, and waits for RTS\_B to be set to '0' again. Generation of BREAK characters and parity errors (for debugging purposes) is supported. The transmitter operates from the clock provided by the Binary Rate Multiplier(BRM). Normal NRZ encoded data is transmitted when the IR interface is disabled.

The transmitter FIFO (TxFIFO) contains 32 bytes. The data is written to TxFIFO by writing to the UTXD register with the byte data to the [7:0] bits. The data is written consecutively if the TxFIFO is not full. It is read (internally) consecutively if the TxFIFO is not empty. TXFULL bit (UTS[4]) can be used to control whether TxFIFO is full or not. The TxFIFO can be written regardless of the transmitter is disabled or enabled. If the UART is disabled, user can still write data into the TxFIFO correctly. But in this case the write access will yield to a transfer error.

#### 15.3.4.5.1 Transmitter FIFO Empty Interrupt Suppression

The transmitter FIFO empty interrupt suppression logic suppresses the TXFE interrupt between writes to the TxFIFO.

When TxFIFO is empty, the software can either send one or several characters. If the software sends one character, it would write the character into the UTXD register, then that character is immediately transferred to the transmitter shift register, assuming the

transmitter is already enabled. Without interrupt suppression logic, the TXFE interrupt flag would be set immediately. But, with this logic, the interrupt flag is set when the last bit of the character has been transmitted, for example, before the transmission of the parity bit (if exists) and the stop bit(s).

So, the suppression logic doesn't immediately send the TXFE interrupt flag. It allows the software to write another character to the TxFIFO before the interrupt flag is asserted.

When the transmitter shift register empties before another character is written to the TxFIFO, the interrupt flag is asserted. Writing data to the TxFIFO would release the interrupt flag. The interrupt flag is asserted on the following conditions:

- System Reset
- UART software reset
- When a single character has been written to Transmitter FIFO and then the Transmitter FIFO and the Transmitter Shift Register become empty until another character is written to the Transmitter FIFO
- The last character in the TxFIFO is transferred to the shift register, when TxFIFO contains two or more characters. See the figure below.

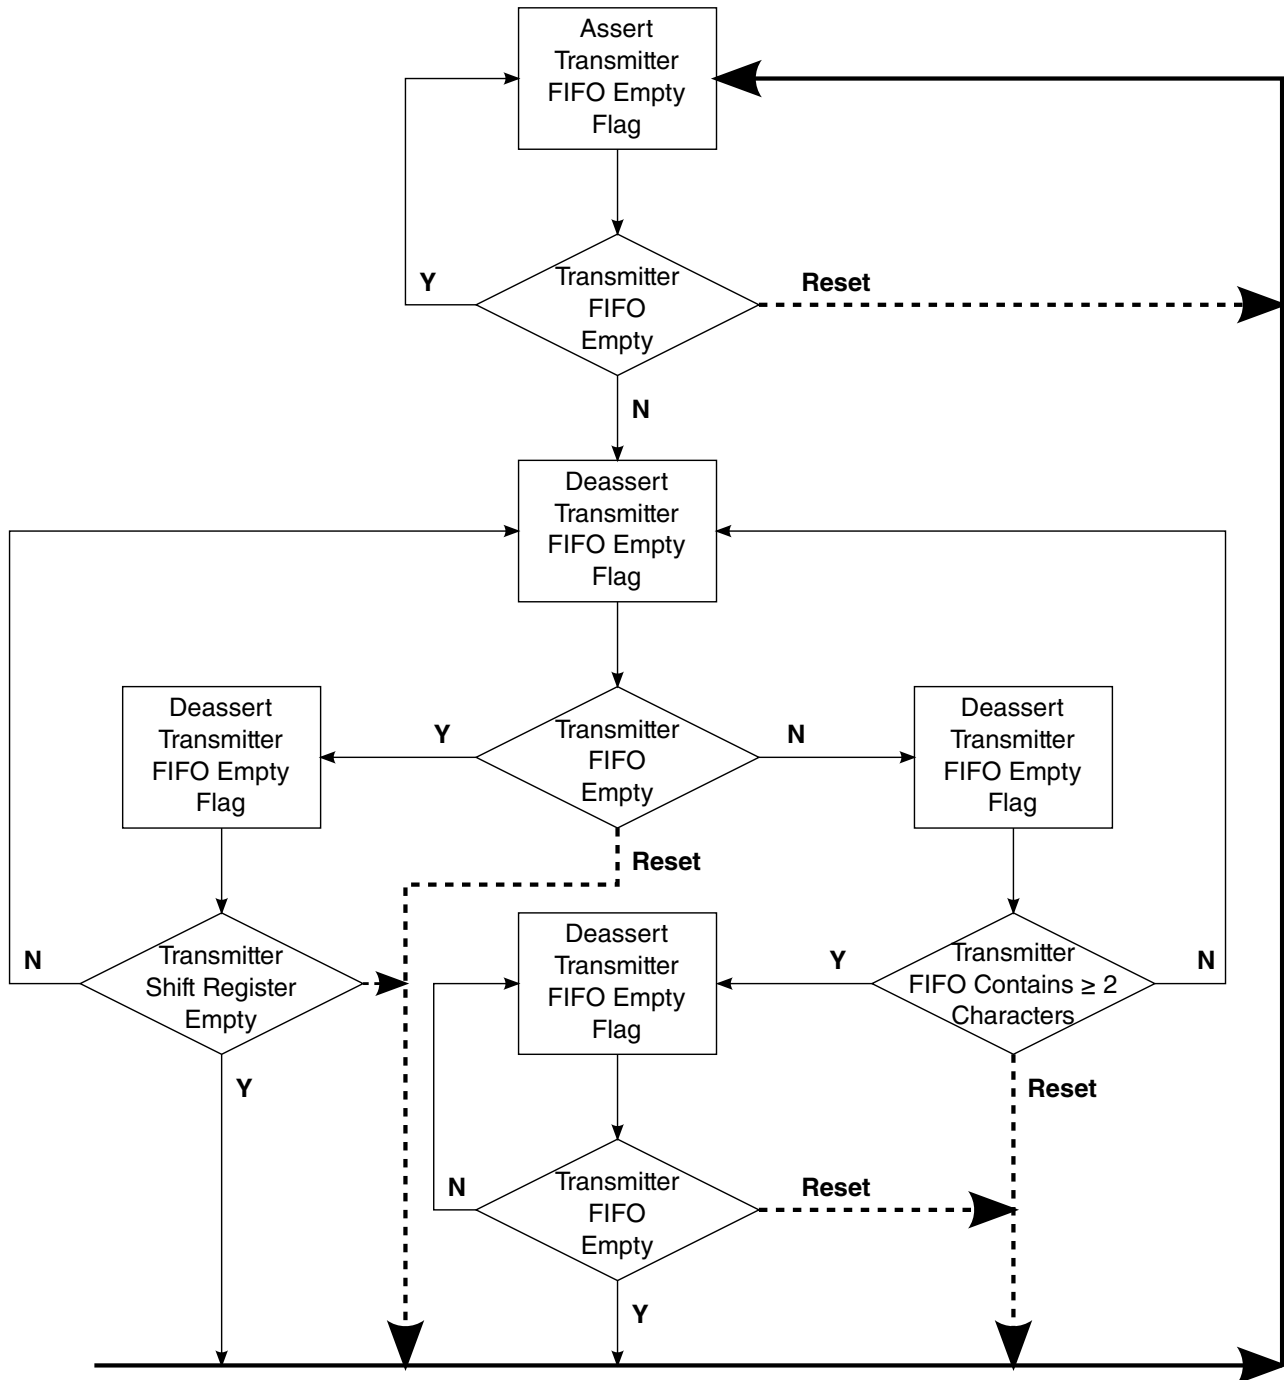

Figure 15-17. Transmitter FIFO Empty Interrupt Suppression Flow Chart

### 15.3.4.5.2 Transmitting a Break Condition

Asserting SNDBRK bit of the UCR1 Register forces the transmitter to send a break character (continuous zeros). The transmitter will finish sending the character in progress (if any) before sending break until this bit is reset.

The user is responsible to ensure that this bit is high for long enough to generate a valid BREAK. The transmitter samples SNDBRK after every bit is transmitted. Following completion of the BREAK transmission, the UART will transmit two mark bits. The user can continue to fill the FIFO and any character remaining will be transmitted when the break is terminated.

### **15.3.4.6 Receiver**

See the figure below for the receiver flow chart.

The receiver accepts a serial data stream and converts it into parallel characters. When enabled, it searches for a start bit, qualifies it, and samples the following data bits at the bit-center.

Jitter tolerance and noise immunity are provided by sampling at a 16x rate and using voting techniques to clean up the samples. Once the start bit is found, the data bits, parity bit (if enabled), and stop bits (either 1 or 2 depending on user selection) are shifted in. Parity is checked and its status reported in the URXD register when parity is enabled. Frame errors and BREAKs are also checked and reported. When a new character is ready to be read by the ARM platform from the RxFIFO, the receive data ready (RDR =  $USR2[0]$ ) bit is asserted and an interrupt is posted (if  $DREN = UCR4[0] = 1$ ). If the receiver trigger level is set to 2 ( $RXTL[5:0] = UFCR[5:0] = 2$ ), and 2 chars have been received into RxFIFO, the receiver ready interrupt flag ( $RRDY = USR1[9]$ ) is asserted and an interrupt is posted if the receiver ready interrupt enable bit is set ( $RRDYEN = UCR1[9] = 1$ ). If the UART Receiver Register (URXD) is read once, and in consequence there is only 1 character in the RxFIFO, the interrupt generated by the RDR bit is automatically cleared. The RRDY bit is cleared when the data in the RxFIFO falls below the programmed trigger level.

Normal NRZ encoded data is expected when the IR interface is disabled. The RxFIFO contains 32 half-word entries. Characters received are written consecutively into this FIFO. If the FIFO is full and a 33rd character is received, this character will be ignored and the  $USR2[ORE]$  bit will be set.

Figure 15-18. Receiver Flow Chart

### 15.3.4.6.1 Idle Line Detect

The receiver logic block includes the ability to detect an idle line. Idle lines indicate the end or the beginning of a message.

For an idle condition to occur:

- RxFIFO must be empty and
- RX\_DATA pin must be idle for more than a configured number of frames (ICD[1:0] = UCR1[11:10]).

When the idle condition detected interrupt enable (IDEN = UCR1[12]) is set and the line is idle for 4 (default), 8, 16, or 32 (maximum) frames, the detection of an idle condition flags an interrupt (see the table below). When an idle condition is detected, the IDLE (USR2[12]) bit is set. Clear the IDLE bit by writing 1 to it. Writing 0 to the IDLE bit has no effect.

**Table 15-32. Detection Truth Table**

IDEN	ICD [1]	ICD [0]	IDLE	<i>interrupt_uart</i>
0	X	X	0	1
1	0	0	asserted after 4 idle frames	asserted after 4 idle frames
1	0	1	asserted after 8 idle frames	asserted after 8 idle frames
1	1	0	asserted after 16 idle frames	asserted after 16 idle frames
1	1	1	asserted after 32 idle frames	asserted after 32 idle frames

**NOTE:** This table assumes that no other interrupt is set at the same time this interrupt is set for the *interrupt\_uart* signal. This table shows how this interrupt affects the *interrupt\_uart* signal.

During a normal message there is no idle time between frames. When all of the information bits in a frame are logic 1s, the start bit ensures that at least one logic 0 bit time occurs for each frame so that the IDLE bit is not asserted.

### 15.3.4.6.2 Aging Character Detect

The receiver block also includes the possibility to detect when at least one character has been sitting into the RxFIFO for a time corresponding to 8 characters. This aging character capability allows the UART to inform the ARM platform that there is less character into the RxFIFO than the Rx trigger and, no new character has been detected on the RXD line.

The aging capability is a timer which starts to count as soon as the RxFIFO is not empty and its trigger level is not reached (RRDY=0). This counter is reset when either a RxFIFO read is performed or another character starts to present on the RXD line. If none of those two events occurs, the bit AGTIM (USR1[8]) is set when the counter has

measured a time corresponding to 8 characters. AGTIM is cleared by writing a 1 to it. AGTIM can flag an interrupt to ARM platform on *interrupt\_uart* if ATEN (UCR2[3]) has been set.

To summarize, AGTIM is set when:

- There is at least one character into RxFIFO.
- No read has occurred on RxFIFO and RXD line has stayed high, for a time corresponding to 8 characters.
- The RxFIFO trigger is not reached (RRDY=0)

### 15.3.4.6.3 Receiver Wake

The WAKE bit (USR2[7]) is set when the receiver detects a qualified Start bit. For this, two conditions must be fulfilled, firstly a falling edge on RX\_DATA line must be detected and secondly the RX\_DATA line must stay at low level for more than a half-bit duration.

When the wake interrupt enable WKEN (UCR4[7]) bit is enabled, the receiver flags an interrupt (*interrupt\_uart*) if the WAKE status bit is set. The WAKE bit is cleared by writing 1 to it. Writing 0 to the WAKE bit has no effect. The WAKE status bit can be asserted in either serial RS-232 mode or IR mode. The generation of the WAKE interrupt needs the clock *module\_clock*.

When the asynchronous wake interrupt (AWAKE) is enabled (AWAKEN = UCR3[4] = 1), and the ARM platform is in STOP mode, and UART clocks have been shut-off, then a falling edge detected on the receive pin (RX\_DATA) asserts the AWAKE bit (USR1[4]) and the *interrupt\_uart* interrupt to wake the ARM platform from STOP mode. Re-enable UART clocks and clear the AWAKE bit by writing 1 to it. Writing 0 to the AWAKE bit has no effect. When IR interface is enabled (UCR1[7]=1), the AWAKE bit is always not asserted. The generation of the asynchronous AWAKE interrupt does not need any clocks.

In IR mode, if the asynchronous IR WAKE interrupt is enabled (AIRINTEN = UCR3[5] = 1), and if the ARM platform is in STOP mode (UART clocks are off when ARM platform in STOP mode), then the detection of a falling edge on the receive pin (RXD\_IR), asserts the AIRINT bit (USR1[5]), and the *interrupt\_uart* interrupt. This interrupt wakes the ARM platform from STOP mode. Software re-enables UART clocks and clear the AIRINT bit by writing 1 to it. Writing 0 to the AIRINT bit has no effect. When IR interface is disabled (UCR1[7]=0), the AIRINT bit is always not asserted. The generation of the asynchronous AIRINT interrupt does not need any clocks.

Recommended procedure for programming the asynchronous interrupts is to first clear them by writing 1 to the appropriate bit in the UART Status Register 1 (USR1). Poll or enable the interrupt for the Receiver IDLE Interrupt Flag (RXDS) in the USR1. When asserted, the RXDS bit indicates to the software that the receiver state machine is in the idle state, the next state is idle, and the RX\_DATA pin is idle (high). After following this procedure, enable the asynchronous interrupt and enter STOP mode.

### 15.3.4.6.4 Receiving a BREAK Condition

A BREAK condition is received when the receiver detects all 0s (including a 0 during the bit time of the stop bit) in a frame. The BREAK condition asserts the BRCD bit (USR2[2]) and writes only the first BREAK character to the RxFIFO. Clear the BRCD bit by writing 1 to it. Writing 0 to the BRCD bit has no effect.

Asserting BRCD would generate an interrupt on *interrupt\_uart*. The interrupt generation can be masked using the control bit BKEN (UCR4[2]). Receiving a break condition will also effect the following bits in the receiver register URXD:

URXD(11) = BRK. While high this bit indicates that the current char was detected as a break.

URXD(12) = FRMERR. The frame error bit will always be set when BRK is set.

URXD(10) = PRERR. If odd parity was selected the parity error bit will also be set when BRK is set.

URXD(14) = ERR. The error detect bit indicates that the character present in the rx data field has an error status. This can be asserted by a break.

### 15.3.4.6.5 Vote Logic

The vote logic block provides jitter tolerance and noise immunity by sampling with respect to a 16x clock (*brm\_clk*) and using voting techniques to clean up the samples. The voting is implemented by sampling the incoming signal constantly on the rising edge of the *brm\_clk*.

See [Figure 15-19](#). The receiver is provided with the majority vote value, which is 2 out of the 3 samples. For examples of the majority vote results of the vote logic, see the following table.

**Table 15-33. Majority Vote Results**

Samples	Vote
000	0

*Table continues on the next page...*

**Table 15-33. Majority Vote Results (continued)**

Samples	Vote
101	1
001	0
111	1

The vote logic captures a sample on every rising edge of *brm\_clk*, however the receiver uses 16x oversampling to take its value in the middle of the sample character.

The receiver starts to count when the Start bit is set however it does not capture the contents of the RxFIFO at the time the Start bit is set. The start bit is validated when 0s are received for 7 consecutive 1/16 of bit times following the 1-to-0 transition. Once the counter reaches 0xF, it starts counting on the next bit and captures it in the middle of the sampling frame (see [Table 15-33](#)). All data bits are captured in the same manner. Once the stop bit is detected, the receiver shift register (SIPO\_OUT) data is parallel shifted to the RxFIFO.

**Figure 15-19. Majority Vote Results**

A new feature has been recently implemented, it allows to re-synchronize the counter on each edge of *RX\_DATA* line. This is automatic and allows to improve the immunity of UART against signal distortion.

There is a special case when the *brm\_clk* frequency is too low and is unable to capture a 0 pulse in IrDA. In this case, the software must set the IRSC (UCR4[5]) bit so that the reference clock (after internal divider) is used for the voting logic. The pulse is validated by counting the length of the pulse.

Refer to [Infrared Interface](#) for more details.

### 15.3.4.6.6 Baud Rate Automatic Detection Logic

When the baud rate automatic detection logic is enabled, the UART locks onto the incoming baud rate. To enable this feature, set the automatic detection of baud rate bit (ADBR = UCR1[14] = 1) and write 1 to the ADET bit (USR2[15]) to clear it.

When ADET=0 and ADBR =1, the detection starts. Then, once the beginning of start bit (transition from 1-to-0 of RX\_DATA) has been detected, UART starts a counter (UBRC) working at reference frequency. Once the end of start bit is detected (transition from 0-to-1 of RX\_DATA), the value of UBRC - 1 is directly copied into UBMR register. UBIR register is filled with 0x000F.

So, at the end of start bit, registers gets following values:

```
UBRC = number of reference clock periods (after divider) during Start bit.
UBIR = 0x000F
UBMR = UBRC - 1
```

The updated values of the 3 registers can be read.

See [Table 15-34](#) for list of parameters for baud rate detection and [Figure 15-20](#) for baud rate detection protocol diagram.

If any of the UART BRM registers are simultaneously written by the baud rate automatic detection logic and by the peripheral data bus, the peripheral data bus would have lower priority.

**Table 15-34. Baud Rate Automatic Detection**

ADBR	ADET	Baud Rate Detection	<i>interrupt_uart</i>
0	X	Manual Configuration	1
1	0	Auto Detection Started	1
1	1	Auto Detection Complete	0

**NOTE:** This table assumes that no other interrupt is set at the same time this interrupt is set for the *interrupt\_uart* signal.

**Note:** LSB Transmitted first.

**Figure 15-20. Baud Rate Detection Protocol Diagram**

#### 15.3.4.6.6.1 Baud Rate Automatic Detection Protocol

The receiver must receive an ASCII character "A" or "a" to verify proper detection of the incoming baud rate. When an ASCII character "A" (0x41) or "a" (0x61) is received and no error occurs, the Automatic Detect baud rate bit is set (ADET=1) and if the interrupt is enabled (ADEN=UCR1[15]=1), an interrupt *interrupt\_uart* is generated.

When an ASCII character "A" or "a" is not received (because of a bit error or the reception of another character), the auto detection sequence restarts and waits for another 1-to-0 transition.

As long as ADET = 0 and ADBR = 1, the UART continues to try to lock onto the incoming baud rate. Once the ASCII character "A" or "a" is detected and the ADET bit is set, the receiver ignores the ADBR bit and continues normal operation with the calculated baud rate.

The UART interrupt is active (*interrupt\_uart* = 0) as long as ADET = 1 and ADBR = 1. This can be disabled by clearing the automatic baud rate detection interrupt enable bit (ADEN = 0). Before starting an automatic baud rate detection sequence, set ADET = 0 and ADBR = 1.

The Rx FIFO must contain the ASCII character "A" or "a" following the automatic baud rate detection interrupt.

The 16-bit UART Baud Rate Count Register (UBRC) is reset to 4 and stays at 0xFFFF when an overflow occurs. The UBRC register counts (measures) the duration of start bit. When the start bit is detected and counted, the UART Baud Rate Count Register retains its value until the next automatic baud rate detection sequence is initiated.

The Baud Rate Count Register counts only when auto detection is enabled.

### 15.3.4.6.6.2 New Baud Rate Determination

In order to fight against the problems caused by the distortion and the noise on the RX\_DATA line, the duration of the baud rate measurement has been extended.

Previously, as described above, this determination was based on the measurement of the START bit duration. Now, this measurement is based on the duration of START bit + bit0. Bit0 is the first bit following the START bit. In fact, the counter which is started at the falling edge of START bit is no longer stopped at next rising edge (end of START bit), but it is stopped at the next falling edge (end of bit0). As the character sent is always a "A" (41h) or a "a" (61h), this second falling edge will always be present and it will indicate the end of bit0. Once this counter is stopped, the result is divided by 2 and used by the BRM to determine the incoming baud rate.

#### NOTE

UBRC register contains the result of this division by two, in consequence it reflects the measurement of the duration of one bit.

#### 15.3.4.6.6.2.1 New Autobaud Counter Stopped bit and Interrupt

A new bit has been added in USR2 register: ACST (USR2[11]). This bit is set immediately after the determination of the baud rate.

So,

- if ADNIMP is not set (default), ACST is set to 1 after the end of bit0,
- If ADNIMP is set to 1, ACST is set to 1 at the end of START bit.

If ACIEN (UCR3[0]) is set to 1, ACST will flag an interrupt on *interrupt\_uart* signal. This interrupt informs the ARM platform that the BRM has just been set with the result of the bit length measurement. If needed, the ARM platform can perform a read of UBMR (or UBRC) register and determine by itself the baud rate measured. Then the ARM platform has the possibility to correct the BRM registers with the nearest standardized baud rate.

#### NOTE

ACST is set only if ADBR is set to 1, for example, the UART is autobauding.

Clear the ACST bit by writing 1 to it. Writing 0 to the ACST bit has no effect.

### 15.3.4.7 Escape Sequence Detection

An escape sequence typically consists of 3 characters entered in rapid succession (such as +++). Because these are valid characters by themselves, the time between characters determines if it is a valid escape sequence.

Too much time between two of the "+" characters is interpreted as two "+" characters, and not part of an escape sequence.

The software chooses the escape character and writes its value to the UART Escape Character Register (UESC). The software must also enable escape detection feature by setting ESCEN (UCR2[11]) to 1. The hardware compares this value to incoming characters in the RxFIFO. When an escape character is detected, the internal escape timer starts to count. The software specifies a time-out value for the maximum allowable time between 2 successive escape characters (see the table below). The escape timer is programmable in intervals of 2 ms to a maximum interval of 8.192 seconds.

**Table 15-35. Escape Timer Scaling**

UTIM Register	Maximum Time Between Specified Escape Characters
0x000	2 ms
0x001	4 ms
0x002	6 ms
0x003	8 ms
0x004	10 ms
...	...
0F8	498 ms
0F9	500 ms
...	...
9C3	5 s
...	...
FFD	8.188 s
FFE	8.190 s
FFF	8.192 s
<p><b>NOTE:</b> To calculate the time interval:  <math>(\text{UTIM\_Value} + 1) \times 0.002 = \text{Time\_Interval}</math>            Example:  <math>(09C3 + 1) \times 0.002 = 5 \text{ s.}</math></p>	

The escape sequence detection feature is available for all the reference frequencies. Before using Escape Sequence Detection, the user must fill the ONEMS register. This 24-bit register must contain the value of the UART internal frequency divided by 1000. The internal frequency is obtained after the UART internal divider which is applied on *module\_clock* clock.

Example I:

- If the input clock *module\_clock* frequency is 66.5 MHz.
- And if the input clock *module\_clock* is divided by 2 with the internal divider:  
UFCR[9:7] = 3'b100

$$\text{ONEMS} = \frac{66.5 \times 10^6}{2 \times 1000} = 33250 = 81E2\text{h}$$

**Figure 15-21. Calculation of Frequency for ONEMS Register**

Example II:

- If the input clock *module\_clock* frequency is 66.5 MHz.
- And if the input clock *module\_clock* is divided by 1 with the internal divider:  
UFCR[9:7] = 3'b101

$$\text{ONEMS} = \frac{66.5 \times 10^6}{1000} = 66500 = 103C4\text{h}$$

**Figure 15-22. Calculation of Frequency for ONEMS Register**

The escape sequence detection interrupt is asserted when the escape sequence interrupt enable (ESCI) bit is set and an escape sequence is detected (ESCF set). Clear the ESCF bit by writing 1 to it. Writing 0 to the ESCF bit has no effect.

### 15.3.5 Binary Rate Multiplier (BRM)

The BRM sub-block receives *ref\_clk* (*module\_clock* clock after divider). From this clock, and with integer and non-integer division, BRM generates a 16x baud rate clock .

The UART transmitter will shift data out based on this 16x baud rate clock. The UART receiver will sample the serial data line based on this 16x baud rate clock. The input and output frequency ratio is programmed in the UART BRM Incremental Register (UBIR) and UART BRM MOD Register (UBMR). The output frequency is divided by the input frequency to produce this ratio. For integer division, set the UBIR = 0x000F and write the divisor to the UBMR register. All values written to these registers must be one less than the actual value to eliminate division by 0 (undefined), and to increase the maximum range of the registers.

Updating the BRM registers requires writing to both registers. The UBIR register must be written before writing to the UBMR register. If only one register is written to by the software, the BRM continues to use the previous values.

The following examples show how to determine what values are to be programmed into UBIR and UBMR for a given reference frequency and desired baud rate. The following equation can be used to help determine these values:

$$\text{BaudRate} = \frac{\text{Ref Freq}}{\left( 16 \times \frac{\text{UBMR} + 1}{\text{UBIR} + 1} \right)}$$

**Figure 15-23. Frequency and Baud Rate for UBIR and UBMR**

With:

Reference Frequency (Hz): UART Reference Frequency (*module\_clock* after RFDIV divider)

Baud Rate (bit/s): Desired baud rate.

Integer Division ÷ 21

Reference Frequency = 19.44 MHz

UBIR = 0x000F

UBMR = 0x0014

Baud Rate = 925.7 kbit/s

#### **NOTE**

Observe that each value written to the registers is one less than the actual value.

Non-Integer Division

## Universal Asynchronous Receiver/Transmitter(UART)

Reference Frequency = 16 MHz  
Desired Baud Rate = 920 Kbits/s

$$\frac{UBMR + 1}{UBIR + 1} = \frac{\text{RefFreq}}{16 \times \text{BaudRate}} = \frac{16 \times 10^6}{16 \times 920 \times 10^3} = 1.087$$

Ratio = 1.087 = 1087 / 1000  
UBIR = 999 (decimal) = 0x3E7  
UBMR = 1086 (decimal) = 0x43E  
Non-Integer Division  
Reference Frequency = 25 MHz  
Desired Baud Rate = 920 kbit/s  
Ratio = 1.69837 = 625 / 368  
UBIR = 367 (decimal) = 0x16F  
UBMR = 624 (decimal) = 0x270

### Non-Integer Division

Reference Frequency: 30 MHz  
Desired Baud Rate = 115.2 kbit/s  
Ratio = 16.276043 = 65153 / 4003  
UBIR = 4002 (decimal) = 0x0FA2  
UBMR = 65152 (decimal) = 0xFE80

## 15.3.6 Infrared Interface

### 15.3.6.1 Generalities-Infrared

The Infrared interface is selected when IREN (UCR1[7]) is set to 1.

The Infrared Interface is compatible with IrDA Serial Infrared Physical Layer Specification. In this specification, a "zero" is represented by a positive pulse, and a "one" is represented by no pulse (line remains low).

In the UART:

In TX: For each "zero" to be transmitted, a narrow positive pulse which is 3/16 of a bit time is generated. For each "one" to be transmitted no pulse is generated (output is low). External circuitry has to be provided to drive an Infrared LED.

In RX: When receiving, a narrow negative pulse is expected for each "zero" transmitted while no pulse is expected for each "one" transmitted (input is high).

#### NOTE

Rx part of IR block expects to receive an inverted signal compared to IrDA specification. Circuitry external to the IC transforms the Infrared signal to an electrical signal.

The IR interface has an edge triggered interrupt (IRINT). This interrupt validates a zero bit being received. This interrupt is enabled by writing a "one" to ENIRI bit.

The behavior of Infrared Interface is determined by 3 bits INVT (UCR3[1]), INVR (UCR4[9]) and IRSC (UCR4[5]).

### 15.3.6.2 Inverted Transmission and Reception bits (INVT & INVR)

The values of INVT and INVR depend of the IrDA transceiver connected on the TXD\_IR and RXD\_IR pins of the UART. If this transceiver is not inverting on both paths Tx and Rx, a Zero is represented by a positive pulse and a One is represented by no pulse (line remains low). In this case, the bit INVT must be set to 0 and the bit INVR must be set to 1 (because Rx IR block expects an inverted signal).

On the contrary user must set INVT=1 and INVR=0 if both paths of the transceiver are inverting, that is, a Zero is represented as a negative pulse and a One is represented by no pulse (line remains high). The transceiver can also be inverting on only one path (Tx or Rx), in this case INVT and INVR must be together equal to 1 or to 0, depending on which path is inverted.

### 15.3.6.3 InfraRed Special Case (IRSC) Bit

The value to apply to IRSC bit is based on 2 parameters: the baud rate and the Minimum Pulse Duration (MPD) of the transceiver.

According to IrDA Standard Specification, for SIR (Serial IR) baud rates from 2.4 Kbit/s to 115.2 Kbit/s this nominal pulse duration is equal to 3/16 of a bit duration (at the selected baud rate). But, for all the baud rates a Minimum Pulse Duration is also specified. According to IrDA Standard, a Zero is represented by a light pulse, so the IrDA transceiver can't emit a light pulse shorter than the MPD. For SIR, the MPD is constant and equal to 1.41  $\mu$ s.

But user must take into account the electrical MPD associated with the transceiver on the receiver path. Typically this value is 2.0  $\mu$ s, but for some manufacturers MPD can go down to 1.0  $\mu$ s.

In order to understand the meaning of IRSC bit, one must understand how the RX path works in IrDA mode.

When the UART is in IrDA mode, a Zero is not only detected by the state of the RXD\_IR line, but also with the duration of the pulse. This pulse duration can be measured with 2 different clocks. In this case, clock is selected with the IRSC bit.

- If IRSC = 0, the clock used is the BRM clock.
- If IRSC = 1, the clock used is the UART internal clock (UART clock after the divider (RFDIV)).

In normal operation, IRSC=0. This means that at any time, the user must ensure that the frequency of BRM\_clock is high enough to measure the pulse. The pulse must last at least 2 BRM clock cycles. If this condition is not fulfilled, IRSC must be set to 1.

Let's examine two examples, for a Minimum Pulse Duration equal to the MPD from the IrDA SIR specification (i.e., 1.41  $\mu$ s).

### 1: Calculation of BRM Clock Period (Clock Period < 1.41 $\mu$ s)

The user wants to receive IrDA data at 115.2 Kbit/s. The UBIR and UBMR registers are set in order to create the BRM\_clock with a frequency of  $16 \times \text{baud rate} = 16 \times 115.2\text{K} = 1.843 \text{ MHz}$ . But at the same time, in order to correctly detect the pulse, the user must be sure that  $2 \times \text{BRM\_clock period}$  is lower than 1.41  $\mu$ s. Lets check:

$$\text{BRM\_clock period} = 1/1843000 = 542 \text{ ns}$$

So  $2 \times \text{BRM\_clock period} = 1.09 \mu\text{s} < 1.41 \mu\text{s}$ . It is fine.

### 2: Calculation of BRM Clock Period (Clock Period > 1.41 $\mu$ s)

This time the user wants to receive at 19.2 Kbit/s. So, the BRM\_clock is set to  $16 \times 19200 = 307.2 \text{ kHz}$ . Let's check if  $2 \times \text{BRM\_clock period} < 1.41 \mu\text{s}$ :

1.  $\text{BRM\_clock period} = 1/307200 = 3.25 \mu\text{s}$

So  $2 \times \text{BRM\_clock period} = 6.50 \mu\text{s} \gg 1.41 \mu\text{s}$ . It doesn't work.

So, in this case, the BRM clock can't be used to measure the pulse duration and the user must select the UART internal clock by setting IRSC =1.

### NOTE

Like for Escape character detection, when IR Special Case is enabled (IRSC=1), the UART must measure a duration. In order to do that, the user must fill the ONEMS register. Refer to [Escape Sequence Detection](#).

### 15.3.6.4 IrDA interrupt

Serial infrared mode (SIR) uses an edge triggered interrupt flag IRINT (USR2[8]). When INVR =0, detection of a falling edge on the RXD pin asserts the IRINT bit. When INVR=1, detection of a rising edge on the RXD pin asserts the IRINT bit. When IRINT and ENIRI bits are both asserted, the *interrupt\_uart* interrupt is asserted. Clear the IRINT bit by writing 1 to it. Writing 0 to the IRINT bit has no effect.

### 15.3.6.5 Conclusion about IrDA

Before using the UART in IrDA, the baud rate limit must be calculated. This baud rate limit will inform the user if IRSC bit has to be set or not.

Let's determine this limit:

As already described, if IRSC = 0, the following condition must always be fulfilled

$$2 \times \text{BRM}ClockPeriod < \text{MinPulseDuration}$$

Figure 15-24. Calculation of Baud Rate

So,

$$\text{BRM}ClockFrequency > \frac{2}{\text{MPD}}$$

So, knowing BRM\_clock frequency = 16 \* Baud Rate, we get:

$$\text{BaudRate} > \frac{1}{8 \times \text{MinPulseDuration}}$$

So, the user needs to set IRSC = 0 when:

- If Minimum Pulse Duration = 2.5 us and Baud Rate > 50 Kbit/s.
- If Minimum Pulse Duration = 2.0 us and Baud Rate > 62.5 Kbit/s.
- If Minimum Pulse Duration = 1.41 us and Baud Rate > 88.6 Kbit/s.

#### NOTE

For baud rates lower than the limit, IRSC must be set to 1.

## 15.3.6.6 Programming IrDA Interface

### 15.3.6.6.1 High Speed

As an example, the following sequence can be used to program the IrDA interface in order to send and receive characters at 115.2 Kbit/s.

Assumptions:

- Input UART clock = 90 MHz
- Internal clock divider = 3 (divide Input UART clock by 3)
- Baud rate = 115.2 Kbit/s
- IrDA transceiver is not inverting on both channels: for Tx and Rx, a Zero is represented by a positive pulse, and a One is represented by no pulse (line stays low).
- Interrupt: Sent to ARM platform when 1 char is received into the Rx FIFO (RDR)

Registers values and Programming orders:

```

UCR1 = 0x0085
UCR1[7] = IREN = 1: Enable IR interface
UCR1[0] = UARTEN = 1: Enable UART
UTS = 0x0000
UFCR = 0x0981
TXTL[5:0] = 0x02: Default value
RFDIV[2:0] = 0x3: Divide Input UART clock by 3 (resulting internal clock is 30 MHz)
RXTL[5:0] = 0x01: Default value
UBIR = 0x0202
UBMR = 0x20BE Baud rate = 115.2 kbit/s with internal clock = 30 MHz
UCR2 = 0x4027
UCR2[14] = IRTS = 1: Ignore level of RTS input signal
UCR2[5] = WS = 1: Characters are 8-bit length
UCR2[2] = TXEN = 1: Enable Rx path
UCR2[1] = RXEN = 1: Enable Tx path
UCR2[0] = SRST_B = 1: No software reset
UCR3 = 0x0000

UCR4 = 0x8201
CTSTL[5:0] = 0x20: Default value
UCR4[9] = INVR = 1: Inverted Infrared Reception (because IrDA transceiver is not inverting)
UCR4[1] = DREN = 1: To enable RDR interrupt (sent when one char is received)

```

The UART is ready to send a character as soon as there is a write into UTXD register. And an interrupt will be sent to ARM platform when a character is received.

### 15.3.6.6.2 Low Speed

This time, we keep the same assumptions but the speed is now 9.6 Kbit/s. So, this baud rate is below the limit (even with a Min. Pulse Duration of 2.5 us) and thus IRSC must be set to 1.

Assumptions:

- Input UART clock = 90 MHz
- Internal clock divider = 3 (divide Input UART clock by 3)
- Baud rate = 9.6 Kbit/s
- IrDA transceiver is not inverting on both channels: for Tx and Rx, a Zero is represented by a positive pulse, and a One is represented by no pulse (line stays low).
- Interrupt: Sent to ARM platform when 1 char is received into the Rx FIFO (RDR).

### Registers values and Programming orders:

```

UCR1 = 0x0085
UCR1[7] = IREN = 1: Enable IR interface
UCR1[0] = UARTEN = 1: Enable UART
UFCCR = 0x0981
UFCCR[15:10] = TXTL[5:0] = 0x02: Default value
RFDIV[2:0] = 0x3: Divide Input UART clock by 3 (resulting internal clock is 30 MHz)
UFCCR[5:0] = RXTL[5:0] = 0x01: Default value
UBIR = 0x00FF
UBMR = 0xC354 Baud rate = 9.6 kbit/s with internal clock = 30 MHz
UCR2 = 0x4027
UCR2[14] = IRTS = 1: Ignore level of RTS input signal
UCR2[5] = WS = 1: Characters are 8-bit length
UCR2[2] = TXEN = 1: Enable Rx path
UCR2[1] = RXEN = 1: Enable Tx path
UCR2[0] = SRST_B = 1: No software reset
UCR3 = 0x0000
UCR3[1] = INVT = 0: Positive pulse represents 0.
UCR4 = 0x8221
UCR4[15:10] = CTSTL[5:0] = 0x20: Default value
UCR4[9] = INVR = 1: Inverted Infrared Reception (because IrDA transceiver is not inverting)
UCR4[5] = IRSC = 1: Because data rate is below the limit and thus the UART internal clock is used to measure the pulse duration.
UCR4[1] = DREN = 1: To enable RDR interrupt (sent when one char is received)

```

The UART is now ready to send a character as soon as there is a write into UTXD register. An interrupt will be sent to ARM platform when a character is received.

## 15.3.7 9-bit RS-485 Mode

### 15.3.7.1 Generalities

The UART provides a 9-bit mode to facilitate multidrop (RS-485) network communication. To enable this mode, set MDEN bit in the UMCR register to 1. When 9-bit RS-485 mode is enabled, UART transmitter can transmit the ninth bit (9<sup>th</sup> bit) set by TXB8, and UART receiver can differentiate between data frames (9<sup>th</sup> bit = 0) and address frames (9<sup>th</sup> bit = 1).

The CTS\_B pin can be used to control RS-485 output driver outside the chip.

Figure 15-25. RS-485 driver connection (UART in DCE mode)

### 15.3.7.2 Transmit 9-bit RS-485 frames

To transmit 9-bit RS-485 frames, user need to enable parity (PREN=1) to enable trasmitting the ninth data bit, set 8-bit data word size (WS=1), and write TXB8 (UMCR[2]) as the 9<sup>th</sup> bit (bit [8]) to be transmitted (write '0' to TXB8 to transmit a data frame, write '1' to transmit a address frame). The other data bit [7:0] is written to TxFIFO by writing to the UTXD same as normal RS-232 operation.

### 15.3.7.3 Receive 9-bit RS-485 frames

To receive 9-bit RS-485 frames, user need to enable parity (PREN=1) to enable receiving the ninth data bit, set 8-bit data word size (WS=1). The receiver will save the 9-bit data to RxFIFO, and user should read the 9<sup>th</sup> databit (bit [8]) by reading the PRERR (URXD[10]) bit, and read data bit [7:0] by reading the RX\_DATA (URXD[7:0]).

There are two slave address detect modes, normal detect mode and automatic detect mode, and can be selected by SLAM (UMCR[1]).

#### 15.3.7.3.1 RS-485 Slave Address Normal Detect Mode

To enable Normal Detect mode, clear SLAM (UMCR[1] to 0). The receiver ignores all data frames (9<sup>th</sup> bit = 0) until an address frame is received (9<sup>th</sup> bit = 1). At that time, the slave address detected (SAD = USR1[3]) bit is asserted and the *interrupt\_uart* interrupt is

generated (if SADEN = UMCR[3] = 1). The address byte and subsequent bytes are all put into RxFIFO along with their 9<sup>th</sup> bit. The UART will also generate DMA request *dma\_req\_rx* when the RxFIFO reaches the selected threshold (controlled by RXTL) if receive ready DMA (RXDMAEN = UCR1[8]) request is enabled.

User should read the 9<sup>th</sup> databit (bit [8]) by reading the PRERR (URXD[10]) bit, and read data bit [7:0] by reading the RX\_DATA (URXD[7:0]).

In this mode, once the UART has detected a 9<sup>th</sup> bit is equal to '1', it will always save the subsequent frames to RxFIFO. So the software must decide whether the address and data in RxFIFO are needed or not.

### 15.3.7.3.2 RS-485 Slave Address Automatic Detect Mode

To enable Automatic Detect Mode, set SLAM (UMCR[1]) to 1. The receiver tries to detect an address byte (frame 9<sup>th</sup> bit = 1) that matches the programmed SLADDR (UMCR[15:8]) character. If the received byte is a data or an address byte that does not match the programmed SLADDR character, the receiver will discard these data.

Once the UART receives a matching address byte, it will assert the slave address detected (SAD = USR1[3]) bit and the *interrupt\_uart* interrupt will be generated (if SADEN = UMCR[3] = 1). The address byte and subsequent bytes are all put into RxFIFO along with their 9<sup>th</sup> bit. If receive ready DMA (RXDMAEN = UCR1[8]) request is enabled, the UART will also generate DMA request *dma\_req\_rx* when the RxFIFO reaches the selected threshold (controlled by RXTL).

If another address byte is received and this address byte does not match SLADDR character, the receiver will discard the address byte and subsequent data byte. If the address byte again matches SLADDR character, the receiver will put this address byte and subsequent data byte in the RxFIFO along with their 9<sup>th</sup> bit.

User should read the 9<sup>th</sup> databit (bit [8]) by reading the PRERR (URXD[10]) bit, and read data bit [7:0] by reading the RX\_DATA (URXD[7:0]).

See [Initialization](#) for 9-bit RS-485 programming guide.

## 15.3.8 Low Power Modes

These modes are controlled by the signals *doze\_req* and *stop\_req*. The control/status/data registers won't change when getting in/out of low power modes.

**Table 15-36. UART Low Power State Operation**

	Normal State ( <i>doze_req</i> = 1'b0 & <i>stop_req</i> = 1'b0)	Doze State ( <i>doze_req</i> = 1'b1)		Stop State ( <i>stop_req</i> = 1'b1)
		DOZE bit = 0	DOZE bit = 1	
UART-Clock	ON	ON	ON	OFF
UART Serial / IrDA	ON	ON	OFF	OFF

### 15.3.8.1 UART Operation in System Doze Mode

While in Doze State (when *doze\_req* input pin is set to 1'b1), the UART behavior depends on the DOZE (UCR1[1]) control bit.

While the DOZE bit is negated, the UART serial interface is enabled. While the system is in the Doze State, and the DOZE bit is asserted, the UART is disabled. If the Doze State is entered with the DOZE bit asserted while the UART serial interface was receiving or transmitting data, it will complete the receive/transmit of the current character and signal to the far-end transmitter/receiver to stop sending/receiving.

### 15.3.8.2 UART Operation in System Stop Mode

The internal baud rate clocks of the transmitter and receiver are gated off if the *stop\_req* signal to UART is asserted. Even though the clocks at the input of the UART continue to run during system Stop mode, the UART will not do any transmission or reception.

The following UART interrupts wake the ARM platform processor from STOP mode:

- RTS (RTSD)
- IrDA Asynchronous WAKE (AIRINT)
- Asynchronous WAKE (AWAKE)
- RI (RIDELT in DTE mode only)
- DCD (DCDDEL in DTE mode only)
- DTR (DTRD in DCE mode only)
- DSR (DTRD in DTE mode only)

When an asynchronous WAKE (awake) interrupt exits the ARM platform from STOP mode, make sure that a dummy character is sent first because the first character may not be received correctly.

### 15.3.8.3 Power Saving Method in UART

The RXEN (UCR2[1]), TXEN (UCR2[2]) and UARTEN (UCR1[0]) bits are set by the user and provide software control of low-power modes.

Setting the UARTEN (UCR1[0]) bit to 0 shuts off the receiver and transmitter logic and the associated clocks.

If the UART is used only in transmit mode, UARTEN and TXEN must be set to 1. If the UART is used only in receive mode, UARTEN and RXEN must be set to 1. Setting TXEN or RXEN to 0 allows to save a lot of power.

### 15.3.9 UART Operation in System Debug State

The bit UTS [11] controls whether the UART will respond to the input signal *debug\_req*, or whether it will continue to run as normal.

If the UART is programmed to respond to *debug\_req*:

1. The UART will halt all operations upon detecting the *debug\_req* input.
2. A transfer in progress, either to/from a core (using the IP Bus interface) or to/from an external device, will be completed before halting. This means a single byte/word transfer, not an entire FIFO. Reception of any further data from an external device will be disabled.
3. Internal registers will continue to be writable and readable using the IP Bus interface. A read will leave the contents unaffected.
4. The RX FIFO is affected in debug mode in the following way:
  - All writes into the RX FIFO are prevented.
  - The bit RXDBG (UTS[9]) is used to select the readability of the RX FIFO during debug mode:

RXDBG = 0: hold the read pointer at the location it had upon entering debug mode, and URXD register returns only the data value at that location, no matter how many reads attempted.

RXDBG = 1, selectable at any time: Allow to read the characters received in Rx FIFO. It will not be possible to re-read previously read locations, nor will it be possible to readjust the read pointer to the value it had prior to entering debug mode.

## 15.3.10 Reset

This section describes how to reset the block and explains special requirements related to reset.

### 15.3.10.1 Hardware reset

All of registers, FIFOs, state machines and sequential elements can be reset to their initial values by hardware reset or power on reset.

### 15.3.10.2 Software reset

The status registers USR1 and USR2, BRM registers UBIR and UBMR, TxFIFO and RxFIFO, and transmitter and receiver state machines can be reset by software reset. Internal logic will keep the software reset asserted for about 4 *module\_clock* cycles.

Programmer can follow the following software reset sequence:

1. Clear the SRST\_B bit (UCR2[0])
2. Wait for software reset complete: poll SOFTRST bit (UTS[0]) until it is 0.
3. Re-program baud rate registers: Re-write UBIR and UBMR.

## 15.3.11 Transfer Error

The UART can generate a transfer error on the peripheral bus in the following cases:

- Core is writing into a read-only register.
- Core is accessing (read or write) an unused location within the assigned address space reserved to UART.
- Core is writing into UTXD register with transmit interface disabled (TXEN=0 or UARTEN=0)
- Core is reading URXD register with receive interface disabled (RXEN=0 or UARTEN=0)

## 15.3.12 Functional Timing

This section includes timing diagrams for functional signaling.

### 15.3.12.1 IrDA Mode

According to IrDA specification, the low speed (115.2Kbit/s and below) IR frame format is compatible with UART frame.

In this figure, an example data 0x65 is used.

Figure 15-26. Timing diagram of Low Speed IR (<=115.2 Kbit/s) Data Line

## 15.3.13 Initialization

### 15.3.13.1 Programming the UART in RS-232 mode

As an example, the following sequence can be used to program the UART in order to send and receive characters in RS-232 mode.

Assumptions:

- Input uart clock = 100 MHz
- Baud rate = 921.6 Kbps

## Universal Asynchronous Receiver/Transmitter(UART)

- Data bits = 8 bits
- Parity = Even
- Stop bits = 1 bit
- Flow control = Hardware

Main program:

1. UCR1 = 0x0001

Enable the UART.

2. UCR2 = 0x2127

Set hardware flow control, data format and enable transmitter and receiver.

3. UCR3 = 0x0704

Set UCR3[RXDMUXSEL] = 1.

4. UCR4 = 0x7C00

Set CTS trigger level to 31,

5. UFCR = 0x089E

Set internal clock divider = 5 (divide input uart clock by 5). So the reference clock is  $100\text{ MHz}/5 = 20\text{ MHz}$ .

Set TXTL = 2 and RXTL = 30.

6. UBIR = 0x08FF

7. UBMR = 0x0C34

In the above two steps, set baud rate to 921.6Kbps based on the 20MHz reference clock.

8. UCR1 = 0x2201

Enable the TRDY and RRDY interrupts.

9. UMCR = 0x0000

UMCR stay at default value 0x0000

Interrupt service routine for the transmitter:

- Write characters into UTXD

The TRDY interrupt will be automatically de-asserted when the data level of the TxFIFO exceeds the TXTL=2. Note: For the first time the interrupt may be de-asserted after 4 characters are written into the TxFIFO because of the shift register.

Interrupt service routine for the receiver:

- Read characters from URXD

The RRDY interrupt will be automatically de-asserted when the data level of the RxFIFO is below the RXTL=30.

### 15.3.13.2 Programming the UART in 9-bit RS-485 mode

As an example, the following sequence can be used to program the UART in order to send and receive frames in RS-485 mode.

Assumptions:

- Input uart clock = 100 MHz
- Baud rate = 5 Mbps

Main program:

1. UCR1 = 0x0001

Enable the UART.

2. UCR2 = 0x4127

Set software flow control ( $\overline{\text{CTS}}$  pin is controlled by UCR2[12] ), enable parity(enable 9<sup>th</sup> bit rxd/txd), 8-bit word size , and enable transmitter and receiver.

3. UCR4 = 0x7C00

Set CTS trigger level to 31,

4. UFCR = 0x0A9E

Set RFDIV = 5 (divide input uart clock by 1), so the reference clock is 100 MHz. Set UART in DCE mode (RS-485 driver connection outside the chip is the same as [Figure 15-25](#))

Set TXTL = 2 and RXTL = 30.

5. UBIR = 0x0003

6. UBMR = 0x0004

In the above two steps, set baud rate to 5 Mbps based on the 100 MHz reference clock.

7. UCR1 = 0x2001 when UART as a master ,

or UCR1 = 0x0201 (or 0x0101) when UART as a slave.

Enable TRDY interrupt when UART as a master, enable RRDY interrupt or DMA request when UART as a slave.

### 8. UMCR = 0xA50B

Enable 9-bit RS-485 mode, enable SAD interrupt, set automatic slave address detect mode, set slave address is 0xA5.

Interrupt service routine for the transmitter:

- Transmit data: write its ninth bit (bit[8]) to UMCR[2], write its bit [7:0] into UTXD[7:0]

The TRDY interrupt will be automatically de-asserted when the data level of the TxFIFO exceeds the TXTL=2.

Note: For the first time the interrupt may be de-asserted after 4 characters are written into the TxFIFO because of the shift register.

Interrupt service routine for the receiver:

- Receive data: read its ninth bit (bit[8]) from URXD[10] , read its bit [7:0] from URXD[7:0].

Note: in RS-485 mode, URXD[10] bit is not the parity error, instead it holds the ninth bit (bit[8]) of the received data.

The SAD interrupt can not de-assert automatically, it needs MCU write 1 to USR1[3] to clear it . The RRDY interrupt or DMA request will be automatically de-asserted when the data level of the RxFIFO is below the RXTL=30.

## 15.3.15 UART Memory Map/Register Definition

UART supports 8-bit, 16-bit and 32-bit accesses to 32-bit memory-mapped addresses. Any access to unmapped memory location will yield a transfer error.

All registers except the ONEMS described in this section are 16-bit registers. The ONEMS register is a 24-bit register.

- For 32-bit write accesses, the upper two bytes will not be taken into account.
- For 32-bit read accesses the upper two bytes will return 0.

The ONEMS register is expanded from 16 bits to 24 bits in order to support the high frequency of the BRM internal clock *ref\_clk* (*module\_clock* after divider). The ONEMS register can be accessed as 8 bits, 16 bits or 32 bits.

- For 32-bit write accesses, the most significant byte of the ONEMS will be discarded.
- For 32-bit read accesses, the most significant byte of the ONEMS will be read as 0.

### UART memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
3086_0000	UART Receiver Register (UART1_URXD)	32	R	0000_0000h	<a href="#">15.3.15.1/4539</a>

### 15.3.15.1 UART Receiver Register (UARTx\_URXD)

#### NOTE

The UART will yield a transfer error on the peripheral bus when core is reading URXD register with receive interface disabled (RXEN=0 or UARTEN=0).

Address: Base address + 0h offset

**UARTx\_URXD field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 CHARRDY	Character Ready. This read-only bit indicates an invalid read when the FIFO becomes empty and software tries to read the same old data. This bit should not be used for polling for data written to the RX FIFO.  0 Character in RX_DATA field and associated flags are invalid. 1 Character in RX_DATA field and associated flags valid and ready for reading.

Table continues on the next page...

**UARTx\_URXD field descriptions (continued)**

Field	Description
14 ERR	<p><b>Error Detect.</b> Indicates whether the character present in the RX_DATA field has an error (OVRRUN, FRMERR, BRK or PRERR) status. The ERR bit is updated and valid for each received character.</p> <p>0 No error status was detected 1 An error status was detected</p>
13 OVRRUN	<p><b>Receiver Overrun.</b> This read-only bit, when HIGH, indicates that the corresponding character was stored in the last position (32nd) of the Rx FIFO. Even if a 33rd character has not been detected, this bit will be set to '1' for the 32nd character.</p> <p>0 No RxFIFO overrun was detected 1 A RxFIFO overrun was detected</p>
12 FRMERR	<p><b>Frame Error.</b> Indicates whether the current character had a framing error (a missing stop bit) and is possibly corrupted. FRMERR is updated for each character read from the RxFIFO.</p> <p>0 The current character has no framing error 1 The current character has a framing error</p>
11 BRK	<p><b>BREAK Detect.</b> Indicates whether the current character was detected as a BREAK character. The data bits and the stop bit are all 0. The FRMERR bit is set when BRK is set. When odd parity is selected, PRERR is also set when BRK is set. BRK is valid for each character read from the RxFIFO.</p> <p>0 The current character is not a BREAK character 1 The current character is a BREAK character</p>
10 PRERR	<p><b>In RS-485 mode, it holds the ninth data bit (bit [8]) of received 9-bit RS-485 data</b></p> <p><b>In RS232/IrDA mode, it is the Parity Error flag.</b> Indicates whether the current character was detected with a parity error and is possibly corrupted. PRERR is updated for each character read from the RxFIFO. When parity is disabled, PRERR always reads as 0.</p> <p>0 = No parity error was detected for data in the RX_DATA field 1 = A parity error was detected for data in the RX_DATA field</p>
9-8 -	<p>This field is reserved. <b>Reserved</b></p>
RX_DATA	<p><b>Received Data.</b> Holds the received character. In 7-bit mode, the most significant bit (MSB) is forced to 0. In 8-bit mode, all bits are active.</p>

### 15.3.15.2 UART Transmitter Register (UARTx\_UTXD)

#### NOTE

The UART will yield a transfer error on the peripheral bus when core is writing into UART\_URXD register with transmit interface disabled (TXEN=0 or UARTEN=0).

Memory space between UART\_URXD and UART\_UTXD registers is reserved. Any read or write access to this space will be considered as an invalid access and yield a transfer error.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### UARTx\_UTXD field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 Reserved	This read-only field is reserved and always has the value 0.
TX_DATA	<b>Transmit Data.</b> Holds the parallel transmit data inputs. In 7-bit mode, D7 is ignored. In 8-bit mode, all bits are used. Data is transmitted least significant bit (LSB) first. A new character is transmitted when the TX_DATA field is written. The TX_DATA field must be written only when the TRDY bit is high to ensure that corrupted data is not sent.

### 15.3.15.3 UART Control Register 1 (UARTx\_UCR1)

Address: Base address + 80h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

#### UARTx\_UCR1 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 ADEN	<b>Automatic Baud Rate Detection Interrupt Enable.</b> Enables/Disables the automatic baud rate detect complete (ADET) bit to generate an interrupt ( <i>interrupt_uart</i> = 0).  0 Disable the automatic baud rate detection interrupt 1 Enable the automatic baud rate detection interrupt
14 ADBR	<b>Automatic Detection of Baud Rate.</b> Enables/Disables automatic baud rate detection. When the ADBR bit is set and the ADET bit is cleared, the receiver detects the incoming baud rate automatically. The ADET flag is set when the receiver verifies that the incoming baud rate is detected properly by detecting an ASCII character "A" or "a" (0x41 or 0x61).  0 Disable automatic detection of baud rate 1 Enable automatic detection of baud rate
13 TRDYEN	<b>Transmitter Ready Interrupt Enable.</b> Enables/Disables the transmitter Ready Interrupt (TRDY) when the transmitter has one or more slots available in the TxFIFO. The fill level in the TXFIFO at which an interrupt is generated is controlled by TxTL bits. When TRDYEN is negated, the transmitter ready interrupt is disabled.  <b>NOTE:</b> An interrupt will be issued as long as TRDYEN and TRDY are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the TRDY interrupt.  0 Disable the transmitter ready interrupt 1 Enable the transmitter ready interrupt
12 IDEN	<b>Idle Condition Detected Interrupt Enable.</b> Enables/Disables the IDLE bit to generate an interrupt ( <i>interrupt_uart</i> = 0).  0 Disable the IDLE interrupt 1 Enable the IDLE interrupt

Table continues on the next page...

## UARTx\_UCR1 field descriptions (continued)

Field	Description
11–10 ICD	<p><b>Idle Condition Detect.</b> Controls the number of frames RXD is allowed to be idle before an idle condition is reported.</p> <p>00 Idle for more than 4 frames 01 Idle for more than 8 frames 10 Idle for more than 16 frames 11 Idle for more than 32 frames</p>
9 RRDYEN	<p><b>Receiver Ready Interrupt Enable.</b> Enables/Disables the RRDY interrupt when the RxFIFO contains data. The fill level in the RxFIFO at which an interrupt is generated is controlled by the RXTL bits. When RRDYEN is negated, the receiver ready interrupt is disabled.</p> <p>0 Disables the RRDY interrupt 1 Enables the RRDY interrupt</p>
8 RXDMAEN	<p><b>Receive Ready DMA Enable.</b> Enables/Disables the receive DMA request <i>dma_req_rx</i> when the receiver has data in the RxFIFO. The fill level in the RxFIFO at which a DMA request is generated is controlled by the RXTL bits. When negated, the receive DMA request is disabled.</p> <p>0 Disable DMA request 1 Enable DMA request</p>
7 IREN	<p><b>Infrared Interface Enable.</b> Enables/Disables the IR interface. See the IR interface description in <a href="#">Infrared Interface</a>, for more information.</p> <p>Note: MDEN(UMCR[0]) must be cleared to 0 when using IrDA interface. See <a href="#">Table 15-27</a></p> <p>0 Disable the IR interface 1 Enable the IR interface</p>
6 TXMPTYEN	<p><b>Transmitter Empty Interrupt Enable.</b> Enables/Disables the transmitter FIFO empty (TXFE) interrupt. <i>interrupt_uart</i>. When negated, the TXFE interrupt is disabled.</p> <p><b>NOTE:</b> An interrupt will be issued as long as TXMPTYEN and TXFE are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the TXFE interrupt.</p> <p>0 Disable the transmitter FIFO empty interrupt 1 Enable the transmitter FIFO empty interrupt</p>
5 RTSDEN	<p><b>RTS Delta Interrupt Enable.</b> Enables/Disables the RTSD interrupt. The current status of the RTS_B pin is read in the RTSS bit.</p> <p>0 Disable RTSD interrupt 1 Enable RTSD interrupt</p>
4 SNDBRK	<p><b>Send BREAK.</b> Forces the transmitter to send a BREAK character. The transmitter finishes sending the character in progress (if any) and sends BREAK characters until SNDBRK is reset. Because the transmitter samples SNDBRK after every bit is transmitted, it is important that SNDBRK is asserted high for a sufficient period of time to generate a valid BREAK. After the BREAK transmission completes, the UART transmits 2 mark bits. The user can continue to fill the TxFIFO and any characters remaining are transmitted when the BREAK is terminated.</p> <p>0 Do not send a BREAK character 1 Send a BREAK character (continuous 0s)</p>
3 TXDMAEN	<p><b>Transmitter Ready DMA Enable.</b> Enables/Disables the transmit DMA request <i>dma_req_tx</i> when the transmitter has one or more slots available in the TxFIFO. The fill level in the TxFIFO that generates the <i>dma_req_tx</i> is controlled by the TXTL bits.</p>

Table continues on the next page...

**UARTx\_UCR1 field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> A DMA request will be issued as long as TXDMAEN and TRDY are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the transmit DMA request.</p> <p>0 Disable transmit DMA request 1 Enable transmit DMA request</p>
2 ATDMAEN	<p><b>Aging DMA Timer Enable.</b> Enables/Disables the receive DMA request <i>dma_req_rx</i> for the aging timer interrupt (triggered with AGTIM flag in USR1[8]).</p> <p>0 Disable AGTIM DMA request 1 Enable AGTIM DMA request</p>
1 DOZE	<p><b>DOZE.</b> Determines the UART enable condition in the DOZE state. When <i>doze_req</i> input pin is at '1', (the ARM Platform executes a doze instruction and the system is placed in the Doze State), the DOZE bit affects operation of the UART. While in the Doze State, if this bit is asserted, the UART is disabled. See the description in <a href="#">Low Power Modes</a>.</p> <p>0 The UART is enabled when in DOZE state 1 The UART is disabled when in DOZE state</p>
0 UARTEN	<p><b>UART Enable.</b> Enables/Disables the UART. If UARTEN is negated in the middle of a transmission, the transmitter stops and pulls the TXD line to a logic 1. UARTEN must be set to 1 before any access to UTXD and URXD registers, otherwise a transfer error is returned.</p> <p>This bit can be set to 1 along with other bits in this register. There is no restriction to the sequence of programing this bit and other control registers.</p> <p>0 Disable the UART 1 Enable the UART</p>

**15.3.15.4 UART Control Register 2 (UARTx\_UCR2)**

Address: Base address + 84h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

## UARTx\_UCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 ESCI	<b>Escape Sequence Interrupt Enable.</b> Enables/Disables the ESCF bit to generate an interrupt. 0 Disable the escape sequence interrupt 1 Enable the escape sequence interrupt
14 IRTS	<b>Ignore RTS Pin.</b> Forces the RTS input signal presented to the transmitter to always be asserted (set to low), effectively ignoring the external pin. When in this mode, the RTS pin serves as a general purpose input. 0 Transmit only when the RTS pin is asserted 1 Ignore the RTS pin
13 CTSC	<b>CTS Pin Control.</b> Controls the operation of the CTS_B module output. When CTSC is asserted, the CTS_B module output is controlled by the receiver. When the Rx FIFO is filled to the level of the programmed trigger level and the start bit of the overflowing character (TRIGGER LEVEL + 1) is validated, the CTS_B module output is negated to indicate to the far-end transmitter to stop transmitting. When the trigger level is programmed for less than 32, the receiver continues to receive data until the Rx FIFO is full. When the CTSC bit is negated, the CTS_B module output is controlled by the CTS bit. On reset, because CTSC is cleared to 0, the CTS_B pin is controlled by the CTS bit, which again is cleared to 0 on reset. This means that on reset the CTS_B signal is negated. 0 The CTS_B pin is controlled by the CTS bit 1 The CTS_B pin is controlled by the receiver
12 CTS	<b>Clear to Send.</b> Controls the CTS_B pin when the CTSC bit is negated. CTS has no function when CTSC is asserted. 0 The CTS_B pin is high (inactive) 1 The CTS_B pin is low (active)
11 ESSEN	<b>Escape Enable.</b> Enables/Disables the escape sequence detection logic. 0 Disable escape sequence detection 1 Enable escape sequence detection
10–9 RTEC	<b>Request to Send Edge Control.</b> Selects the edge that triggers the RTS interrupt. This has no effect on the RTS delta interrupt. RTEC has an effect only when RTSEN = 1 (see <a href="#">Table 15-31</a> ). 00 Trigger interrupt on a rising edge 01 Trigger interrupt on a falling edge 1X Trigger interrupt on any edge
8 PREN	<b>Parity Enable.</b> Enables/Disables the parity generator in the transmitter and parity checker in the receiver. When PREN is asserted, the parity generator and checker are enabled, and disabled when PREN is negated. 0 Disable parity generator and checker 1 Enable parity generator and checker
7 PROE	<b>Parity Odd/Even.</b> Controls the sense of the parity generator and checker. When PROE is high, odd parity is generated and expected. When PROE is low, even parity is generated and expected. PROE has no function if PREN is low. 0 Even parity 1 Odd parity

Table continues on the next page...

UARTx\_UCR2 field descriptions (continued)

Field	Description
6 STPB	<p><b>Stop.</b> Controls the number of stop bits after a character. When STPB is low, 1 stop bit is sent. When STPB is high, 2 stop bits are sent. STPB also affects the receiver.</p> <p>0 The transmitter sends 1 stop bit. The receiver expects 1 or more stop bits. 1 The transmitter sends 2 stop bits. The receiver expects 2 or more stop bits.</p>
5 WS	<p><b>Word Size.</b> Controls the character length. When WS is high, the transmitter and receiver are in 8-bit mode. When WS is low, they are in 7-bit mode. The transmitter ignores bit 7 and the receiver sets bit 7 to 0. WS can be changed in-between transmission (reception) of characters, however not when a transmission (reception) is in progress, in which case the length of the current character being transmitted (received) is unpredictable.</p> <p>0 7-bit transmit and receive character length (not including START, STOP or PARITY bits) 1 8-bit transmit and receive character length (not including START, STOP or PARITY bits)</p>
4 RTSEN	<p><b>Request to Send Interrupt Enable.</b> Controls the RTS edge sensitive interrupt. When RTSEN is asserted and the programmed edge is detected on the RTS_B pin (the RTSF bit is asserted), an interrupt will be generated on the <i>interrupt_uart</i> pin. (See <a href="#">Table 15-31</a>.)</p> <p>0 Disable request to send interrupt 1 Enable request to send interrupt</p>
3 ATEN	<p><b>Aging Timer Enable.</b> This bit is used to enable the aging timer interrupt (triggered with AGTIM)</p> <p>0 AGTIM interrupt disabled 1 AGTIM interrupt enabled</p>
2 TXEN	<p><b>Transmitter Enable.</b> Enables/Disables the transmitter. When TXEN is negated the transmitter is disabled and idle. When the UARTEN and TXEN bits are set the transmitter is enabled. If TXEN is negated in the middle of a transmission, the UART disables the transmitter immediately, and starts marking 1s. The transmitter FIFO cannot be written when this bit is cleared.</p> <p>0 Disable the transmitter 1 Enable the transmitter</p>
1 RXEN	<p><b>Receiver Enable.</b> Enables/Disables the receiver. When the receiver is enabled, if the RXD input is already low, the receiver does not recognize BREAK characters, because it requires a valid 1-to-0 transition before it can accept any character.</p> <p>0 Disable the receiver 1 Enable the receiver</p>
0 SRST	<p><b>Software Reset.</b> Once the software writes 0 to SRST_B, the software reset remains active for 4 <i>module_clock</i> cycles before the hardware deasserts SRST_B. The software can only write 0 to SRST_B. Writing 1 to SRST_B is ignored.</p> <p>0 Reset the transmit and receive state machines, all FIFOs and register USR1, USR2, UBIR, UBMR, UBRC, URXD, UTXD and UTS[6-3]. 1 No reset</p>

### 15.3.15.5 UART Control Register 3 (UARTx\_UCR3)

Address: Base address + 88h offset

**UARTx\_UCR3 field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–14 DPEC	This bit is not used in this chip.
13 DTREN	This bit is not used in this chip.
12 PARERREN	<b>Parity Error Interrupt Enable. Enables/Disables the interrupt. When asserted, PARERREN causes the PARITYERR bit to generate an interrupt.</b>  0 Disable the parity error interrupt 1 Enable the parity error interrupt
11 FRAERREN	<b>Frame Error Interrupt Enable. Enables/Disables the interrupt. When asserted, FRAERREN causes the FRAMERR bit to generate an interrupt.</b>  0 Disable the frame error interrupt 1 Enable the frame error interrupt
10 DSR	This bit is not used in this chip.
9 DCD	This bit is not used in this chip.
8 RI	This bit is not used in this chip.
7 ADNIMP	<b>Autobaud Detection Not Improved-. Disables new features of autobaud detection (See <a href="#">Baud Rate Automatic Detection Protocol</a>, for more details).</b>  0 Autobaud detection new features selected 1 Keep old autobaud detection mechanism

Table continues on the next page...

**UARTx\_UCR3 field descriptions (continued)**

Field	Description
6 RXDSEN	Receive Status Interrupt Enable. Controls the receive status interrupt ( <i>interrupt_uart</i> ). When this bit is enabled and RXDS status bit is set, the interrupt <i>interrupt_uart</i> will be generated.  0 Disable the RXDS interrupt 1 Enable the RXDS interrupt
5 AIRINTEN	Asynchronous IR WAKE Interrupt Enable. Controls the asynchronous IR WAKE interrupt. An interrupt is generated when AIRINTEN is asserted and a pulse is detected on the RXD pin.  0 Disable the AIRINT interrupt 1 Enable the AIRINT interrupt
4 AWAKEN	Asynchronous WAKE Interrupt Enable. Controls the asynchronous WAKE interrupt. An interrupt is generated when AWAKEN is asserted and a falling edge is detected on the RXD pin.  0 Disable the AWAKE interrupt 1 Enable the AWAKE interrupt
3 DTRDEN	This bit is not used in this chip.
2 RXDMUXSEL	RXD Muxed Input Selected. Selects proper input pins for serial and Infrared input signal. <b>NOTE:</b> In this chip, UARTs are used in MUXED mode, so that this bit should always be set.
1 INVT	Invert TXD output in RS-232/RS-485 mode, set TXD active level in IrDA mode.  In RS232/RS-485 mode(UMCR[0] = 1), if this bit is set to 1, the TXD output is inverted before transmitted.  In <b>IrDA mode</b> , when INVT is cleared, the infrared logic block transmits a positive IR 3/16 pulse for all 0s and 0s are transmitted for 1s. When INVT is set (INVT = 1), the infrared logic block transmits an active low or negative infrared 3/16 pulse for all 0s and 1s are transmitted for 1s.  0 <b>TXD is not inverted</b> 1 <b>TXD is inverted</b> 0 <b>TXD</b> Active low transmission 1 <b>TXD</b> Active high transmission
0 ACIEN	<b>Autobaud Counter Interrupt Enable.</b> This bit is used to enable the autobaud counter stopped interrupt (triggered with ACST (USR2[11]).  0 ACST interrupt disabled 1 ACST interrupt enabled

### 15.3.15.6 UART Control Register 4 (UARTx\_UCR4)

UARTx\_UCR4 field descriptions (continued)

Field	Description
7 WKEN	<b>WAKE Interrupt Enable.</b> Enables/Disables the WAKE bit to generate an interrupt. The WAKE bit is set at the detection of a start bit by the receiver.  0 Disable the WAKE interrupt 1 Enable the WAKE interrupt
6 IDDMAEN	<b>DMA IDLE Condition Detected Interrupt Enable</b> Enables/Disables the receive DMA request <i>dma_req_rx</i> for the IDLE interrupt (triggered with IDLE flag in USR2[12]).  0 DMA IDLE interrupt disabled 1 DMA IDLE interrupt enabled
5 IRSC	<b>IR Special Case.</b> Selects the clock for the vote logic. When set, IRSC switches the vote logic clock from the sampling clock to the UART reference clock. The IR pulses are counted a predetermined amount of time depending on the reference frequency. See <a href="#">InfraRed Special Case (IRSC) Bit</a> .  0 The vote logic uses the sampling clock (16x baud rate) for normal operation 1 The vote logic uses the UART reference clock
4 LPBYP	<b>Low Power Bypass.</b> Allows to bypass the low power new features in UART. To use during debug phase.  0 Low power features enabled 1 Low power features disabled
3 TCEN	<b>TransmitComplete Interrupt Enable.</b> Enables/Disables the TXDC bit to generate an interrupt ( <i>interrupt_uart = 0</i> )  <b>NOTE:</b> An interrupt will be issued as long as TCEN and TXDC are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the TXDC interrupt.  0 Disable TXDC interrupt 1 Enable TXDC interrupt
2 BKEN	<b>BREAK Condition Detected Interrupt Enable.</b> Enables/Disables the BRCD bit to generate an interrupt.  0 Disable the BRCD interrupt 1 Enable the BRCD interrupt
1 OREN	<b>Receiver Overrun Interrupt Enable.</b> Enables/Disables the ORE bit to generate an interrupt.  0 Disable ORE interrupt 1 Enable ORE interrupt
0 DREN	<b>Receive Data Ready Interrupt Enable.</b> Enables/Disables the RDR bit to generate an interrupt.  0 Disable RDR interrupt 1 Enable RDR interrupt

### 15.3.15.7 UART FIFO Control Register (UARTx\_UFCR)

Address: Base address + 90h offset

#### UARTx\_UFCR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–10 TXTL	<p><b>Transmitter Trigger Level.</b> Controls the threshold at which a maskable interrupt is generated by the TxFIFO. A maskable interrupt is generated whenever the data level in the TxFIFO falls below the selected threshold. The bits are encoded as shown in the Settings column.</p> <p>Settings 0 to 32 are in use. All other settings are Reserved.</p> <p>000000 Reserved                      000001 Reserved                      000010 TxFIFO has 2 or fewer characters                      ... —                      ... —                      011111 TxFIFO has 31 or fewer characters                      100000 TxFIFO has 32 characters (maximum)</p>
9–7 RFDIV	<p>Reference Frequency Divider. Controls the divide ratio for the reference clock. The input clock is <i>module_clock</i>. The output from the divider is <i>ref_clk</i> which is used by BRM to create the 16x baud rate oversampling clock (<i>brm_clk</i>).</p> <p>000 Divide input clock by 6                      001 Divide input clock by 5                      010 Divide input clock by 4                      011 Divide input clock by 3                      100 Divide input clock by 2                      101 Divide input clock by 1                      110 Divide input clock by 7                      111 Reserved</p>
6 DCEDTE	<p><b>DCE/DTE mode select.</b> Select UART as data communication equipment (DCE mode) or as data terminal equipment (DTE mode).</p>

Table continues on the next page...

**UARTx\_UFCR field descriptions (continued)**

Field	Description
	0 DCE mode selected 1 DTE mode selected
RXTL	<p><b>Receiver Trigger Level.</b> Controls the threshold at which a maskable interrupt is generated by the RxFIFO. A maskable interrupt is generated whenever the data level in the RxFIFO reaches the selected threshold. The RXTL bits are encoded as shown in the Settings column.</p> <p>Setting 0 to 32 are in use. All other settings are Reserved.</p> <p>000000 0 characters received                      000001 RxFIFO has 1 character                      ... —                      ... —                      011111 RxFIFO has 31 characters                      100000 RxFIFO has 32 characters (maximum)</p>

### 15.3.15.8 UART Status Register 1 (UARTx\_USR1)

Address: Base address + 94h offset

**UARTx\_USR1 field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 PARITYERR	<b>Parity Error Interrupt Flag.</b> Indicates a parity error is detected. PARITYERR is cleared by writing 1 to it. Writing 0 to PARITYERR has no effect. When parity is disabled, PARITYERR always reads 0. At reset, PARITYERR is set to 0.  0 No parity error detected 1 Parity error detected (write 1 to clear)
14 RTSS	<b>RTS_B Pin Status.</b> Indicates the current status of the RTS_B pin. A "snapshot" of RTS_B is taken immediately before RTSS is presented to the data bus. RTSS cannot be cleared because all writes to RTSS are ignored. At reset, RTSS is set to 0.

Table continues on the next page...

UARTx\_USR1 field descriptions (continued)

Field	Description
	<p>0 The RTS_B module input is high (inactive)</p> <p>1 The RTS_B module input is low (active)</p>
13 TRDY	<p><b>Transmitter Ready Interrupt / DMA Flag.</b> Indicates that the TxFIFO emptied below its target threshold and requires data. TRDY is automatically cleared when the data level in the TxFIFO exceeds the threshold set by TXTL bits. At reset, TRDY is set to 1.</p> <p>0 The transmitter does not require data</p> <p>1 The transmitter requires data (interrupt posted)</p>
12 RTSD	<p><b>RTS Delta.</b> Indicates whether the RTS_B pin changed state. It (RTSD) generates a maskable interrupt. When in STOP mode, RTS assertion sets RTSD and can be used to wake the processor. The current state of the RTS_B pin is available on the RTSS bit. Clear RTSD by writing 1 to it. Writing 0 to RTSD has no effect. At reset, RTSD is set to 0.</p> <p>0 RTS_B pin did not change state since last cleared</p> <p>1 RTS_B pin changed state (write 1 to clear)</p>
11 ESCF	<p><b>Escape Sequence Interrupt Flag.</b> Indicates if an escape sequence was detected. ESCF is asserted when the ESCEN bit is set and an escape sequence is detected in the RxFIFO. Clear ESCF by writing 1 to it. Writing 0 to ESCF has no effect.</p> <p>0 No escape sequence detected</p> <p>1 Escape sequence detected (write 1 to clear).</p>
10 FRAMERR	<p><b>Frame Error Interrupt Flag.</b> Indicates that a frame error is detected. The <i>interrupt_uart</i> interrupt will be generated if a frame error is detected and the interrupt is enabled. Clear FRAMERR by writing 1 to it. Writing 0 to FRAMERR has no effect.</p> <p>0 No frame error detected</p> <p>1 Frame error detected (write 1 to clear)</p>
9 RRDY	<p><b>Receiver Ready Interrupt / DMA Flag.</b> Indicates that the RxFIFO data level is above the threshold set by the RXTL bits. (See the RXTL bits description in <a href="#">UART FIFO Control Register (UART_UFCR)</a> for setting the interrupt threshold.) When asserted, RRDY generates a maskable interrupt or DMA request. RRDY is automatically cleared when data level in the RxFIFO goes below the set threshold level. At reset, RRDY is set to 0.</p> <p>0 No character ready</p> <p>1 Character(s) ready (interrupt posted)</p>
8 AGTIM	<p><b>Ageing Timer Interrupt Flag.</b> Indicates that data in the RxFIFO has been idle for a time of 8 character lengths (where a character length consists of 7 or 8 bits, depending on the setting of the WS bit in UCR2, with the bit time corresponding to the baud rate setting) and FIFO data level is less than RxFIFO threshold level (RXTL in the UFCR). Clear by writing a 1 to it.</p> <p>0 AGTIM is not active</p> <p>1 AGTIM is active (write 1 to clear)</p>
7 DTRD	<p>This bit is not used in this chip.</p>
6 RXDS	<p><b>Receiver IDLE Interrupt Flag.</b> Indicates that the receiver state machine is in an IDLE state, the next state is IDLE, and the receive pin is high. RXDS is automatically cleared when a character is received. RXDS is active only when the receiver is enabled.</p> <p>0 Receive in progress</p> <p>1 Receiver is IDLE</p>

Table continues on the next page...

**UARTx\_USR1 field descriptions (continued)**

<b>Field</b>	<b>Description</b>
5 AIRINT	Asynchronous IR WAKE Interrupt Flag. Indicates that the IR WAKE pulse was detected on the RXD pin. Clear AIRINT by writing 1 to it. Writing 0 to AIRINT has no effect.  0 No pulse was detected on the RXD IrDA pin 1 A pulse was detected on the RXD IrDA pin
4 AWAKE	Asynchronous WAKE Interrupt Flag. Indicates that a falling edge was detected on the RXD pin. Clear AWAKE by writing 1 to it. Writing 0 to AWAKE has no effect.  0 No falling edge was detected on the RXD Serial pin 1 A falling edge was detected on the RXD Serial pin
3 SAD	RS-485 Slave Address Detected Interrupt Flag.  Indicates if RS-485 Slave Address was detected . SAD was asserted in RS-485 mode when the SADEN bit is set and Slave Address is detected in RxFIFO (in Nomal Address Detect Mode, the 9 <sup>th</sup> data bit = 1; in Automatic Address Detect Mode, the received charater matches the programmed SLADDR).  0 No slave address detected 1 Slave address detected
-	This field is reserved. Reserved

### 15.3.15.9 UART Status Register 2 (UARTx\_USR2)

Address: Base address + 98h offset

**UARTx\_USR2 field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 ADET	<b>Automatic Baud Rate Detect Complete.</b> Indicates that an "A" or "a" was received and that the receiver detected and verified the incoming baud rate. Clear ADET by writing 1 to it. Writing 0 to ADET has no effect.  0 ASCII "A" or "a" was not received 1 ASCII "A" or "a" was received (write 1 to clear)
14 TXFE	<b>Transmit Buffer FIFO Empty.</b> Indicates that the transmit buffer (TxFIFO) is empty. TXFE is cleared automatically when data is written to the TxFIFO. Even though TXFE is high, the transmission might still be in progress.  0 The transmit buffer (TxFIFO) is not empty 1 The transmit buffer (TxFIFO) is empty
13 DTRF	This bit is not used in this chip.

Table continues on the next page...

## UARTx\_USR2 field descriptions (continued)

Field	Description
12 IDLE	<p><b>Idle Condition.</b> Indicates that an idle condition has existed for more than a programmed amount frame (see <a href="#">Idle Line Detect</a>). An interrupt can be generated by this IDLE bit if IDEN (UCR1[12]) is enabled. IDLE is cleared by writing 1 to it. Writing 0 to IDLE has no effect.</p> <p>0 No idle condition detected 1 Idle condition detected (write 1 to clear)</p>
11 ACST	<p><b>Autobaud Counter Stopped.</b> In autobaud detection (ADBR=1), indicates the counter which determines the baud rate was running and is now stopped. This means either START bit is finished (if ADNIMP=1), or Bit 0 is finished (if ADNIMP=0). See <a href="#">New Autobaud Counter Stopped bit and Interrupt</a>, for more details. An interrupt can be flagged on <i>interrupt_uart</i> if ACIEN=1.</p> <p>0 Measurement of bit length not finished (in autobaud) 1 Measurement of bit length finished (in autobaud). (write 1 to clear)</p>
10 RIDELT	This bit is not used in this chip.
9 RIIN	This bit is not used in this chip.
8 IRINT	<p><b>Serial Infrared Interrupt Flag.</b> When an edge is detected on the RXD pin during SIR Mode, this flag will be asserted. This flag can cause an interrupt which can be masked using the control bit ENIRI: UCR4 [8].</p> <p>0 no edge detected 1 valid edge detected (write 1 to clear)</p>
7 WAKE	<p><b>Wake.</b> Indicates the start bit is detected. WAKE can generate an interrupt that can be masked using the WKEN bit. Clear WAKE by writing 1 to it. Writing 0 to WAKE has no effect.</p> <p>0 start bit not detected 1 start bit detected (write 1 to clear)</p>
6 DCDDELT	This bit is not used in this chip.
5 DCDIN	This bit is not used in this chip.
4 RTSF	<p><b>RTS Edge Triggered Interrupt Flag. Indicates if</b> a programmed edge is detected on the RTS_B pin. The RTEC bits select the edge that generates an interrupt (see <a href="#">Table 15-31</a>). RTSF can generate an interrupt that can be masked using the RTSSEN bit. Clear RTSF by writing 1 to it. Writing 0 to RTSF has no effect.</p> <p>0 Programmed edge not detected on RTS_B 1 Programmed edge detected on RTS_B (write 1 to clear)</p>
3 TXDC	<p><b>Transmitter Complete.</b> Indicates that the transmit buffer (TxFIFO) and Shift Register is empty; therefore the transmission is complete. TXDC is cleared automatically when data is written to the TxFIFO.</p> <p>0 Transmit is incomplete 1 Transmit is complete</p>
2 BRCD	<p><b>BREAK Condition Detected.</b> Indicates that a BREAK condition was detected by the receiver. Clear BRCD by writing 1 to it. Writing 0 to BRCD has no effect.</p> <p>0 No BREAK condition was detected 1 A BREAK condition was detected (write 1 to clear)</p>
1 ORE	<p><b>Overrun Error.</b> When set to 1, ORE indicates that the receive buffer (Rx FIFO) was full (32 chars inside), and a 33rd character has been fully received. This 33rd character has been discarded. Clear ORE by writing 1 to it. Writing 0 to ORE has no effect.</p>

*Table continues on the next page...*

**UARTx\_USR2 field descriptions (continued)**

Field	Description
	0 No overrun error 1 Overrun error (write 1 to clear)
0 RDR	<b>Receive Data Ready</b> -Indicates that at least 1 character is received and written to the RxFIFO. If the URXD register is read and there is only 1 character in the RxFIFO, RDR is automatically cleared.  0 No receive data ready 1 Receive data ready

**15.3.15.10 UART Escape Character Register (UARTx\_UESC)**

Address: Base address + 9Ch offset

**UARTx\_UESC field descriptions**

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
ESC_CHAR	<b>UART Escape Character.</b> Holds the selected escape character that all received characters are compared against to detect an escape sequence.

**15.3.15.11 UART Escape Timer Register (UARTx\_UTIM)**

Address: Base address + A0h offset

**UARTx\_UTIM field descriptions**

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
TIM	<b>UART Escape Timer.</b> Holds the maximum time interval (in ms) allowed between escape characters. The escape timer register is programmable in intervals of 2 ms. See <a href="#">Escape Sequence Detection</a> and <a href="#">Table 15-35</a> for more information on the UART escape sequence detection.  Reset value 0x000 = 2 ms up to 0xFFFF = 8.192 s.

### 15.3.15.12 UART BRM Incremental Register (UARTx\_UBIR)

This register can be written by both software and hardware. When enabling the automatic baud rate detection feature hardware can write 0x000F value into the UBIR after finishing detecting baud rate. Hardware has higher priority when both software and hardware try to write it at the same cycle<sup>8</sup>.

Please note software reset will reset the register to its reset value.

Address: Base address + A4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																INC															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### UARTx\_UBIR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
INC	Incremental Numerator. Holds the numerator value minus one of the BRM ratio (see <a href="#">Binary Rate Multiplier (BRM)</a> ). The UBIR register MUST be updated before the UBMR register for the baud rate to be updated correctly. If only one register is written to by software, the BRM will ignore this data until the other register is written to by software. Updating this field using byte accesses is not recommended and is undefined.

### 15.3.15.13 UART BRM Modulator Register (UARTx\_UBMR)

This register can be written by both software and hardware. When enabling the automatic baud rate detection feature hardware can write a proper value into the UBMR based on detected baud rate. Hardware has higher priority when both software and hardware try to write it at the same cycle<sup>9</sup>.

Please note software reset will reset the register to its reset value.

Address: Base address + A8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																MOD															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

8. Note: The write priority in the new design is not same as the original UART. In the original design, software has higher priority than hardware when writing this register at the same time.
9. Note: The write priority in the new design is not same as the original UART. In the original design, software has higher priority than hardware when writing this register at the same time.

**UARTx\_UBMR field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
MOD	<b>Modulator Denominator.</b> Holds the value of the denominator minus one of the BRM ratio (see <a href="#">Binary Rate Multiplier (BRM)</a> ). The UBIR register MUST be updated before the UBMR register for the baud rate to be updated correctly. If only one register is written to by software, the BRM will ignore this data until the other register is written to by software. Updating this register using byte accesses is not recommended and undefined.

**15.3.15.14 UART Baud Rate Count Register (UARTx\_UBRC)**

Address: Base address + ACh offset

**UARTx\_UBRC field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
BCNT	<b>Baud Rate Count Register.</b> This read only register is used to count the start bit of the incoming baud rate (if ADNIMP=1), or start bit + bit0 (if ADNIMP=0). When the measurement is done, the Baud Rate Count Register contains the number of UART internal clock cycles (clock after divider) present in an incoming bit. BCNT retains its value until the next Automatic Baud Rate Detection sequence has been initiated. The 16 bit Baud Rate Count register is reset to 4 and stays at hex FFFF in the case of an overflow.

### 15.3.15.15 UART One Millisecond Register (UARTx\_ONEMS)

#### NOTE

This register has been expanded from 16 bits to 24 bits. In previous versions, the 16-bit ONEMS can only support the maximum 65.535MHz (0xFFFFx1000) *ref\_clk*. To support 4Mbps Bluetooth application with 66.5MHz *module\_clock*, the value 0x103C4 (66.5M/1000) should be written into this register. In this case, the 16 bits are not enough to contain the 0x103C4. So this register was expanded to 24 bits to support high frequency of the *ref\_clk*.

Address: Base address + B0h offset

#### UARTx\_ONEMS field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
ONEMS	<p><b>One Millisecond Register.</b> This 24-bit register must contain the value of the UART internal frequency (<i>ref_clk</i> in <a href="#">Figure 15-14</a>) divided by 1000. The internal frequency is obtained after the UART BRM internal divider (<math>F(\text{ref\_clk}) = F(\text{module\_clock}) / \text{RFDIV}</math>).</p> <p>In fact this register contains the value corresponding to the number of UART BRM internal clock cycles present in one millisecond.</p> <p>The ONEMS (and UTIM) registers value are used in the escape character detection feature (<a href="#">Escape Sequence Detection</a>) to count the number of clock cycles left between two escape characters. The ONEMS register is also used in infrared special case mode (IRSC = UCR4[5] = 1'b1), see <a href="#">InfraRed Special Case (IRSC) Bit</a>.</p>

### 15.3.15.16 UART Test Register (UARTx\_UTS)

Address: Base address + B4h offset

#### UARTx\_UTS field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13 FRCPERR	Force Parity Error. Forces the transmitter to generate a parity error if parity is enabled. FRCPERR is provided for system debugging.  0 Generate normal parity 1 Generate inverted parity (error)
12 LOOP	Loop TX and RX for Test. Controls loopback for test purposes. When LOOP is high, the receiver input is internally connected to the transmitter and ignores the RXD pin. The transmitter is unaffected by LOOP. If RXDMUXSEL (UCR3[2]) is set to 1, the loopback is applied on serial and IrDA signals. If RXDMUXSEL is set to 0, the loopback is only applied on serial signals.  0 Normal receiver operation 1 Internally connect the transmitter output to the receiver input
11 DBGEN	This bit is not used in this chip.  debug_enable_B. This bit controls whether to respond to the debug_req input signal.  0 UART will go into debug mode when debug_req is HIGH 1 UART will not go into debug mode even if debug_req is HIGH
10 LOOPIR	<b>Loop TX and RX for IR Test (LOOPIR).</b> This bit controls loopback from transmitter to receiver in the InfraRed interface.  0 No IR loop 1 Connect IR transmitter to IR receiver
9 RXDBG	This bit is not used in this chip.  <b>RX_fifo_debug_mode.</b> This bit controls the operation of the RX fifo read counter when in debug mode.  0 rx fifo read pointer does not increment 1 rx_fifo read pointer increments as normal

Table continues on the next page...

## UARTx\_UTS field descriptions (continued)

Field	Description
8–7 Reserved	This read-only field is reserved and always has the value 0.
6 TXEMPTY	TxFIFO Empty. Indicates that the TxFIFO is empty. 0 The TxFIFO is not empty 1 The TxFIFO is empty
5 RXEMPTY	RxFIFO Empty. Indicates the RxFIFO is empty. 0 The RxFIFO is not empty 1 The RxFIFO is empty
4 TXFULL	TxFIFO FULL. Indicates the TxFIFO is full. 0 The TxFIFO is not full 1 The TxFIFO is full
3 RXFULL	RxFIFO FULL. Indicates the RxFIFO is full. 0 The RxFIFO is not full 1 The RxFIFO is full
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SOFTTRST	Software Reset. Indicates the status of the software reset (SRST_B bit of UCR2). 0 Software reset inactive 1 Software reset active

## 15.3.15.17 UART RS-485 Mode Control Register (UARTx\_UMCR)

Address: Base address + B8h offset

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W	[Shaded]																
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	SLADDR								0				SADEN	TXB8	SLAM	MDEN

Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

**UARTx\_UMCR field descriptions**

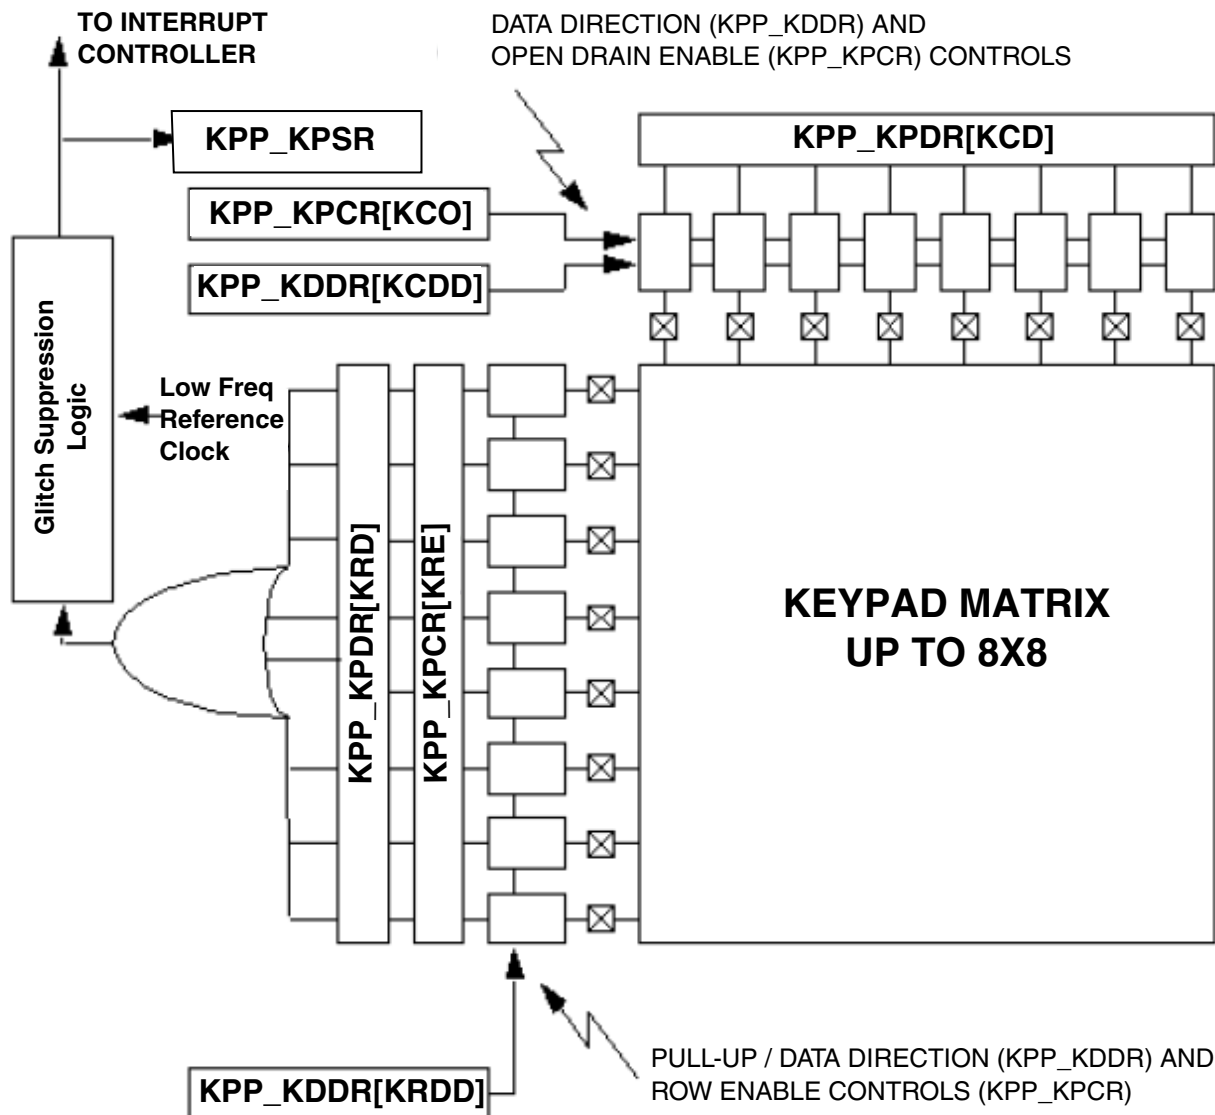

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 SLADDR	RS-485 Slave Address Character. Holds the selected slave address character that the receiver will try to detect.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 SADEN	RS-485 Slave Address Detected Interrupt Enable. 0 Disable RS-485 Slave Address Detected Interrupt 1 Enable RS-485 Slave Address Detected Interrupt
2 TXB8	Transmit RS-485 bit 8 (the ninth bit or 9 <sup>th</sup> bit). In RS-485 mode, software writes TXB8 bit as the 9 <sup>th</sup> data bit to be transmitted. 0 0 will be transmitted as the RS485 9 <sup>th</sup> data bit 1 1 will be transmitted as the RS485 9 <sup>th</sup> data bit
1 SLAM	RS-485 Slave Address Detect Mode Selection. 0 Select Normal Address Detect mode 1 Select Automatic Address Detect mode
0 MDEN	9-bit data or Multidrop Mode (RS-485) Enable. 0 Normal RS-232 or IrDA mode, see <a href="#">Table 15-27</a> for detail. 1 Enable RS-485 mode, see <a href="#">Table 15-27</a> for detail

## 15.4 Keypad Port (KPP)

### 15.4.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

### 15.4.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

### 15.4.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

## 15.4.2 Clocks

The table found here describes the clock sources for KPP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 15-37. KPP Clocks**

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 15.4.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

**Table 15-38. KPP External Signals**

Signal	Description	Pad	Mode	Direction
KEY_COL0	Column input or output pin, from chip	ENET1_TDATA1	ALT6	IO
		EPDC1_DATA07	ALT3	
KEY_COL1	Column input or output pin, from chip	ENET1_RXC	ALT6	IO
		EPDC1_DATA05	ALT3	
KEY_COL2	Column input or output pin, from chip	ENET1_RDATA3	ALT6	IO
		EPDC1_DATA03	ALT3	
KEY_COL3	Column input or output pin, from chip	ENET1_RDATA1	ALT6	IO
		EPDC1_DATA01	ALT3	
KEY_COL4	Column input or output pin, from chip	EPDC1_SDLE	ALT3	IO
		GPIO1_IO07	ALT6	
KEY_COL5	Column input or output pin, from chip	EPDC1_SDOE	ALT3	IO
		GPIO1_IO08	ALT6	
KEY_COL6	Column input or output pin, from chip	EPDC1_SDCE2	ALT3	IO
		GPIO1_IO10	ALT6	
KEY_COL7	Column input or output pin, from chip	EPDC1_GDCLK	ALT3	IO
		SAI2_RXD	ALT6	
KEY_ROW0	Row input or output pin, from chip	ENET1_TDATA0	ALT6	IO
		EPDC1_DATA06	ALT3	
KEY_ROW1	Row input or output pin, from chip	ENET1_RX_CTL	ALT6	IO
		EPDC1_DATA04	ALT3	
KEY_ROW2	Row input or output pin, from chip	ENET1_RDATA2	ALT6	IO
		EPDC1_DATA02	ALT3	
KEY_ROW3	Row input or output pin, from chip	ENET1_RDATA0	ALT6	IO
		EPDC1_DATA00	ALT3	
KEY_ROW4	Row input or output pin, from chip	EPDC1_SDCLK	ALT3	IO
		GPIO1_IO06	ALT6	
KEY_ROW5	Row input or output pin, from chip	EPDC1_SDSHR	ALT3	IO
		GPIO1_IO09	ALT6	
KEY_ROW6	Row input or output pin, from chip	EPDC1_SDCE3	ALT3	IO

*Table continues on the next page...*

**Table 15-38. KPP External Signals (continued)**

Signal	Description	Pad	Mode	Direction
		GPIO1_IO11	ALT6	
KEY_ROW7	Row input or output pin, from chip	EPDC1_GDOE	ALT3	IO
		SAI2_TXD	ALT6	

### 15.4.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP\_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP\_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

### 15.4.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP\_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP\_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

**Table 15-39. Keypad Port Column Modes**

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

#### NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

### 15.4.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

## 15.4.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock is on. The KPP may generate an ARM platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

### 15.4.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

### 15.4.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

### 15.4.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

### 15.4.4.4 Keypad Standby

There is no need for the ARM platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the ARM platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the ARM platform if any key is pressed.

Upon receiving a keypad interrupt, the ARM platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

### 15.4.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the ARM platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock source.

This clock must continue to run in any low power mode where the keypad is a wake-up source, as the ARM platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

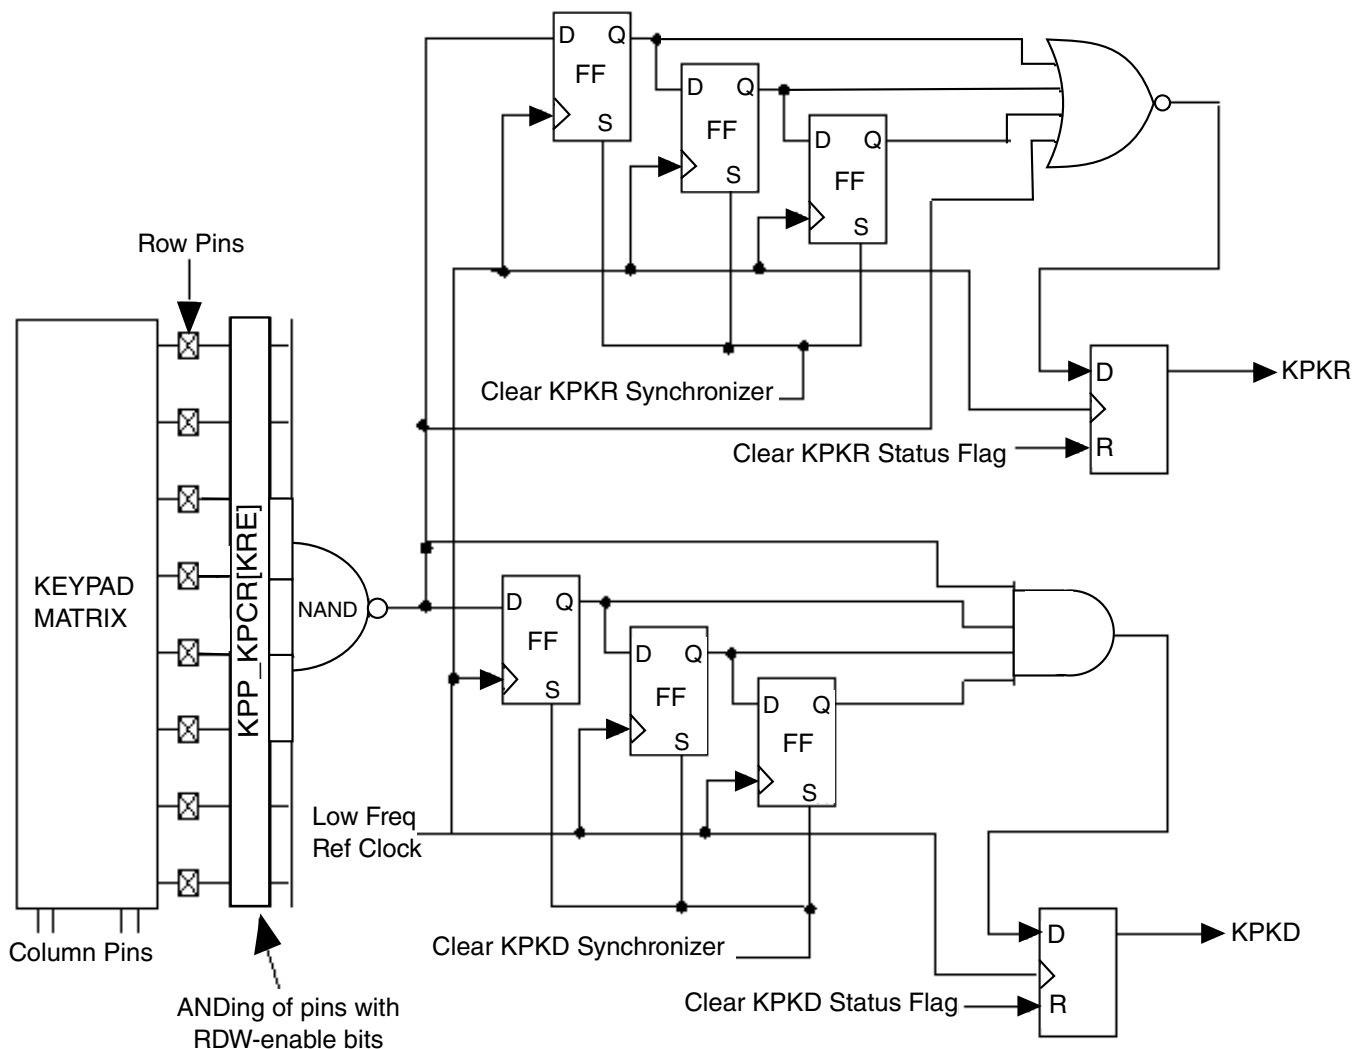

Figure 15-28. Keypad Synchronizer Functional Diagram

### 15.4.4.6 Multiple Key Closures

Using the key press and Key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly.

See the following figures for illustrations of the interfacing of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected. Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

**Figure 15-29. Multiple Key Presses on Same Column Line (Simplified View)**

**Figure 15-30. Multiple Key Presses on Same Row Line (Simplified View)**

**NOTE**

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

#### 15.4.4.6.1 Ghost Key Problem and Correction

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

As can be seen in [Figure 15-31](#), three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see [Figure 15-32](#)).

**Figure 15-31. Decoding Wrong Three- Key-Presses**

Figure 15-32. Matrix with "Ghost" Key Protections

### 15.4.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in [Figure 15-33](#), two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

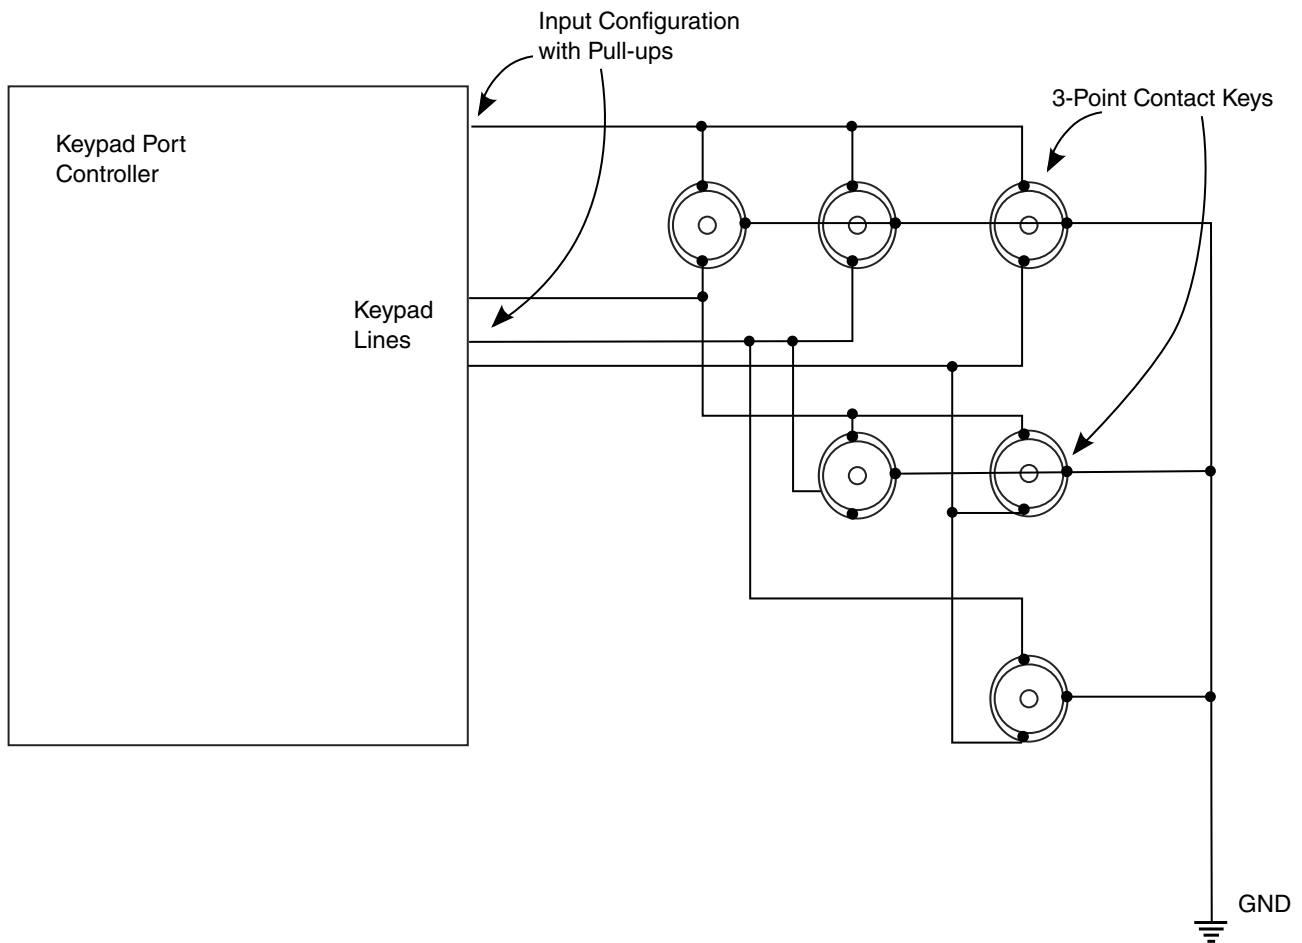

Figure 15-33. KPP Interface with 3-point Contact Key Matrix (Simplified View)

## 15.4.5 Initialization/Application Information

### 15.4.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP\_KPCR[KRE]).
2. Write 0s to KPP\_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP\_KPCR[KCO]).
4. Configure columns as output (KPP\_KDDR[KCDD]) and rows as input (KPP\_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).
7. (The system is now in standby mode, and awaiting a key press.)

### 15.4.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP\_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP\_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

### 15.4.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

## 15.4.6 KPP Memory Map/Register Definition

The KPP contains four registers.

**KPP memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
3032_0000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	<a href="#">15.4.6.1/4579</a>
3032_0002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	<a href="#">15.4.6.2/4580</a>
3032_0004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	<a href="#">15.4.6.3/4582</a>
3032_0006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	<a href="#">15.4.6.4/4582</a>

### 15.4.6.1 Keypad Control Register (KPP\_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP\_KPCR register is byte- or half-word-addressable.

Address: 3032\_0000h base + 0h offset = 3032\_0000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCO								KRE							
Write	KCO								KRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**KPP\_KPCR field descriptions**

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input.  <b>NOTE:</b> Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin.

*Table continues on the next page...*

## KPP\_KPCR field descriptions (continued)

Field	Description
	0 <b>TOTEM_POLE</b> — Column strobe output is totem pole drive. 1 <b>OPEN_DRAIN</b> — Column strobe output is open drain.
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set.  0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

## 15.4.6.2 Keypad Status Register (KPP\_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP\_KPSR register is byte- or half-word-addressable.

Address: 3032\_0000h base + 2h offset = 3032\_0002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write								
Reset	0	0	0	0	0	1	0	0
Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write					KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

## KPP\_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.  0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of

Table continues on the next page...

**KPP\_KPSR field descriptions (continued)**

Field	Description
	<p>being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.</p> <p>0 No interrupt request is generated when KPKD is set. 1 An interrupt request is generated when KPKD is set.</p>
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	<p>Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit.</p> <p>Reads return a value of "0".</p> <p>0 No effect 1 Set bits which sets keypad release synchronizer chain</p>
2 KDSC	<p>Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit.</p> <p>Reads return a value of "0".</p> <p>0 No effect 1 Set bits that clear the keypad depress synchronizer chain</p>
1 KPKR	<p>Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents.</p> <p>Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1".</p> <p>0 No key release detected 1 All keys have been released</p>
0 KPKD	<p>Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys.</p> <p>Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents.</p> <p>0 No key presses detected 1 A key has been depressed</p>

### 15.4.6.3 Keypad Data Direction Register (KPP\_KDDR)

The bits in the KPP\_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP\_KDDR register is byte- or half-word addressable.

#### NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

Address: 3032\_0000h base + 4h offset = 3032\_0004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCDD								KRDD							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### KPP\_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL $n$ pin as an output (where $n = 7$ through 0).  0 <b>INPUT</b> — COL $n$ pin is configured as an input. 1 <b>OUTPUT</b> — COL $n$ pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW $n$ pin as an output (where $n = 7$ through 0).  0 <b>INPUT</b> — ROW $n$ pin configured as an input. 1 <b>OUTPUT</b> — ROW $n$ pin configured as an output.

### 15.4.6.4 Keypad Data Register (KPP\_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

The KPP\_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 3032\_0000h base + 6h offset = 3032\_0006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCD								KRD							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**KPP\_KPDR field descriptions**

Field	Description
15–8 KCD	Keypad Column Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to column ports 1 Read/Write "1" from/to column ports
KRD	Keypad Row Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to row ports 1 Read/Write "1" from/to row ports
