# **i.MX 7Dual Applications Processor Reference Manual**

Document Number: IMX7DRM  
Rev. 0.1, 08/2016

# Contents

Section number	Title	Page
<b>Chapter 1</b>		
<b>Introduction</b>		
1.1	Introduction.....	175
1.2	Target Applications.....	175
1.3	Acronyms and Abbreviations.....	175
1.4	Features.....	178
1.4.1	ARM Cortex-A7 Platform.....	178
1.4.2	Cortex-M4 Core Platform.....	179
1.4.3	System Bus and Interconnect.....	179
1.4.4	Clocking and Resets.....	179
1.4.5	Interrupts and DMA.....	180
1.4.6	On-Chip Memory.....	180
1.4.7	External Memory Interface.....	180
1.4.8	Timers.....	181
1.4.9	Image/Graphic Accelerators.....	181
1.4.10	Display and Camera Interfaces.....	182
1.4.11	Audio.....	182
1.4.12	General Connectivity Interfaces.....	182
1.4.13	Security.....	183
1.4.14	Multicore Support.....	184
1.4.15	Analog.....	184
1.4.16	GPIO and Pin Multiplexing.....	184
1.4.17	Power Management.....	184
1.4.18	System Debug.....	185
1.5	Architectural Overview.....	185
1.5.1	Simplified Block Diagram.....	185
1.6	Primary Boot Options.....	186

Section number	Title	Page
1.7	Operation Temperature.....	187
1.8	Package.....	187
1.9	Endianness Support.....	187

## Chapter 2 Memory Map

2.1	Memory.....	189
2.1.1	Memory system overview.....	189
2.1.1.1	On-chip L1, L2 caches, TCM.....	189
2.1.1.2	On-chip memories.....	189
2.1.1.3	External L3 memories.....	190
2.1.2	Cortex-A7 Memory Map .....	190
2.1.3	Cortex-M4 Memory Map.....	192
2.1.4	DMA memory map.....	194
2.1.5	AIPS Memory Map.....	195
2.1.6	DAP Memory Map.....	199

## Chapter 3 Security

3.1	System Security.....	201
3.1.1	Overview.....	201
3.1.2	Central Security Unit (CSU).....	202
3.1.2.1	CSU Overview.....	202
3.1.2.2	CSU Features.....	202
3.1.2.3	CSU Functional Description.....	202
3.1.2.3.1	CSU Peripheral Access Policy.....	203
3.1.3	Cryptographic Acceleration and Assurance Module (CAAM).....	204
3.1.3.1	CAAM Overview.....	204
3.1.4	Secure Non-Volatile Storage (SNVS).....	204
3.1.4.1	SNVS Overview.....	204
3.1.4.2	Tamper Detection.....	205

Section number	Title	Page
3.1.5	High Assurance Boot (HAB).....	206
3.1.6	RDC Overview.....	206
3.1.7	System JTAG Controller (SJC).....	206
3.2	Resource Domain Controller (RDC).....	207
3.2.1	Overview.....	207
3.2.1.1	Features.....	208
3.2.2	Functional Description.....	209
3.2.2.1	Domain ID .....	211
3.2.2.2	Resource Assignment .....	211
3.2.2.3	Safe Sharing.....	212
3.2.2.4	Resource Domain Control and Security Considerations .....	213
3.2.3	Modes of Operation.....	215
3.2.3.1	Low Power Modes.....	215
3.2.4	Programming Interface.....	216
3.2.4.1	Master Assignment Registers.....	216
3.2.4.2	Peripheral Mapping .....	217
3.2.4.3	Memory Region Map.....	221
3.2.5	RDC Memory Map/Register Definition.....	221
3.2.5.1	Version Information (RDC_VIR).....	232
3.2.5.2	Status (RDC_STAT).....	233
3.2.5.3	Interrupt and Control (RDC_INTCTRL).....	234
3.2.5.4	Interrupt Status (RDC_INTSTAT).....	234
3.2.5.5	Master Domain Assignment (RDC_MDAn).....	235
3.2.5.6	Peripheral Domain Access Permissions (RDC_PDAPn).....	236
3.2.5.7	Memory Region Start Address (RDC_MRSA <sub>n</sub> ).....	237
3.2.5.8	Memory Region End Address (RDC_MREAn).....	238
3.2.5.9	Memory Region Control (RDC_MRC <sub>n</sub> ).....	238
3.2.5.10	Memory Region Violation Status (RDC_MRVS <sub>n</sub> ).....	240
3.2.6	RDC SEMA42 Memory Map/Register Definition.....	240

Section number	Title	Page
3.2.6.1	Gate Register (RDC_SEMAPHORE <sub>x</sub> _GATE <sub>n</sub> ).....	244
3.2.6.2	Reset Gate Write (RDC_SEMAPHORE <sub>x</sub> _RSTGT_W).....	245
3.2.6.3	Reset Gate Read (RDC_SEMAPHORE <sub>x</sub> _RSTGT_R).....	247

## Chapter 4 ARM Platform and Debug

4.1	ARM Cortex A7 Platform (CA7).....	249
4.1.1	Overview.....	249
4.1.2	External Signals.....	250
4.1.3	Clocks.....	251
4.1.4	Platform Configuration.....	251
4.1.5	Low-Power and Performance.....	252
4.2	ARM Cortex M4 Platform (CM4).....	252
4.2.1	Overview.....	252
4.2.1.1	Cortex-M4 Block Diagram.....	253
4.2.2	Cortex-M4 Platform Features.....	254
4.2.2.1	Core Module Features.....	254
4.2.2.2	Network Interconnect Features.....	255
4.2.3	Cortex-M4 Instruction Fetches on the System Bus.....	255
4.2.4	Major Platform Bus Interfaces.....	256
4.2.5	Cortex-M4 Boot Requirements.....	256
4.2.6	Clocks and Resets.....	257
4.2.7	Debug Configuration.....	257
4.2.8	Platform JTAG Requirements.....	258
4.2.9	Local Memory Controller (LMEM).....	259
4.2.9.1	LMEM Block Diagram.....	259
4.2.9.2	Cache features.....	260
4.2.9.3	LMEM Function.....	262
4.2.9.3.1	Processor Code accesses.....	262
4.2.9.3.2	Processor Space accesses.....	262

Section number	Title	Page
4.2.9.3.3	Backdoor port accesses.....	262
4.2.9.3.4	SRAM Function.....	262
4.2.9.3.4.1	SRAM Configuration.....	263
4.2.9.3.4.2	SRAM Arrays.....	263
4.2.9.3.4.3	SRAM accesses.....	263
4.2.9.3.5	Cache Function.....	264
4.2.9.3.6	Cache Control.....	265
4.2.9.3.6.1	Cache set commands.....	265
4.2.9.3.6.2	Cache line commands.....	266
4.2.10	Miscellaneous Control Module (MCM).....	269
4.2.10.1	MCM features.....	269
4.2.10.2	MCM Interrupts.....	269
4.2.10.2.1	Normal interrupt.....	269
4.2.11	LMEM Memory Map/Register Definition.....	270
4.2.11.1	Cache control register (LMEM_PCCCR).....	270
4.2.11.2	Cache line control register (LMEM_PCCLCR).....	272
4.2.11.3	Cache search address register (LMEM_PCCSAR).....	274
4.2.11.4	Cache read/write value register (LMEM_PCCCVR).....	275
4.2.11.5	Cache control register (LMEM_PSCCR).....	276
4.2.11.6	Cache line control register (LMEM_PSCLCR).....	277
4.2.11.7	Cache search address register (LMEM_PSCSAR).....	280
4.2.11.8	Cache read/write value register (LMEM_PSCCVR).....	281
4.2.12	MCM Memory Map/Register Definition.....	281
4.2.12.1	Crossbar Switch (AXBS) Slave Configuration (MCM_PLASC).....	282
4.2.12.2	Crossbar Switch (AXBS) Master Configuration (MCM_PLAMC).....	282
4.2.12.3	Crossbar Switch (AXBS) Control Register (MCM_PLACR).....	283
4.2.12.4	Fault address register (MCM_FADR).....	283
4.2.12.5	Fault attributes register (MCM_FATR).....	284
4.2.12.6	Fault data register (MCM_FDR).....	286

Section number	Title	Page
4.3	Messaging Unit (MU).....	287
4.3.1	Overview.....	287
4.3.1.1	Features.....	287
4.3.1.2	Modes of Operation.....	288
4.3.2	External Signals.....	288
4.3.3	Functional Description.....	288
4.3.3.1	Processor A Side Memory-Mapping.....	289
4.3.3.2	Processor B Side Memory-Mapping.....	289
4.3.3.3	MU Messaging.....	289
4.3.3.3.1	Programmer Model.....	290
4.3.3.3.2	Messaging Examples.....	291
4.3.3.4	Operating Modes.....	292
4.3.3.5	Low Power Modes.....	292
4.3.3.5.1	Low Power Clocks and Synchronization.....	292
4.3.3.5.2	Processor Low Power Modes.....	292
4.3.3.6	Event Update Timing.....	293
4.3.3.7	Interrupts.....	294
4.3.3.7.1	Interrupts to the Processors.....	294
4.3.3.7.2	General Purpose Interrupt Clearing Sequence.....	294
4.3.3.8	Interrupt Messaging Protocols.....	295
4.3.3.8.1	Messaging Protocols using Interrupts.....	295
4.3.3.8.2	Messaging Protocols using Event Interrupts.....	297
4.3.3.9	Exclusive Access to Shared Memory.....	298
4.3.3.10	Packet Data Transfers.....	299
4.3.3.11	MU Resets.....	300
4.3.4	Software Restrictions.....	301
4.3.4.1	General Restrictions.....	301
4.3.4.1.1	Write-After-Write to a Transmit Register.....	301
4.3.4.1.2	Read-After-Read from a Receive Register.....	301

Section number	Title	Page
4.3.4.2	Processor Restrictions.....	302
4.3.4.2.1	Before Entering Low Power Mode.....	302
4.3.4.2.2	Before Setting a General Interrupt Request Bit (GIR0–3).....	302
4.3.4.2.3	Reset Bit Restrictions.....	302
4.3.5	MU Processor A-side Memory Map/Register Definition.....	303
4.3.5.1	Processor A Transmit Register 0 (MU_ATR0).....	303
4.3.5.2	Processor A Transmit Register 1 (MU_ATR1).....	304
4.3.5.3	Processor A Transmit Register 2 (MU_ATR2).....	305
4.3.5.4	Processor A Transmit Register 3 (MU_ATR3).....	305
4.3.5.5	Processor A Receive Register 0 (MU_ARR0).....	306
4.3.5.6	Processor A Receive Register 1 (MU_ARR1).....	307
4.3.5.7	Processor A Receive Register 2 (MU_ARR2).....	307
4.3.5.8	Processor A Receive Register 3 (MU_ARR3).....	308
4.3.5.9	Processor A Status Register (MU_ASR).....	309
4.3.5.10	Processor A Control Register (MU_ACR).....	312
4.3.6	MU Processor B-side Memory Map/Register Definition.....	314
4.3.6.1	Processor B Transmit Register 0 (MU_BTR0).....	315
4.3.6.2	Processor B Transmit Register 1 (MU_BTR1).....	316
4.3.6.3	Processor B Transmit Register 2 (MU_BTR2).....	316
4.3.6.4	Processor B Transmit Register 3 (MU_BTR3).....	317
4.3.6.5	Processor B Receive Register 0 (MU_BRR0).....	318
4.3.6.6	Processor B Receive Register 1 (MU_BRR1).....	318
4.3.6.7	Processor B Receive Register 2 (MU_BRR2).....	319
4.3.6.8	Processor B Receive Register 3 (MU_BRR3).....	320
4.3.6.9	Processor B Status Register (MU_BSR).....	321
4.3.6.10	Processor B Control Register (MU_BCR).....	324
4.4	Semaphore (SEMA4).....	326
4.4.1	Overview.....	326
4.4.1.1	Features.....	327

Section number	Title	Page
4.4.1.2	Modes of Operation.....	328
4.4.2	External Signal Description.....	328
4.4.3	Functional Description.....	328
4.4.3.1	SEMA4_GATE <sub>n</sub> Operation.....	328
4.4.3.2	SEMA4_CP <sub>n</sub> NTF Operation.....	330
4.4.4	Initialization Information.....	333
4.4.5	Application Information.....	333
4.4.6	Memory map and register definition.....	335
4.4.6.1	Semaphores Gate 0 Register (SEMA4_Gate00).....	336
4.4.6.2	Semaphores Gate 1 Register (SEMA4_Gate01).....	337
4.4.6.3	Semaphores Gate 2 Register (SEMA4_Gate02).....	338
4.4.6.4	Semaphores Gate 3 Register (SEMA4_Gate03).....	339
4.4.6.5	Semaphores Gate 4 Register (SEMA4_Gate04).....	340
4.4.6.6	Semaphores Gate 5 Register (SEMA4_Gate05).....	341
4.4.6.7	Semaphores Gate 6 Register (SEMA4_Gate06).....	342
4.4.6.8	Semaphores Gate 7 Register (SEMA4_Gate07).....	343
4.4.6.9	Semaphores Gate 8 Register (SEMA4_Gate08).....	344
4.4.6.10	Semaphores Gate 9 Register (SEMA4_Gate09).....	345
4.4.6.11	Semaphores Gate 10 Register (SEMA4_Gate10).....	346
4.4.6.12	Semaphores Gate 11 Register (SEMA4_Gate11).....	347
4.4.6.13	Semaphores Gate 12 Register (SEMA4_Gate12).....	348
4.4.6.14	Semaphores Gate 13 Register (SEMA4_Gate13).....	349
4.4.6.15	Semaphores Gate 14 Register (SEMA4_Gate14).....	350
4.4.6.16	Semaphores Gate 15 Register (SEMA4_Gate15).....	351
4.4.6.17	Semaphores Processor n IRQ Notification Enable (SEMA4_CP <sub>n</sub> INE).....	352
4.4.6.18	Semaphores Processor n IRQ Notification (SEMA4_CP <sub>n</sub> NTF).....	354
4.4.6.19	Semaphores (Secure) Reset Gate n (SEMA4_RSTGT).....	356
4.4.6.20	Semaphores (Secure) Reset IRQ Notification (SEMA4_RSTNTF).....	357
4.5	On-Chip RAM Memory Controller (OCRAM).....	359

Section number	Title	Page
4.5.1	Overview.....	359
4.5.2	Basic Functions.....	359
4.5.2.1	Read/Write Arbitration.....	359
4.5.3	Advanced Features.....	360
4.5.3.1	Read Data Wait State.....	360
4.5.3.2	Read Address Pipeline.....	360
4.5.3.3	Write Data Pipeline.....	361
4.5.3.4	Write Address Pipeline.....	361
4.5.4	Programmable Registers.....	361
4.6	Network Interconnect Bus System (NIC-301).....	362
4.6.1	Overview .....	362
4.6.1.1	Block diagram.....	362
4.6.1.2	NIC-301 Main Features.....	363
4.6.1.3	Modes and Operations.....	363
4.6.2	External Signals.....	363
4.6.3	Memory Map and Register Definition.....	363
4.6.3.1	Memory Map.....	363
4.6.3.2	Configuration programmers model.....	363
4.6.3.2.1	Address control and ID registers.....	364
4.6.3.2.2	AMBA master interface block (AMIB) configuration registers.....	364
4.6.3.2.3	ASIB (AMBA slave interface block) configuration registers.....	365
4.6.3.3	Register Descriptions.....	365
4.7	AHB to IP Bridge (AIPSTZ).....	366
4.7.1	Overview.....	366
4.7.1.1	Features.....	366
4.7.2	Clocks.....	366
4.7.3	Functional Description.....	367
4.7.4	Access Protections.....	368
4.7.5	Access Support.....	368

Section number	Title	Page
4.7.6	Initialization Information.....	369
4.7.6.1	Security Block.....	369
4.7.7	AIPSTZ Memory Map/Register Definition.....	370
4.7.7.1	Master Priviledge Registers (AIPSTZ_MPR).....	371
4.7.7.2	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR).....	373
4.7.7.3	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR1).....	377
4.7.7.4	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR2).....	380
4.7.7.5	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR3).....	383
4.7.7.6	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR4).....	386
4.8	Shared Peripheral Bus Arbiter (SPBA).....	387
4.8.1	Overview.....	387
4.8.1.1	Features.....	388
4.8.1.2	Modes of operation.....	389
4.8.2	Clocks.....	389
4.8.3	Functional description.....	390
4.8.3.1	Masters arbitration.....	390
4.8.4	Resource ownership control.....	393
4.8.4.1	Access control .....	393
4.8.4.1.1	Peripheral access.....	393
4.8.4.1.2	Peripheral Right Register access.....	394
4.8.4.2	Owner election.....	395
4.8.4.3	Ending ownership.....	395
4.8.4.3.1	Software Controlled Ownership Ending.....	395
4.8.4.4	The Un-owned State.....	396
4.8.5	SPBA Memory Map/Register Definition.....	396
4.8.5.1	Peripheral Rights Register (SPBA_PRRn).....	398
4.9	ROM Controller with Patch (ROMCP).....	399
4.9.1	Overview.....	399
4.9.1.1	Features.....	400

Section number	Title	Page
4.9.1.2	Modes of Operation.....	401
4.9.1.2.1	Low Power Mode.....	401
4.9.2	Clocks.....	401
4.9.3	Memory Map.....	401
4.9.3.1	ROM Memory Map in detail.....	401
4.9.4	Functional Description.....	402
4.9.4.1	ROM Controller (ROMC) Functional Description.....	402
4.9.4.1.1	Functionality overview.....	402
4.9.4.2	ROMC Functional Description.....	402
4.9.4.2.1	ROMC Disabling.....	402
4.9.4.2.2	ROMC Event Priority.....	403
4.9.4.2.3	Data Fixing.....	403
4.9.4.2.4	Opcode Patching.....	404
4.9.4.2.4.1	Typical Software Response to Opcode Patch.....	405
4.9.4.2.5	External Boot Feature.....	406
4.9.4.2.6	Alternate Masters and ROMC.....	406
4.9.5	ROMCP Memory Map/Register Definition.....	407
4.9.5.1	ROMC Data Registers (ROMC_ROMPATCHnD).....	408
4.9.5.2	ROMC Control Register (ROMC_ROMPATCHCNTL).....	409
4.9.5.3	ROMC Enable Register High (ROMC_ROMPATCHENH).....	410
4.9.5.4	ROMC Enable Register Low (ROMC_ROMPATCHENL).....	410
4.9.5.5	ROMC Address Registers (ROMC_ROMPATCHnA).....	411
4.9.5.6	ROMC Status Register (ROMC_ROMPATCHSR).....	412
4.10	TrustZone Address Space Controller (TZASC).....	413
4.10.1	Overview.....	413
4.10.2	Clocks.....	414
4.10.3	Address Mapping in various memory mapping modes.....	414
4.11	System Debug.....	414
4.11.1	Debug Architecture.....	414

Section number	Title	Page
4.11.1.1	i.MX7D debug architecture.....	414
4.11.1.2	Main feature of i.MX7D debug system.....	415
4.11.1.3	System level debug architecture.....	415
4.11.1.4	JTAG topology.....	417
4.11.1.4.1	Debug Access Port (DAP) TAP.....	418
4.11.1.5	Debug status and control registers.....	418
4.12	System JTAG Controller (SJC).....	421
4.12.1	Overview.....	421
4.12.1.1	Features.....	421
4.12.1.2	Modes of Operation.....	422
4.12.2	External Signals.....	424
4.12.2.1	External Signal Overview.....	424
4.12.2.2	TAP Controller.....	425
4.12.2.3	Accessing ExtraDebug Registers.....	427
4.12.3	TAP Selection Block (TSB).....	429
4.12.3.1	Select Mode Using Software.....	429
4.12.4	Boundary Scan Register (BSR) .....	430
4.12.5	SoC JTAG Instruction Register (SJIR) .....	431
4.12.5.1	ID_CODE Instruction (IDCODE) .....	431
4.12.5.2	SAMPLE/PRELOAD Instruction .....	433
4.12.5.3	EXTEST Instruction.....	433
4.12.5.4	HIGHZ Instruction.....	434
4.12.5.5	BYPASS Instruction .....	434
4.12.5.6	ENABLE_ExtraDebug Instruction .....	434
4.12.5.7	ENTER_DEBUG instruction .....	435
4.12.5.8	TAP Select Instruction .....	435
4.12.5.9	EXTEST_PULSE instruction .....	436
4.12.5.10	EXTEST_TRAIN instruction.....	436
4.12.6	Security.....	436

<b>Section number</b>	<b>Title</b>	<b>Page</b>
4.12.6.1	JTAG Security Modes .....	437
4.12.6.1.1	Mode 1: No Debug - Maximum Security.....	437
4.12.6.1.2	Mode 2: Secure JTAG - High Security .....	437
4.12.6.1.2.1	Challenge/Response Mechanism in System JTAG Mode.....	438
4.12.6.1.3	Mode 3: JTAG Enabled - Low Security .....	439
4.12.6.2	Software Enabled JTAG.....	439
4.12.6.3	Kill Trace.....	439
4.12.6.4	SJC Disable Fuse .....	440
4.12.7	Functional Description.....	441
4.12.7.1	Static Core Debug.....	441
4.12.7.2	Reset Mechanism.....	441
4.12.8	Initialization/Application Information.....	442
4.12.9	SJC Memory Map/Register Definition.....	443
4.12.9.1	General Purpose Unsecured Status Register 1 (SJC_GPUSR1).....	445
4.12.9.2	General Purpose Unsecured Status Register 2 (SJC_GPUSR2).....	447
4.12.9.3	General Purpose Unsecured Status Register 3 (SJC_GPUSR3).....	447
4.12.9.4	General Purpose Secured Status Register (SJC_GPSSR).....	448
4.12.9.5	Debug Control Register (SJC_DCR).....	449
4.12.9.6	Security Status Register (SJC_SSR).....	451
4.12.9.7	General Purpose Clocks Control Register (SJC_GPCCR).....	454

## **Chapter 5**

### **Clocks and Power Management**

5.1	Clock, Reset, and Power Management.....	455
5.1.1	Introduction.....	455
5.1.2	Components of Clock and Power Management.....	455
5.1.3	Clock Generation.....	456
5.1.3.1	Overview.....	457
5.1.3.2	Oscillator.....	458
5.1.3.3	Clock I/O Port.....	459

Section number	Title	Page
5.1.3.4	PLL and PFD.....	459

## Chapter 7 Interrupts and DMA Events

7.1	Interrupts and DMA Events.....	1217
7.1.1	Overview.....	1217
7.1.2	A7 Interrupts.....	1217
7.1.3	CM4 interrupts.....	1221
7.1.4	SDMA event mapping.....	1225
7.2	Smart Direct Memory Access Controller (SDMA).....	1226
7.2.1	Overview.....	1226
7.2.1.1	Block Diagram.....	1226
7.2.1.2	Features.....	1228
7.2.2	External Signals.....	1229
7.2.3	Clocks.....	1229
7.2.4	Functional Description.....	1230
7.2.4.1	SDMA Core.....	1230
7.2.4.1.1	SDMA Core Structure.....	1230
7.2.4.1.2	Program Control Unit (PCU).....	1233
7.2.4.1.2.1	Instruction Types.....	1233
7.2.4.1.2.2	PCU States.....	1234
7.2.4.1.3	SDMA Core Memory.....	1237
7.2.4.2	Scheduler.....	1237
7.2.4.2.1	Primary Functions.....	1237
7.2.4.2.2	Channels and DMA Requests.....	1238

Section number	Title	Page
7.2.4.2.2.1	Channels.....	1238
7.2.4.2.2.2	DMA Requests.....	1238
7.2.4.2.2.3	Mapping from DMA Requests to Channels and Priorities.....	1238
7.2.4.2.3	Scheduler Functional Description.....	1238
7.2.4.2.3.1	Scheduler Overview.....	1238
7.2.4.2.3.2	DMA Requests Scanning.....	1239
7.2.4.2.3.3	Mapping DMA Requests to Pending Channels.....	1240
7.2.4.2.3.4	Channel Overflow.....	1243
7.2.4.2.3.5	Runnable Channels Evaluation.....	1243
7.2.4.2.3.6	Next Channel Decision Tree.....	1245
7.2.4.2.3.7	Scheduler State Diagram.....	1247
7.2.4.2.3.8	Scheduler Pipeline Timing Diagram.....	1249
7.2.4.2.3.9	Channel-DMA Request Mapping.....	1249
7.2.4.2.3.10	Examples: How to Start a Channel.....	1249
7.2.4.2.4	Context Switching.....	1250
7.2.4.2.4.1	Context Switch Modes.....	1251
7.2.4.2.4.2	Context Switch Procedure.....	1252
7.2.4.2.4.3	Context Map in Memory.....	1253
7.2.4.3	Functional Units.....	1253
7.2.4.3.1	Burst DMA Unit.....	1253
7.2.4.3.1.1	Burst DMA Structure.....	1254
7.2.4.3.1.2	Burst DMA Registers.....	1255
7.2.4.3.1.3	Burst DMA Data Transfers.....	1256
7.2.4.3.2	Peripheral DMA Unit.....	1257
7.2.4.3.2.1	Peripheral DMA Structure.....	1258
7.2.4.3.2.2	Peripheral DMA Registers.....	1259
7.2.4.3.2.3	Peripheral DMA Data Transfers.....	1260
7.2.4.4	SDMA Security Support.....	1261
7.2.4.4.1	Locked Mode.....	1261

Section number	Title	Page
7.2.4.5	OnCE and PCU Debug States.....	1262
7.2.4.6	SDMA Clocks and Low Power Modes.....	1264
7.2.4.6.1	Clock Gating and Low Power Modes.....	1265
7.2.4.6.1.1	Coarse Clock Gating.....	1265
7.2.4.6.1.2	Refined Clock Gating.....	1266
7.2.4.6.1.3	Low Power Modes and User Control.....	1266
7.2.4.6.1.4	Stop Mode Response.....	1268
7.2.4.6.2	Reset.....	1268
7.2.4.7	Software Interface.....	1268
7.2.4.8	Initialization Information.....	1268
7.2.4.8.1	Hardware Reset.....	1269
7.2.4.8.2	Channel Script Execution.....	1270
7.2.4.8.3	Initialization and Script Execution Setup Sequence.....	1270
7.2.4.9	SDMA Programming Model.....	1271
7.2.4.9.1	State and Registers Per Channel.....	1271
7.2.4.9.2	General Purpose Registers.....	1272
7.2.4.9.3	Functional Unit State.....	1272
7.2.4.9.3.1	Program Counter Register (PC).....	1272
7.2.4.9.3.2	Flags.....	1272
7.2.4.9.3.3	Return Program Counter (RPC).....	1273
7.2.4.9.3.4	Loop Mode Start Program Counter (SPC).....	1273
7.2.4.9.3.5	Loop Mode End Program Counter (EPC).....	1273
7.2.4.9.4	Context Switching-Programming.....	1273
7.2.4.9.5	Address Space.....	1275
7.2.4.9.5.1	Instruction Memory Map.....	1276
7.2.4.9.5.2	Data Memory Map.....	1276
7.2.4.10	SDMA Initialization.....	1277
7.2.4.10.1	Hardware Reset-SDMA.....	1278
7.2.4.10.2	Standard Boot Sequence.....	1278

Section number	Title	Page
7.2.4.10.3	User-Defined Boot Sequence.....	1278
7.2.4.10.4	Script Loading and Context Initialization.....	1279
7.2.4.11	Instruction Description.....	1279
7.2.4.11.1	Scheduling Instructions.....	1279
7.2.4.11.2	Conditional Branch Instructions.....	1280
7.2.4.11.3	Unconditional Jump Instructions.....	1280
7.2.4.11.4	Subroutine Return Instructions.....	1281
7.2.4.11.5	Loop Instruction.....	1281
7.2.4.11.6	Miscellaneous Instructions.....	1281
7.2.4.11.7	Logic Instructions.....	1281
7.2.4.11.8	Arithmetic Instructions.....	1282
7.2.4.11.9	Compare Instructions.....	1282
7.2.4.11.10	Test Instructions.....	1283
7.2.4.11.11	Byte Permutation Instructions.....	1283
7.2.4.11.12	Bit Shift Instructions.....	1283
7.2.4.11.13	Bit Manipulation Instructions.....	1283
7.2.4.11.14	SDMA Memory Access Instructions.....	1283
7.2.4.11.15	Functional Unit Instructions.....	1284
7.2.4.11.16	Illegal Instructions.....	1284
7.2.4.11.17	Debug Instructions.....	1285
7.2.4.12	Functional Units Programming Model.....	1285
7.2.4.12.1	Burst DMA Unit Programming.....	1286
7.2.4.12.1.1	Memory Source Address Register (MSA).....	1286
7.2.4.12.1.2	Memory Destination Address Register (MDA).....	1287
7.2.4.12.1.3	Memory Data Buffer Register (MD).....	1287
7.2.4.12.1.4	State Register (MS).....	1288
7.2.4.12.1.5	Burst DMA Write (stf).....	1289
7.2.4.12.1.6	Burst DMA Read (ldf).....	1292
7.2.4.12.1.7	Prefetch/Flush and Auto-Flush Management-Burst DMA Unit	1294

Section number	Title	Page
7.2.4.12.1.8	Data Alignment and Endianness-Burst DMA Unit.....	1295
7.2.4.12.1.9	Burst DMA Unit Copy Mode.....	1298
7.2.4.12.1.10	Burst DMA Unit Error Management.....	1299
7.2.4.12.1.11	Conditional Yielding-Burst DMA Unit.....	1301
7.2.4.12.2	Peripheral DMA Unit Programming.....	1302
7.2.4.12.2.1	Peripheral Source Address Register (PSA).....	1302
7.2.4.12.2.2	Peripheral Destination Address Register (PDA).....	1303
7.2.4.12.2.3	Peripheral Data Register (PD).....	1304
7.2.4.12.2.4	Peripheral State Register (PS).....	1304
7.2.4.12.2.5	Peripheral DMA Write (stf)-Write Mode.....	1306
7.2.4.12.2.6	Peripheral DMA Read (ldf)-Read Mode.....	1308
7.2.4.12.2.7	Peripheral DMA Unit Copy Mode.....	1310
7.2.4.12.2.8	Error Management.....	1310
7.2.4.12.2.9	Peripheral DMA Unit Prefetch/Flush Management.....	1313
7.2.4.12.3	OnCE and Real-Time Debug.....	1314
7.2.4.12.3.1	Memory and Register Access.....	1314
7.2.4.12.3.2	Hardware Breakpoints.....	1314
7.2.4.12.3.3	Watchpoints.....	1314
7.2.4.12.3.4	Software Breakpoints.....	1315
7.2.4.12.3.5	Core Control.....	1315
7.2.4.13	The OnCE Controller.....	1315
7.2.4.13.1	OnCE Commands.....	1315
7.2.4.13.2	Sending Commands to the OnCE Controller.....	1316
7.2.4.13.2.1	Using the JTAG Interface.....	1316
7.2.4.13.2.2	Using the ARM platform.....	1317
7.2.4.13.2.3	Conflicts Between the JTAG and the ARM platform Accesses.....	1318
7.2.4.13.3	Executing a Command from the OnCE.....	1319
7.2.4.13.3.1	Nature of the Commands.....	1319
7.2.4.13.3.2	Execution Request.....	1319

Section number	Title	Page
	7.2.4.13.3.3 Command Execution.....	1320
7.2.4.13.4	Registers Descriptions.....	1322
	7.2.4.13.4.1 Event Cell Counter Register (ECOUNT).....	1322
	7.2.4.13.4.2 Event Cell Address Registers (EAA or EAB).....	1322
	7.2.4.13.4.3 Event Cell Address Mask Register (EAM).....	1322
	7.2.4.13.4.4 Event Cell Data Register (ED).....	1323
	7.2.4.13.4.5 Event Cell Data Mask Register (EDM).....	1323
	7.2.4.13.4.6 Real Time Buffer Register (RTB).....	1323
	7.2.4.13.4.7 Event Control Register (ECTL).....	1323
	7.2.4.13.4.8 Trace Buffer (TB).....	1323
	7.2.4.13.4.9 OnCE Status Register (OSTAT).....	1324
7.2.4.13.5	JTAG Interface Requirements.....	1324
	7.2.4.13.5.1 TCK Speed Limitation.....	1325
	7.2.4.13.5.2 Synchronization Implementation.....	1325
	7.2.4.13.5.3 JTAG Controller Start-Up Recommended Procedure.....	1327
7.2.4.14	Using the OnCE.....	1327
	7.2.4.14.1 Activating Clocks in Debug Mode.....	1327
	7.2.4.14.2 Getting the Current Status.....	1327
	7.2.4.14.3 Methods of Entering Debug Mode.....	1327
	7.2.4.14.3.1 External Debug Request During Reset.....	1328
	7.2.4.14.3.2 Debug Request During Normal Activity.....	1328
	7.2.4.14.3.3 Software Breakpoint Instruction.....	1328
	7.2.4.14.3.4 Event Detection Unit Matching Condition.....	1328
7.2.4.14.4	Executing Instructions in Debug Mode.....	1329
7.2.4.14.5	Command Sequences Examples.....	1329
	7.2.4.14.5.1 Getting the SDMA Status.....	1329
	7.2.4.14.5.2 Saving the Context.....	1330
	7.2.4.14.5.3 Restoring the Context.....	1331
	7.2.4.14.5.4 Accessing the Memory.....	1332

Section number	Title	Page
	7.2.4.14.5.5 Resuming Program Execution.....	1333
	7.2.4.14.5.6 Single Stepping in RAM.....	1333
	7.2.4.14.5.7 Single Stepping in ROM.....	1334
7.2.4.14.6	OnCE Event Detection Unit.....	1334
7.2.4.14.7	Clock Gating and Reset.....	1335
	7.2.4.14.7.1 Clocks.....	1335
	7.2.4.14.7.2 Resets.....	1336
7.2.4.14.8	Real Time Features.....	1336
	7.2.4.14.8.1 Trace Buffer.....	1336
	7.2.4.14.8.2 Real Time Buffer.....	1338
	7.2.4.14.8.3 Emulation Pin.....	1338
	7.2.4.14.8.4 Real-Time Debug Outputs.....	1338
7.2.5	Instruction Set.....	1342
7.2.5.1	Instruction Encoding.....	1342
7.2.5.2	SDMA Instruction Set.....	1343
	7.2.5.2.1 ADD (Addition).....	1345
	7.2.5.2.2 ADDI (Add with Immediate Value).....	1346
	7.2.5.2.3 AND (Logical AND).....	1347
	7.2.5.2.4 ANDI (Logical AND with Immediate Value).....	1348
	7.2.5.2.5 ANDN (Logical AND NOT).....	1349
	7.2.5.2.6 ANDNI (Logical AND with Negated Immediate Value).....	1350
	7.2.5.2.7 ASR1 (Arithmetic Shift Right by 1 Bit).....	1351
	7.2.5.2.8 BCLR1I (Bit Clear Immediate).....	1352
	7.2.5.2.9 BDF (Conditional Branch if Destination Fault).....	1353
	7.2.5.2.10 BF (Conditional Branch if False).....	1354
	7.2.5.2.11 BSETI (Bit Set Immediate).....	1355
	7.2.5.2.12 BSF (Conditional Branch if Source Fault).....	1356
	7.2.5.2.13 BT (Conditional Branch if True).....	1357
	7.2.5.2.14 BTSTI (Bit Test immediate).....	1358

Section number	Title	Page
7.2.5.2.15	CLRF (Clear ARM platform flags).....	1359
7.2.5.2.16	CMPEQ (Compare for Equal).....	1360
7.2.5.2.17	CMPEQI (Compare with Immediate for Equal).....	1361
7.2.5.2.18	CMPHS (Compare for Higher or Same).....	1362
7.2.5.2.19	CMPLT (Compare for Less Than).....	1362
7.2.5.2.20	cpShReg (Update Context of PCU Registers and Flag).....	1363
7.2.5.2.21	DONE (DONE, Yield) .....	1364
7.2.5.2.22	ILLEGAL (ILLEGAL Instruction).....	1366
7.2.5.2.23	JMP (Unconditional Jump Immediate).....	1366
7.2.5.2.24	JMPR (Unconditional Jump).....	1367
7.2.5.2.25	JSR (Unconditional Jump to Subroutine Immediate).....	1368
7.2.5.2.26	JSRR (Unconditional Jump to Subroutine).....	1368
7.2.5.2.27	LD (Load Register).....	1369
7.2.5.2.28	LDF (Load Register from Functional Unit).....	1370
7.2.5.2.29	LDI (Load Register with Immediate Value).....	1372
7.2.5.2.30	LDRPC (Load from RPC to Register).....	1373
7.2.5.2.31	LOOP (Hardware Loop).....	1374
7.2.5.2.32	LSL1 (Logical Shift Left by 1 Bit).....	1377
7.2.5.2.33	LSR1 (Logical Shift Right by 1 Bit).....	1378
7.2.5.2.34	MOV (Logical Move).....	1378
7.2.5.2.35	NOTIFY (Notify to ARM platform).....	1379
7.2.5.2.36	OR (Logical OR).....	1380
7.2.5.2.37	ORI (Logical OR with Immediate Value).....	1381
7.2.5.2.38	RET (Return from Subroutine).....	1382
7.2.5.2.39	REVB (Reverse Byte Order).....	1383
7.2.5.2.40	Reverse Low Order Bytes(REVBLO).....	1383
7.2.5.2.41	ROR1 (Rotate Right by 1 Bit).....	1384
7.2.5.2.42	RORB (Rotate Right by 1 Byte).....	1385
7.2.5.2.43	SOFTBKPT (Software Breakpoint).....	1386

Section number	Title	Page
7.2.5.2.44	ST (Store Register).....	1386
7.2.5.2.45	STF (Store Register in Functional Unit).....	1388
7.2.5.2.46	SUB (Subtract).....	1391
7.2.5.2.47	SUBI (Subtract with Immediate).....	1392
7.2.5.2.48	TST (Test with Zero).....	1393
7.2.5.2.49	TSTI (Test Immediate).....	1394
7.2.5.2.50	XOR (Logical Exclusive OR).....	1395
7.2.5.2.51	XORI (Exclusive OR with Immediate).....	1396
7.2.5.2.52	YIELD, YIELDGE (DONE, Yield).....	1397
7.2.6	Software Restrictions.....	1397
7.2.6.1	Unsupported Burst DMA Access Sequence.....	1397
7.2.7	Application Notes.....	1398
7.2.7.1	Data Structures for Boot Code and Channel Scripts.....	1398
7.2.7.1.1	Buffer Descriptor Format.....	1399
7.2.7.1.2	Buffer Descriptor Commands for Bootload scripts.....	1402
7.2.7.1.3	Example of Buffer Descriptors for Channel 0.....	1403

## Chapter 9 External Memory

9.1	External Memory Controllers.....	2135
9.1.1	Overview.....	2135
9.1.2	DDR controller (DDRC) overview and feature summary.....	2135
9.1.3	EIM-PSRAM/NOR Flash controller overview.....	2136
9.1.3.1	EIM features.....	2136
9.1.3.2	EIM boot scenarios.....	2137
9.1.3.3	EIM boot configuration.....	2137
9.1.3.4	OneNAND requirements.....	2138
9.2	DDR Controller (DDRC).....	2138
9.2.1	Introduction.....	2138
9.2.2	General Overview.....	2138
9.2.2.1	Block diagram.....	2139
9.2.2.2	Clocks.....	2140
9.2.3	Features.....	2140
9.2.4	Functional Description.....	2142
9.2.4.1	Functional overview.....	2142
9.2.4.2	Address mapper.....	2143
9.2.4.2.1	System address regions.....	2144
9.2.4.2.1.1	System address regions example.....	2145
9.2.4.2.1.2	Application to HIF address mapping.....	2146

Section number	Title	Page
	9.2.4.2.1.3 HIF address to SDRAM address mapping.....	2147
	9.2.4.2.1.4 LPDDR3 6-Gb and 12-Gb device densities.....	2151
9.2.4.3	Transaction service control.....	2151
	9.2.4.3.1 Transaction stores.....	2152
	9.2.4.3.1.1 Read transaction store.....	2152
	9.2.4.3.1.2 Write transaction store.....	2153
	9.2.4.3.1.3 Transaction store state transitions.....	2154
	9.2.4.3.1.4 Read / Write turn-around.....	2155
	9.2.4.3.1.5 Read priority management.....	2156
	9.2.4.3.2 Address collision handling.....	2157
	9.2.4.3.3 Write combine.....	2158
	9.2.4.3.4 Page policy.....	2158
	9.2.4.3.4.1 Explicit auto-precharge (Per command).....	2158
	9.2.4.3.4.2 Intelligent precharges.....	2159
9.2.4.4	Quality of service.....	2160
	9.2.4.4.1 Traffic classes.....	2160
	9.2.4.4.1.1 Read classes.....	2160
	9.2.4.4.1.2 Write classes.....	2161
	9.2.4.4.1.3 QoS mapping.....	2161
	9.2.4.4.2 Dual read address queue.....	2163
	9.2.4.4.2.1 ID collisions.....	2163
	9.2.4.4.3 VPR / VPW timeout.....	2164
	9.2.4.4.3.1 Head of line blocking.....	2165
	9.2.4.4.4 Urgent signalling.....	2166
9.2.4.5	Refresh controls.....	2166
	9.2.4.5.1 Refresh using direct software request of refresh command.....	2166
	9.2.4.5.2 Refresh using auto refresh feature inside the DDRMC .....	2167
	9.2.4.5.2.1 Single refresh.....	2168
	9.2.4.5.2.2 Burst refresh.....	2168

Section number	Title	Page
	9.2.4.5.2.3 Per-bank refresh (LPDDR2/LPDDR3 only).....	2169
9.2.4.6	ZQ calibration.....	2169
	9.2.4.6.1 DDR3 devices.....	2169
	9.2.4.6.2 LPDDR2 / LPDDR3 devices.....	2170
	9.2.4.6.3 Automatic and software initiated ZQCs.....	2171
	9.2.4.6.4 LPDDR2 / LPDDR3 ZQ reset command.....	2172
9.2.4.7	SDRAM initialization sequence.....	2172
	9.2.4.7.1 DDR3 initialization sequence.....	2173
	9.2.4.7.2 LPDDR2 / LPDDR3 initialization sequence.....	2173
9.2.4.8	ODT control.....	2174
9.2.4.9	Power saving features.....	2178
	9.2.4.9.1 SDRAM power saving features.....	2178
	9.2.4.9.1.1 Precharge power-down.....	2180
	9.2.4.9.1.2 Self-refresh.....	2182
	9.2.4.9.1.3 Deep power-down.....	2184
	9.2.4.9.1.4 Assertion of dfi_dram_clk_disable.....	2185
	9.2.4.9.1.5 DLL-off mode (DDR3).....	2186
	9.2.4.9.2 Software sequence for removal of clocks.....	2186
	9.2.4.9.3 Power removal flow.....	2187
9.2.4.10	Mode register reads and writes.....	2188
	9.2.4.10.1 Mode register write.....	2189
9.2.5	Register Descriptions.....	2190
9.2.5.1	Description introduction.....	2190
9.2.5.2	DDRC Registers.....	2192
	9.2.5.2.1 Master Register (DDRC_MSTR).....	2196
	9.2.5.2.2 Operating Mode Status Register (DDRC_STAT).....	2199
	9.2.5.2.3 Mode Register Read / Write Control Register 0 (DDRC_MRCTRL0).....	2200
	9.2.5.2.4 Mode Register Read / Write Control Register 1 (DDRC_MRCTRL1).....	2202
	9.2.5.2.5 Mode Register Read / Write Status Register (DDRC_MRSTAT).....	2203

Section number	Title	Page
9.2.5.2.6	Temperature Derate Enable Register (DDRC_DERATEEN).....	2204
9.2.5.2.7	Temperature Derate Interval Register (DDRC_DERATEINT).....	2205

9.7.7	Typical Application.....	2530
9.7.7.1	Access to Intel Sibley Flash.....	2531
9.7.7.1.1	Intel Sibley Flash Asynchronous Mode Configuration.....	2531
9.7.7.1.2	Intel Sibley Flash Synchronous Mode Configuration.....	2531
9.7.7.1.3	Intel Sibley Flash Utility.....	2531
9.7.7.2	Access to MDOC Device.....	2532
9.7.7.2.1	MDOC Device Boot.....	2532
9.7.7.2.2	MDOC Device Asynchronous Mode Configuration.....	2532
9.7.7.2.3	MDOC Device Utility.....	2532
9.7.7.3	Access to Micron PSRAM .....	2532
9.7.7.3.1	Micron PSRAM Asynchronous Mode Configuration.....	2532
9.7.7.3.2	Micron PSRAM Synchronous Mode Configuration.....	2533
9.7.7.4	Access to Samsung OneNAND .....	2533
9.7.7.4.1	Samsung OneNAND Boot.....	2533
9.7.7.4.2	Samsung OneNAND Asynchronous Mode Configuration.....	2533
9.7.7.4.3	Samsung OneNAND Synchronous Mode Configuration.....	2534
9.7.7.4.4	Samsung OneNAND Utility.....	2534
9.7.7.5	Access to Samsung UtRAM .....	2534
9.7.7.5.1	Samsung UtRAM Asynchronous Mode Configuration.....	2535
9.7.7.5.2	Samsung UtRAM Synchronous Mode Configuration.....	2535
9.7.7.6	Access to Spansion Flash .....	2535
9.7.7.6.1	Spansion Flash Asynchronous Mode Configuration.....	2535
9.7.7.6.2	Spansion Flash Synchronous Mode Configuration.....	2535
9.7.7.6.3	Spansion Flash Utility.....	2535
9.7.7.7	8 bit support.....	2537
9.7.8	External Bus Timing Diagrams.....	2538

Section number	Title	Page
9.7.8.1	Asynchronous Read Memory Accesses Timing Diagram.....	2538
9.7.8.2	Asynchronous Write Memory Accesses Timing Diagram.....	2539
9.7.8.3	Asynchronous Read/Write Memory Accesses Timing Diagram.....	2540
9.7.8.4	Asynchronous Read/Write Using RAL, WAL and CSREC.....	2542
9.7.8.5	Consecutive Asynchronous Write Memory Accesses Timing Diagram.....	2543
9.7.8.6	Consecutive Asynchronous Read Memory Accesses Timing Diagram.....	2546
9.7.8.7	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0.....	2548
9.7.8.8	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1.....	2549
9.7.8.9	Burst (Synchronous Mode) Write Memory Access Timing - BCD=1.....	2550
9.7.8.10	Asynchronous Page Mode Access.....	2552
9.7.8.11	DTACK Mode - AXI Single Access.....	2552
9.7.8.12	DTACK Mode - AXI Single Write Access.....	2555
9.7.8.13	DTACK Mode - AXI Burst Access.....	2556
9.7.9	EIM Memory Map/Register Definition.....	2557
9.7.9.1	Chip Select n General Configuration Register 1 (EIM_CSnGCR1).....	2560
9.7.9.2	Chip Select n General Configuration Register 2 (EIM_CSnGCR2).....	2565
9.7.9.3	Chip Select n Read Configuration Register 1 (EIM_CSnRCR1).....	2566
9.7.9.4	Chip Select n Read Configuration Register 2 (EIM_CSnRCR2).....	2569
9.7.9.5	Chip Select n Write Configuration Register 1 (EIM_CSnWCR1).....	2570
9.7.9.6	Chip Select n Write Configuration Register 2 (EIM_CSnWCR2).....	2573
9.7.9.7	EIM Configuration Register (EIM_WCR).....	2574
9.7.9.8	DLL Control Register (EIM_DCR).....	2576
9.7.9.9	DLL Status Register (EIM_DSR).....	2577
9.7.9.10	EIM IP Access Register (EIM_WIAR).....	2578
9.7.9.11	Error Address Register (EIM_EAR).....	2579

## Chapter 10 Mass Storage

10.1	Enhanced Configurable SPI (ECSPI).....	2581
10.1.1	Overview.....	2581

Section number	Title	Page
10.1.1.1	Features.....	2582
10.1.1.2	Modes and Operations.....	2582
10.1.2	External Signals.....	2583
10.1.3	Clocks.....	2585
10.1.4	Functional Description.....	2586
10.1.4.1	Master Mode.....	2586
10.1.4.2	Slave Mode.....	2586
10.1.4.3	Low Power Modes.....	2587
10.1.4.4	Operations.....	2587
10.1.4.4.1	Typical Master Mode.....	2587
10.1.4.4.1.1	Master Mode with SPI_RDY.....	2588
10.1.4.4.1.2	Master Mode with Wait States.....	2590
10.1.4.4.1.3	Master Mode with SS_CTL[3:0] Control.....	2590
10.1.4.4.1.4	Master Mode with Phase Control.....	2591
10.1.4.4.2	Typical Slave Mode.....	2592
10.1.4.5	Reset.....	2593
10.1.4.6	Interrupts.....	2594
10.1.4.7	DMA .....	2594
10.1.4.8	Byte Order.....	2595
10.1.5	Initialization.....	2596
10.1.6	Applications.....	2597
10.1.7	ECSPI Memory Map/Register Definition.....	2598
10.1.7.1	Receive Data Register (ECSPiX_RXDATA).....	2600
10.1.7.2	Transmit Data Register (ECSPiX_TXDATA).....	2600
10.1.7.3	Control Register (ECSPiX_CONREG).....	2601
10.1.7.4	Config Register (ECSPiX_CONFIGREG).....	2603
10.1.7.5	Interrupt Control Register (ECSPiX_INTREG).....	2606
10.1.7.6	DMA Control Register (ECSPiX_DMAREG).....	2607
10.1.7.7	Status Register (ECSPiX_STATREG).....	2609

<b>Section number</b>	<b>Title</b>	<b>Page</b>
10.1.7.8	Sample Period Control Register (ECSPLx_PERIODREG).....	2610
10.1.7.9	Test Control Register (ECSPLx_TESTREG).....	2611
10.1.7.10	Message Data Register (ECSPLx_MSGDATA).....	2612
10.2	Quad Serial Peripheral Interface (QuadSPI).....	2613
10.2.1	Overview.....	2613
10.2.1.1	Features.....	2615
10.2.1.2	QuadSPI Modes of Operation.....	2616
10.2.1.2.1	Normal Mode.....	2616
10.2.1.2.2	Module Disable Mode.....	2616
10.2.1.3	Acronyms and Abbreviations.....	2616
10.2.1.4	Glossary for QuadSPI module.....	2617
10.2.2	External Signals.....	2618
10.2.2.1	Driving External Signals.....	2619
10.2.3	Memory Map and Register Definition.....	2621
10.2.3.1	Register Write Access.....	2621
10.2.3.2	Serial Flash Address Assignment.....	2622
10.2.3.3	AMBA Bus Register Memory Map.....	2622
10.2.3.4	AHB Bus Register Memory Map Descriptions.....	2624
10.2.3.4.1	AHB Bus Access Considerations.....	2624
10.2.3.4.2	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A.....	2624
10.2.3.4.3	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B.....	2625
10.2.3.4.4	Parallel Flash Mode.....	2626
10.2.4	Interrupt Signals.....	2627
10.2.5	Functional Description.....	2628
10.2.5.1	Serial Flash Access Schemes.....	2628
10.2.5.2	Modes of Operation.....	2629
10.2.5.3	Normal Mode.....	2630
10.2.5.3.1	Programmable Sequence Engine.....	2630
10.2.5.3.2	Flexible AHB buffers.....	2632

Section number	Title	Page
10.2.5.3.3	Suspend-Abort Mechanism.....	2634
10.2.5.3.4	Look-up Table.....	2634
10.2.5.3.5	Issuing SFM Commands.....	2636
10.2.5.3.6	Flash Programming.....	2637
10.2.5.3.7	Flash Read.....	2638
10.2.5.3.8	Byte Ordering of Serial Flash Read Data.....	2642
10.2.5.3.9	Normal Mode Interrupt and DMA Requests.....	2645
10.2.5.3.10	TX Buffer Operation.....	2647
10.2.5.3.11	Address scheme.....	2647
10.2.6	Initialization/Application Information.....	2648
10.2.6.1	Power Up and Reset.....	2648
10.2.6.2	Available Status/Flag Information.....	2649
10.2.6.2.1	IP Commands.....	2649
10.2.6.2.2	AHB Commands.....	2649
10.2.6.2.3	Overview of Error Flags.....	2649
10.2.6.2.4	IP Bus and AHB Access Command Collisions.....	2651
10.2.6.3	Exclusive Access to Serial Flash for AHB Commands.....	2651
10.2.6.3.1	RX Buffer Read via QSPI_ARDB Registers.....	2652
10.2.6.3.2	RX Buffer Read via QSPI_RBDR Registers.....	2652
10.2.6.4	Command Arbitration .....	2652
10.2.6.5	Flash Device Selection.....	2653
10.2.6.6	DMA Usage.....	2653
10.2.6.6.1	DMA Usage in Normal Mode.....	2653
10.2.6.6.1.1	Bandwidth considerations.....	2654
10.2.6.7	Parallel mode.....	2656
10.2.7	Byte Ordering - Endianness.....	2658
10.2.7.1	Programming Flash Data.....	2658
10.2.7.2	Reading Flash Data into the RX Buffer.....	2659
10.2.7.2.1	Readout of the RX Buffer via QSPI_RBDRn.....	2659

Section number	Title	Page
	10.2.7.2.2 Readout of the RX Buffer via ARDBn.....	2660
10.2.7.3	Reading Flash Data into the AHB Buffer.....	2660
	10.2.7.3.1 Readout of the AHB Buffer via Memory Mapped Read.....	2660
10.2.8	Serial Flash Devices.....	2661
10.2.8.1	Example Sequences.....	2661
	10.2.8.1.1 Fast Read Sequence (Macronix/Numonyx/Spansion/Winbond).....	2661
	10.2.8.1.2 Fast Dual I/O DT Read Sequence (Macronix).....	2661
	10.2.8.1.3 Fast Read Quad Output (Winbond).....	2662
	10.2.8.1.4 4 x I/O Read Enhance Performance Mode (XIP) (Macronix).....	2662
	10.2.8.1.5 Dual Command Page Program (Numonyx).....	2663
	10.2.8.1.6 Sector Erase (Macronix/Spansion/Numonyx).....	2663
	10.2.8.1.7 Read Status Register (Macronix/Spansion/Numonyx/Winbond).....	2663
10.2.8.2	Dual Die Flashes.....	2663
10.2.8.3	Boot initialization sequence.....	2664
10.2.9	Sampling of Serial Flash Input Data.....	2665
	10.2.9.1 Internal Sampling of Serial Flash Input Data.....	2665
	10.2.9.2 DDR Mode.....	2668
10.2.10	Serial Flash Data Input Timing.....	2668
	10.2.10.1 Input timing in SDR mode with internal sampling.....	2670
	10.2.10.2 Input timing in DDR mode with internal sampling.....	2670
	10.2.10.3 Input timing in SDR mode with loopback DQS sampling.....	2671
	10.2.10.4 Input timing in DDR mode with loopback DQS sampling.....	2672
	10.2.10.5 Input timing in SDR mode with flash DQS sampling.....	2673
	10.2.10.6 Input timing in DDR mode with flash DQS sampling.....	2674
	10.2.10.7 Data Strobe Signal functionality.....	2675
10.2.11	Output timing in SDR mode.....	2675
10.2.12	Output timing in DDR mode.....	2676
10.2.13	AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31).....	2677
	10.2.13.1 AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31).....	2677

Section number	Title	Page
10.2.13.1.1	AHB RX Data Buffer register (ARDB $n$ ).....	2677
10.2.14	Peripheral Bus Register Descriptions.....	2679
10.2.14.1	Module Configuration Register (QuadSPI $x$ _MCR).....	2691
10.2.14.2	IP Configuration Register (QuadSPI $x$ _IPCR).....	2693
10.2.14.3	Flash Configuration Register (QuadSPI $x$ _FLSHCR).....	2694
10.2.14.4	Buffer0 Configuration Register (QuadSPI $x$ _BUF0CR).....	2695
10.2.14.5	Buffer1 Configuration Register (QuadSPI $x$ _BUF1CR).....	2696
10.2.14.6	Buffer2 Configuration Register (QuadSPI $x$ _BUF2CR).....	2697
10.2.14.7	Buffer3 Configuration Register (QuadSPI $x$ _BUF3CR).....	2698
10.2.14.8	Buffer Generic Configuration Register (QuadSPI $x$ _BFGENCR).....	2699
10.2.14.9	Buffer0 Top Index Register (QuadSPI $x$ _BUF0IND).....	2700
10.2.14.10	Buffer1 Top Index Register (QuadSPI $x$ _BUF1IND).....	2700
10.2.14.11	Buffer2 Top Index Register (QuadSPI $x$ _BUF2IND).....	2701
10.2.14.12	Serial Flash Address Register (QuadSPI $x$ _SFAR).....	2702
10.2.14.13	Sampling Register (QuadSPI $x$ _SMPR).....	2702
10.2.14.14	RX Buffer Status Register (QuadSPI $x$ _RBSR).....	2703
10.2.14.15	RX Buffer Control Register (QuadSPI $x$ _RBCT).....	2704
10.2.14.16	TX Buffer Status Register (QuadSPI $x$ _TBSR).....	2705
10.2.14.17	TX Buffer Data Register (QuadSPI $x$ _TBDR).....	2705
10.2.14.18	Status Register (QuadSPI $x$ _SR).....	2707
10.2.14.19	Flag Register (QuadSPI $x$ _FR).....	2710
10.2.14.20	Interrupt and DMA Request Select and Enable Register (QuadSPI $x$ _RSER).....	2713
10.2.14.21	Sequence Suspend Status Register (QuadSPI $x$ _SPNDST).....	2716
10.2.14.22	Sequence Pointer Clear Register (QuadSPI $x$ _SPTRCLR).....	2718
10.2.14.23	Serial Flash A1 Top Address (QuadSPI $x$ _SFA1AD).....	2718
10.2.14.24	Serial Flash A2 Top Address (QuadSPI $x$ _SFA2AD).....	2719
10.2.14.25	Serial Flash B1 Top Address (QuadSPI $x$ _SFB1AD).....	2719
10.2.14.26	Serial Flash B2 Top Address (QuadSPI $x$ _SFB2AD).....	2720
10.2.14.27	RX Buffer Data Register (QuadSPI $x$ _RBDR $n$ ).....	2720

Section number	Title	Page
10.2.14.28	LUT Key Register (QuadSPIx_LUTKEY).....	2721
10.2.14.29	LUT Lock Configuration Register (QuadSPIx_LCKCR).....	2722
10.2.14.30	Look-up Table register (QuadSPIx_LUT0).....	2723
10.2.14.31	Look-up Table register (QuadSPIx_LUT1).....	2724
10.2.14.32	Look-up Table register (QuadSPIx_LUTn).....	2725
10.3	Ultra Secured Digital Host Controller (uSDHC).....	2726
10.3.1	Overview.....	2726
10.3.1.1	Features.....	2729
10.3.1.2	Modes and Operations.....	2730
10.3.1.2.1	Data transfer Modes.....	2730
10.3.2	External Signals.....	2730
10.3.2.1	Signals Overview.....	2733
10.3.3	Clocks.....	2733
10.3.4	Functional Description.....	2734
10.3.4.1	Data Buffer.....	2734
10.3.4.1.1	Write Operation Sequence.....	2736
10.3.4.1.2	Read Operation Sequence.....	2737
10.3.4.1.3	Data Buffer and Block Size.....	2737
10.3.4.1.4	Dividing Large Data Transfer.....	2738
10.3.4.1.5	External DMA Request.....	2739
10.3.4.2	DMA AHB Interface.....	2740
10.3.4.2.1	Internal DMA Request.....	2741
10.3.4.2.2	DMA Burst Length.....	2742
10.3.4.2.3	AHB Master Interface.....	2742
10.3.4.2.4	ADMA Engine.....	2742
10.3.4.2.4.1	ADMA Concept and Descriptor Format.....	2743
10.3.4.2.4.2	ADMA Interrupt.....	2747

## Chapter 11 Connectivity

11.1	Ethernet MAC (ENET).....	2863
11.1.1	Introduction.....	2863
11.1.2	Overview.....	2863
11.1.2.1	Features.....	2864
11.1.2.1.1	Ethernet MAC features.....	2864
11.1.2.1.2	IP protocol performance optimization features.....	2865
11.1.2.1.3	IEEE 1588 features.....	2866
11.1.2.2	Block diagram.....	2867
11.1.3	External Signals.....	2867
11.1.4	Clocks.....	2875
11.1.5	Memory map/register definition.....	2875
11.1.5.1	Interrupt Event Register (ENETx_EIR).....	2887
11.1.5.2	Interrupt Mask Register (ENETx_EIMR).....	2890
11.1.5.3	Receive Descriptor Active Register - Ring 0 (ENETx_RDAR).....	2894
11.1.5.4	Transmit Descriptor Active Register - Ring 0 (ENETx_TDAR).....	2895
11.1.5.5	Ethernet Control Register (ENETx_ECR).....	2896

Section number	Title	Page
11.1.5.6	MII Management Frame Register (ENETx_MMFR).....	2898
11.1.5.7	MII Speed Control Register (ENETx_MSCR).....	2899
11.1.5.8	MIB Control Register (ENETx_MIBC).....	2901
11.1.5.9	Receive Control Register (ENETx_RCR).....	2902
11.1.5.10	Transmit Control Register (ENETx_TCR).....	2905
11.1.5.11	Physical Address Lower Register (ENETx_PALR).....	2907
11.1.5.12	Physical Address Upper Register (ENETx_PAUR).....	2907
11.1.5.13	Opcode/Pause Duration Register (ENETx_OPD).....	2908
11.1.5.14	Transmit Interrupt Coalescing Register (ENETx_TXICn).....	2908
11.1.5.15	Receive Interrupt Coalescing Register (ENETx_RXICn).....	2909
11.1.5.16	Descriptor Individual Upper Address Register (ENETx_IAUR).....	2910
11.1.5.17	Descriptor Individual Lower Address Register (ENETx_IALR).....	2911
11.1.5.18	Descriptor Group Upper Address Register (ENETx_GAUR).....	2911
11.1.5.19	Descriptor Group Lower Address Register (ENETx_GALR).....	2912
11.1.5.20	Transmit FIFO Watermark Register (ENETx_TFWR).....	2912
11.1.5.21	Receive Descriptor Ring 1 Start Register (ENETx_RDSR1).....	2913
11.1.5.22	Transmit Buffer Descriptor Ring 1 Start Register (ENETx_TDSR1).....	2914
11.1.5.23	Maximum Receive Buffer Size Register - Ring 1 (ENETx_MRBR1).....	2915
11.1.5.24	Receive Descriptor Ring 2 Start Register (ENETx_RDSR2).....	2916
11.1.5.25	Transmit Buffer Descriptor Ring 2 Start Register (ENETx_TDSR2).....	2916
11.1.5.26	Maximum Receive Buffer Size Register - Ring 2 (ENETx_MRBR2).....	2917
11.1.5.27	Receive Descriptor Ring 0 Start Register (ENETx_RDSR).....	2918
11.1.5.28	Transmit Buffer Descriptor Ring 0 Start Register (ENETx_TDSR).....	2919
11.1.5.29	Maximum Receive Buffer Size Register - Ring 0 (ENETx_MRBR).....	2919
11.1.5.30	Receive FIFO Section Full Threshold (ENETx_RSFL).....	2920
11.1.5.31	Receive FIFO Section Empty Threshold (ENETx_RSEM).....	2921
11.1.5.32	Receive FIFO Almost Empty Threshold (ENETx_RAEM).....	2921
11.1.5.33	Receive FIFO Almost Full Threshold (ENETx_RAFL).....	2922
11.1.5.34	Transmit FIFO Section Empty Threshold (ENETx_TSEM).....	2922

Section number	Title	Page
11.1.5.35	Transmit FIFO Almost Empty Threshold (ENETx_TAEM).....	2923
11.1.5.36	Transmit FIFO Almost Full Threshold (ENETx_TAFL).....	2923
11.1.5.37	Transmit Inter-Packet Gap (ENETx_TIPG).....	2924
11.1.5.38	Frame Truncation Length (ENETx_FTRL).....	2924
11.1.5.39	Transmit Accelerator Function Configuration (ENETx_TACC).....	2925
11.1.5.40	Receive Accelerator Function Configuration (ENETx_RACC).....	2926
11.1.5.41	Receive Classification Match Register for Class n (ENETx_RCMRn).....	2927
11.1.5.42	DMA Class Based Configuration (ENETx_DMA $n$ CFG).....	2928
11.1.5.43	Receive Descriptor Active Register - Ring 1 (ENETx_RDAR1).....	2930
11.1.5.44	Transmit Descriptor Active Register - Ring 1 (ENETx_TDAR1).....	2931
11.1.5.45	Receive Descriptor Active Register - Ring 2 (ENETx_RDAR2).....	2932
11.1.5.46	Transmit Descriptor Active Register - Ring 2 (ENETx_TDAR2).....	2933
11.1.5.47	QOS Scheme (ENETx_QOS).....	2933
11.1.5.48	Reserved Statistic Register (ENETx_RMON_T_DROP).....	2935
11.1.5.49	Tx Packet Count Statistic Register (ENETx_RMON_T_PACKETS).....	2935
11.1.5.50	Tx Broadcast Packets Statistic Register (ENETx_RMON_T_BC_PKT).....	2936
11.1.5.51	Tx Multicast Packets Statistic Register (ENETx_RMON_T_MC_PKT).....	2936
11.1.5.52	Tx Packets with CRC/Align Error Statistic Register (ENETx_RMON_T_CRC_ALIGN).....	2937
11.1.5.53	Tx Packets Less Than Bytes and Good CRC Statistic Register (ENETx_RMON_T_UNDERSIZE).....	2937
11.1.5.54	Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENETx_RMON_T_OVERSIZE).....	2938
11.1.5.55	Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_T_FRAG).....	2938
11.1.5.56	Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENETx_RMON_T_JAB).....	2939
11.1.5.57	Tx Collision Count Statistic Register (ENETx_RMON_T_COL).....	2939
11.1.5.58	Tx 64-Byte Packets Statistic Register (ENETx_RMON_T_P64).....	2940
11.1.5.59	Tx 65- to 127-byte Packets Statistic Register (ENETx_RMON_T_P65TO127).....	2940
11.1.5.60	Tx 128- to 255-byte Packets Statistic Register (ENETx_RMON_T_P128TO255).....	2941

Section number	Title	Page
11.1.5.61	Tx 256- to 511-byte Packets Statistic Register (ENETx_RMON_T_P256TO511).....	2941
11.1.5.62	Tx 512- to 1023-byte Packets Statistic Register (ENETx_RMON_T_P512TO1023).....	2942
11.1.5.63	Tx 1024- to 2047-byte Packets Statistic Register (ENETx_RMON_T_P1024TO2047).....	2942
11.1.5.64	Tx Packets Greater Than 2048 Bytes Statistic Register (ENETx_RMON_T_P_GTE2048)....	2943
11.1.5.65	Tx Octets Statistic Register (ENETx_RMON_T_OCTETS).....	2943
11.1.5.66	Reserved Statistic Register (ENETx_IEEE_T_DROP).....	2943
11.1.5.67	Frames Transmitted OK Statistic Register (ENETx_IEEE_T_FRAME_OK).....	2944
11.1.5.68	Frames Transmitted with Single Collision Statistic Register (ENETx_IEEE_T_1COL).....	2944
11.1.5.69	Frames Transmitted with Multiple Collisions Statistic Register (ENETx_IEEE_T_MCOL)...	2945
11.1.5.70	Frames Transmitted after Deferral Delay Statistic Register (ENETx_IEEE_T_DEF).....	2945
11.1.5.71	Frames Transmitted with Late Collision Statistic Register (ENETx_IEEE_T_LCOL).....	2946
11.1.5.72	Frames Transmitted with Excessive Collisions Statistic Register (ENETx_IEEE_T_EXCOL).....	2946
11.1.5.73	Frames Transmitted with Tx FIFO Underrun Statistic Register (ENETx_IEEE_T_MACERR).....	2947
11.1.5.74	Frames Transmitted with Carrier Sense Error Statistic Register (ENETx_IEEE_T_CSERR)..	2947
11.1.5.75	Reserved Statistic Register (ENETx_IEEE_T_SQE).....	2947
11.1.5.76	Flow Control Pause Frames Transmitted Statistic Register (ENETx_IEEE_T_FDXFC).....	2948
11.1.5.77	Octet Count for Frames Transmitted w/o Error Statistic Register (ENETx_IEEE_T_OCTETS_OK).....	2948
11.1.5.78	Rx Packet Count Statistic Register (ENETx_RMON_R_PACKETS).....	2949
11.1.5.79	Rx Broadcast Packets Statistic Register (ENETx_RMON_R_BC_PKT).....	2949
11.1.5.80	Rx Multicast Packets Statistic Register (ENETx_RMON_R_MC_PKT).....	2950
11.1.5.81	Rx Packets with CRC/Align Error Statistic Register (ENETx_RMON_R_CRC_ALIGN).....	2950
11.1.5.82	Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENETx_RMON_R_UNDERSIZE).....	2951
11.1.5.83	Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENETx_RMON_R_OVERSIZE).....	2951
11.1.5.84	Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_R_FRAG).....	2952

Section number	Title	Page
11.1.5.85	Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENETx_RMON_R_JAB).....	2952
11.1.5.86	Reserved Statistic Register (ENETx_RMON_R_RESVD_0).....	2952
11.1.5.87	Rx 64-Byte Packets Statistic Register (ENETx_RMON_R_P64).....	2953
11.1.5.88	Rx 65- to 127-Byte Packets Statistic Register (ENETx_RMON_R_P65TO127).....	2953
11.1.5.89	Rx 128- to 255-Byte Packets Statistic Register (ENETx_RMON_R_P128TO255).....	2954
11.1.5.90	Rx 256- to 511-Byte Packets Statistic Register (ENETx_RMON_R_P256TO511).....	2954
11.1.5.91	Rx 512- to 1023-Byte Packets Statistic Register (ENETx_RMON_R_P512TO1023).....	2955
11.1.5.92	Rx 1024- to 2047-Byte Packets Statistic Register (ENETx_RMON_R_P1024TO2047).....	2955
11.1.5.93	Rx Packets Greater than 2048 Bytes Statistic Register (ENETx_RMON_R_P_GTE2048).....	2956
11.1.5.94	Rx Octets Statistic Register (ENETx_RMON_R_OCTETS).....	2956
11.1.5.95	Frames not Counted Correctly Statistic Register (ENETx_IEEE_R_DROP).....	2957
11.1.5.96	Frames Received OK Statistic Register (ENETx_IEEE_R_FRAME_OK).....	2957
11.1.5.97	Frames Received with CRC Error Statistic Register (ENETx_IEEE_R_CRC).....	2958
11.1.5.98	Frames Received with Alignment Error Statistic Register (ENETx_IEEE_R_ALIGN).....	2958
11.1.5.99	Receive FIFO Overflow Count Statistic Register (ENETx_IEEE_R_MACERR).....	2959
11.1.5.100	Flow Control Pause Frames Received Statistic Register (ENETx_IEEE_R_FDXFC).....	2959
11.1.5.101	Octet Count for Frames Received without Error Statistic Register (ENETx_IEEE_R_OCTETS_OK).....	2960
11.1.5.102	Adjustable Timer Control Register (ENETx_ATCR).....	2960
11.1.5.103	Timer Value Register (ENETx_ATVR).....	2962
11.1.5.104	Timer Offset Register (ENETx_ATOFF).....	2962
11.1.5.105	Timer Period Register (ENETx_ATPER).....	2963
11.1.5.106	Timer Correction Register (ENETx_ATCOR).....	2963
11.1.5.107	Time-Stamping Clock Period Register (ENETx_ATINC).....	2964
11.1.5.108	Timestamp of Last Transmitted Frame (ENETx_ATSTMP).....	2964
11.1.5.109	Timer Global Status Register (ENETx_TGSR).....	2965
11.1.5.110	Timer Control Status Register (ENETx_TCSRn).....	2966
11.1.5.111	Timer Compare Capture Register (ENETx_TCCRn).....	2967

11.5.2.5.4	Switchable 1.5KΩ USB_DP Pullup Resistor.....	3447
11.5.2.5.5	Switchable 15KΩ USB_DP Pulldown Resistor.....	3448
11.5.2.6	Recommended Register Configuration for USB Certification.....	3449

## Chapter 12 Timers

12.1	General Purpose Timer (GPT).....	3451
12.1.1	Overview.....	3451
12.1.1.1	Features.....	3452
12.1.1.2	Modes and Operation.....	3453
12.1.2	External Signals.....	3453
12.1.2.1	External Clock Input .....	3454
12.1.2.2	Input Capture Trigger Signals .....	3455
12.1.2.3	Output Compare Signals.....	3455
12.1.3	Signals.....	3455
12.1.3.1	External Clock Input .....	3455
12.1.3.2	Input Capture Trigger Signals .....	3455

Section number	Title	Page
12.1.3.3	Output Compare Signals.....	3456
12.1.4	Clocks.....	3456
12.1.5	Functional Description.....	3458
12.1.5.1	Operating Modes.....	3458
12.1.5.1.1	Restart Mode.....	3458
12.1.5.1.2	Free-Run Mode.....	3458
12.1.5.2	Operation.....	3458
12.1.5.2.1	Input Capture.....	3459
12.1.5.2.2	Output Compare.....	3460
12.1.5.2.3	Interrupts.....	3461
12.1.5.2.4	Low Power Mode Behavior.....	3462
12.1.5.2.5	Debug Mode Behavior.....	3462
12.1.6	Initialization/ Application Information .....	3462
12.1.6.1	Selecting the Clock Source .....	3462
12.1.7	GPT Memory Map/Register Definition.....	3463
12.1.7.1	GPT Control Register (GPTx_CR).....	3466
12.1.7.2	GPT Prescaler Register (GPTx_PR).....	3470
12.1.7.3	GPT Status Register (GPTx_SR).....	3471
12.1.7.4	GPT Interrupt Register (GPTx_IR).....	3472
12.1.7.5	GPT Output Compare Register 1 (GPTx_OCR1).....	3473
12.1.7.6	GPT Output Compare Register 2 (GPTx_OCR2).....	3474
12.1.7.7	GPT Output Compare Register 3 (GPTx_OCR3).....	3474
12.1.7.8	GPT Input Capture Register 1 (GPTx_ICR1).....	3475
12.1.7.9	GPT Input Capture Register 2 (GPTx_ICR2).....	3475
12.1.7.10	GPT Counter Register (GPTx_CNT).....	3476
12.2	Flextimer (FTM).....	3476
12.2.1	Introduction.....	3476
12.2.1.1	FlexTimer philosophy.....	3476
12.2.1.2	Features.....	3477

Section number	Title	Page
12.2.1.3	Modes of operation.....	3478
12.2.1.4	Block diagram.....	3479
12.2.2	FTM signal descriptions.....	3481
12.2.3	Memory map and register definition.....	3481
12.2.3.1	Memory map.....	3481
12.2.3.2	Register descriptions.....	3482
12.2.3.3	Status And Control (FTMx_SC).....	3486
12.2.3.4	Counter (FTMx_CNT).....	3487
12.2.3.5	Modulo (FTMx_MOD).....	3488
12.2.3.6	Channel (n) Status And Control (FTMx_CnSC).....	3489
12.2.3.7	Channel (n) Value (FTMx_CnV).....	3492
12.2.3.8	Counter Initial Value (FTMx_CNTIN).....	3492
12.2.3.9	Capture And Compare Status (FTMx_STATUS).....	3493
12.2.3.10	Features Mode Selection (FTMx_MODE).....	3495
12.2.3.11	Synchronization (FTMx_SYNC).....	3496
12.2.3.12	Initial State For Channels Output (FTMx_OUTINIT).....	3499
12.2.3.13	Output Mask (FTMx_OUTMASK).....	3500
12.2.3.14	Function For Linked Channels (FTMx_COMBINE).....	3502
12.2.3.15	Deadtime Insertion Control (FTMx_DEADTIME).....	3506
12.2.3.16	FTM External Trigger (FTMx_EXTTRIG).....	3507
12.2.3.17	Channels Polarity (FTMx_POL).....	3509
12.2.3.18	Fault Mode Status (FTMx_FMS).....	3511
12.2.3.19	Input Capture Filter Control (FTMx_FILTER).....	3512
12.2.3.20	Quadrature Decoder Control And Status (FTMx_QDCTRL).....	3513
12.2.3.21	Configuration (FTMx_CONF).....	3515
12.2.3.22	Synchronization Configuration (FTMx_SYNCONF).....	3516
12.2.3.23	FTM Inverting Control (FTMx_INVCTRL).....	3518
12.2.3.24	FTM Software Output Control (FTMx_SWOCTRL).....	3519
12.2.3.25	FTM PWM Load (FTMx_PWMLOAD).....	3522

Section number	Title	Page
12.2.4	Functional description.....	3523
12.2.4.1	Clock source.....	3524
12.2.4.1.1	Counter clock source.....	3524
12.2.4.2	Prescaler.....	3524
12.2.4.3	Counter.....	3524
12.2.4.3.1	Up counting.....	3525
12.2.4.3.2	Up-down counting.....	3527
12.2.4.3.3	Free running counter.....	3528
12.2.4.3.4	Counter reset.....	3529
12.2.4.3.5	When the TOF bit is set.....	3529
12.2.4.4	Input Capture mode.....	3530
12.2.4.4.1	Filter for Input Capture mode.....	3531
12.2.4.4.2	FTM Counter Reset in Input Capture Mode.....	3532
12.2.4.5	Output Compare mode.....	3533
12.2.4.6	Edge-Aligned PWM (EPWM) mode.....	3534
12.2.4.7	Center-Aligned PWM (CPWM) mode.....	3536
12.2.4.8	Combine mode.....	3538
12.2.4.8.1	Asymmetrical PWM.....	3546
12.2.4.9	Complementary mode.....	3546
12.2.4.10	Registers updated from write buffers.....	3547
12.2.4.10.1	CNTIN register update.....	3547
12.2.4.10.2	MOD register update.....	3548
12.2.4.10.3	CnV register update.....	3548
12.2.4.11	PWM synchronization.....	3549
12.2.4.11.1	Hardware trigger.....	3549
12.2.4.11.2	Software trigger.....	3550
12.2.4.11.3	Boundary cycle and loading points.....	3550
12.2.4.11.4	MOD register synchronization.....	3551
12.2.4.11.5	CNTIN register synchronization.....	3554

Section number	Title	Page
12.2.4.11.6	C(n)V and C(n+1)V register synchronization.....	3555
12.2.4.11.7	OUTMASK register synchronization.....	3555
12.2.4.11.8	INVCTRL register synchronization.....	3558
12.2.4.11.9	SWOCTRL register synchronization.....	3559
12.2.4.11.10	FTM counter synchronization.....	3561
12.2.4.12	Inverting.....	3563
12.2.4.13	Software output control.....	3565
12.2.4.14	Deadtime insertion.....	3567
12.2.4.14.1	Deadtime insertion corner cases.....	3568
12.2.4.15	Output mask.....	3570
12.2.4.16	Polarity control.....	3570
12.2.4.17	Initialization.....	3571
12.2.4.18	Features priority.....	3571
12.2.4.19	Channel trigger output.....	3572
12.2.4.20	Initialization trigger.....	3574
12.2.4.21	Capture Test mode.....	3576
12.2.4.22	DMA.....	3576
12.2.4.23	Dual Edge Capture mode.....	3577
12.2.4.23.1	One-Shot Capture mode.....	3579
12.2.4.23.2	Continuous Capture mode.....	3579
12.2.4.23.3	Pulse width measurement.....	3580
12.2.4.23.4	Period measurement.....	3582
12.2.4.23.5	Read coherency mechanism.....	3584
12.2.4.24	Quadrature Decoder mode.....	3585
12.2.4.24.1	Quadrature Decoder boundary conditions.....	3589
12.2.4.25	Intermediate load.....	3590
12.2.4.26	Global time base (GTB).....	3592
12.2.4.26.1	Enabling the global time base (GTB).....	3593
12.2.5	Reset overview.....	3593

Section number	Title	Page
12.2.6	FTM Interrupts.....	3595
12.2.6.1	Timer Overflow Interrupt.....	3595
12.2.6.2	Channel (n) Interrupt.....	3595
12.2.7	Initialization Procedure.....	3595
12.3	Pulse Width Modulation (PWM).....	3597
12.3.1	Overview.....	3597
12.3.2	External Signals.....	3598
12.3.3	Clocks.....	3599
12.3.4	Functional Description.....	3600
12.3.4.1	Operation.....	3600
12.3.4.1.1	FIFO.....	3600
12.3.4.1.2	Rollover and Compare Event.....	3601
12.3.4.1.3	Low Power Mode Behavior.....	3601
12.3.4.1.4	Debug Mode Behavior.....	3601
12.3.5	Enable Sequence for the PWM.....	3601
12.3.6	Disable Sequence for the PWM.....	3602
12.3.7	PWM Memory Map/Register Definition.....	3602
12.3.7.1	PWM Control Register (PWMx_PWMCR).....	3604
12.3.7.2	PWM Status Register (PWMx_PWMSR).....	3606
12.3.7.3	PWM Interrupt Register (PWMx_PWMIR).....	3607
12.3.7.4	PWM Sample Register (PWMx_PWMSAR).....	3608
12.3.7.5	PWM Period Register (PWMx_PWMPR).....	3609
12.3.7.6	PWM Counter Register (PWMx_PWMCNR).....	3609

## Chapter 13 Multimedia

13.1	Multimedia.....	3611
13.1.1	Display and camera subsystem.....	3611
13.1.1.1	Electrophoretic Display Controller.....	3612
13.1.1.2	PiXeL Processing Pipeline.....	3613

Section number	Title	Page
13.1.1.3	LCD Interface.....	3613
13.1.1.4	Parallel CMOS Sensor Interface.....	3614
13.1.2	Display / Sensor MIPI interfaces.....	3615
13.1.2.1	Introduction.....	3615
13.1.2.2	MIPI DSI.....	3615
13.1.2.3	MIPI CSI-2.....	3616
13.1.3	Audio subsystem.....	3617
13.1.3.1	Audio Subsystem Module Overview.....	3617
13.1.3.2	Synchronous Audio Interface (SAI).....	3618
13.2	Enhanced LCD Interface (eLCDIF).....	3618
13.2.1	Overview.....	3618
13.2.2	External Signals.....	3619
13.2.3	Clocks.....	3621
13.2.4	Functional Description.....	3622
13.2.4.1	Bus Interface Mechanisms.....	3623
13.2.4.1.1	Bus Master Operation in Write/Display Modes.....	3623
13.2.4.1.2	System Bus Master Performance.....	3623
13.2.4.2	Write Data Path.....	3624
13.2.4.3	Read Data Path.....	3631
13.2.4.4	eLCDIF Interrupts.....	3636
13.2.4.5	Initializing the eLCDIF.....	3636
13.2.4.5.1	Write Modes.....	3636
13.2.4.5.2	MPU Read Mode.....	3637
13.2.4.6	MPU Interface.....	3638
13.2.4.6.1	Code Example to Initialize the eLCDIF in MPU Write Mode.....	3640
13.2.4.7	VSYNC Interface.....	3640
13.2.4.7.1	Code Example to Initialize eLCDIF in VSYNC Mode.....	3641
13.2.4.8	DOTCLK Interface.....	3642
13.2.4.8.1	Code Example.....	3644

Section number	Title	Page
13.2.4.9	CSI HANDSHAKE INTERFACE.....	3644
13.2.4.10	Alpha Blending Interface.....	3645
13.2.4.11	ITU-R BT.656 Digital Video Interface (DVI).....	3645
13.2.4.12	eLCDIF Pin Usage by Interface Mode.....	3647
13.2.5	Behavior During Reset.....	3650
13.2.6	ELCDIF Memory Map/Register Definition.....	3650
13.2.6.1	eLCDIF General Control Register (LCDIFx_RLn).....	3656
13.2.6.2	eLCDIF General Control1 Register (LCDIFx_CTRL1n).....	3659
13.2.6.3	eLCDIF General Control2 Register (LCDIFx_CTRL2n).....	3661
13.2.6.4	eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIFx_TRANSFER_COUNT).....	3664
13.2.6.5	LCD Interface Current Buffer Address Register (LCDIFx_CUR_BUF).....	3664
13.2.6.6	LCD Interface Next Buffer Address Register (LCDIFx_NEXT_BUF).....	3665
13.2.6.7	LCD Interface Timing Register (LCDIFx_TIMING).....	3665
13.2.6.8	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIFx_VDCTRL0n).....	3666
13.2.6.9	eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIFx_VDCTRL1).....	3667
13.2.6.10	LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIFx_VDCTRL2).....	3668
13.2.6.11	eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIFx_VDCTRL3).....	3668
13.2.6.12	eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIFx_VDCTRL4).....	3669
13.2.6.13	Digital Video Interface Control0 Register (LCDIFx_DVICTRL0).....	3670
13.2.6.14	Digital Video Interface Control1 Register (LCDIFx_DVICTRL1).....	3671
13.2.6.15	Digital Video Interface Control2 Register (LCDIFx_DVICTRL2).....	3672
13.2.6.16	Digital Video Interface Control3 Register (LCDIFx_DVICTRL3).....	3673
13.2.6.17	Digital Video Interface Control4 Register (LCDIFx_DVICTRL4).....	3674
13.2.6.18	RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIFx_CSC_COEFF0).....	3675
13.2.6.19	RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIFx_CSC_COEFF1).....	3676
13.2.6.20	RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIFx_CSC_COEFF2).....	3676
13.2.6.21	RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIFx_CSC_COEFF3).....	3677
13.2.6.22	RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIFx_CSC_COEFF4).....	3678

Section number	Title	Page
13.2.6.23	RGB to YCbCr 4:2:2 CSC Offset Register (LCDIFx_CSC_OFFSET).....	3679
13.2.6.24	RGB to YCbCr 4:2:2 CSC Limit Register (LCDIFx_CSC_LIMIT).....	3679
13.2.6.25	LCD Interface Data Register (LCDIFx_DATA).....	3680
13.2.6.26	Bus Master Error Status Register (LCDIFx_BM_ERROR_STAT).....	3681
13.2.6.27	CRC Status Register (LCDIFx_CRC_STAT).....	3681
13.2.6.28	LCD Interface Status Register (LCDIFx_STAT).....	3682
13.2.6.29	LCD Interface Version Register (LCDIFx_VERSION).....	3683
13.2.6.30	LCD Interface Debug0 Register (LCDIFx_DEBUG0).....	3684
13.2.6.31	LCD Interface Debug1 Register (LCDIFx_DEBUG1).....	3687
13.2.6.32	LCD Interface Debug2 Register (LCDIFx_DEBUG2).....	3688
13.2.6.33	eLCDIF Threshold Register (LCDIFx_THRES).....	3688
13.2.6.34	eLCDIF AS Buffer Control Register (LCDIFx_AS_CTRL).....	3690
13.2.6.35	Alpha Surface Buffer Pointer (LCDIFx_AS_BUF).....	3692
13.2.6.36	LCDIFx_AS_NEXT_BUF.....	3693
13.2.6.37	eLCDIF Overlay Color Key Low (LCDIFx_AS_CLRKEYLOW).....	3693
13.2.6.38	eLCDIF Overlay Color Key High (LCDIFx_AS_CLRKEYHIGH).....	3694
13.2.6.39	LCD working insync mode with CSI for VSYNC delay (LCDIFx_SYNC_DELAY).....	3694
13.2.6.40	eLCDIF Interface Debug3 Register (LCDIFx_DEBUG3).....	3695
13.2.6.41	LCD Interface Debug4 (LCDIFx_DEBUG4).....	3696
13.2.6.42	LCD Interface Debug5 (LCDIFx_DEBUG5).....	3697
13.3	CMOS Sensor Interface (CSI).....	3697
13.3.1	Overview.....	3697
13.3.2	External Signals.....	3698
13.3.3	Clocks.....	3700
13.3.4	Principles of Operation.....	3700
13.3.4.1	Data Transfer with the Embedded DMA Controllers.....	3702
13.3.4.2	Gated Clock Mode.....	3703
13.3.4.3	Non-Gated Clock Mode.....	3703
13.3.4.4	CCIR656 Interlace Mode.....	3704

Section number	Title	Page
13.3.4.5	CCIR656 Progressive Mode.....	3706
13.3.4.6	Error Correction for CCIR656 Coding.....	3707
13.3.5	Interrupt Generation.....	3707
13.3.5.1	Start Of Frame Interrupt (SOF_INT).....	3708
13.3.5.2	End Of Frame Interrupt (EOF_INT).....	3708

# Chapter 1

## Introduction

### 1.1 Introduction

This chapter introduces the architecture of the “i.MX 7Dual” Multimedia Applications Processor. The “i.MX 7D” (Short name, used across this document) processor represents Freescale Semiconductor’s latest achievement in integrated multimedia applications processors that are part of a growing family of multimedia-focused products offering high-performance processing optimized for lowest power consumption.

### 1.2 Target Applications

The i.MX 7Dual is defined as the next-generation Applications Processor for the power sensitive use cases. It has a specific feature set for many mobile battery powered applications. The i.MX 7Dual device integrates the unique display controller for EPD panel, pixel processing engines and graphics engines to make it an ideal solution for EPD based devices such as eReaders, Signage, as well as any application relying on the bi-stable characteristic of the EPD panel. i.MX 7Dual also provides all the interfaces necessary for connecting peripherals such as WLAN, BlueTooth and etc.

i.MX 7Dual is a follow-on to the i.MX 6SoloLite, with advanced performance and higher power efficiency.

### 1.3 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

## Acronyms and Abbreviations

Term	Meaning
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	ARM IP Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BIST	Built-In Self Test
CA7	ARM Cortex A7
CAN	Controller Area Network
CCM	Clock Controller Module
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
ECSPI	Enhanced Configurable SPI
EIM	External Interface Module
ENET	Ethernet
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable Programmable Read-Only Memory
ETM	Embedded Trace Macrocell
FIFO	First-In-First-Out
GIC	General Interrupt Controller
GPC	General Power Controller
GPIO	General-Purpose I/O
GPR	General-Purpose Register
GPS	Global Positioning System
GPT	General-Purpose Timer
GPU	Graphics Processing Unit
HAB	High-Assurance Boot
I2C or I <sup>2</sup> C	Inter-Integrated Circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IOMUX	Input-Output Multiplexer

*Table continues on the next page...*

Term	Meaning
IP	Intellectual Property
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LCDIF	Liquid Crystal Display Interface
LDO	Low-Dropout
LIFO	Last-In-First-Out
LRU	Least-Recently Used
LSB	Least-Significant Byte
LUT	Look-Up Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MMC	Multimedia Card
MMDC	Multi Mode DDR Controller
MSB	Most-Significant Byte
MT/s	Mega Transfers per second
OCRAM	On-Chip Random-Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCI	Peripheral Component Interconnect
PCIe	PCI enhanced
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable Interrupt Controller
PMU	Power Management Unit
POR	Power-On Reset
PSRAM	Pseudo-Static Random Access Memory
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced Instruction Set Computing
ROM	Read-Only Memory
ROMCP	ROM Controller with Patch
RTOS	Real-Time Operating System
Rx	Receive
SAI	Synchronous Audio Interface
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous Data Link Control
SDMA	Smart DMA

*Table continues on the next page...*

## Features

Term	Meaning
SIM	Subscriber Identification Module
SoC	System-on-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Phillips Digital Interface
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory
SRC	System Reset Controller
TFT	Thin-Film Transistor
TPIU	Trace Port Interface
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

## 1.4 Features

### 1.4.1 ARM Cortex-A7 Platform

The i.MX 7Dual Applications Processor is based on ARM Cortex A7 MPCore™ Platform, which has the following features:

- ARM Cortex A7 MPCore™ Processor, including
  - 32KB L1 Instruction Cache
  - 32KB L1 Data Cache
  - Media Processing Engine(MPE) with NEON technology supporting the Advanced Single Instruction Multiple Data version 2 (SIMDv2) architecture
- Support of ARMv7A architecture including:
  - Security extensions for enhanced security
  - Virtualization extensions
  - Large Physical Address (LPA) extension (supported within Cortex-A7 MPCore platform)

- 512KB unified I/D L2 cache
- Snoop control unit(SCU)
- Generic timer
- Integrated Global Interrupt Controller(GIC) configured to support 128 shared peripheral interrupts
- In-order pipeline with direct and indirect branch prediction
- Harvard *Level 1* (L1) memory system with a *Memory Management Unit* (MMU)
- *Level2* (L2) memory system
- APB debug interface that supports integer processor clock ratios for 1:4 only
- Debug trace support through an *Embedded Trace Macrocell* (ETM) interface
- Floating Point Unit (FPU) with support of the VFPv4-D32 architecture

### NOTE

This is a superset of VFPv4-D16

## 1.4.2 Cortex-M4 Core Platform

Cortex-M4 Core Platform include the following:

- 16 KB L1 Instruction Cache
- 16 KB L1 Data Cache
- 64KB TCM
- Integrated Nested Vectored Interrupt Controller (NVIC)
- FPU
- CoreMPU (Memory Protection Unit)

## 1.4.3 System Bus and Interconnect

System bus and interconnect include the following:

- Network interconnect(NIC-301) AXI arbiter
- Quality of service controller(QoS) to configure priorities and limits of AXI transactions
- Performance monitor(PERFMON) to monitor AXI bus activity
- Debug monitor(DBGMON) to record AXI transactions preceding a system reset

## 1.4.4 Clocking and Resets

Clocking and resets include:

- Clock control module(CCM) provides centralized clock generation and control
  - Simplified clock tree structure
  - Unified clock programming model for each clock root
  - Multicore awareness for resource domains
- System reset controller(SRC) provides reset generation and distribution

## 1.4.5 Interrupts and DMA

Interrupts and DMA include :

- 128 shared peripheral interrupts routed to Cortex-A7 Global Interrupt Controller(GIC) and Cortex-M4 nested vector interrupt controller(NVIC) for flexible interrupt handling
- Smart direct memory access(SDMA) controller supporting 48 DMA requests

## 1.4.6 On-Chip Memory

The on-chip memory system consists of the following levels:

- Level 1 Cache - 32KB Instruction, 32KB Data cache
- Level 2 Cache - Unified instruction and data, 512KB
- Boot ROM - including HAB, 96 KB
- Internal multimedia / shared, fast access RAM (OCRAM, 128KB)
- EPDC buffer/general-purpose RAM (OCRAM\_EPDC, 128KB)

## 1.4.7 External Memory Interface

The external memory interfaces supported on this chip include:

- DRAM
  - 16/32-bit DDR3 up to 533MHz clock (1066MT/s)
  - 16/32-bit DDR3L up to 533MHz clock (1066MT/s)
  - 32-bit LP-DDR2 up to 533MHz clock (1066MT/s)
  - 32-bit LP-DDR3 up to 533MHz clock (1066MT/s)

- 16-bit NOR FLASH
- 16-bit PSRAM/Cellular RAM
- 8-bit NAND-Flash, including support for Raw MLC/SLC devices, BCH ECC up to 62-bit, and ONFi3.2 compliance (clock rates up to 100 MHz and data rates upto 200 MB/sec)
- Quad SPI flash with support for parallel read mode of two identical flash devices
- SD/MMC Ports:
  - SDXC 8-bit, 832 Mbps
  - eMMC 5.0 (DDR) and eSD 3.0

### 1.4.8 Timers

The timers on this chip include :

- One local generic timer integrated into each Cortex-A7 CPU
- Global system counter with timer bus interface to Cortex-A7 MPCore generic timers
- One local system timer (SysTick) integrated into the Cortex-M4 CPU
- Four general purpose timer (GPT) modules
- Four watchdog timer (WDOG) modules
- Two flex Timer (FTM) modules supporting PWM signal generation and input and output capture

### 1.4.9 Image/Graphic Accelerators

The i.MX 7Dual makes use of dedicated HW image processing, in order to meet the targeted multimedia performance. The use of HW accelerators enables high performance at low power dissipation and lowers the CPU utilization, allowing it to be used for other tasks.

The i.MX 7Dual incorporate the following graphical hardware accelerators:

- ePXP – Enhanced PiXel Processing engine to off loading key pixel processing operations required to support both LCD and EPD display applications
  - EPD display support including collision detection and auto-waveform selection
  - Multiple input/output format support, including YUV / RGB / Gray Scale
  - Support both RGB/YUV scaling
  - Support overlay with Alpha blending
  - RGB656/RGB444 to RGBW4444 conversion with LUT for color EPD panel
  - Color space conversion (CSC) , secondary color space conversion (CSC2), and rotation

## 1.4.10 Display and Camera Interfaces

i.MX 7Dual has both parallel LCD interface and EPD panel interface to support eReaders with either LCD panel or EPD panel, or both of them

- EPDC – Supporting direct-driver for E-Ink EPD panels with up to 2048 x 1536 at 106 Hz refresh (or 4096 x 4096 at 20 Hz)
  - Support up to 64 LUT for concurrent update
  - Support Auto-Waveform selection based on both input image and current panel content
  - Support collision detection
- LCDIF supporting one parallel 24-bit LCD display with resolution up to 1920x1080 at 60Hz
- MIPI DSI host controller and D-PHY:
  - Supports 2 data lanes and 1 clock lane
  - Maximum bit rate of 1.5 Gbps
- CMOS sensor interface (CSI) supporting up to one parallel 24-bit camera interface
- MIPI CSI-2 controller and D-PHY:
  - Supports 2 data lanes and 1 clock lane
  - Maximum bit rate of 1.5 Gbps

## 1.4.11 Audio

Audio include the following:

- Three synchronous audio interface (SAI) modules supporting I2S, AC97, TDM, and codec/DSP interfaces
- Medium Quality Sound (MQS) for low-cost stereo audio output

## 1.4.12 General Connectivity Interfaces

The i.MX 7Dual contains a rich set of general connectivity interfaces, including:

- Three Ultra Secure Digital Host Controller (uSDHC) interfaces:
  - SD/SDIO 3.01 compliance with 208 MHZ SDR signaling to support up to 104 MB/sec
  - Support for SDXC (extended capacity)
- Two USB 2.0 OTG controllers with integrated PHY interface

- One USB 2.0 host controller with HSIC interface
- Two Gigabit Ethernet controllers with support for Ethernet AVB and IEEE1588
- PCI Express (PCIe)
  - Single lane supporting PCIe v2.1
  - Dual mode operation to function as root complex or endpoint
  - Integrated PHY interface
- Four eCSPI (Enhanced CSPI), up to 52 Mbps each
- Two Flexible Controller Area Network (FlexCAN) modules supporting the CAN 2.0B protocol specification
- Two Smartcard Interface Modules (SIMv2) supporting PCIv4 compliance
- Seven universal asynchronous receiver/transmitter (UARTs) modules
  - Providing RS232 interface
  - Supporting 9-bit RS485 multidrop mode
  - One of the five supports 8-wire (uart1) while others four supports 4-wire. (Due to SoC IOMUX limitation, since all UART IP are identical.)
- Four I2C modules
- Four SPI modules
- Four PWM modules
- Keypad module (KPP)

### 1.4.13 Security

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.) :
  - ARM Cortex A7 MPCore TrustZone support
  - TrustZone-aware Global Interrupt Controller(GIC)
  - TrustZone Address Space Controller (TZASC)
  - TrustZone watchdog timer
- SJC – System JTAG Controller, protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features
- Cryptographic Acceleration and Assurance Module (CAAM)
  - PKHA block to support Public Key Cryptography with RSA 4096 and Elliptic Curve (ECC) algorithms
  - Real-time integrity checker (RTIC)
  - DPA(Differential Power Analysis) protection
  - True random number generation (RNG)
  - Manufacturing protection support

## Features

- Secure Non-Volatile Storage(SNVS), including
  - Secure Real Time Clock (RTC)
  - 10 External Tamper pins that can be configured to support 5 active meshes
- Central Security Unit(CSU)
- On-chip RAM (OCRAM) secure region protection using OCRAM controller
- Security Sensor detection of physical attacks using temperature/voltage/frequency detection
- RNGB-True Random Number Generation
- HAB-High Assurance Boot(Secure Boot)

### 1.4.14 Multicore Support

Multicore support contains :

- Resource domain controller (RDC) to support isolation and safe sharing of system resources
- Messaging unit(MU)
- Hardware Semaphore(SEMA42)
- Shared bus topology
- ARMv7 exclusive access support for external memory interfaces that support a global monitor

### 1.4.15 Analog

The i.MX 7Dual Applications Processor has two 12-bit general purpose ADC modules

### 1.4.16 GPIO and Pin Multiplexing

- Seven general-purpose input/output (GPIO) modules with interrupt capability
- Input/output multiplexing controller (IOMUXC) to provide centralized pad control.

### 1.4.17 Power Management

The i.MX 7D power management unit consists of :

- Temperature sensor with programmable trip points
- General Power Controller (GPC) to provide coordination of system power states
- Flexible power domain partitioning with internal power switches to support efficient power management

## 1.4.18 System Debug

The i.MX 7D processor system debug features are :

- ARM CoreSight debug and trace architecture
- Trace Port Interface Unit (TPIU) to support off-chip real-time trace
- Embedded Trace FIFO (ETF) with 4 KB internal storage to provide trace buffering
- Unified trace capability for Cortex-A7 and Cortex-M4 CPUs
- Cross Triggering Interface (CTI)
- Support for 5-pin (JTAG) and 2-pin (cJTAG, SWD) debug interfaces

### NOTE

GPR1 bits 28-29 must be set in order to enable debug mode for on-chip modules.

## 1.5 Architectural Overview

This section contains the i.MX 7D architectural details.

### 1.5.1 Simplified Block Diagram

The high-level block diagram is shown in the figure below. This diagram provides a view of the i.MX 7D major sub-systems and logical connectivity.

## Primary Boot Options

Figure 1-1. i.MX 7Dual Architecture Specification, Rev. 0.1

## 1.6 Primary Boot Options

The i.MX 7Dual supports boot from following devices:

- NOR Flash
- NAND flash (including SLC and MLC)
- SDIO / MMC / SDXC
- eSD 3.0/eMMC 5.0 (fast boot)
- SPI (serial flash)
- USB (recovery mode) and plug detect (USB host stack not required in ROM, can be stored in an external boot device, e.g. serial flash)
- USB Solid-State Drive (via plug-in mode)

- Ethernet (via plug-in mode)
- QSPI
- PCIe

The Cortex-A7 is the primary boot on the i.MX7D. The Cortex-M4 core can be enabled during boot as a secondary core to handle timing-critical tasks, but it cannot be used as the boot core.

## 1.7 Operation Temperature

The i.MX 7Dual supports both consumer temperature range and extended consumer temperature range. The operation condition for these 2 different parts will be:

- The junction temperature will be 0 to 95 °C for consumer part
- The junction temperature will be -20 to 105°C for extended consumer part

### NOTE

Junction temperature ( $T_j$ ) is the average temperature of the whole chip. Although the junction temperature may be within the specification, certain regions of the chip develop hot spots that can be greater than  $T_j$ . These hot spots must stay below 105 C to ensure the chip is reliable and operates within cell library limits.

## 1.8 Package

There will be 2 packages supported for i.MX 7Dual:

- 12mm x 12mm MAPBGA, 0.4mm pitch
- 19mm x 19mm MAPBGA, 0.75mm pitch

## 1.9 Endianness Support

i.MX 7D supports Little Endian mode only.

# Chapter 2

## Memory Map

### 2.1 Memory

This chapter introduces the memory architecture of the chip. The system memory high-level partition is defined below:

#### 2.1.1 Memory system overview

##### 2.1.1.1 On-chip L1, L2 caches, TCM

Cortex-A7 MPcore Platform

- Level 1 Cache (2x per Cortex-A7 Core)
  - Instruction (32 KB)
  - Data (32 KB)
- Level 2 Cache, shared by the two Cortex-A7 cores:
  - Unified instruction and data (512 KB)

Cortex M4 Platform

- Cache
  - Instruction (32 KB)
  - Data (32 KB)
- Tightly-Coupled-Memory
  - TCML on Code Bus (32KB)
  - TCMH on System Bus (32KB)

##### 2.1.1.2 On-chip memories

### 2.1.1.3 External L3 memories

The chip supports external memories, via the following memory interfaces / controllers:

- DDR Controller
  - x32/x16 LPDDR2-1066
  - x32/x16 LPDDR3-1066
  - x32/x16 DDR3-1066
  - x32/x16 DDR3L-1066
- NOR Flash
  - Dual-Channel Quad-SPI (Q-SPI) interface. (include support for in-place execution)
  - 16-bit/8-bit Parallel NOR Flash interface. (include support for in-place execution)
- Expansion SD/MMC (eSD/eMMC) and SDXC ports
  - Conforms to the SD Host Controller Standard Specification version 3.0;
  - Compatible with the MMC System Specification version 4.5;
  - Card bus clock frequency up to 208 MHz;
  - Up to 3 controllers supported;
- RawNAND Flash
  - 8-bit NAND FLASH, up to 4 devices supported by 4 chip-selects and 1 ganged ready/busy;
  - ONFI 2.x complaint, synchronous clock rate of up to 100 MHz with data rate of up to 200 MB/s;
  - Support ONFI NAND for Micron and Hynix and Toggle NAND for Toshiba and Samsung.
  - BCH62 for ECC, up to 200MB/s

### 2.1.2 Cortex-A7 Memory Map

Start Address	End Address	Region	Size	Description
8000_0000	FFFF_FFFF	DDR Address	2048MB	DDR Main memory
7000_0000	7FFF_FFFF	FLASH	256MB	Reserved

## 2.1.4 DMA memory map

The Smart DMA memory map is defined in the following table.

**Table 2-1. SDMA Peripheral Memory Map**

Address	Size	Peripheral
0xE000	4 KB	Reserved for SDMA internal registers
0xD000	4 KB	Reserved
0xC000	4 KB	SAI3
0xB000	4 KB	SAI2
0xA000	4 KB	SAI1
0x9000	4 KB	UART2
0x8000	4 KB	UART3
0x7000	4 KB	Reserved for SDMA internal registers
0x6000	4 KB	UART1
0x5000	4 KB	Reserved
0x4000	4 KB	eCSPI3
0x3000	4 KB	eCSPI2
0x2000	4 KB	eCSPI1
0x1000	4 KB	Reserved
0x0000	4 KB	Reserved for SDMA internal memory

## 2.1.5 AIPS Memory Map

**Table 2-2. AIPS-1 memory map**

Start Address	End Address	Region	NIC Port	Size
303F_0000	303F_FFFF	AIPS-1 (s_b_0)	Reserved	64KB
303E_0000	303E_FFFF		CSU	64KB

# Chapter 3

## Security

### 3.1 System Security

#### 3.1.1 Overview

Security is a common requirement for platforms built using the i.MX 7D, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

For the platform designer to meet the requirements for each market, the i.MX 7D incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the i.MX 7D security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the i.MX 7D includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the i.MX 7D security components.

- Cryptographic module with AES 128/256 symmetric algorithms, elliptic curve and RSA public key algorithms, random number generator entropy source and NIST-validated DRBG, cryptographic key protection, run-time integrity checking.
- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A7 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)

- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.
- 32 Kbyte of on-chip Secure RAM
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Resource Domain Controller (RDC)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller

Detailed descriptions of the components are provided in the *Multimedia Applications Processor Security Reference Manual*.

### 3.1.2 Central Security Unit (CSU)

#### 3.1.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

#### 3.1.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

### 3.1.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

#### 3.1.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- `csu_sec_level` for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the `csu_sec_level` signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual (see System Security Overview section).

**Table 3-1. Permission Access Table**

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

### 3.1.3 Cryptographic Acceleration and Assurance Module (CAAM)

#### 3.1.3.1 CAAM Overview

CAAM is a cryptographic acceleration device that accelerates symmetric block and stream cipher algorithms, hashing algorithms, and random number generation. It has an integral DMA engine that allows CAAM to fetch its command programs, read input data and write the resulting output.

CAAM works with the SNVS to provide platform assurance features, including support for High Assurance Boot, detection of and response to potential tamper events, and short-term and long-term protection of secret data such as public-private keypairs, Digital Rights Management keys and proprietary software.

CAAM provides the following features:

- Cryptographic acceleration of hashing, encryption and decryption
- Random Number Generation using a true random number generator and a NIST-compliant pseudo random number generator
- Secure Memory for access-controlled protection of critical data, and automatic zeroization in the case of tampering
- Offloading of cryptographic functions via programmable command descriptor language
- Independent queues for job-specific commands and results
- Register Bus Interface used for configuration, control and status
- DMA, including scatter/gather support for data
- Short-term encryption/decryption of cryptographic keys
- Long-term protection of secret data via device-specific encryption keys

### 3.1.4 Secure Non-Volatile Storage (SNVS)

#### 3.1.4.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS sends an interrupt to alert the Operating System of the event. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and security violation detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Security violation indicators that detect JTAG events, power glitches, Master Key ECC check failure, and HAB/software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Secure Realtime Counter that can continue running by coincell power domain when main chip power is off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value, persistent across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt to wakeup system

### 3.1.4.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD\_SNVS\_IN).

An always-ON power supply (coincell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

### 3.1.5 High Assurance Boot (HAB)

HAB, which is the high assurance boot feature in the system boot ROM, detects and prevents execution of unauthorized software (malware) during the boot sequence.

When unauthorized software is permitted to gain control of the boot sequence, it can be exploited for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks; or repurposing the platform.

Unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from USB connections or removable devices.

HAB protects against unauthorized software by:

- Using digital signatures to recognize authentic software. This allows the user to boot the device to a known initial state, running software signed by the device manufacturer.

### 3.1.6 RDC Overview

The Resource Domain Controller (RDC) provides robust support for the isolation of destination memory mapped locations such as peripherals and memory to a single core, a bus master, or set of cores and bus masters.

Many of today's processors have multiple cores for increased performance and flexibility. In some cases, the cores serve different functions (e.g. user level applications versus real time machine control) and in such cases the software for each core may be developed by different providers.

Without careful collaboration between the two operating systems inadvertent malfunction or degradation in performance may result. Similarly, malware present on one core should not be able to affect the operating conditions of the other domain. The RDC provides isolation to allow for more robust and secure operation on the chip. Details can be found in the RDC chapter.

### 3.1.7 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This allows program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary scan) testing.

SJC provides the following security levels:

- JTAG Disabled-JTAG use is permanently blocked.
- No-Debug-All security sensitive JTAG features are permanently blocked.
- Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- JTAG Enabled-JTAG use is unrestricted.

Security levels are selected via e-fuse configuration.

## 3.2 Resource Domain Controller (RDC)

### 3.2.1 Overview

The Resource Domain Controller (RDC) provides robust support for the isolation of destination memory mapped locations such as peripherals and memory to a single core, a bus master, or set of cores and bus masters.

Many of today's processors have multiple cores for increased performance and flexibility. In some cases, the cores serve different functions (e.g. user level applications versus real time machine control) and in such cases the software for each core may be developed by different providers.

**Figure 3-1. Dedicated and Shared Peripherals**

For efficiency reasons the code on the cores may share chip resources such as peripherals and memory. The sharing of chip resources between the somewhat independent processing domains allows for the opportunity of data collisions where information stored in peripherals or memory by a process on one core is overwritten by software running on another core. Without careful collaboration between the two operating systems inadvertent malfunction or degradation in performance may result.

The RDC provides a mechanism to allow boot time configuration code to establish resource domains by assigning cores, bus masters, peripherals and memory regions to domain identifiers. Once configured, bus transactions are monitored to restrict accesses initiated by cores and bus masters to their respective peripherals and memory.

For shared peripherals, the RDC provides a semaphore-based locking mechanism to provide for temporary exclusivity while the domain software uses the peripheral. Once the software of one domain has finished the task and finished with the peripheral then it may release the semaphore making the peripheral available to the other domain.

### 3.2.1.1 Features

Resource domain subsystem has the following features:

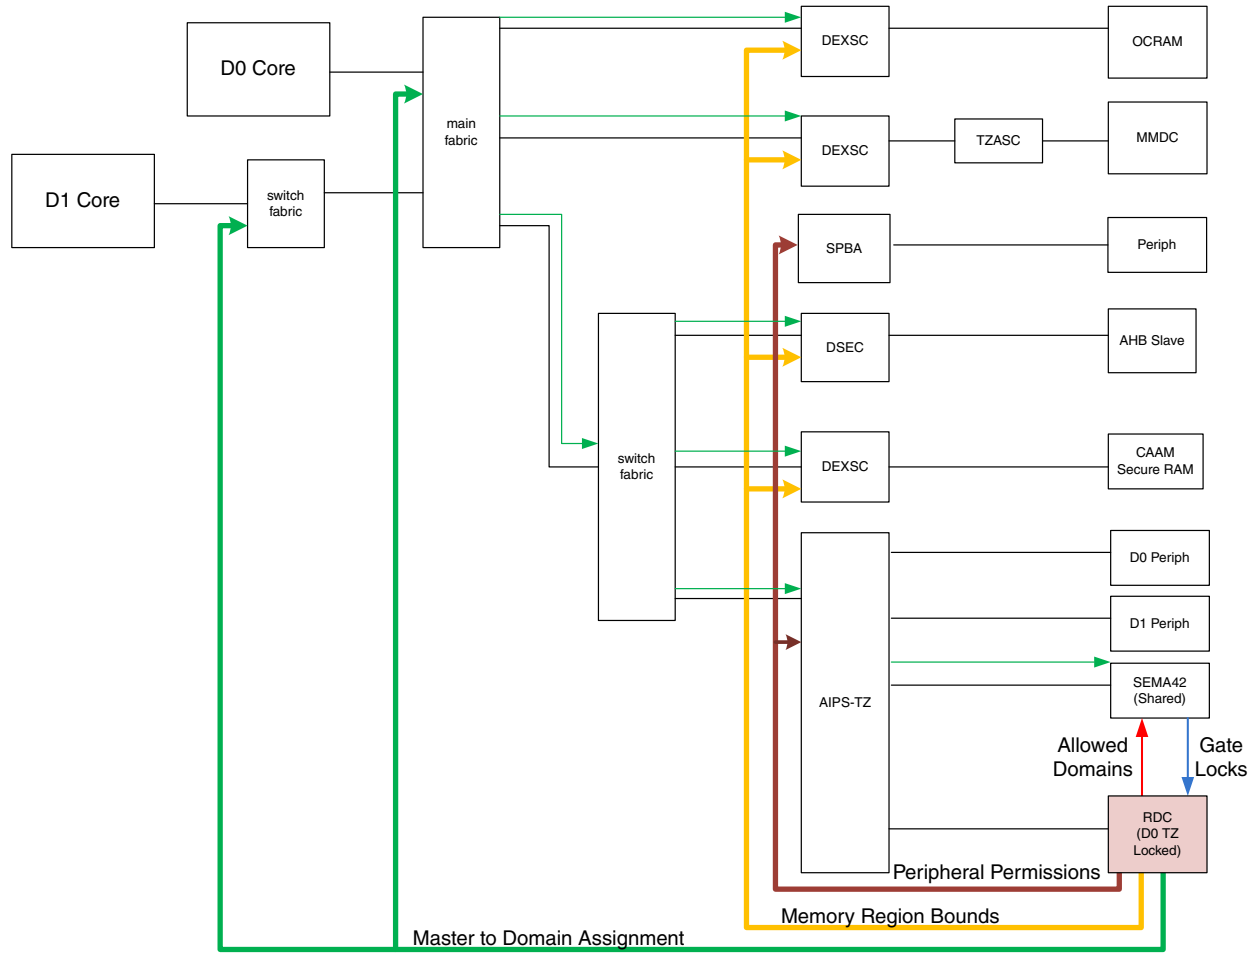

- Assignment of cores, bus masters, peripherals, and memory regions to a resource domain
- Fixed memory resolution of 128 Bytes for small address spaces and 4 KB for large address spaces
- Four resource domain identifiers
- Memory read/write access controls for each resource domain and region
- Optional semaphore-based, hardware-enforced exclusive access of shared peripherals to a resource domain
- Prioritized access permissions for overlapping memory regions
- Automatic restoration of resource domain access permissions to memory regions in the power-down domain

### 3.2.2 Functional Description

The RDC is the central location for creation of isolated resource domains and for the enablement of semaphore-based access also known as “safe sharing”. Configuration software assigns one of four resource domain identifiers to each core and bus master, and allocates each memory region and peripheral to one or more resource domains.

Memory Read or Write access privileges for each resource domain are declared for each memory region. In addition, the software configuration determines which shared peripherals (those peripherals allocated to more than one domain) require safe sharing by setting the semaphore-required configuration for each peripheral.

The RDC configuration information is sent to the fabric ports, memories gaskets, semaphore controller, and peripherals to control access based on domain assignments. The fabric uses the domain identifier associated with each port to include this information along with the bus transaction. When the slave gasket encounters a bus transaction it makes a comparison of the transaction domain ID to the RDC-provided list of allowed domains. If the transaction domain ID is on the list then access may be permitted.

**Figure 3-2. Example RDC Connections**

For shared peripherals, RDC permits more than one domain access to a single peripheral. RDC also provides three ways to control synchronized use of shared peripherals. These methods include hardware-enforced synchronization, software-based semaphores, or no synchronization. The latter may be suitable for well-tuned multi-core operating systems that handle synchronization in the core platform, for instance.

For hardware-enforced synchronization, also known as "safe sharing", ownership of the peripheral must be claimed in the semaphore controller before access is allowed to the shared peripheral. The "semaphore required" bit (SREQ) is set in the PDAP register corresponding to the shared peripheral which causes the RDC to require that a semaphore is obtained by a domain before access by that domain to the shared peripheral is allowed. During the time that the domain has the semaphore in possession its bus masters have exclusive access to the peripheral.

When the semaphore is released then no domain masters have access until the semaphore is obtained again. When the SREQ is set, RDC does not allow masters to obtain semaphores of peripherals to which it is not allocated; the master must have designated access in the D-registers of the corresponding PDAP register (e.g. D3R bit set for Domain 3 access of the shared peripheral). There is a one-to-one mapping between the semaphore controller gate and the resource domain controller peripheral. The mapping of PDAP registers and peripherals can be found in the Peripheral Map section of the RDC chapter.

### 3.2.2.1 Domain ID

The RDC provides for an isolation of domain resources by use of a identifier called the Domain ID (DID). A core and its resources including memory, bus masters, and peripherals are all associated with a single DID. When software or a DMA attempts to access a peripheral or memory, the corresponding bus transaction includes the DID along with the other bus control information such as Read, Write, and privilege mode.

### 3.2.2.2 Resource Assignment

The RDC allows assignment of peripherals and memories to one or more domains while each bus master or core is placed in one of four domains. The masters are assigned a domain in the MDA register. A peripheral is given R/W access permissions to each domain in the PDAP register. Memory regions are bound by address space in start and end registers, the MRSA and MREA. Each memory region is assigned one or more allowed domains and R/W permissions in the MRC control register. Memory regions must be enabled before the permissions are active. Otherwise the permissions are not restricted.

The RDC itself should be isolated to ensure that only a trustworthy resource manager can configure the RDC registers. This process may either be present initially, during secure boot, or during the runtime in the secure world, for example. If the operating system does not support a runtime trusted execution then during the secure boot process the RDC configuration can be locked to prevent further modification after the operating systems are running.

#### NOTE

The CCM supports multicore awareness based on resource domain assignments programmed into the RDC. Refer to the CCM chapter regarding the relationship between core resource domains and their respective CCM resources. Failing to follow the proper sequence when updating the resource domain

assignments of the core can result in clocks being inadvertently gated.

### 3.2.2.3 Safe Sharing

For shared peripherals, the RDC can be configured to require a domain to obtain a semaphore lock before access to the peripheral is allowed. This feature helps prevent collisions from processes on separate cores that may want to use the same peripheral at the same time. The RDC sends a list of eligible domains to the semaphore module for each gate/peripheral. The eligible domains are those that are set in the peripheral domain access permissions (PDAP) registers. There is a one-to-one correspondence between semaphore gates and peripherals so each gate in the semaphore block represents a peripheral. The RDC receives semaphore locks from the hardware semaphore module (SEMA42). A semaphore lock is acquired when a core or bus master from a given domain requests a lock for a particular gate. The semaphore module compares the request's domain ID against the list of eligible domain IDs. If the domain ID is on the list and the lock is available then the lock is set and a signal is sent back to the RDC module indicating a lock has been acquired for a particular gate and to which domain ID the lock belongs. The RDC then restricts access to the corresponding peripheral to only transactions originating from the domain that has the lock. Another domain, though on the shared list to access the peripheral, must then wait until the lock is released before acquiring the lock and gaining access to the peripheral. To enable this feature of hardware enforcement for the semaphore locks, the SREQ bit is set in the RDC resource register.

If the SREQ is set, then when a process determines it needs a shared peripheral, it must first lock the resource in the semaphore module. Once the resource is locked, the semaphore module sends a signal to the RDC indicating the domain has access to the resource. The RDC will then set the access permissions to allow that domain access to the peripheral.

For a domain to acquire a lock on a peripheral, the domain must have been assigned to the peripheral in the RDC Peripheral Domain Access Permissions register (PDAP). The semaphore module only allows safe-sharing locks for those domains that are assigned to the peripheral. The semaphore module does not consider the access type (Read or Write) when allowing domains to acquire locks.

The SEMA42 module implements hardware-enforced semaphores as an IPS-mapped slave peripheral device. The feature set includes:

- Module definition supporting 64 hardware-enforced gates in a multi-processor configuration, where up to 15 processors can be supported; cpX is meant to represent core processor X
  - Gates appear as an  $n$ -entry byte-size array with read and write accesses ( $n = 16, 32, 64$ ).
    - Processors lock gates by writing "Master\_index" to the appropriate gate and must read back the gate value to verify the lock operation was successful. The Master\_index value for the processors can be found in Table 14-7. Also note that after locking, the gate register contains the master\_id value of the locking processor (in bits [3:0]), and also the value of the locking domain (in bits [5:4]).
    - Once locked, the gate is unlocked by a write of zeroes from the locking processor.
    - The number of implemented gates is specified by a hardware configuration define.
  - Each hardware gate appears as a 16-state, 4-bit state machine.
    - 16-state implementation
      - if gate = 0x0, then state = unlocked
      - if gate = 0x1, then state = locked by processor (master\_index) 0
      - if gate = 0x2, then state = locked by processor (master\_index) 1
      - ...
      - if gate = 0xF, then state = locked by processor (master\_index) 14
    - Uses the logical bus master number (master\_index) as a reference attribute plus the specified data patterns to validate all write operations.
    - Once locked, the gate can (and must) be unlocked by a write of zeroes from the locking processor.
  - Secure reset mechanisms are supported to clear the contents of individual gates, as well as a clear\_all capability.
- Memory-mapped IPS slave peripheral platform module
  - Interface to the IPS bus for programming-model accesses

### 3.2.2.4 Resource Domain Control and Security Considerations

Conceptually, the RDC configuration is independent of the processor privilege mode and security domain. It is intended to allow for isolation between core processing environments to prevent collisions and increase reliability. Access between resource domains is mutually exclusive and each domain should be in control of its own privilege modes and access rights.

However, it is important to realize multi-core processors may have a multiple resource domains but only one overarching security domain. Chip security controls reside in one resource domain. In this configuration, a domain can affect at least one level of access privileges in the other domain. This may be acceptable but clarity and care is needed to ensure expected functionality.

**Figure 3-3. Access Control to Memory**

Therefore, access to the security controls should be restricted to the most trustworthy operating mode of the core and privilege levels should be coordinated to ensure that shared peripherals and memory regions are accessible by both cores. For instance, if a memory region is designated for secure accesses then all domain masters that share that region must have secure privileges.

### 3.2.3 Modes of Operation

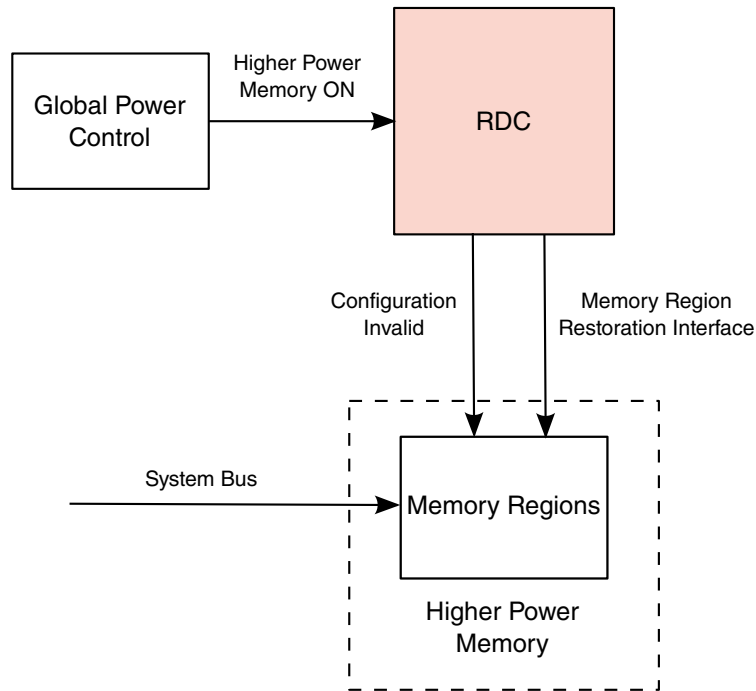

The RDC provides access controls to the resource domain subsystem. When the device is in a low power mode then some memory regions in the subsystem may be powered off. RDC responds to the impacted memory regions by automatically reconfiguring the memory regions once power returns and blocking access to those memory regions until the reconfiguration process is complete.

#### 3.2.3.1 Low Power Modes

The RDC loads configuration information for memory regions (MRSA, MRSE, MRC) into access control mechanisms (gaskets) at the memory interface. The location of this configuration information may reside inside power domains that lose power during sleep modes for energy savings. To restore configuration information upon return from sleep mode, the RDC receives a global power control signal indicating power is restored. The RDC then automatically reconfigures the memory regions with the configuration information.

During reconfiguration, access is blocked to the previously powered down memories. When the RDC completes reconfiguration it issues an interrupt and allows access to the memory regions. Only the powered down regions are blocked during the reconfiguration. Memory regions in the "always-on" power domain (still powered during sleep mode) remain available according to the programmed access rights. If no memory regions were enabled then the powered down regions are available immediately when power is restored.

The figure below shows the Global Power Control signal which RDC uses to invalidate the configuration upon deassertion and to restore the configuration when re-asserted. The configuration is valid and bus transactions allowed once the memory regions have been restored.

**Figure 3-4. Memory Restoration Signaling**

### 3.2.4 Programming Interface

This section provides product specific details describing the mapping of resources - peripherals, bus masters, and memory regions - to corresponding resource domain controls RDC registers.

The RDC and RDC\_SEMA42 register maps are combined in this chapter. The base address for the one RDC map and two SEMA42 maps are each separated by 4KB. While there are two SEMA42 submodules and therefore two sets of SEMA42 registers, this chapter describes one. Please refer to the peripheral memory map for the base addresses of the RDC and SEMA42 modules.

#### 3.2.4.1 Master Assignment Registers

**Table 3-2. Master Assignment Mapping**

Master	RDC MDA register
A7 Core 0	RDC_MDA0
A7 Core 1	RDC_MDA0

ENET2 TX	RDC_MDA24
ENET2 RX	RDC_MDA25
SDMA port	RDC_MDA26

### 3.2.4.2 Peripheral Mapping

Each peripheral has a corresponding resource domain assignment register in the RDC and semaphore lock register in the RDC\_SEMA42 module. The following table shows allocation of the RDC PDAP and RDC\_SEMA4 GATE registers for peripheral resource domain assignment.

#### NOTE

Access control of the RDC registers can be programmed using the respective PDAP register. The default setting of the PDAP register for the RDC allows access from all domains. Use

caution when restricting access of the RDC registers to avoid conditions where access to the RDC registers is needed but no master is assigned to a domain with access rights to the RDC.

**Table 3-3. RDC Peripheral Mapping**

### 3.2.4.3 Memory Region Map

The number of memories with domain isolation support varies per device. The number of memory regions for a particular memory and the size of those regions varies per memory gasket. Each region of memory has a set of registers to define the boundaries of the region based on start and end addresses, a control register to set the domain access permissions and enable the region, and a status register to determine if access was denied to a region.

For this device, refer to the table below to determine the memories with domain support, the number of regions for each memory, the region resolution, the identifying numbers for the sets of memory region registers, and the addresses of the RDC registers to access the sets of Memory Region registers.

**Table 3-4. Memory Region Mapping**

Memory/Port	Number of Regions	Region Resolution	Memory Region Register Set Number (e.g. MRSA, MREA, MRC, MRVS)	Register Address Range
MMDC	8	4 KB	0-7	0x800-0x87C
QSPI	8	4 KB	8-15	0x880-0x8FC
WEIM	8	4 KB	16-23	0x900-0x97C
PCIe	8	4 KB	24-31	0x980-0x9FC
OCRAM	5	128 B	32-36	0xA00-0xA4C
OCRAM_S	5	128 B	37-41	0xA50-0xA9C
OCRAM_EPDC	5	128 B	42-46	0xAA0-0xAEC
OCRAM_PXP	5	128 B	47-51	0xAF0-0xB3C

### 3.2.5 RDC Memory Map/Register Definition

## RDC memory map

### 3.2.5.1 Version Information (RDC\_VIR)

The VIR provides version information including the number of domains, number of master slots, number of peripheral slots, and number of memory regions.

Address: 303D\_0000h base + 0h offset = 303D\_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	Reserved				NRGN				NPER				NMSTR				NDID																
W	Reserved				Reserved				Reserved				Reserved				Reserved																
Reset	0	0	0	0	0	0	1	1	0	1	1	1	0	1	1	0	1	1	1	0	0	0	1	0	0	0	0	0	0	0	1	0	0

#### RDC\_VIR field descriptions

Field	Description
31–28 Reserved	This field is reserved.
27–20 NRGN	Number of Memory Regions Indicates the number of memory regions in this instance of the RDC.
19–12 NPER	Number of Peripherals Indicates the number of peripherals that can be isolated or safe-shared

Table continues on the next page...

## RDC\_VIR field descriptions (continued)

Field	Description
11–4 NMSTR	Number of Masters  Indicates the number of masters supported by this instance of RDC.
NDID	Number of Domains  Indicates the number of domain ids supported by this instance of the RDC. Add one to the register value to get the actual number of domains.

## 3.2.5.2 Status (RDC\_STAT)

Address: 303D\_0000h base + 24h offset = 303D\_0024h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved															
W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved							PDS	Reserved				DID			
W	Reserved							PDS	Reserved				DID			
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

## RDC\_STAT field descriptions

Field	Description
31–9 Reserved	This field is reserved.
8 PDS	Power Domain Status  Indicates if the "Power Down" memory regions are powered and available. Power Down memory regions are only those memory regions susceptible to power outage for power savings are unavailable if this is zero. "Always-On" memory regions remain available. Always On memory regions are those regions that are not powered down unless the entire SoC is powered down. This signal remains low until all access controls have been restored to the domain.  0 Power Down Domain is OFF 1 Power Down Domain is ON
7–4 Reserved	This field is reserved.
DID	Domain ID  The Domain ID of the core or bus master that is reading this. The value is different for requests from different domains.

### 3.2.5.3 Interrupt and Control (RDC\_INTCTRL)

Address: 303D\_0000h base + 28h offset = 303D\_0028h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	Reserved																
W	Reserved																
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	Reserved															RCl_EN	
W	Reserved															RCl_EN	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

#### RDC\_INTCTRL field descriptions

Field	Description
31–1 Reserved	This field is reserved.
0 RCl_EN	Restoration Complete Interrupt Interrupt generated when the RDC has completed restoring state to a recently re-powered memory regions.  0 Interrupt Disabled 1 Interrupt Enabled

### 3.2.5.4 Interrupt Status (RDC\_INTSTAT)

Indication of Interrupt Pending for State Restoration

Address: 303D\_0000h base + 2Ch offset = 303D\_002Ch

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

W	Reserved															
Reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

#### RDC\_PDAPn field descriptions

Field	Description
31 LCK	Peripheral Permissions Lock  When set prevents further modification of the Peripheral Domain Access Permissions (sticky bit until reset)  0 Not Locked 1 Locked
30 SREQ	Semaphore Required  When set the hardware semaphore state enforces the semaphore lock. If a domain has access permissions and a semaphore has locked a shared peripheral then only the domain holding the semaphore signal can access this peripheral.  0 Semaphores have no effect 1 Semaphores are enforced
29–8 Reserved	This field is reserved.
7 D3R	Domain 3 Read Access  0 No Read Access 1 Read Access Allowed
6 D3W	Domain 3 Write Access  0 No Write Access 1 Write Access Allowed
5 D2R	Domain 2 Read Access  0 No Read Access 1 Read Access Allowed
4 D2W	Domain 2 Write Access  0 No Write Access 1 Write Access Allowed
3 D1R	Domain 1 Read Access

Table continues on the next page...

RDC\_PDAP<sub>n</sub> field descriptions (continued)

Field	Description
	0 No Read Access 1 Read Access Allowed
2 D1W	Domain 1 Write Access 0 No Write Access 1 Write Access Allowed
1 D0R	Domain 0 Read Access 0 No Read Access 1 Read Access Allowed
0 D0W	Domain 0 Write Access 0 No Write Access 1 Write Access Allowed

3.2.5.7 Memory Region Start Address (RDC\_MRSA<sub>n</sub>)

Address: 303D\_0000h base + 800h offset + (16d × i), where i=0d to 51d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SADR																Reserved															
W	SADR																Reserved															
Reset	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	x*	

\* Notes:

- x = Undefined at reset.

RDC\_MRSA<sub>n</sub> field descriptions

Field	Description
31–7 SADR	Start address for memory region  Lower bound (inclusive) modulo the defined granularity byte size of a region. The region size (granularity) is defined for each Memory/Port in the Memory Region Map section. Region boundaries are aligned to the minimum possible region size for the Memory/Port.
Reserved	This field is reserved.

### 3.2.5.8 Memory Region End Address (RDC\_MREAn)

Address: 303D\_0000h base + 804h offset + (16d × i), where i=0d to 51d

- \* Notes:
- x = Undefined at reset.

#### RDC\_MREAn field descriptions

Field	Description
31–7 EADR	Upper bound for memory region  Upper bound (exclusive) modulo the defined granularity byte size of a region. The region size (granularity) is defined for each Memory/Port in the Memory Region Map section. Region boundaries are aligned to the minimum possible region size for the Memory/Port.
Reserved	This field is reserved.

### 3.2.5.9 Memory Region Control (RDC\_MRCn)

Address: 303D\_0000h base + 808h offset + (16d × i), where i=0d to 51d

#### RDC\_MRCn field descriptions

Field	Description
31 LCK	Region Lock  Locks all region fields from further modification except ENA, which can be set but not reset after LCK is set. LCK is a sticky bit.  0 No Lock. All fields in this register may be modified. 1 Locked. No fields in this register may be modified except ENA, which may be set but not cleared.
30 ENA	Region Enable  Activates the memory region. If the region is not activated then the permissions and address boundaries have not affect and the region will be fully accessible.

Table continues on the next page...

## RDC\_MRCn field descriptions (continued)

Field	Description
	0 Memory region is not defined or restricted. 1 Memory boundaries, domain permissions and controls are in effect.
29–8 Reserved	This field is reserved.
7 D3R	Domain 3 Read Access to Region 0 Processing Domain 3 does not have Read access to the memory region 1 Processing Domain 3 has Read access to the memory region
6 D3W	Domain 3 Write Access to Region 0 Processing Domain 3 does not have Write access to the memory region 1 Processing Domain 3 has Read access to the memory region
5 D2R	Domain 2 Read Access to Region 0 Processing Domain 2 does not have Read access to the memory region 1 Processing Domain 2 has Read access to the memory region
4 D2W	Domain 2 Write Access to Region 0 Processing Domain 2 does not have Write access to the memory region 1 Processing Domain 2 has Write access to the memory region
3 D1R	Domain 1 Read Access to Region 0 Processing Domain 1 does not have Read access to the memory region 1 Processing Domain 1 has Read access to the memory region
2 D1W	Domain 1 Write Access to Region 0 Processing Domain 1 does not have Write access to the memory region 1 Processing Domain 1 has Write access to the memory region
1 D0R	Domain 0 Read Access to Region 0 Processing Domain 0 does not have Read access to the memory region 1 Processing Domain 0 has Read access to the memory region
0 D0W	Domain 0 Write Access to Region 0 Processing Domain 0 does not have Write access to the memory region 1 Processing Domain 0 has Write access to the memory region

### 3.2.5.10 Memory Region Violation Status (RDC\_MRVS<sub>n</sub>)

Address: 303D\_0000h base + 80Ch offset + (16d × i), where i=0d to 51d

#### RDC\_MRVS<sub>n</sub> field descriptions

Field	Description
31–5 VADR	Violating Address  The address of the denied access. The first access violation is captured. Subsequent violations are ignored until the status register is cleared. Contents are cleared upon reading the register. Clearing of contents occurs only when the status is read by the memory region's associated domain ID (s).
4 AD	Access Denied  Access to a memory region denied. This bit is cleared when this bit is written by one of the allowed domains.
3–2 Reserved	This field is reserved.
VDID	Violating Domain ID  The domain ID of the denied access. The first access violation is captured. Subsequent violations are ignored until the status register is cleared. Contents are cleared upon reading the register.  00 Processing Domain 0 01 Processing Domain 1 10 Processing Domain 2 11 Processing Domain 3

### 3.2.6 RDC SEMA42 Memory Map/Register Definition

Only Supervisor Mode accesses are allowed on these registers. User accesses generate an error termination.

## RDC\_SEMAPHORE memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

**3.2.6.1 Gate Register (RDC\_SEMAPHOREx\_GATE $n$ )**

Each semaphore gate is implemented in a 4-bit finite state machine, right-justified in a byte data structure. The hardware uses the logical bus master number (`master_index`) in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. Attempted writes with a data value that is neither the unlock value nor the appropriate lock value (`master_index + 1`) are simply treated as "no operation" and do not affect any gate state. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes. Processor dex values can be found in [Table 4-29](#).

Address: Base address + 0h offset + (1d × i), where i=0d to 63d

Bit	7	6	5	4	3	2	1	0
Read	0		LDOM		GTFSM			
Write	0		0		0			
Reset	0	0	0	0	0	0	0	0

### RDC\_SEMAPHOREx\_GATE<sub>n</sub> field descriptions

Field	Description
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5–4 LDOM	Read-only bits. They indicate which domain had currently locked the gate.  00 The gate is locked by domain 0. (True if bits [3:0] do not equal 0000.) 01 The gate has been locked by domain 1. 10 The gate has been locked by domain 2. 11 The gate has been locked by domain 3.
GTFSM	Gate Finite State Machine.  The state of the gate reflects the last processor that locked it, which can be useful during system debug.  The hardware gate is maintained in a 16-state implementation, defined as:  0000 The gate is unlocked (free). 0001 The gate has been locked by processor with master_index = 0. 0010 The gate has been locked by processor with master_index = 1. 0011 The gate has been locked by processor with master_index = 2. 0100 The gate has been locked by processor with master_index = 3. 0101 The gate has been locked by processor with master_index = 4. 0110 The gate has been locked by processor with master_index = 5. 0111 The gate has been locked by processor with master_index = 6. 1000 The gate has been locked by processor with master_index = 7. 1001 The gate has been locked by processor with master_index = 8. 1010 The gate has been locked by processor with master_index = 9. 1011 The gate has been locked by processor with master_index = 10. 1100 The gate has been locked by processor with master_index = 11. 1101 The gate has been locked by processor with master_index = 12. 1110 The gate has been locked by processor with master_index = 13. 1111 The gate has been locked by processor with master_index = 14.

### 3.2.6.2 Reset Gate Write (RDC\_SEMAPHOREx\_RSTGT\_W)

Although the intent of the hardware gate implementation specifies a protocol where the locking processor must unlock the gate, it is recognized that system operation may require a reset function to re-initialize the state of any gate(s) without requiring a system-level reset.

To support this special gate reset requirement, the RDC Semaphores module implements a "secure" reset mechanism that allows a hardware gate (or all the gates) to be initialized by following a specific dual-write access pattern. Using a technique similar to that required for the servicing of a software watchdog timer, the secure gate reset requires two consecutive writes with predefined data patterns from the same processor to force the clearing of the specified gate(s). The required access pattern is:

1. A processor performs a 16-bit write to the RDC\_SEMA42RSTGT memory location. The least significant byte (RDC\_SEMA42RSTGT[RSTGDP]) must be 0xE2; the most significant byte is a "don't\_care" for this reference.
2. The same processor then performs a second 16-bit write to the RDC\_SEMA42RSTGT location. For this write, the lower byte (RDC\_SEMA42RSTGT[RSTGDP]) is the logical complement of the first data pattern (0x1D) and the upper byte (RDC\_SEMA42RSTGT[RSTGTN]) specifies the gate(s) to be reset. This gate field can specify a single gate be cleared, or else that all gates are to be cleared. If the same processor writes incorrect data on the second access or another processor performs the second write access, the special gate reset sequence is aborted and no error signal will be asserted.
3. Reads of the RDC\_SEMA42RSTGT location return information on the 2-bit state machine (RDC\_SEMA42RSTGT[RSTGSM]) that implements this function, the bus master performing the reset (RDC\_SEMA42RSTGT[RSTGMS]), and the gate number(s) last cleared (RDC\_SEMA42RSTGT[RSTGTN]). Reads of the RDC\_SEMA42RSTGT register do not affect the secure reset finite state machine in any manner.

Address: Base address + 40h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	RSTGTN								0							
Write									RSTGDP							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**RDC\_SEMAPHOREx\_RSTGT\_W field descriptions**

Field	Description
15–8 RSTGTN	Reset Gate Number. This 8-bit field specifies the specific hardware gate to be reset. This field is updated by the second write.  If RSTGTN < 64, then reset the single gate defined by RSTGTN, else reset all the gates.
RSTGDP	Reset Gate Data Pattern. This write-only field is accessed with the specified data patterns on the two consecutive writes to enable the gate reset mechanism. For the first write, RSTGDP = 0xE2 while the second write requires RSTGDP = 0x1D.

### 3.2.6.3 Reset Gate Read (RDC\_SEMAPHOREx\_RSTGT\_R)

Although the intent of the hardware gate implementation specifies a protocol where the locking processor must unlock the gate, it is recognized that system operation may require a reset function to re-initialize the state of any gate(s) without requiring a system-level reset.

To support this special gate reset requirement, the RDC Semaphores module implements a "secure" reset mechanism that allows a hardware gate (or all the gates) to be initialized by following a specific dual-write access pattern. Using a technique similar to that required for the servicing of a software watchdog timer, the secure gate reset requires two consecutive writes with predefined data patterns from the same processor to force the clearing of the specified gate(s). The required access pattern is:

1. A processor performs a 16-bit write to the RDC\_SEMA42RSTGT memory location. The least significant byte (RDC\_SEMA42RSTGT[RSTGDP]) must be 0xE2; the most significant byte is a "don't\_care" for this reference.
2. The same processor then performs a second 16-bit write to the RDC\_SEMA42RSTGT location. For this write, the lower byte (RDC\_SEMA42RSTGT[RSTGDP]) is the logical complement of the first data pattern (0x1D) and the upper byte (RDC\_SEMA42RSTGT[RSTGTN]) specifies the gate(s) to be reset. This gate field can specify a single gate be cleared, or else that all gates are to be cleared. If the same processor writes incorrect data on the second access or another processor performs the second write access, the special gate reset sequence is aborted and no error signal will be asserted.
3. Reads of the RDC\_SEMA42RSTGT location return information on the 2-bit state machine (RDC\_SEMA42RSTGT[RSTGSM]) that implements this function, the bus master performing the reset (RDC\_SEMA42RSTGT[RSTGMS]), and the gate number(s) last cleared (RDC\_SEMA42RSTGT[RSTGTN]). Reads of the RDC\_SEMA42RSTGT register do not affect the secure reset finite state machine in any manner.

Address: Base address + 40h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	RSTGTN								0	RSTGSM		RSTGMS				
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### RDC\_SEMAPHOREx\_RSTGT\_R field descriptions

Field	Description
15–8 RSTGTN	Reset Gate Number. This 8-bit field specifies the specific hardware gate to be reset. This field is updated by the second write.

*Table continues on the next page...*

**RDC\_SEMAPHOREx\_RSTGT\_R field descriptions (continued)**

Field	Description
	If RSTGTN < 64, then reset the single gate defined by RSTGTN, else reset all the gates.
7-6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5-4 RSTGSM	<p>Reset Gate Finite State Machine. Reads of the RDC_SEMA42RSTGT register return the encoded state machine value. Note the RSTGSM = 10 state is valid for only a single machine cycle, so it is impossible for a read to return this value. The reset state machine is maintained in a 2-bit, 3-state implementation, defined as:</p> <p>00 Idle, waiting for the first data pattern write.  01 Waiting for the second data pattern write.  10 The 2-write sequence has completed. Generate the specified gate reset(s). After the reset is performed, this machine returns to the idle (waiting for first data pattern write) state. The "01" state persists for only one clock cycle. Software will never be able to observe this state.  11 This state encoding is never used and therefore reserved.</p>
RSTGMS	<p>Reset Gate Bus Master. This 4-bit read-only field records the logical number of the bus master performing the gate reset function. The reset function requires that the two consecutive writes to this register must be initiated by the same bus master to succeed. This field is updated each time a write to this register occurs.</p> <p>The association between system bus master port numbers, the associated bus master device, and the logical processor number is SoC-specific. Consult the device reference manual for this information.</p>

# Chapter 4

## ARM Platform and Debug

### 4.1 ARM Cortex A7 Platform (CA7)

#### 4.1.1 Overview

The Cortex-A7 MPCore platform is a high-performance, low-power processor compliant with the ARMv7-A architecture. The Cortex-A7 MPCore platform has dual symmetric ARM®Cortex®-A7 cores with a L1 cache subsystem, integrated L2 cache subsystem, and integrated Generic Interrupt Controller (GIC).

Each Cortex-A7 MPCore includes the following:

- 32 KB L1 Instruction Cache
- 32 KB L1 Data Cache
- Media Processing Engine (MPE) with NEON technology supporting the Advanced Single Instruction Multiple Data version 2 (SIMDv2) architecture
- Floating Point Unit (FPU) with support of the VFPv4-D32 architecture

#### **NOTE**

This is a superset of VFPv4-D16

- Support of ARMv7A architecture including:
  - Security extensions for enhanced security
  - Virtualization extensions
  - Large Physical Address (LPA) extension (LPA only supported within Cortex-A7 MPCore platform)

The Cortex-A7 MPCore platform includes the following:

- Integrated Global Interrupt Controller (GIC) configured to support 128 shared peripheral interrupts
- Generic timer
- Snoop control unit (SCU)
- 512 KB unified L2 cache

- Interconnect using a single 128-bit wide bus AMBA AXI bus
- ARMv7.1 ARM debug architecture that complies with the Coresight debug/trace architecture

### 4.1.2 External Signals

The following table describes the external signals of ARM:

**Table 4-1. ARM External Signals**

Signal	Description	Pad	Mode	Direction
ARM_EVENTI	Input event signal	LCD_RESET	ALT2	I
ARM_EVENTO	Output event signal	LCD_DATA18	ALT2	O
ARM_TRACE00	Trace signal	LCD_DATA00	ALT2	O
ARM_TRACE01	Trace signal	LCD_DATA01	ALT2	O
ARM_TRACE02	Trace signal	LCD_DATA02	ALT2	O
ARM_TRACE03	Trace signal	LCD_DATA03	ALT2	O
ARM_TRACE04	Trace signal	LCD_DATA04	ALT2	O
ARM_TRACE05	Trace signal	LCD_DATA05	ALT2	O
ARM_TRACE06	Trace signal	LCD_DATA06	ALT2	O
ARM_TRACE07	Trace signal	LCD_DATA07	ALT2	O
ARM_TRACE08	Trace signal	LCD_DATA08	ALT2	O
ARM_TRACE09	Trace signal	LCD_DATA09	ALT2	O
ARM_TRACE10	Trace signal	LCD_DATA10	ALT2	O
ARM_TRACE11	Trace signal	LCD_DATA11	ALT2	O
ARM_TRACE12	Trace signal	LCD_DATA12	ALT2	O
ARM_TRACE13	Trace signal	LCD_DATA13	ALT2	O
ARM_TRACE14	Trace signal	LCD_DATA14	ALT2	O
ARM_TRACE15	Trace signal	LCD_DATA15	ALT2	O
ARM_TRACE_CLK	Clock signal	LCD_DATA16	ALT2	O
ARM_TRACE_CTL	Control signal	LCD_DATA17	ALT2	O

### 4.1.3 Clocks

This section will discuss the Cortex-A7 clocks. For the specification of the maximum Cortex-A7 core frequency, please see the product datasheet. The following table describes the clock sources for ARM.

**Bus Clocks:** The AXI master port of the Cortex-A7 MPCore platform is designed to run at half the speed (1:2 ratio) of the Cortex-A7 core.

**Debug Clocks:** The APB debug interface is designed to run at quarter the speed (1:4 ratio) of the Cortex-A7 core.

### 4.1.4 Platform Configuration

The revision and configuration of components the Cortex-A7 MPCore platform are detailed below.

**Table 4-2. Component Revision**

Component	Revision
Cortex-A7 MPCore	MP020-MS-28610-r0p5-00rel0
ETM-A7	TM956-MS-28610-r0p0-00rel0

**Table 4-3. Cortex-A7 MPCore Global Configuration**

Option	Selected Value	Comments
Instruction cache size	32 KB	L1 instruction cache size per core
Data cache size	32 KB	L1 data cache size per core
L2 cache controller	Present	Integrated L2 cache controller
L2 data RAM cycle latency	3 cycles	
Shared Peripheral Interrupts	128	128 shared peripheral interrupts
Number of processors	2	Dual Cortex-A7 MPCore
Integrated GIC	True	GIC included

**Table 4-4. Cortex-A7 Core-Level Configuration**

Option	Selected Value	Comments
NEON and/or FPU	FPU and NEON	FPU and NEON are both included in each processor

## 4.1.5 Low-Power and Performance

This section will discuss the low-power and performance features of the Cortex-A7 Core Platform.

The Cortex-A7 MPCore includes the following low-power features:

- Power-efficient processing provided by Cortex-A7 CPU
- 28nm LP process technology
- Flexible power domain partitioning with separate domains for the following blocks:
  - CPU0 and respective L1 caches
  - CPU1 and respective L1 caches
  - SCU and L2 cache controller
  - L2 cache memory
  - Debug including ETM
- Power-efficient timer events using combination of local generic timers and the global system counter

## 4.2 ARM Cortex M4 Platform (CM4)

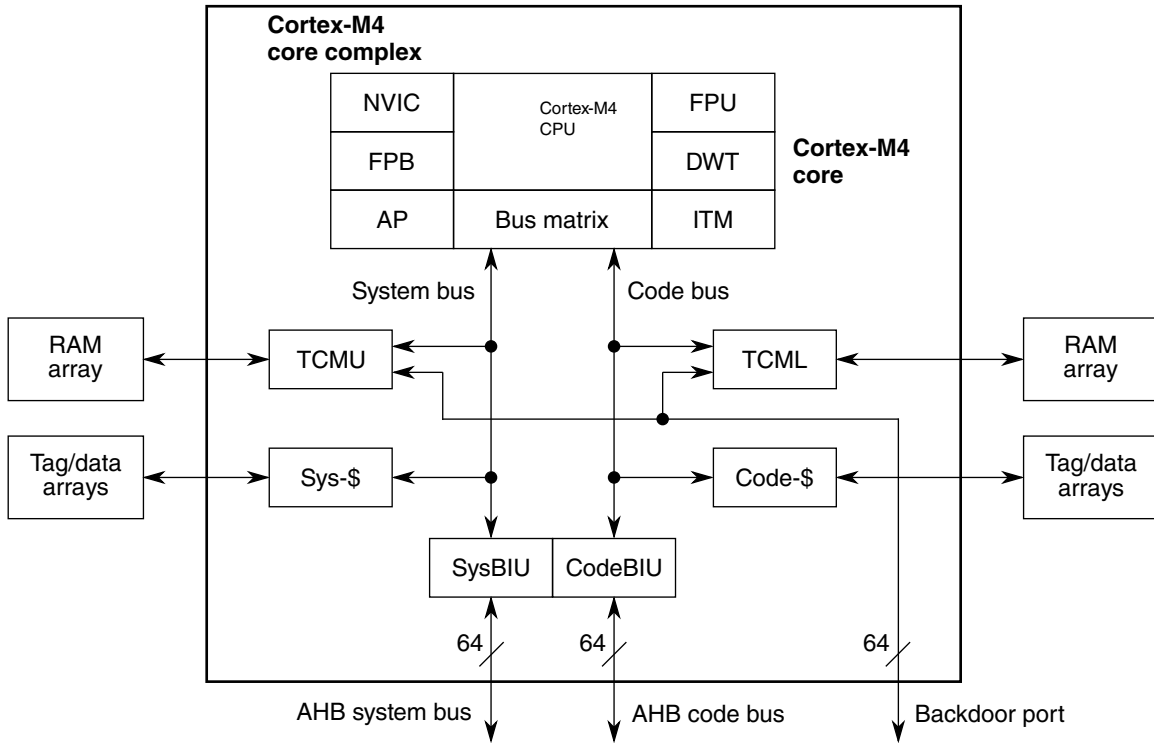

### 4.2.1 Overview

This block details the ARM Cortex-M4 core. The Cortex-M4 implements the ARMv7-ME instruction set architecture (ISA). It provides compatibility with Cortex-M3 and adds significant new capabilities with DSP and SIMD extensions. The basic multiply-accumulate instructions support operations up to  $32 \times 32 + 64$ . Cortex-M4 also includes a single-precision floating-point unit (FPU), which includes an extension register file of thirty-two 32-bit floating-point data registers. Cortex-M4 complex includes the FPU and two 32-bit system bus interfaces. The Cortex-M4 implementation includes two tightly-coupled local memories and two cache memories connected to these bus interfaces although the device implementation connects to the 64-bit system bus interconnect and supports a 32-byte cache line size.

- L1 2-way set-associative 16 KB Instruction/Data cache with 32B line size length

The ARM Cortex-M4 core provides additional general processing capability to the SoC with lower power and fast interrupt response time. The typical use cases for the Cortex-M4 include automotive applications and systems interfaced with CAN that must be able to meet the CAN wakeup requirement, which would otherwise be difficult for the Cortex-A7 to do while running a complex OS.

### 4.2.1.1 Cortex-M4 Block Diagram

**Figure 4-1. Cortex-M4 Block Diagram**

Cortex-M4 core features a single issue, three stage pipeline microarchitecture. A high-level spatial pipeline block diagram of the CPU is shown below. The stages of the pipeline include:

- Fe - Instruction fetch stage where data is returned from instruction memory
- De - Instruction decode stage, generation of Load/Store Unit (LSU) address using forwarded register ports and immediate offset of LR register branch forwarding
- Ex - Instruction execute stage, single pipeline with multi-cycle stalls, LSU address/data pipelining to AHB interface, multiply/divide and ALU with branch result

Figure 4-2. Cortex-M4 Pipeline Block Diagram

## 4.2.2 Cortex-M4 Platform Features

### 4.2.2.1 Core Module Features

The following are the Cortex-M4 core module features:

- Cortex M4 Core
  - 3-stage pipelined processor supporting ARM v7-M ISA with DSP extensions
  - Single precision FPU supporting the variant of the ARMv7-M Floating-Point Extension (FPv4-SP)
  - MPU - Memory Protection Unit supporting up to 8 regions
  - Modified Harvard connections to AHB\_LMEM and the crossbar switch
  - NVIC - Nested Vectored Interrupt Controller with 128 interrupt connections and 16 levels
- AHB LMEM
  - TCMC - Tightly Coupled Memory Controller with support for 64 Kbyte RAM
  - Two 16 KB of combined data/instructions caches to minimize the performance impact of memory access latencies. One for the system bus and one for I/D bus.

### 4.2.2.2 Network Interconnect Features

The CoreLink Network Interconnect (PL301) is a 2nd generation highly configurable IP component. The PL301 in the core platform has 2 master and 1 slave bus connections.

- Network Interconnect (PL301)
  - 2 on-platform masters, 64-bit AHB interfaces
  - 1 off-platform slave, 64-bit AXI interface

### 4.2.3 Cortex-M4 Instruction Fetches on the System Bus

The Cortex-M4 processors implement multiple 32-bit bus interfaces that support a Harvard memory architecture. Specifically, the cores provide a modified Harvard connection with 2-cycle pipelined AMBA-AHB code and system buses. The modified Harvard memory architecture results since the bus interfaces are activated by address range and include both instruction fetches and operand data references on a given bus port. A traditional Harvard architecture separates instruction fetches and operand data references onto specific bus ports regardless of access address.

The code bus is typically used for instruction fetching and data accesses of PC-relative data, while the system bus is typically used for operand data references to the on- and off-chip memories and peripheral accesses. This bus structure fully supports concurrent instruction fetch and data accesses, but the Cortex-M4 implementations can generate both types of references on each bus. Additionally, there is a separate 32-bit Private Peripheral Bus (PPB) connection to several important modules (for example, the Nested Vectored Interrupt Controller) accessible to only the core. By placing the various code and data sections in the appropriate locations within the memory map, overall system performance can be maximized.

To provide a “clean timing interface” on the core's system bus, instruction and vector fetch requests to this bus are registered. This increases fetch time by an additional cycle of latency because instructions fetched from the system bus take a minimum of two cycles. This also means that back-to-back instruction fetches from the system bus are not possible.

Instruction fetch requests to the code bus are not registered. It is recommended that performance critical code be located such that it fetches from the ICode bus interface as defined by addresses  $< 0x2000\_0000$  (the system bus interface includes the addresses  $\geq 0x2000\_0000$  and  $< 0xE000\_0000$  and the Private Peripheral Bus is used for addresses  $\geq 0xE000\_0000$ ).

**NOTE**

In the device, the memory map includes aliased address spaces that are mapped into the ICode region for code sections that reside in the system address space. As a simple example, the DDR address space is located in the system region of the memory map, but a subset of this space is aliased so that it appears in the ICode region that instructions mapped into the DDR space can be executed as maximum performance.

**4.2.4 Major Platform Bus Interfaces**

- The platform supports the AMBA AHB and AXI bus protocol.
  - HBSTRB is the only v6 extension that is supported
  - HRESP[1] (SPLIT/RETRY) is not supported.
  - HTRANS[1:0] = 2b01 (BUSY) is not supported
  - HBURST - The platform and its memory controllers support the full range of AHB burst sizes
  - M0, M1 are 64-bit AHB-lite master bus interfaces, S1 is 64-bit AXI slave bus interface
  - Support AXI standard exclusive access on system bus address (above 0x2000\_0000). In MX7ULT1, only a small region of MMDC support it.

**4.2.5 Cortex-M4 Boot Requirements**

- Cortex-A7 always boots as the primary core.
- Cortex-M4 does not have a boot ROM and at POR is not provided a clock
- Cortex-A7 user code is responsible for the following:
  - Loading and authenticating Cortex-M4 firmware by HAB API or with Cortex-A7 firmware together as a unified image by boot ROM.
  - Launching the Cortex-M4 by enabling its clock and clearing its reset bit in SRC (See System Reset Controller Chapter for more details).

## 4.2.6 Clocks and Resets

The platform inputs several reset signals. The following table describes the use of each reset.

**Table 4-5. Platform Reset Descriptions**

Reset Name	Description
ipg_core_async_reset_b	asynchronous reset for CORTEX-M4
ipg_hard_async_reset_b	asynchronous system reset for platform modules
ipg_hard_async_po_reset_b	asynchronous power-on reset used in CM4 Core
debug_reset_b	debug reset

The platform inputs several clocks. The following table describes each clock input:

**Table 4-6. Platform Clock Descriptions**

Clock Input Name	Description
dap_clk	DAP Bus Clock
tcmc_hclk	TCMC Clock
cm4_cti_clk	CTI Clock
cm4_hclk	Gated CPU Clock. Platform output "cm4_gate_hclk" can be used as the enable signal.
cm4_fclk	Free-running CPU Clock
ipg_clk_nic	Gated PL301 Clock

The platform clocks, cm4\_fclk, cm4\_hclk, tcmc\_hclk and ipg\_clk\_nic must be equal in frequency and phase.

## 4.2.7 Debug Configuration

The following table presents a brief description of each one of the debug components.

**Table 4-7. Debug Components Description**

Module	Description
AHB-AP	AHB Master Interface from JTAG to debug module and SOC system memory maps
ROM Table	Identifies which debug IP is available.
Core Debug	Singlestep, Register Access, Run, Core Status
CoreSight ATB Funnel	The Funnel combines multiple trace streams onto a single ATB bus.

*Table continues on the next page...*

**Table 4-7. Debug Components Description (continued)**

Module	Description
CoreSight ATB Upsizer	The ATB upsizer converts the ATB bus from 8-bit to 32-bit or from 32-bit to 64-bit.
CoreSight ATB Async Bridge	The ATB asynchronous bridge is the interface to different trace clock domain.
CoreSight CTI	Cross trigger interface to M4
ETM (Embedded Trace Macrocell)	ETMv3.5 Architecture
ITM	S/W Instrumentation Messaging + Simple Data Trace Messaging + Watchpoint Messaging
DWT (Data and Address Watchpoints)	4 data and address watchpoints
FPB (Flash Patch and Breakpoints)	<p>The FPB implements hardware breakpoints and patches code and data from code space to system space.</p> <p>The FPB unit contains two literal comparators for matching against literal loads from Code space, and remapping to a corresponding area in System space.</p> <p>The FPB also contains six instruction comparators for matching against instruction fetches from Code space, and remapping to a corresponding area in System space. Alternatively, the six instruction comparators can individually configure the comparators to return a Breakpoint Instruction (BKPT) to the processor core on a match, so providing hardware breakpoint capability.</p>
MCM (Miscellaneous Control Module)	The MCM provides miscellaneous control functions.

## 4.2.8 Platform JTAG Requirements

The Miscellaneous Debug Module (MDM) contains the DAP (Debug Access Port) status, control and ID registers as well as the DAP mux. Access to these DAP registers is through the SWJ-DP. The read-only DAP status register is located at  $DAPADDR[31:0] = 32'h0100_0000$ , while the DAP control register is located at  $DAPADDR = 32'h0100_0004$ . The IDR is located at  $DAPADDR = 32'h0100_00FC$ .

The platform's 32-bit *dap\_status[31:1]* input vector is registered in the MDM. Bit 0 is reserved for platform itself.

The *mdm\_ap\_control[31:0]* platform output vector controls SoC-defined functions. The *mdm\_ap\_control[0]* is reserved for platform itself.

The IDR is a read-only register with a value of  $32'h001C_0000$ .

## 4.2.9 Local Memory Controller (LMEM)

The Local Memory Controller provides the ARM®Cortex-M4™ processor with tightly-coupled processor-local memories and bus paths to all slave memory spaces.

### 4.2.9.1 LMEM Block Diagram

The Cortex-M4 processor has a modified 32-bit Harvard bus architecture. Using a 32-bit address space, low-order addresses (0x0000\_0000 through 0x1FFF\_FFFF) use the Processor Code (PC) bus, and high-order addresses (0x2000\_0000 through 0xFFFF\_FFFF) use the Processor System (PS) bus. As the bus names imply, normal operation has code accesses on the PC bus and data accesses on the PS bus.

This device has been augmented with tightly-coupled memories for the PC and PS buses. The memories include RAMs and caches. These local memories provide zero wait state access to RAM and cacheable address spaces.

The local memory controller includes four memory controllers and their attached memories:

- SRAM lower (SRAM\_L) controller via the PC bus
- SRAM upper (SRAM\_U) controller via the PS bus
- Cache memory controller via the PC bus
- Cache memory controller via the PS bus

Figure 4-3. Local memory controller block diagram

**NOTE**

The SRAM and cache controllers reside within the LMEM, but the single-port synchronous RAM arrays used by these controllers are external.

The LMEM contains address decode logic for the PC and PS buses. This logic routes the core's accesses to the various system resources. The address spaces are device-specific and are specified in the device's Chip Configuration chapter.

**4.2.9.2 Cache features**

A cache is a block of high-speed memory locations containing address information (commonly known as a tag) and the associated data. The purpose is to decrease the average time of a memory access. Caches operate on two principles of locality:

- Spatial locality — An access to one location is likely to be followed by accesses from adjacent locations (for example, sequential instruction execution or usage of a data structure).
- Temporal locality — An access to an area of memory is likely to be repeated within a short time period (for example, execution of a code loop).

To minimize the quantity of control information stored, the spatial locality property is used to group several locations together under the same tag. This logical block is commonly known as a cache line.

When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a cache hit, and other accesses are called cache misses.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the processor wants to access a cacheable location, the cache is checked. If the access is a cache hit, the access occurs immediately. Otherwise, a location is allocated and the cache line is loaded from memory. Different cache topologies and access policies are possible. However, they must comply with the memory coherency model of the underlying architecture.

Caches introduce a number of potential problems, mainly because of:

- memory accesses occurring at times other than when the programmer would normally expect them,
- the existence of multiple physical locations where a data item can be held.

The local memory controller supports three modes of operation:

1. Write-through — access to address spaces with this cache mode are cacheable.
  - A read miss on the input bus causes a line read on the output bus of a 32-byte-aligned memory address containing the desired address. This miss data is loaded into the cache and is marked as valid and not modified.
  - A write-through read hit to a valid cache location returns data from the cache with no output bus access.
  - A write-through write miss bypasses the cache and writes to the output bus (no allocate on write miss policy for write-through mode spaces).
  - A write-through write hit updates the cache hit data and writes to the output bus.
2. Write-back — access to address spaces with this cache mode are cacheable.
  - A write-back read miss on the input bus will cause a line read on the output bus of a 32-byte-aligned memory address containing the desired address. This miss data is loaded into the cache and marked as valid and not modified.
  - A write-back read hit to a valid cache location will return data from the cache with no output bus access.
  - A write-back write miss will do a "read-to-write" (allocate on write miss policy for write-back mode spaces). A line read on the output bus of a 16 byte aligned memory address containing the desired write address is performed. This miss data is loaded into the cache and marked as valid and modified; and the write data will then update the appropriate cache data locations.

3. Non-cacheable — access to address spaces with this cache mode are not cacheable. These accesses bypass the cache and access the output bus.

### 4.2.9.3 LMEM Function

The LMEM receives the following requests:

- Core master bus requests on the Processor Code (PC) bus,
- Core master bus requests on the Processor Space (PS) bus, and
- SRAM controller requests from all other bus masters on the backdoor port.

The LMEM address decode logic routes these accesses and also provides any crossbar switch slave target logic. Finally, the Local Memory controller provides the needed MPU connections for checking all SRAM controller and cacheable accesses.

The programming model for the Code and System Caches is accessed via the core's Private Peripheral Bus (PPB).

#### 4.2.9.3.1 Processor Code accesses

Processor Code accesses are routed to the SRAM\_L if they are mapped to that space. All other PC accesses are routed to the Code Cache Memory Controller. This controller then processes the cacheable accesses as needed, while bypassing the non-cacheable, cache write-through, cache miss, and cache maintenance accesses to the CCM bus and the crossbar switch using the Master0 port.

#### 4.2.9.3.2 Processor Space accesses

Processor Space accesses are routed to the SRAM\_U if they are mapped to that space. All other PS accesses are routed to the PS Cache Memory Controller. This controller then processes the cacheable accesses as needed, while bypassing the non-cacheable, cache write-through, cache miss, and cache maintenance accesses to the CCM bus and the crossbar switch using the Master1 port.

#### 4.2.9.3.3 Backdoor port accesses

All LMEM backdoor port accesses are for the SRAM controller. These accesses go to the SRAM\_L or the SRAM\_U depending on their specific address.

#### 4.2.9.3.4 SRAM Function

#### 4.2.9.3.4.1 SRAM Configuration

The figure below shows how the SRAM controller is configured.

Figure 4-4. SRAM Configuration

#### 4.2.9.3.4.2 SRAM Arrays

The on-chip SRAM is split into two logical arrays, SRAM\_L and SRAM\_U.

From equal-sized memories, valid address ranges for SRAM\_L and SRAM\_U are then defined as:

- $SRAM\_L = 0x1FFF\_8000 - (0x1FFF\_8000 + SRAM\_size/2)$
- $SRAM\_U = 0x2000\_0000 - (0x2000\_0000 + SRAM\_size/2)$

#### 4.2.9.3.4.3 SRAM accesses

The SRAM is split into two logical arrays that are 64-bits wide:

- **SRAM\_L** — Accessible by the code bus of the Cortex-M4 core and by the backdoor port.
- **SRAM\_U** — Accessible by the system bus of the Cortex-M4 core and by the backdoor port.

The backdoor port makes the SRAM accessible to the non-core bus masters (such as DMA).

The figure below illustrates the SRAM accesses within the device.

**Figure 4-5. SRAM access diagram**

The following simultaneous accesses can be made to different logical halves of the SRAM:

- Core code and core system
- Core code and non-core master
- Core system and non-core master

#### **NOTE**

Two non-core masters cannot access SRAM simultaneously. The required arbitration and serialization is provided by the crossbar switch. The SRAM\_{L,U} arbitration is controlled by the SRAM controller based on the configuration bits in the MCM module.

#### **4.2.9.3.5 Cache Function**

The caches on this device are structured as follows. Both caches have a 2-way set-associative cache structure with a total size of 32 KBytes. The caches have a 32-bit address, 64-bit data paths and a 32-byte line size. The cache tags and data storage use single-port, synchronous RAMs.

For these 16-KByte caches, each cache TAG function uses two 256 x 22-bit RAM arrays and the cache DATA function uses two 1024 x 32-bit RAM arrays. The cache TAG entries store 20 bits of upper address as well as a modified and valid bit per cache line. The cache DATA entries store eight bytes of code or data.

All normal cache accesses use physical addresses. This leads to the following cache address use:

CACHE - 16 KByte size = (256 sets) x (32-byte lines) x (2-way set associative)

TAG:

- Only address[31:29] and [21:13] are implemented. All other bits are tied to zero. Only the memories below are supported:
  - address[31] - DDR space, first 2M (0x8000\_0000 - 0x801F\_FFFF)
  - address[30:29] - QSPI channel A, first 2M (0x6000\_0000 - 0x601F\_FFFF)
  - address[30:29]+[21] - QSPI channel A, second 2M (0x6020\_0000 - 603F\_FFFF)
  - address[29]+[21] - OCRAM (0x2020\_0000 - 0x203F\_FFFF)

### NOTE

To use cache, user needs to configure MPU to set those memories as cacheable and all the other memories set as non-cacheable.

DATA

- address[31:13] not used
- address[12:5] used to select one of 256 sets
- address[4:2] used to select one of eight 32-bit words within a set
- address[1:0] used to select the byte within the 32-bit word

#### 4.2.9.3.6 Cache Control

The Code and System Caches are disabled at reset. Cache tag and data arrays are not cleared at reset. Therefore, to enable the caches, cache commands must be done to clear and initialize the required tag array bits and to configure and enable the caches.

##### 4.2.9.3.6.1 Cache set commands

The cache set commands may operate on:

- all of way 0,
- all of way 1, or
- all of both ways (complete cache).

Cache set commands are initiated using the upper bits in the CCR register. Cache set commands perform their operation on the cache independent of the cache enable bit, CCR[ENCACHE].

A cache set command is initiated by setting the CCR[GO] bit. This bit also acts as a busy bit for set commands. It stays set while the command is active and is cleared by the hardware when the set command completes.

Supported cache set commands are given in the table below. Set commands work as follows:

- Invalidate – Unconditionally clear valid and modify bits of a cache entry.
- Push – Push a cache entry if it is valid and modified, then clear the modify bit. If entry not valid or not modified, leave as is.
- Clear – Push a cache entry if it is valid and modified, then clear the valid and modify bits. If entry not valid or not modified, clear the valid bit.

**Table 4-8. Cache Set Commands**

CCR[27:24]				Command
PUSH W1	INVW1	PUSH W0	INVW0	
0	0	0	0	NOP
0	0	0	1	Invalidate all way 0
0	0	1	0	Push all way 0
0	0	1	1	Clear all way 0
0	1	0	0	Invalidate all way 1
0	1	0	1	Invalidate all way 1; invalidate all way 0 (invalidate cache)
0	1	1	0	Invalidate all way 1; push all way 0
0	1	1	1	Invalidate all way 1; clear all way 0
1	0	0	0	Push all way 1
1	0	0	1	Push all way 1; invalidate all way 0
1	0	1	0	Push all way 1; push all way 0 (push cache)
1	0	1	1	Push all way 1; clear all way 0
1	1	0	0	Clear all way 1
1	1	0	1	Clear all way 1; invalidate all way 0
1	1	1	0	Clear all way 1; push all way 0
1	1	1	1	Clear all way 1; clear all way 0 (clear cache)

After a reset, complete an invalidate cache command before using the cache. It is possible to combine the cache invalidate command with the cache enable. That is, setting CCR to 0x8500\_0003 will invalidate the cache and enable the cache and write buffer.

#### 4.2.9.3.6.2 Cache line commands

Cache line commands operate on a single line in the cache at a time. Cache line commands can be performed using a physical or cache address.

- A cache address consists of a set address and a way select. The line command acts on the specified cache line.
- Cache line commands with physical addresses first search both ways of the cache set specified by bits [11:4] of the physical address. If they hit, the commands perform their action on the hit way.

Cache line commands are specified using the upper bits in the CLCR register. Cache line commands perform their operation on the cache independent of the cache enable bit (CCR[ENCACHE]). Using a cache address, the command can be completely specified using the CLCR register. Using a physical address, the command must also use the CSAR register to specify the physical address.

A line cache command is initiated by setting the line command go bit (CLCR[LGO] or CSAR[LGO]). This bit also acts as a busy bit for line commands. It stays set while the command is active and is cleared by the hardware when the command completes.

The CLCR[27:24] bits select the line command as follows:

**Table 4-9. Cache Line Commands**

CLCR[27:24]			Command
LACC	LADSEL	LCMD	
0	0	00	Search by cache address and way
0	0	01	Invalidate by cache address and way
0	0	10	Push by cache address and way
0	0	11	Clear by cache address and way
0	1	00	Search by physical address
0	1	01	Invalidate by physical address
0	1	10	Push by physical address
0	1	11	Clear by physical address
1	0	00	Write by cache address and way
1	0	01	Reserved, NOP
1	0	10	Reserved, NOP
1	0	11	Reserved, NOP
1	1	xx	Reserved, NOP

#### 4.2.9.3.6.2.1 Executing a series of line commands using cache addresses

A series of line commands with incremental cache addresses can be performed by just writing to the CLCR.

- Place the command in CLCR[27:24],
- Set the way (CLCR[WSEL]) and tag/data (CLCR[TDSEL]) controls as needed,

- Place the cache address in CLCR[CACHEADDR], and
- Set the line command go bit (CLCR[LGO]).

When one line command completes, initiate the next command by following these steps:

- Increment the cache address (at bit 2 to step through data or at bit 4 to step through lines), and
- Set the line command go bit (CLCR[LGO]).

#### 4.2.9.3.6.2.2 Executing a series of line commands using physical addresses

Perform a series of line commands with incremental physical addresses using the following steps:

- Write to the CLCR.
  - Place the command in CLCR[27:24]
  - Set the tag/data (CLCR[TDSEL]) control
- Place the physical address in CSAR[PHYADDR] and set the line command go bit (CSAR[LGO]).

When one line command completes, initiate the next command by following these steps:

- Increment the physical address (at bit 2 to step through data or at bit 4 to step through lines), and
- Set the line command go bit (CSAR[LGO]).

The line command go bit is shared between the CLCR and CSAR registers, so that the above steps can be completed in a single write to the CSAR register.

#### 4.2.9.3.6.2.3 Line command results

At completion of a line command, the CLCR register contains information on the initial state of the line targeted by the command. For line commands with cache addresses, this information is read before the line command action is performed from the targeted cache line. For line commands with physical addresses, this information is read on a hit before the line command action is performed from the hit cache line or has initial valid bit cleared if the command misses. In general, if the valid indicator (CLCR[LCIVB]) is cleared, the targeted line was invalid at the start of the line command and no line operation was performed.

**Table 4-10. Line command results**

CLCR[22:20]			For cache address commands	For physical address commands
LCWAY	LCIMB	LCIVB		
0	0	0	Way 0 line was invalid	No hit
0	0	1	Way 0 valid, not modified	Way 0 valid, not modified
0	1	0	Way 0 line was invalid	No hit
0	1	1	Way 0 valid and modified	Way 0 valid and modified
1	0	0	Way 1 line was invalid	No hit
1	0	1	Way 1 valid, not modified	Way 1 valid, not modified
1	1	0	Way 1 line was invalid	No hit
1	1	1	Way 1 valid and modified	Way 1 valid and modified

At completion of a line command other than a write, the CCVR (Cache R/W Value Register) contains information on the initial state of the line tag or data targeted by the command. For line commands, CLCR[TDSEL] selects between tag and data. If the line command used a physical address and missed, the data is don't care. For write commands, the CCVR holds the write data.

## 4.2.10 Miscellaneous Control Module (MCM)

The Miscellaneous Control Module (MCM) provides a myriad of miscellaneous control functions.

### 4.2.10.1 MCM features

The MCM includes the following features:

- Program-visible information on the platform configuration and revision

### 4.2.10.2 MCM Interrupts

The MCM generates the following interrupt requests:

- Normal interrupt

#### 4.2.10.2.1 Normal interrupt

The MCM's normal interrupt is generated if any of the following is true:

- ISCR[ETBI] is set, when
  - The ETB counter is enabled, ETBCC[*CNTEN*] = 1
  - The ETB count expires
  - The response to counter expiration is a normal interrupt, ETBCC[*RSPT*] = 01

## 4.2.11 LMEM Memory Map/Register Definition

LMEM memory map

Field	Description
31 GO	<p>Initiate Cache Command</p> <p>Setting this bit initiates the cache command indicated by bits 27-24. Reading this bit indicates if a command is active</p> <p><b>NOTE:</b> This bit stays set until the command completes. Writing zero has no effect.</p> <p>0 Write: no effect. Read: no cache command active. 1 Write: initiate command indicated by bits 27-24. Read: cache command active.</p>
30–28 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
27 PUSHW1	<p>Push Way 1</p> <p>0 No operation 1 When setting the GO bit, push all modified lines in way 1</p>
26 INVW1	<p>Invalidate Way 1</p> <p><b>NOTE:</b> If the PUSHW1 and INVW1 bits are set, then after setting the GO bit, push all modified lines in way 1 and invalidate all lines in way 1 (clear way 1).</p> <p>0 No operation 1 When setting the GO bit, invalidate all lines in way 1</p>
25 PUSHW0	<p>Push Way 0</p> <p>0 No operation 1 When setting the GO bit, push all modified lines in way 0</p>
24 INVW0	<p>Invalidate Way 0</p> <p><b>NOTE:</b> If the PUSHW0 and INVW0 bits are set, then after setting the GO bit, push all modified lines in way 0 and invalidate all lines in way 0 (clear way 0).</p> <p>0 No operation 1 When setting the GO bit, invalidate all lines in way 0.</p>
23–4 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
3 PCCR3	Forces no allocation on cache misses (must also have ACCR2 asserted)
2 PCCR2	Forces all cacheable spaces to write through
1 ENWRBUF	<p>Enable Write Buffer</p> <p>0 Write buffer disabled 1 Write buffer enabled</p>
0 ENCACHE	<p>Cache enable</p> <p>0 Cache disabled 1 Cache enabled</p>

### 4.2.11.2 Cache line control register (LMEM\_PCCLCR)

This register defines specific line-sized cache operations to be performed using a specific cache line address or a physical address.

If a physical address is specified, both ways of the cache are searched, and the command is only performed on the way which hits.

Address: E008\_2000h base + 4h offset = E008\_2004h

**LMEM\_PCCLCR field descriptions**

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 LACC	Line access type 0 Read 1 Write
26 LADSEL	Line Address Select When using the cache address, the way must also be specified in CLCR[WSEL].

*Table continues on the next page...*

## LMEM\_PCCLCR field descriptions (continued)

Field	Description
	When using the physical address, both ways are searched and the command is performed only if a hit. 0 Cache address 1 Physical address
25–24 LCMD	Line Command 00 Search and read or write 01 Invalidate 10 Push 11 Clear
23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 LCWAY	Line Command Way Indicates the way used by the line command.
21 LCIMB	Line Command Initial Modified Bit If command used cache address and way, then this bit shows the initial state of the modified bit If command used physical address and a hit, then this bit shows the initial state of the modified bit. If a miss, this bit reads zero.
20 LCIVB	Line Command Initial Valid Bit If command used cache address and way, then this bit shows the initial state of the valid bit If command used physical address and a hit, then this bit shows the initial state of the valid bit. If a miss, this bit reads zero.
19–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 TDSEL	Tag/Data Select Selects tag or data for search and read or write commands. 0 Data 1 Tag
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 WSEL	Way select Selects the way for line commands. 0 Way 0 1 Way 1
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–2 CACHEADDR	Cache address CLCR[11:4] bits are used to access the tag arrays CLCR[11:2] bits are used to access the data arrays
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**LMEM\_PCCLCR field descriptions (continued)**

Field	Description
0 LGO	<p>Initiate Cache Line Command</p> <p>Setting this bit initiates the cache line command indicated by bits 27-24. Reading this bit indicates if a line command is active</p> <p><b>NOTE:</b> This bit stays set until the command completes. Writing zero has no effect.</p> <p><b>NOTE:</b> This bit is shared with CSAR[LGO]</p> <p>0 Write: no effect. Read: no line command active. 1 Write: initiate line command indicated by bits 27-24. Read: line command active.</p>

**4.2.11.3 Cache search address register (LMEM\_PCCSAR)**

The CSAR register is used to define the explicit cache address or the physical address for line-sized commands specified in the CLCR[LADSEL] bit.

Address: E008\_2000h base + 8h offset = E008\_2008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

*Table continues on the next page...*

**LMEM\_PCCSAR field descriptions (continued)**

Field	Description
0	Write: no effect. Read: no line command active.
1	Write: initiate line command indicated by bits CLCR[27:24]. Read: line command active.

**4.2.11.4 Cache read/write value register (LMEM\_PCCCVR)**

The CCVR register is used to source write data or return read data for the commands specified in the CLCR register.

Address: E008\_2000h base + Ch offset = E008\_200Ch

**LMEM\_PCCCVR field descriptions**

Field	Description
DATA	<p>Cache read/write Data</p> <p>For tag search, read or write:</p> <ul style="list-style-type: none"> <li>• CCVR[31:12] bits are used for tag array R/W value</li> <li>• CCVR[11:4] bits are used for tag set address on reads; unused on writes</li> <li>• CCVR[3:2] bits are reserved</li> </ul> <p>For data search, read or write:</p> <ul style="list-style-type: none"> <li>• CCVR[31:0] bits are used for data array R/W value</li> </ul>

### 4.2.11.5 Cache control register (LMEM\_PSCCR)

Address: E008\_2000h base + 800h offset = E008\_2800h

#### LMEM\_PSCCR field descriptions

Field	Description
31 GO	Initiate Cache Command  Setting this bit initiates the cache command indicated by bits 27-24. Reading this bit indicates if a command is active  <b>NOTE:</b> This bit stays set until the command completes. Writing zero has no effect.  0 Write: no effect. Read: no cache command active. 1 Write: initiate command indicated by bits 27-24. Read: cache command active.
30–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 PUSHW1	Push Way 1  0 No operation 1 When setting the GO bit, push all modified lines in way 1
26 INWV1	Invalidate Way 1  <b>NOTE:</b> If the PUSHW1 and INWV1 bits are set, then after setting the GO bit, push all modified lines in way 1 and invalidate all lines in way 1 (clear way 1).  0 No operation 1 When setting the GO bit, invalidate all lines in way 1
25 PUSHW0	Push Way 0  0 No operation 1 When setting the GO bit, push all modified lines in way 0
24 INWV0	Invalidate Way 0

Table continues on the next page...

**LMEM\_PSCCR field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> If the PUSHW0 and INVW0 bits are set, then after setting the GO bit, push all modified lines in way 0 and invalidate all lines in way 0 (clear way 0).</p> <p>0 No operation 1 When setting the GO bit, invalidate all lines in way 0.</p>
23–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 ENWRBUF	Enable Write Buffer 0 Write buffer disabled 1 Write buffer enabled
0 ENCACHE	Cache enable 0 Cache disabled 1 Cache enabled

**4.2.11.6 Cache line control register (LMEM\_PSCLCR)**

This register defines specific line-sized cache operations to be performed using a specific cache line address or a physical address.

If a physical address is specified, both ways of the cache are searched, and the command is only performed on the way which hits.

Address: E008\_2000h base + 804h offset = E008\_2804h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	0				LACC	LADSEL	LCMD			0	LCWAY	LCIMB	LCIVB	0			TDSEL
W	0				0	0	0			0	0	0	0	0			0
Reset	0	0	0	0	0	0	0			0	0	0	0	0			0

**LMEM\_PSCLCR field descriptions**

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 LACC	Line access type 0 Read 1 Write
26 LADSEL	Line Address Select When using the cache address, the way must also be specified in CLCR[WSEL]. When using the physical address, both ways are searched and the command is performed only if a hit. 0 Cache address 1 Physical address
25–24 LCMD	Line Command 00 Search and read or write 01 Invalidate 10 Push 11 Clear
23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 LCWAY	Line Command Way Indicates the way used by the line command.
21 LCIMB	Line Command Initial Modified Bit If command used cache address and way, then this bit shows the initial state of the modified bit If command used physical address and a hit, then this bit shows the initial state of the modified bit. If a miss, this bit reads zero.
20 LCIVB	Line Command Initial Valid Bit If command used cache address and way, then this bit shows the initial state of the valid bit If command used physical address and a hit, then this bit shows the initial state of the valid bit. If a miss, this bit reads zero.
19–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

## LMEM\_PSCLCR field descriptions (continued)

Field	Description
16 TDSEL	Tag/Data Select Selects tag or data for search and read or write commands. 0 Data 1 Tag
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 WSEL	Way select Selects the way for line commands. 0 Way 0 1 Way 1
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–2 CACHEADDR	Cache address CLCR[11:4] bits are used to access the tag arrays CLCR[11:2] bits are used to access the data arrays
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
0 LGO	Initiate Cache Line Command Setting this bit initiates the cache line command indicated by bits 27-24. Reading this bit indicates if a line command is active <b>NOTE:</b> This bit stays set until the command completes. Writing zero has no effect. <b>NOTE:</b> This bit is shared with CSAR[LGO] 0 Write: no effect. Read: no line command active. 1 Write: initiate line command indicated by bits 27-24. Read: line command active.

### 4.2.11.7 Cache search address register (LMEM\_PSCSAR)

The CSAR register is used to define the explicit cache address or the physical address for line-sized commands specified in the CLCR[LADSEL] bit.

Address: E008\_2000h base + 808h offset = E008\_2808h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	PHYADDR																
W	PHYADDR

### 4.2.12.1 Crossbar Switch (AXBS) Slave Configuration (MCM\_PLASC)

PLASC is a 16-bit read-only register identifying the presence/absence of bus slave connections to the device's crossbar switch.

Address: E008\_0000h base + 8h offset = E008\_0008h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Read	0								ASC								
Write																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

#### MCM\_PLASC field descriptions

Field	Description
15–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
ASC	Each bit in the ASC field indicates whether there is a corresponding connection to the crossbar switch's slave input port.  0 A bus slave connection to AXBS input port <i>n</i> is absent 1 A bus slave connection to AXBS input port <i>n</i> is present

### 4.2.12.2 Crossbar Switch (AXBS) Master Configuration (MCM\_PLAMC)

PLAMC is a 16-bit read-only register identifying the presence/absence of bus master connections to the device's crossbar switch.

Address: E008\_0000h base + Ah offset = E008\_000Ah

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Read	0								AMC								
Write																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

#### MCM\_PLAMC field descriptions

Field	Description
15–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

## MCM\_PLAMC field descriptions (continued)

Field	Description
AMC	Each bit in the AMC field indicates whether there is a corresponding connection to the AXBS master input port. 0 A bus master connection to AXBS input port <i>n</i> is absent 1 A bus master connection to AXBS input port <i>n</i> is present

## 4.2.12.3 Crossbar Switch (AXBS) Control Register (MCM\_PLACR)

The PLACR register selects the arbitration policy for the crossbar masters.

Address: E008\_0000h base + Ch offset = E008\_000Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																Reserved															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

## MCM\_PLACR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
Reserved	This field is reserved.

## 4.2.12.4 Fault address register (MCM\_FADR)

When a properly-enabled cache write buffer error interrupt event is detected, the faulting address is captured in the MCM\_FADR register. The MCM logic supports capturing a single cache write buffer bus error event; if a subsequent error is detected before the captured error information has been read from the corresponding registers and the MCM\_ISCR[CWBER] indicator cleared, the MCM\_FATR[BEOVR] flag is set. However, no additional information is captured.

The bits in this register are set by hardware and signaled by the assertion of MCM\_ISCR[CWBER]. Attempted writes to this location are terminated with an error.

## ARM Cortex M4 Platform (CM4)

Address: E008\_0000h base + 20h offset = E008\_0020h

- \* Notes:
- x = Undefined at reset.

### MCM\_FADR field descriptions

Field	Description
ADDRESS	Fault address

## 4.2.12.5 Fault attributes register (MCM\_FATR)

When a properly-enabled cache write buffer error interrupt event is detected, the faulting attributes are captured in the MCM\_FATR register.

The bits in this register are set by hardware and signaled by the assertion of MCM\_ISCR[CWBER]. Attempted writes to this location are terminated with an error.

Address: E008\_0000h base + 24h offset = E008\_0024h

- \* Notes:
- x = Undefined at reset.

### MCM\_FATR field descriptions

Field	Description
31 BEOVR	<p>Bus error overrun</p> <p>Indicates if another cache write buffer bus error is detected before system software has retrieved all the error information from the original event, this overrun flag is set. The window of time is defined from the detection of the original cache write buffer error termination until the MCM_ISCR[CWBER] is written with a 1 to clear it and rearm the capture logic. This bit is set by the hardware and cleared whenever software writes a 1 to the CWBER bit.</p> <p>0 No bus error overrun 1 Bus error overrun occurred. The FADR and FDR registers and the other FATR bits are not updated to reflect this new bus error.</p>
30–12 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
11–8 BEMN	<p>Bus error master number</p> <p>Crossbar switch bus master number of the captured cache write buffer bus error. For this device, this value is always 0x1.</p>
7 BEWT	<p>Bus error write</p> <p>Indicates the type of system bus access when the error was detected. Since this logic is monitoring data transfers from the cache write buffer, this bit is always a logical one, signaling a write operation.</p> <p>0 Read access 1 Write access</p>
6 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
5–4 BESZ	<p>Bus error size</p> <p>Indicates the size of the cache write buffer access when the error was detected.</p> <p>00 8-bit access 01 16-bit access</p>

Table continues on the next page...

**MCM\_FATR field descriptions (continued)**

Field	Description
	10 32-bit access 11 Reserved
3-2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 BEMD	Bus error privilege level  Indicates the privilege level of the cache write buffer access when the error was detected.  0 User mode 1 Supervisor/privileged mode
0 BEDA	Bus error access type  Indicates the type of cache write buffer access when the error was detected. This attribute is always a logical one signaling a data reference.  0 Instruction 1 Data

**4.2.12.6 Fault data register (MCM\_FDR)**

When a properly-enabled cache write buffer error interrupt event is detected, the faulting data is captured in the MCM\_FDR register.

The bits in this register are set by hardware and signaled by the assertion of MCM\_ISCR[CWBER]. For byte and halfword writes, only the accessed byte lanes contain valid data; the contents of the other bytes are undefined. Attempted writes to this location are terminated with an error.

Address: E008\_0000h base + 28h offset = E008\_0028h

- \* Notes:
- x = Undefined at reset.

Field	Description
DATA	Fault data

## 4.3 Messaging Unit (MU)

### 4.3.1 Overview

The Messaging Unit module enables two processors within the SoC to communicate and coordinate by passing messages (e.g. data, status and control) through the MU interface. The MU also provides the ability for one processor to signal the other processor using interrupts.

Because the MU manages the messaging between processors, the MU uses different clocks (from each side of the different peripheral buses). Therefore, the MU must synchronize the accesses from one side to the other. The MU accomplishes synchronization using two sets of matching registers (Processor A-facing, Processor B-facing).

Figure 4-6. MU Block Diagram

#### 4.3.1.1 Features

The MU includes the following features:

- Messaging control by interrupts or by polling

- The Processor B can take the Processor A out of low-power modes by asserting one of the above twelve interrupts to the Processor A and vice versa
- Symmetrical processor interfaces with each side supporting the following:
  - Four general-purpose interrupt requests reflected to the other side
  - Three general-purpose flags reflected to the other side
  - Four receive registers with maskable interrupt
  - Four transmit registers with maskable interrupt

### 4.3.1.2 Modes of Operation

The MU supports the modes described in the indicated sections:

- [Operating Modes](#)
- [Low Power Modes](#)

### 4.3.2 External Signals

There are no Messaging Unit signals directly available at the chip boundary of the SoC.

### 4.3.3 Functional Description

**Table 4-11. Major Features of the MU**

Major Feature	Description
Interprocessor Interrupts	<ul style="list-style-type: none"> <li>• The MU has 12 interrupt sources on each side (Processor A-side, Processor B-side) that are used for signaling the other processor. The interrupts can be used for notification of RX/TX events and general-purpose signaling between the processors.</li> </ul>
MU Reset	<ul style="list-style-type: none"> <li>• The Processor A can issue a reset to the entire MU, using a control bit (MUR) in the Processor A Control Register (ACR).</li> <li>• The MUR bit is a self-clearing bit.</li> </ul>
Processor B Boot Configuration	<ul style="list-style-type: none"> <li>• The Boot Source for Processor B can be configured with the BBOOT bits in the ACR register.</li> <li>• Boot Source Options are:                             <ul style="list-style-type: none"> <li>• DMEM Base Address</li> <li>• IMEM Base Address</li> <li>• Address 0x00</li> </ul> </li> <li>• The value at reset is loaded from Flash IFR</li> </ul>
Processor B Reset Hold	<ul style="list-style-type: none"> <li>• Processor B can be held in reset following any reset event. This is done by setting the BRSTH bit in the ACR register.</li> <li>• Processor B will be released from reset when this bit is cleared.</li> <li>• The value at reset is loaded from Flash IFR.</li> </ul>
Processor A/B Clock Enable	<ul style="list-style-type: none"> <li>• The Processor A/B platform clock can be enabled to continue running when Processor A/B enters Stop Mode, until Processor B/A also enters Stop Mode. This allows Processor B/A to continue accessing peripherals on Processor A/B's AIPS bus even when it has entered a Stop Mode.</li> </ul>

*Table continues on the next page...*

**Table 4-11. Major Features of the MU (continued)**

Major Feature	Description
Status and Control Communications between Cores	<ul style="list-style-type: none"> <li>The MU provides a way for the two cores to communicate using the status and control registers present on both the Processor B and Processor A sides of the MU.</li> <li>The status register of one MU side reflects the status of the other MU side.</li> <li>The control register is used for control operations, such as enabling an interrupt and sending an interrupt to the other processor.</li> </ul>
Synchronized Message Transfers between Cores	<ul style="list-style-type: none"> <li>The transfer of data messages between cores uses transmit empty and receive full flags provided on both sides of the MU.</li> <li>The update of these transmit and receive flags is accomplished using a synchronization mechanism. There is inherent latency between updating the flag on one side and reflecting its status on other side. For more about latency, see <a href="#">Event Update Timing</a></li> </ul>
Accessing Shared Memory Directly and Avoiding Collisions	<ul style="list-style-type: none"> <li>For sending data or messages from one MU-side to the other MU-side, the MU provides 4 transmit registers and 4 receive registers on each side of the MU.</li> <li>The Processor A or Processor B can access shared memory resources of the SoC directly. However, to avoid simultaneous access to shared memory by both cores, the MU provides a method (to prevent simultaneous access) using interrupts and transmit-receive registers for both processors.</li> </ul>
Support for Different Clocks in the Two Cores	<ul style="list-style-type: none"> <li>The heart of the MU module is the event control mechanism, which synchronizes the access of one MU-side to the other MU-side, because these two MU-sides can operate using different clocks.</li> <li>Formulated event update latency.</li> </ul>
Memory-Mapped Registers	<ul style="list-style-type: none"> <li>The MU is connected as a peripheral under the Peripheral bus on both sides—on the Processor A-side, the Processor A Peripheral Bus, and on the Processor B-side, the Processor B Peripheral Bus.</li> </ul>

### 4.3.3.1 Processor A Side Memory-Mapping

The messaging, control, and status registers of the Processor A-side for the MU are mapped to the Processor A memory as a regular peripheral. The Peripheral bus data bus is 32 bits wide inside the MU module.

### 4.3.3.2 Processor B Side Memory-Mapping

The messaging, control, and status registers of the Processor B-side for the MU are mapped to the Processor B memory as a regular peripheral. The Peripheral bus data bus is 32 bits wide inside the MU module.

### 4.3.3.3 MU Messaging

The MU provides 32-bit status and control registers to the Processor B and Processor A sides for control operations (such as interrupts and reset), and for status checking of the other MU-side.

For messaging, the MU has four, 32-bit write-only transmit registers and four, 32-bit read-only receive registers on the Processor B and Processor A-sides. These registers are used for sending messages to each other. These messages can be also be controlled using the 3 general purpose flags provided in the control and status registers of either MU-side.

#### 4.3.3.3.1 Programmer Model

The messaging logic is used in conjunction with external memory. You have various messaging methods, which you can use to implement a messaging protocol. Some of these messages could mean “I have just written a message of N words, starting at offset X in the memory,” or “I have just finished reading the previous data block that was sent.” Having the messaging logic independent from the memory array does not restrict you to a predefined hardware protocol. On the other hand, the software needed to manage the messaging is short and straightforward.

Most of the messaging mechanisms are symmetric; they are duplicated and are available on both the Processor B-side and the Processor A-side. The messaging mechanisms are:

- Four, 32-bit write-only transmit registers, which are each reflected in four, read-only receive registers in the other processor’s side. You can use these registers to transfer 32-bit word messages or frame information of messages written to the shared memory (number of words, initial address, and message type code).
- A write to a transmit register on the transmitter side clears a “transmitter empty” bit in the Status Register on the transmitter side, and sets a “receiver full” bit in the Status Register on the receiver side. The setting of the bit at the receiver side can optionally trigger an interrupt at the receiver side (maskable receive interrupt).
- A read of one of the receive registers at the receiver side clears the “receiver full” bit in the Status Register at the receiver side, and sets the “transmitter empty” bit in the Status Register on the transmitter side. The setting of the “transmitter empty” bit can optionally trigger an interrupt at the transmitter side (maskable transmit interrupt).
- Four general purpose flags are reflected in the Status Register on the receiver side
- A read/write access to any reserved location and a write to a read-only register on the Processor A-side of the MU will generate a module transfer error acknowledge to the Processor A.
- A read/write access to any reserved location and write to a read-only register on the Processor B-side of the MU will generate a module transfer error acknowledge to the Processor B.

### 4.3.3.3.2 Messaging Examples

The following are messaging examples:

- **Passing short messages:** Transmit register(s) can be used to pass short messages from one to four words in length. For example, when a four-word message is desired, only one of the registers needs to have its corresponding interrupt enable bit set at the receiver side; the message's first three words are written to the registers whose interrupt is masked, and the fourth word is written to the other register (which triggers an interrupt at the receiver side).
- **Passing frame information:** Transmit registers can be used to pass frame information for long messages written to the shared system (SDRAM and SyncFLASH). Such frame information normally includes a start address, number of words, and perhaps a message type code.
- **Passing event notices and requests:** Events and requests that do not include data words can be signaled from the Processor B to the Processor A using the general interrupts, such as acknowledging that a long message was read from the shared system memory.
- **Passing fixed length data:** Formatted data with a fixed length can be written in predetermined locations in the shared memory. A processor can use a general interrupt (Processor A or Processor B) to signal the other processor that the data is ready.
- **Passing announcements:** The three flags can be used by a processor to announce its current program state or other billboard messages to the other processor.

Figure 4-7 shows the MU registers schematic.

Figure 4-7. MU Registers

### 4.3.3.4 Operating Modes

This section describes all functional operation modes of the module.

### 4.3.3.5 Low Power Modes

This section describes the low power operating modes of the MU module.

#### 4.3.3.5.1 Low Power Clocks and Synchronization

The Processor B and the Processor A clocks operate at different frequencies and from different sources. The MU design does not assume any frequency relationship between the Processor A and the Processor B clocks. Be aware, however, that the frequency relationship affects the MU's throughput performance.

- The data buffers and control logic of each MU-side operate with its corresponding clock.

#### 4.3.3.5.2 Processor Low Power Modes

The Processors have four power modes:

- Run
- WAIT

- STOP
- DSM

The Processor can be awakened from a low-power mode by any enabled Processor side MU interrupt, as reflected in the xSR “status” register (RF0–3, TE0–3, GIP0–3 bits are set) and enabled in the xCR control register. Using these bits, the Processor can actively control when to wake the other Processor.

While the Processor is in STOP mode (such that the xSR register bits cannot be updated with events), special logic drives the enabled Processor interrupts directly from the other Processor-side (instead of from the xSR register).

While the Processor is in STOP mode, the asynchronous Processor interrupt will be asserted to wake the Processor:

- If any transmit data register of the other Processor-side is full, because of a write to it (transmit data register); that is, its “empty” bit in the xSR register is cleared while its corresponding receive interrupt is enabled on the Processor-side.
- If any receive data register of the other Processor-side is empty, because of a read on the other Processor -side; that is, its “full” bit in the xSR register is cleared while its corresponding transmit interrupt is enabled on the Processor-side.
- If any general purpose interrupt is set in the xCR register while the corresponding interrupt is enabled on the Processor-side.
- If the other Processor issues a non-maskable interrupt to the Processor.

The logic enables the other Processor to operate independently while the Processor is in any power mode (including STOP). However, the Processor power mode change protocol should be handled with care regarding:

- The interrupts that are enabled on the Processor-side
- The events that could be triggered by the other Processor-side
- The compatibility with the other Processor protocol of entering STOP mode

If the Processor is in STOP mode and an event on the other Processor is triggered, the EP bit (in the xSR register) will remain high until the Processor wakes up.

Before entering STOP mode, the Processor programmer should verify that the EP bit (in the xSR register) is cleared. This check is needed to ensure that all pending updates from the Processor, including the power mode change when STOP or WAIT is executed, will be updated in the xSR register.

- If the other Processor is in STOP mode or DSM mode, the EP bit (in the xSR register) may be stuck high; in this case, the Processor need not check the EP bit before entering STOP mode.

### 4.3.3.6 Event Update Timing

Each processor's MU messaging side (Processor B or Processor A) has a hardware mechanism to send "event update requests" to the other processor's side. An "event" is considered when any information change should be reflected at the Status Register of the receiving processor. The event update latency is the delay between the event being ready at one processor and the resulting update at the Status Register of the other processor.

- The minimum event latency is "1 clock of the sending side" + "2 1/2 clocks of the receiving side". The minimum case is if there is no event pending when the new event occurs.
- The maximum event latency is "6 clocks of the sending side" + "6 1/2 clocks of the receiving side." The maximum case is if the event occurred just after a previous event was sent to the other side. The event update latency will vary between the above-mentioned minimum and maximum latencies, depending on the time at which the subsequent event is triggered.

### 4.3.3.7 Interrupts

The MU controls the Processor B interrupt requests to the Processor A, and the Processor A interrupt requests to the Processor B. This section describes all the interrupts that the module generates.

#### 4.3.3.7.1 Interrupts to the Processors

There are 12 interrupt sources from the MU to the Processors:

- Four receive interrupts (asserted when the Processors receive full bits are set and enabled in the xCR register) for each of the receive registers
- Four transmit interrupts (asserted when the Processor transmit empty bits are set and enabled in the xCR register) for each of the transmit registers
- Four general purpose interrupts (asserted when the GIP bits are set and enabled in the xCR register)

All the interrupts are maskable in the Processor Control Register (xCR). The MU does not assume any internal priority of these interrupts. Multiple interrupts (for example, Receive 0 and Receive 1 interrupts or any of the transmit and general purpose interrupts) can be asserted at one time. The priority of these interrupts should be resolved by the interrupt controller at the chip level.

The General Purpose Interrupt Pending bits (GIP0, GIP1, GIP2, and GIP3) should be cleared by the software (as part of the interrupt service routine) to de-assert the request to the interrupt controller.

### 4.3.3.7.2 General Purpose Interrupt Clearing Sequence

When a Processor writes to the general interrupt bit (GIR), the write event is synchronized to the other Processor clock to set the general interrupt request pending bit (GIP). When the GIP bit is set, and if the general purpose interrupt is enabled on the transmitting Processor side (GIE bit is set), then the receiving Processor general purpose interrupt is issued to the transmitting Processor. The transmitting Processor clears this interrupt by writing a “1” on the GIP bit. The interrupt is de-asserted as soon as the GIP bit is written. The write event of the GIP bit is synchronized to the other Processor clock. The synchronized signal clears the GIR bit. The software should not write the GIR bit again until the GIR bit is cleared.

### 4.3.3.8 Interrupt Messaging Protocols

#### 4.3.3.8.1 Messaging Protocols using Interrupts

The example below describes a four-word messaging sequence sent by the Processor to the other Processor.

In this example, the first, second, and third receive interrupts are disabled, and the fourth receive interrupt is enabled. We write registers sequentially for  $n = 0, 1, 2, 3$ . For  $n = 0, 1, 2$ , the interrupts are disabled, therefore no interrupt will go to the other core (although interrupt conditions occur). For  $n = 3$ , the interrupt is enabled, and the last Receive Interrupt request is generated.

#### 1. Write Sequence

- The Processor writes the message information sequentially to its Transmit Registers 0, 1, 2.
- When the write to the Transmit Register 3 occurs, the RF3 bit of the xSR is set after synchronization, and it immediately trigger the Receive 3 interrupt to the other Processor.

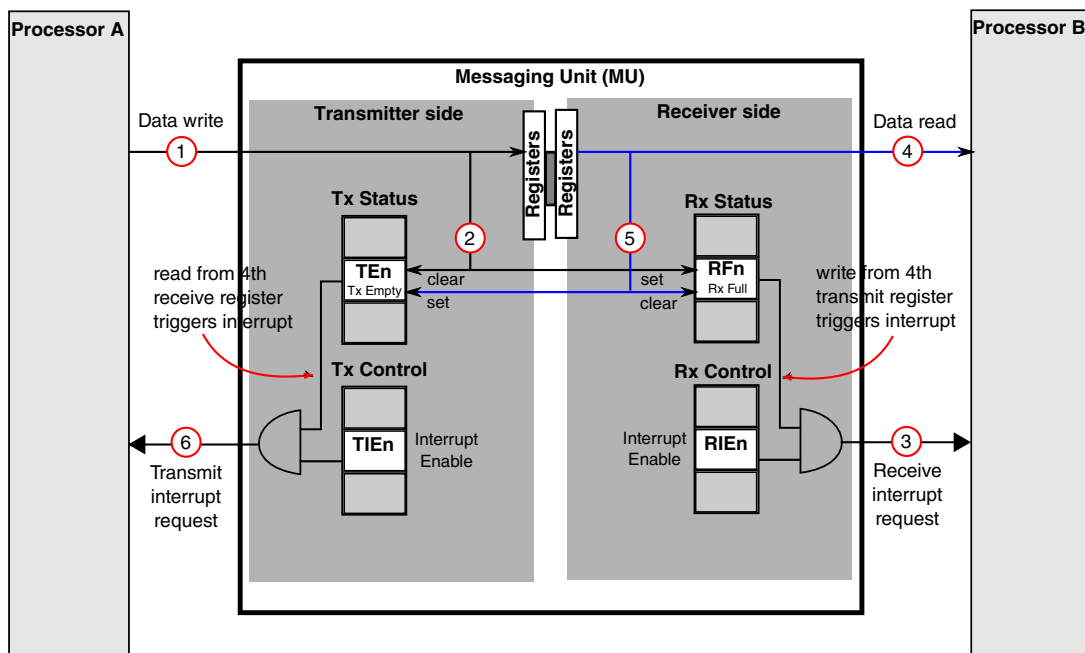

#### 2. Read Sequence

- The other Processor receives the Receive 3 interrupt and starts reading the message transferred from the receive registers.
- After Receive Register 3 is read, the interrupt bit is cleared.

Figure 4-8 shows the programmer’s model of a messaging protocol using transmit and receive registers. Use Table 4-12 and Figure 4-8 to understand the generalized protocol sequence.

**Table 4-12. Interrupt Messaging Protocol (Generalized)**

Sequence	Action	Description
1	Processor A Data write	A data write to the ATRn register by Processor A is immediately reflected in the Processor B BRRn register.
2	Clear Tx Empty bit and Set Rx Full bit	The data write to the ATRn register <ul style="list-style-type: none"> <li>• Clears the transmitter empty bit (TEn) in the Processor A Transmit Status Register</li> <li>• Sets the receiver full bit (RFn) in the Processor B Receive Status Register</li> </ul>
3	Generate Receive Interrupt request	The setting of the receiver full bit (RFn) in the Receive Status Register generates a Receive Interrupt request to Processor B.
4	Processor B Data read	After receiving the Receive Interrupt request, Processor B performs a data read of the BRRn register.
5	Clear Rx Full bit and Set Tx Empty bit	Reading the data out of the BRRn register <ul style="list-style-type: none"> <li>• Clears the receiver full bit (RFn) in the Processor B Receive Status Register</li> <li>• Sets the transmitter empty bit (TEn) in the Processor A Transmit Status Register</li> </ul>
6	Generate Transmit Interrupt request	The setting of the transmitter empty bit (TEn) in the Transmit Status Register generates a Transmit Interrupt request to Processor A.

**Figure 4-8. Messaging Model Using Transmit and Receive Registers**

**NOTE**

The Transmit registers can be used to pass frame information on long messages written to the shared memory. Such frame

information would typically include an initial address, number of words, and perhaps a message type code.

The messaging hardware can be used by software to implement messaging protocols for a wide array of message types. Full support is given for both interrupt and polling management schemes.

#### 4.3.3.8.2 Messaging Protocols using Event Interrupts

Events and requests that do not include data words can be signaled from the Processor B to the Processor A using the two general interrupts.

Formatted data with a fixed length can be written in predetermined locations in the shared memory. A processor can use a general purpose interrupt to signal the other processor that the data is ready.

The three flags can be used by a processor to announce to the other processor the program state it is currently in, or to announce similar messages.

[Table 4-13](#) and [Figure 4-9](#) describe the event sequence when the Processor triggers an interrupt.

**Table 4-13. Interrupt Messaging Protocol (Generalized)**

Sequence	Action	Description
1	Processor A sets General Interrupt request bit	Processor A sets its associated General Interrupt request bit (GIRn = 1) in the control register (ACR).
2	General Interrupt Request Pending status bit is set	The General Interrupt Request Pending status bit (GIPn) in the status register (BSR) is set to "1"
3	General Interrupt request to Processor B is generated	Setting the GIPn bit generates the General Interrupt request to Processor B (Interrupt Request Enable bit, GIEn, must be set for Processor B)
4	Processor B reads status register	The Processor B reads the GIPn bit in the BSR register.
5	Processor B services the interrupt	-
6	Processor B sets GIPn bit to clear interrupt	The Processor B writes "1" to the corresponding GIPn bit to clear the interrupt
7	GIRn bit is cleared	Setting the GIPn bit to "1" clears the General Interrupt request bit (GIRn) in the Processor A control register (ACR).

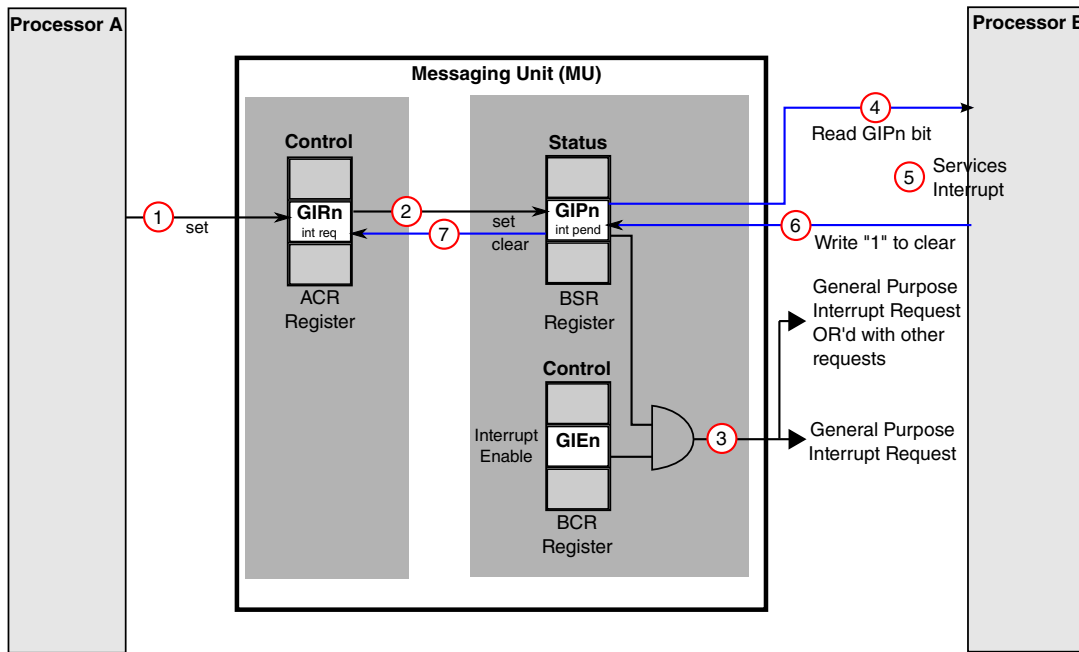

Figure 4-9. Messaging Model Using a General Purpose Interrupt

### 4.3.3.9 Exclusive Access to Shared Memory

You can use the MU to signal one processor about its current access to the shared memory, so that the data is not overwritten by the other processor during the exclusive memory access period.

The following tables describe the signaling protocol that the Processor A uses to inform the Processor B about its current access (write) to the shared memory, assuming that the set of bits and registers (GIR0 bit, BRR0 register, BTR0 register, GIR0 bit, ARR0 register, ATR0 register) are reserved to support exclusive access to the shared memory protocol.

Table 4-14. How the Processor A Performs an Exclusive Access to Shared Memory

Sequence	Action	Description
1	Processor A sends GIRn request to Processor B using Processor A control register	When the Processor A wants to perform an exclusive access to the shared memory, the Processor A sends an GIR0 request to the Processor B.
2	Processor A sends an exclusive-access request using a transmit data register (ATRn)	The Processor A will send an exclusive-access request (command, location, and length of target access) to Processor B using a selected transmit data register (ATR0).
3	Processor A waits for a dedicated interrupt from Processor B	The Processor A waits for a dedicated interrupt (as an acknowledgement) triggered by the Processor B before proceeding.

Table continues on the next page...

**Table 4-14. How the Processor A Performs an Exclusive Access to Shared Memory (continued)**

Sequence	Action	Description
4	Processor A accesses shared memory	After receiving a dedicated interrupt from the Processor B, Processor A proceeds.

**Table 4-15. How the Processor B Scans for Transaction Information**

Sequence	Action	Description
1	Processor B receives an interrupt from a receive data register (BRRn)	-
2	Processor B reads the receive data register (BRRn)	-
3	Processor B scans the receive data register contents	For transaction information (whether Processor A has requested an exclusive-access)

**Table 4-16. How the Processor B Accepts Exclusive Access by Processor A**

Sequence	Action	Description
1	Processor B triggers a dedicated interrupt	Processor B acknowledges the Processor A request by triggering a dedicated interrupt (ack) to the Processor A.
2	Processor B sends a code message to Processor A	Along with the acknowledge interrupt, the Processor B sends a code message to the Processor A through the selected transmit register (BTRn). The message informs the Processor A that it can exclusively access the shared memory.

**Table 4-17. How the Processor B Rejects Exclusive Access by Processor A**

Sequence	Action	Description
1	Processor B ignores Processor A request for exclusive access	If the Processor B does not want to give go-ahead permission to the Processor A, Processor B ignores the exclusive access request.

### 4.3.3.10 Packet Data Transfers

The following example describes the packet transfer sequence between the Processor B and Processor A subsystems:

**Table 4-18. Packet Data Transfer Sequence**

Action	Sequence	Description
Processor B requests DMA	1	The Processor B sends a DMA request to initiate the packet data transfer

*Table continues on the next page...*

**Table 4-18. Packet Data Transfer Sequence (continued)**

Action	Sequence	Description
DMA data transfer	2	DMA acknowledges.
	3	DMA starts transferring data from the specified Processor B location to the specified shared memory
	4	DMA interrupts the Processor B to signal that the packet transfer has finished.
Processor B informs Processor A that data is in shared memory	5	Using an MU Processor B-side transmit register, the Processor B sends a packet information message to the Processor A to inform the Processor A of the arrival of new packet data that is stored in shared memory . The message contains the command, location, and length of packet data information.
Processor A receives interrupt	6	The Processor A receives an interrupt (assuming its corresponding Processor A MU-side receive interrupt is enabled), and the pending processing task becomes active and processes packet data from memory.
Processor A reads data, writes data	7	The Processor A reads or processes packet data from shared memory.
	8	The Processor A writes the result from packet processing to a separate buffer.
Processor A informs Processor B that transfer is finished	9	After the processing of the packet data finishes, the Processor A informs the Processor B (using the MU Processor A-side transmit register, ATRn).
Processor A sends interrupt to Processor B (request for more data)	10	The Processor B receives the next interrupt from the Processor A, in which the Processor A requests more packet data.

### 4.3.3.11 MU Resets

The MU has two sources of reset, and each reset has a different function from the MU or system perspective.

- One asynchronous system that is connected to both sides of the MU interface.
- One programmable hardware reset (MUR bit) in the ACR register (on the Processor A-side).

**Table 4-19. MU programmable resets**

Reset	Description
Processor A MU reset	<ul style="list-style-type: none"> <li>• Processor A MU Reset bit (MUR) of the ACR register</li> <li>• The MUR reset affects the messaging section on both the Processor A and the Processor B sides. The MUR reset causes all control and status registers to return to their default values and all internal states to be cleared.</li> <li>• It is up to the Processor A software to decide whether to use the MUR reset or not.</li> <li>• The instruction immediately following assertion of the MUR bit should not write to MU registers. Such a write may be overwritten by the reset sequence and the register will remain with the reset value. You should wait at least one instruction (after assertion of the MUR bit) before attempting a write to MU registers.</li> </ul>

After issuing MUR bit reset events, the Processor A programmer can verify that the reset sequence on the Processor B-side has ended, by checking the RS bit in the ASR register.

### NOTE

MUR bit assertion is a delicate operation because it affects the other side's registers asynchronously. MUR bit assertion may cause unpredictable behavior if, for example, the Processor B is concurrently testing an MU register bit (TE bit in Processor B SR register). Before asserting the MUR bit, you should verify that the Processor B is not presently engaged in an MU signalling activity.

## 4.3.4 Software Restrictions

This section describes certain software restrictions when accessing the MU.

### 4.3.4.1 General Restrictions

This section lists the restrictions that apply to both the sides (Processor A, Processor B) of the MU.

#### 4.3.4.1.1 Write-After-Write to a Transmit Register

A write to a transmit register signals the receiver side that data is ready for retrieval.

- Writing to the transmit register again without verifying that the data was retrieved is prohibited, because the transmitter side has no way of knowing the exact time that the receiver will attempt to retrieve the data.
- Before attempting to write the transmit register again, the transmitter side should wait for a “Transmitter Empty” interrupt, or should poll the “Transmitter Empty” bit in the Status Register.
- Failure to follow this restriction may result in the wrong data being read on the receiver side of the MU.

#### 4.3.4.1.2 Read-After-Read from a Receive Register

A read of a receive register signals the transmitter side that data can be written to that register. In the same way, the receiver processor should not read a receive register before receiving a “Receiver Full” interrupt or polling the “Receiver Full” bit in the Status Register.

- Reading the receive register again without verifying that the data was written is prohibited, because the receiver side has no way of knowing the exact time that the transmitter will attempt to write the data.
- Before attempting to read the receive register again, the receiver side should wait for a “Receiver Full” interrupt, or should poll the “Receiver Full” bit in the Status Register.
- Failure to follow this restriction may result in the wrong data being written on the transmitter side of the MU.

#### **4.3.4.2 Processor Restrictions**

This section lists the restrictions that apply each side of the processor in the MU.

##### **4.3.4.2.1 Before Entering Low Power Mode**

Before entering Low Power mode, the Processor should verify that the Processor Event Pending (EP) bit in the Status Register is cleared.

- If the Event Pending bit (EP) is still set to “1”, then the Processor should wait and poll the EP bit until it is cleared, before executing the LPM instruction.
- Note that if the other Processor is in Low Power mode (programmed for clock gating in CCM), the EP bit may be stuck high. In this case, the other Processor clock must be turned ON to get the EP bit cleared before the Processor can enter Low Power mode.
- To discover which power mode the other Processor is in, the Processor can check the PM bits in the xSR register.

##### **4.3.4.2.2 Before Setting a General Interrupt Request Bit (GIR0–3)**

Before setting a General Interrupt Request bit (GIR0–3), you must verify that the GIR<sub>n</sub> bit is cleared, which means that a general interrupt is not pending. Generally, setting the GIR<sub>n</sub> bit while the bit is set to “1” will be ignored, but in some cases it may issue a second interrupt. This restriction is meant to prevent this indeterministic behavior.

##### **4.3.4.2.3 Reset Bit Restrictions**

The reset bit (MUR, HR) restrictions are:

- Before asserting the MUR bit in the ACR register, verify that the Processor B-side is not engaged in some MU activity.
- Do not write to an MU register in the instruction immediately after the assertion of the MUR bit in the ACR register, because the written data can be overridden by the reset value.

### 4.3.5 MU Processor A-side Memory Map/Register Definition

This section contains the detailed register descriptions for the Processor A-side MU registers.

#### MU memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
30AA_0000	Processor A Transmit Register 0 (MU_ATR0)	32	R/W	0000_0000h	<a href="#">4.3.5.1/303</a>
30AA_0004	Processor A Transmit Register 1 (MU_ATR1)	32	R/W	0000_0000h	<a href="#">4.3.5.2/304</a>
30AA_0008	Processor A Transmit Register 2 (MU_ATR2)	32	R/W	0000_0000h	<a href="#">4.3.5.3/305</a>
30AA_000C	Processor A Transmit Register 3 (MU_ATR3)	32	R/W	0000_0000h	<a href="#">4.3.5.4/305</a>
30AA_0010	Processor A Receive Register 0 (MU_ARR0)	32	R	0000_0000h	<a href="#">4.3.5.5/306</a>
30AA_0014	Processor A Receive Register 1 (MU_ARR1)	32	R	0000_0000h	<a href="#">4.3.5.6/307</a>

30AA_0024	Processor A Control Register (MU_ACR)	32	R/W	0000_0000h	<a href="#">4.3.5.10/312</a>

#### 4.3.5.1 Processor A Transmit Register 0 (MU\_ATR0)

Use Processor A Transmit Register 0 (ATR0, 32-bit, write-only) to transmit a message or data to the Processor B.

- You can only write to the ATR0 register when the TE0 bit in ASR register is set to “1”.
- Reading the ATR0 register returns all zeros.

Address: 30AA\_0000h base + 0h offset = 30AA\_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ATR0																															
W	ATR0																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### MU\_ATR0 field descriptions

Field	Description
ATR0	Processor A Transmit Register 0. (Write-only)

**MU\_ATR0 field descriptions (continued)**

Field	Description
	<ul style="list-style-type: none"> <li>• Data written to the ATR0 register is reflected on the Processor B-side in the Processor B Receive Register 0 (BRR0). The ATR0 and BRR0 registers are not double-buffered—a write to the ATR0 register overrides the data readable at the BRR0 register.</li> <li>• A write to the transmit register clears a “transmitter empty” bit (TE0) in the Processor A Status Register (ASR) on the transmitter side, and sets a “receiver full” bit (RF0) in the Processor B Status Register (BSR) on the receiver side (optionally triggering an interrupt 0 on the Processor B-side).</li> <li>• Any write to the ATR0 register will update all status information.</li> </ul>

**4.3.5.2 Processor A Transmit Register 1 (MU\_ATR1)**

Use Processor A Transmit Register 1 (ATR1, 32-bit, write-only) to transmit a message or data to the Processor B.

- You can only write to the ATR1 register when the TE1 bit in ASR register is set to “1”.
- Reading the ATR1 register returns all zeros.

Address: 30AA\_0000h base + 4h offset = 30AA\_0004h

**MU\_ATR1 field descriptions**

Field	Description
ATR1	<p>Processor A Transmit Register 1. (Write-only)</p> <ul style="list-style-type: none"> <li>• Data written to the ATR1 register is reflected on the Processor B-side in the Processor B Receive Register 1 (BRR1). The ATR1 and BRR1 registers are not double-buffered—a write to the ATR1 register overrides the data readable at the BRR1 register.</li> <li>• A write to the transmit register clears a “transmitter empty” bit (TE1) in the Processor A Status Register (ASR) on the transmitter side, and sets a “receiver full” bit (RF1) in the Processor B Status Register (BSR) on the receiver side (optionally triggering an interrupt 1 on the Processor B-side).</li> <li>• Any write to the ATR1 register will update all status information.</li> </ul>

### 4.3.5.3 Processor A Transmit Register 2 (MU\_ATR2)

Use Processor A Transmit Register 2 (ATR2, 32-bit, write-only) to transmit a message or data to the Processor B.

- You can only write to the ATR2 register when the TE2 bit in ASR register is set to “1”.
- Reading the ATR2 register returns all zeros.

Address: 30AA\_0000h base + 8h offset = 30AA\_0008h

#### MU\_ATR2 field descriptions

Field	Description
ATR2	<p>Processor A Transmit Register 2. (Write-only)</p> <ul style="list-style-type: none"> <li>• Data written to the ATR2 register is reflected on the Processor B-side in the Processor B Receive Register 2 (BRR2). The ATR2 and BRR2 registers are not double-buffered—a write to the ATR2 register overrides the data readable at the BRR2 register.</li> <li>• A write to the transmit register clears a “transmitter empty” bit (TE2) in the Processor A Status Register (ASR) on the transmitter side, and sets a “receiver full” bit (RF2) in the Processor B Status Register (BSR) on the receiver side (optionally triggering an interrupt 2 on the Processor B-side).</li> <li>• Any write to the ATR2 register will update all status information.</li> </ul>

### 4.3.5.4 Processor A Transmit Register 3 (MU\_ATR3)

Use Processor A Transmit Register 3 (ATR3, 32-bit, write-only) to transmit a message or data to the Processor B.

- You can only write to the ATR3 register when the TE3 bit in ASR register is set to “1”.
- Reading the ATR3 register returns all zeros.

Address: 30AA\_0000h base + Ch offset = 30AA\_000Ch

### MU\_ATR3 field descriptions

Field	Description
ATR3	<p>Processor A Transmit Register 3. (Write-only)</p> <ul style="list-style-type: none"> <li>Data written to the ATR3 register is reflected on the Processor B-side in the Processor B Receive Register 3 (BRR3). The ATR3 and BRR3 registers are not double-buffered—a write to the ATR3 register overrides the data readable at the BRR3 register.</li> <li>A write to the transmit register clears a “transmitter empty” bit (TE3) in the Processor A Status Register (ASR) on the transmitter side, and sets a “receiver full” bit (RF3) in the Processor B Status Register (BSR) on the receiver side (optionally triggering an interrupt 3 on the Processor B-side).</li> <li>Any write to the ATR3 register will update all status information.</li> </ul>

### 4.3.5.5 Processor A Receive Register 0 (MU\_ARR0)

Use Processor A Receive Register 0 (ARR0, 32-bit, read-only) to receive a message or data from the Processor B.

- Data written to the BTR0 register is immediately reflected in the ARR0 register.
- You can only read the ARR0 register when the RF0 bit in the ASR register is set to “1”.
- Writing to the ARR0 register generates an error response to the Processor A.

Address: 30AA\_0000h base + 10h offset = 30AA\_0010h

### MU\_ARR0 field descriptions

Field	Description
ARR0	<p>Processor A Receive Register 0. (Read-only)</p> <ul style="list-style-type: none"> <li>Reflects the data written to Processor B Transmit Register 0 (BTR0).</li> <li>Reading the ARR0 register clears the “receiver full” bit (RF0) in the Processor A Status Register (ASR) on the receiver side, and sets the “transmitter empty” bit (TE0) in the Processor B Status Register on the transmitter side (optionally triggering a transmit interrupt 0 on the Processor B-side).</li> <li>Any read of the ARR0 register will update all status information.</li> </ul>

### 4.3.5.6 Processor A Receive Register 1 (MU\_ARR1)

Use Processor A Receive Register 1 (ARR1, 32-bit, read-only) to receive a message or data from the Processor B.

- Data written to the BTR1 register is immediately reflected in the ARR1 register.
- You can only read the ARR1 register when the RF1 bit in the ASR register is set to “1”.
- Writing to the ARR1 register generates an error response to the Processor A.

Address: 30AA\_0000h base + 14h offset = 30AA\_0014h

#### MU\_ARR1 field descriptions

Field	Description
ARR1	<p>Processor A Receive Register 1. (Read-only)</p> <ul style="list-style-type: none"> <li>• Reflects the data written to Processor B Transmit Register 1 (BTR1).</li> <li>• Reading the ARR1 register clears the “receiver full” bit (RF1) in the Processor A Status Register (ASR) on the receiver side, and sets the “transmitter empty” bit (TE1) in the Processor B Status Register on the transmitter side (optionally triggering a transmit interrupt 1 on the Processor B-side).</li> <li>• Any read of the ARR1 register will update all status information.</li> </ul>

### 4.3.5.7 Processor A Receive Register 2 (MU\_ARR2)

Use Processor A Receive Register 2 (ARR2, 32-bit, read-only) to receive a message or data from the Processor B.

- Data written to the BTR2 register is immediately reflected in the ARR2 register.
- You can only read the ARR2 register when the RF2 bit in the ASR register is set to “1”.
- Writing to the ARR2 register generates an error response to the Processor A.

Address: 30AA\_0000h base + 18h offset = 30AA\_0018h

### MU\_ARR2 field descriptions

Field	Description
ARR2	<p>Processor A Receive Register 2. (Read-only)</p> <ul style="list-style-type: none"> <li>• Reflects the data written to Processor B Transmit Register 1 (BTR2).</li> <li>• Reading the ARR2 register clears the “receiver full” bit (RF2) in the Processor A Status Register (ASR) on the receiver side, and sets the “transmitter empty” bit (TE2) in the Processor B Status Register on the transmitter side (optionally triggering a transmit interrupt 2 on the Processor B-side).</li> <li>• Any read of the ARR2 register will update all status information.</li> </ul>

### 4.3.5.8 Processor A Receive Register 3 (MU\_ARR3)

Use Processor A Receive Register 3 (ARR3, 32-bit, read-only) to receive a message or data from the Processor B.

- Data written to the BTR3 register is immediately reflected in the ARR3 register.
- You can only read the ARR3 register when the RF3 bit in the ASR register is set to “1”.
- Writing to the ARR3 register generates an error response to the Processor A.

Address: 30AA\_0000h base + 1Ch offset = 30AA\_001Ch

### MU\_ARR3 field descriptions

Field	Description
ARR3	<p>Processor A Receive Register 3. (Read-only)</p> <ul style="list-style-type: none"> <li>• Reflects the data written to Processor B Transmit Register 3 (BTR3).</li> <li>• Reading the ARR3 register clears the “receiver full” bit (RF3) in the Processor A Status Register (ASR) on the receiver side, and sets the “transmitter empty” bit (TE3) in the Processor B Status Register on the transmitter side (optionally triggering a transmit interrupt 3 on the Processor B-side).</li> <li>• Any read of the ARR3 register will update all status information.</li> </ul>

### 4.3.5.9 Processor A Status Register (MU\_ASR)

Use the Processor A Status Register (ASR, 32-bit, read-write) to show interrupt status from the Processor B, general purpose flags, and to set dual function control-status bits.

- Some dual-purpose bits are set by the MU logic, and cleared by the Processor A-side programmer
- Other dual-purpose bits are set by the Processor A-side programmer, and cleared by the MU logic.

Address: 30AA\_0000h base + 20h offset = 30AA\_0020h

**MU\_ASR field descriptions**

Field	Description
31–28 GIPn	<p>For <math>n = \{0, 1, 2, 3\}</math> Processor A General Interrupt Request <math>n</math> Pending. (Read-Write)</p> <ul style="list-style-type: none"> <li>• GIPn bit signals the Processor A that the GIRn bit in the BCR register on the Processor B-side was set from “0” to “1”. If the GIEn bit in the ACR register is set to “1”, a General Interrupt <math>n</math> request is issued.</li> <li>• The GIPn bit is cleared by writing it back as “1”. Writing “0”, or writing “1” when the GIPn bit is cleared is ignored. Use this feature in the interrupt routine, where the GIPn bit is cleared in order to de-assert the interrupt request source at the interrupt controller. The proper bit clearing sequence is: clear an Processor A register, set the desired bit in it (Processor A register), and write it to the ASR register, thus clearing the GIPn bit.</li> <li>• GIPn bit is cleared when the MU is reset.</li> </ul>

*Table continues on the next page...*

**MU\_ASR field descriptions (continued)**

Field	Description
	0 Processor A general purpose interrupt n is not pending. (default) 1 Processor A general purpose interrupt n is pending.
27–24 RFn	For n = {0, 1, 2, 3} Processor A Receive Register n Full. (Read-only) <ul style="list-style-type: none"> <li>The RFn bit is set to “1” when the BTRn register is written on the Processor B-side.</li> <li>After the RFn bit is set to “1”, the RFn bit signals the Processor A-side that new data is ready to be read by the Processor A in the ARRn register, and a Receive n interrupt is issued on the Processor A-side (if the RIEn bit in the ACR register has been set to “1”).</li> <li>RFn bit is cleared when the ARRn register is read, and when the MU is reset.</li> </ul> 0 ARRn register is not full (default). 1 ARRn register has received data from BTRn register and is ready to be read by the Processor A.
23–20 TEn	For n = {0, 1, 2, 3} Processor A Transmit Register n Empty. (Read-only) <ul style="list-style-type: none"> <li>The TEn bit is set to “1” after the BRRn register is read on the Processor B-side.</li> <li>After the TEn bit is set to “1”, the TEn bit signals the Processor A-side that the ATRn register is ready to be written on the Processor A-side, and a Transmit n interrupt is issued on the Processor A-side (if the TEn bit in the ACR register is set to “1”).</li> <li>TEn bit is cleared after the ATRn register is written on the Processor A-side.</li> <li>TEn bit is set to “1” when the MU is reset.</li> </ul> 0 ATRn register is not empty. 1 ATRn register is empty (default).
19–10 -	This field is reserved. Reserved.
9 BRDIP	Processor B Reset De-asserted Interrupt Pending. (Read-Write) <ul style="list-style-type: none"> <li>BRDIP bit signals the Processor A-side that the Processor B-side has come out of reset.</li> <li>BRDIP bit is set to “1” after the MU Processor B-side comes out of reset, after synchronization. The interrupt generated by a Processor B-side reset de-assertion is ORed with the Processor A general purpose interrupt 3. The Processor A general purpose interrupt 3 is issued when the Processor B-side comes out of reset (if the interrupt is enabled).</li> <li>To clear the BRDIP bit, write “1”, which also clears general purpose interrupt 3.</li> <li>When Processor A-side of MU comes out of reset BRDIP bit has value “0”(default).Then Processor A sees the status of Processor B-side and if Processor B-side has come out of reset then BRDIP bit goes high.This takes 5-6 clock cycles.And if you read BRDIP bit now you will see it as high although its reset value was "0".</li> </ul> 0 The Processor A general purpose interrupt 3, because of a Processor B-side reset de-assertion, is cleared (default). 1 The Processor B-side is out of reset.
8 FUP	Processor A Flags Update Pending. (Read-only) <ul style="list-style-type: none"> <li>FUP bit is set to “1” when the Processor A-side sends a Flags Update request to the Processor B-side.</li> <li>A Flags Update request is generated when the ABF[2:0] bits of the ACR register change. No flag update changes are allowed while the FUP bit is set to “1”. Any write to the ABF[2:0] bits, while the FUP bit is set to “1”, will not generate a Flags Update event, and the ABF[2:0] bits will stay unchanged.</li> <li>FUP bit is cleared when this Flags Update request is internally acknowledged (that the flag is updated) from the MU Processor B-side, and during MU reset.</li> </ul>

*Table continues on the next page...*

### MU\_ASR field descriptions (continued)

Field	Description
	0 No flags updated, initiated by the Processor A, in progress (default) 1 Processor A initiated flags update, processing
7 BRS	Processor B-side Reset State. (Read-only) <ul style="list-style-type: none"> <li>• BRS bit indicates if the Processor B-side of the MU is in a reset state or not.</li> <li>• If the BRS bit is set to “1”, then the Processor B-side of the MU is still in the reset state.</li> <li>• If the BRS bit is cleared, then the Processor B-side of the MU are out of reset.</li> <li>• The BRS bit is set to “1” during: a Processor B system reset, or an MU reset (caused by setting the MUR bit at the ACR register).</li> <li>• The BRS bit is cleared when the reset sequence on the Processor B-side of the MU ends. After issuing any of the reset events mentioned previously, you should verify that the BRS bit is cleared before starting any accesses.</li> <li>• When Processor A side of MU comes out of reset BRS bit has value “1”(default). Then Processor A sees the status of Processor B-side and if Processor B-side has come out of reset then BRS bit goes low. This takes 5-6 clock cycles. And if you read BRS bit now you will see it as low although its reset value was “1” .</li> </ul> 0 The Processor B-side of the MU is not in reset. 1 The Processor B-side of the MU is in reset.
6–5 -	This field is reserved. Reserved
4 EP	Processor A-Side Event Pending. (Read-only) <ul style="list-style-type: none"> <li>• EP bit is set to “1” when the Processor A-side mechanism sends an event update request to the Processor B-side.</li> <li>• EP bit is cleared when the event update acknowledge is received. An “event” is any hardware message that is reflected in the BSR register on the Processor B-side (for example, “transmit register 0 written”). During normal operations, you do not have to deal with the state of the EP bit because the event update mechanism works automatically.</li> <li>• To ensure events have been posted to Processor B before entering STOP mode, you should verify that the EP bit is cleared. If EP bit is set to “1”, you should wait and continue to poll it (EP bit) before entering STOP mode.</li> <li>• Reading the ASR register (to check the EP bit) should be the last access to the MU that should be performed before entering STOP or WAIT modes; otherwise, the EP bit may be set by subsequent additional actions.</li> <li>• The EP bit is cleared when the MU resets.</li> </ul> 0 The Processor A-side event is not pending (default). 1 The Processor A-side event is pending.
3 -	This field is reserved. Reserved.
Fn	For n = {0, 1, 2} Processor A-Side Flag n. (Read-only) <ul style="list-style-type: none"> <li>• Fn bit is the Processor A-side flag that reflects the values written to the BAFn bit in the Processor B control register.</li> <li>• Every time that the BAFn bit is written, the BAFn bit write event updates the Fn bit after the event update latency, which is measured in terms of the number of clocks of the Processor B and the Processor A.</li> </ul> 0 BAFn bit in BCR register is written 0 (default). 1 BAFn bit in BCR register is written 1.

### 4.3.5.10 Processor A Control Register (MU\_ACR)

Use the Processor A Control Register (ACR, 32-bit, read-write) to enable the MU interrupts on the Processor A-side, and trigger events and interrupts on the Processor B-side (general purpose interrupt, flag update).

Address: 30AA\_0000h base + 24h offset = 30AA\_0024h

**MU\_ACR field descriptions**

Field	Description
31–28 GIEn	<p>For n = {0, 1, 2, 3} Processor A General Purpose Interrupt Enable n. (Read-Write)</p> <ul style="list-style-type: none"> <li>GIEn bit enables Processor A General Interrupt n.</li> <li>If GIEn bit is set to “1” (enabled), then a General Interrupt n request is issued when the GIPn bit in the ASR register is set to “1”.</li> <li>If GIEn is cleared (disabled), then the value of the GIPn bit is ignored and no General Interrupt n request will be issued.</li> <li>GIEn bit is cleared when the MU resets.</li> </ul> <p>0 Disables Processor A General Interrupt n. (default) 1 Enables Processor A General Interrupt n.</p>
27–24 RIEn	<p>For n = {0, 1, 2, 3} Processor A Receive Interrupt Enable n. (Read-Write)</p> <ul style="list-style-type: none"> <li>RIEn bit enables Processor A Receive Interrupt n.</li> </ul>

### 4.3.6.1 Processor B Transmit Register 0 (MU\_BTR0)

Use Processor B Transmit Register 0 (BTR0, 32-bit, write-only) to transmit a message or data to the Processor A.

- You can only write to the BTR0 register when the TE0 bit in BSR register is set to “1”.
- Reading the BTR0 register returns all zeros.

Address: 30AB\_0000h base + 0h offset = 30AB\_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### MU\_BTR0 field descriptions

Field	Description
BTR0	<p>Processor B Transmit Register 0. (Write-only)</p> <ul style="list-style-type: none"> <li>Data written to the BTR0 register is reflected on the Processor A-side in the Processor A Receive Register 0 (ARR0). The BTR0 and ARR0 registers are not double-buffered—a write to the BTR0 register overrides the data readable at the ARR0 register.</li> <li>A write to the transmit register clears a “transmitter empty” bit (TE0) in the Processor B Status Register (BSR) on the transmitter side, and sets a “receiver full” bit (RF0) in the Processor A Status Register (ASR) on the receiver side (optionally triggering an interrupt 0 on the Processor A-side).</li> <li>Any write to the BTR0 register will update all status information.</li> </ul>

### 4.3.6.2 Processor B Transmit Register 1 (MU\_BTR1)

Use Processor B Transmit Register 1 (BTR1, 32-bit, write-only) to transmit a message or data to the Processor A.

- You can only write to the BTR1 register when the TE1 bit in BSR register is set to “1”.
- Reading the BTR1 register returns all zeros.

Address: 30AB\_0000h base + 4h offset = 30AB\_0004h

#### MU\_BTR1 field descriptions

Field	Description
BTR1	<p>Processor B Transmit Register 1. (Write-only)</p> <ul style="list-style-type: none"> <li>• Data written to the BTR1 register is reflected on the Processor A-side in the Processor A Receive Register 1 (ARR1). The BTR1 and ARR1 registers are not double-buffered—a write to the BTR1 register overrides the data readable at the ARR1 register.</li> <li>• A write to the transmit register clears a “transmitter empty” bit (TE1) in the Processor B Status Register (BSR) on the transmitter side, and sets a “receiver full” bit (RF1) in the Processor A Status Register (ASR) on the receiver side (optionally triggering an interrupt 1 on the Processor A-side).</li> <li>• Any write to the BTR1 register will update all status information.</li> </ul>

### 4.3.6.3 Processor B Transmit Register 2 (MU\_BTR2)

Use Processor B Transmit Register 2 (BTR2, 32-bit, write-only) to transmit a message or data to the Processor A.

- You can only write to the BTR2 register when the TE2 bit in BSR register is set to “1”.
- Reading the BTR2 register returns all zeros.

Address: 30AB\_0000h base + 8h offset = 30AB\_0008h

### MU\_BTR2 field descriptions

Field	Description
BTR2	<p>Processor B Transmit Register 2. (Write-only)</p> <ul style="list-style-type: none"> <li>Data written to the BTR2 register is reflected on the Processor A-side in the Processor A Receive Register 2 (ARR2). The BTR2 and ARR2 registers are not double-buffered—a write to the BTR2 register overrides the data readable at the ARR2 register.</li> <li>A write to the transmit register clears a “transmitter empty” bit (TE2) in the Processor B Status Register (BSR) on the transmitter side, and sets a “receiver full” bit (RF2) in the Processor A Status Register (ASR) on the receiver side (optionally triggering an interrupt 2 on the Processor A-side).</li> <li>Any write to the BTR2 register will update all status information.</li> </ul>

#### 4.3.6.4 Processor B Transmit Register 3 (MU\_BTR3)

Use Processor B Transmit Register 3 (BTR3, 32-bit, write-only) to transmit a message or data to the Processor A.

- You can only write to the BTR3 register when the TE3 bit in BSR register is set to “1”.
- Reading the BTR3 register returns all zeros.

Address: 30AB\_0000h base + Ch offset = 30AB\_000Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### MU\_BTR3 field descriptions

Field	Description
BTR3	<p>Processor B Transmit Register 3. (Write-only)</p> <ul style="list-style-type: none"> <li>Data written to the BTR3 register is reflected on the Processor A-side in the Processor A Receive Register 3 (ARR3). The BTR3 and ARR3 registers are not double-buffered—a write to the BTR3 register overrides the data readable at the ARR3 register.</li> <li>A write to the transmit register clears a “transmitter empty” bit (TE3) in the Processor B Status Register (BSR) on the transmitter side, and sets a “receiver full” bit (RF3) in the Processor A Status Register (ASR) on the receiver side (optionally triggering an interrupt 3 on the Processor A-side).</li> <li>Any write to the BTR3 register will update all status information.</li> </ul>

### 4.3.6.5 Processor B Receive Register 0 (MU\_BRR0)

Use Processor B Receive Register 0 (BRR0, 32-bit, read-only) to receive a message or data from the Processor A.

- Data written to the ATR0 register is immediately reflected in the BRR0 register.
- You can only read the BRR0 register when the RF0 bit in the BSR register is set to “1”.
- Writing to the BRR0 register generates an error response to the Processor B.

Address: 30AB\_0000h base + 10h offset = 30AB\_0010h

#### MU\_BRR0 field descriptions

Field	Description
BRR0	<p>Processor B Receive Register 0. (Read-only)</p> <ul style="list-style-type: none"> <li>• Reflects the data written to Processor A Transmit Register 0 (ATR0).</li> <li>• Reading the BRR0 register clears the “receiver full” bit (RF0) in the Processor B Status Register (BSR) on the receiver side, and sets the “transmitter empty” bit (TE0) in the Processor A Status Register on the transmitter side (optionally triggering a transmit interrupt 0 on the Processor A-side).</li> <li>• Any read of the BRR0 register will update all status information.</li> </ul>

### 4.3.6.6 Processor B Receive Register 1 (MU\_BRR1)

Use Processor B Receive Register 1 (BRR1, 32-bit, read-only) to receive a message or data from the Processor A.

- Data written to the ATR1 register is immediately reflected in the BRR1 register.
- You can only read the BRR1 register when the RF1 bit in the BSR register is set to “1”.
- Writing to the BRR1 register generates an error response to the Processor B.

Address: 30AB\_0000h base + 14h offset = 30AB\_0014h

### MU\_BRR1 field descriptions

Field	Description
BRR1	<p>Processor B Receive Register 1. (Read-only)</p> <ul style="list-style-type: none"> <li>Reflects the data written to Processor A Transmit Register 1 (ATR1).</li> <li>Reading the BRR1 register clears the “receiver full” bit (RF1) in the Processor B Status Register (BSR) on the receiver side, and sets the “transmitter empty” bit (TE1) in the Processor A Status Register on the transmitter side (optionally triggering a transmit interrupt 1 on the Processor A-side).</li> <li>Any read of the BRR1 register will update all status information.</li> </ul>

#### 4.3.6.7 Processor B Receive Register 2 (MU\_BRR2)

Use Processor B Receive Register 2 (BRR2, 32-bit, read-only) to receive a message or data from the Processor A.

- Data written to the ATR2 register is immediately reflected in the BRR2 register.
- You can only read the BRR2 register when the RF2 bit in the BSR register is set to “1”.
- Writing to the BRR2 register generates an error response to the Processor B.

Address: 30AB\_0000h base + 18h offset = 30AB\_0018h

### MU\_BRR2 field descriptions

Field	Description
BRR2	<p>Processor B Receive Register 2. (Read-only)</p> <ul style="list-style-type: none"> <li>Reflects the data written to Processor A Transmit Register 1 (ATR2).</li> <li>Reading the BRR2 register clears the “receiver full” bit (RF2) in the Processor B Status Register (BSR) on the receiver side, and sets the “transmitter empty” bit (TE2) in the Processor A Status Register on the transmitter side (optionally triggering a transmit interrupt 2 on the Processor A-side).</li> <li>Any read of the BRR2 register will update all status information.</li> </ul>

### 4.3.6.8 Processor B Receive Register 3 (MU\_BRR3)

Use Processor B Receive Register 3 (BRR3, 32-bit, read-only) to receive a message or data from the Processor A.

- Data written to the ATR3 register is immediately reflected in the BRR3 register.
- You can only read the BRR3 register when the RF3 bit in the BSR register is set to “1”.
- Writing to the BRR3 register generates an error response to the Processor B.

Address: 30AB\_0000h base + 1Ch offset = 30AB\_001Ch

#### MU\_BRR3 field descriptions

Field	Description
BRR3	<p>Processor B Receive Register 3. (Read-only)</p> <ul style="list-style-type: none"> <li>• Reflects the data written to Processor A Transmit Register 3 (ATR3).</li> <li>• Reading the BRR3 register clears the “receiver full” bit (RF3) in the Processor B Status Register (BSR) on the receiver side, and sets the “transmitter empty” bit (TE3) in the Processor A Status Register on the transmitter side (optionally triggering a transmit interrupt 3 on the Processor A-side).</li> <li>• Any read of the BRR3 register will update all status information.</li> </ul>

### 4.3.6.9 Processor B Status Register (MU\_BSR)

Use the Processor B Status Register (BSR, 32-bit, read-write) to show interrupt status from the Processor B, general purpose flags, the Processor A power mode, and to set dual function control-status bits.

- Dual-purpose bits are set by the Processor B-side programmer, and cleared by the MU logic.

Address: 30AB\_0000h base + 20h offset = 30AB\_0020h

MU\_BSR field descriptions

Field	Description
31–28 GIPn	<p>For n = {0, 1, 2, 3} Processor B General Interrupt Request n Pending. (Read-Write)</p> <ul style="list-style-type: none"> <li>• GIPn bit signals the Processor B that the GIPn bit in the ACR register on the Processor A-side was set from “0” to “1”. If the GIPn bit in the BCR register is set to “1”, a General Interrupt n request is issued.</li> <li>• The GIPn bit is cleared by writing it back as “1”. Writing “0”, or writing “1” when the GIPn bit is cleared is ignored. Use this feature in the interrupt routine, where the GIPn bit is cleared in order to de-assert the interrupt request source at the interrupt controller.</li> <li>• GIPn bit is cleared when the MU is reset.</li> </ul> <p>0 Processor B general purpose interrupt n is not pending. (default)                      1 Processor B general purpose interrupt n is pending.</p>

Table continues on the next page...

**MU\_BSR field descriptions (continued)**

Field	Description
27–24 RFn	<p>For n = {0, 1, 2, 3} Processor B Receive Register n Full. (Read-only)</p> <ul style="list-style-type: none"> <li>RFn bit signals to the Processor B-side that new data was written by the Processor A to the ATRn register, and is ready to be read by the Processor B in the BRRn register.</li> <li>The RFn bit is set to “1” when the ATRn register is written on the Processor A-side.</li> <li>After the RFn bit is set to “1”, the RFn bit signals the Processor B-side that new data is ready to be read by the Processor B in the BRRn register, and a Receive n interrupt is issued on the Processor A-side (if the RIEn bit in the BCR register has been set to “1”).</li> <li>RFn bit is cleared when the BRRn register is read, and when the MU is reset.</li> </ul> <p>0 BRRn register is not full (default). 1 BRRn register has received data from ATRn register and is ready to be read by the Processor B.</p>
23–20 TEn	<p>For n = {0, 1, 2, 3} Processor B Transmit Register n Empty. (Read-only)</p> <ul style="list-style-type: none"> <li>When TEEn = “1”, it signals to the Processor B-side that the BTRn register is ready to be written on the Processor B-side.</li> <li>The TEEn bit is set to “1” after the ARRn register is read on the Processor A-side.</li> <li>Setting TEEn bit will issue a transmit n interrupt on the Processor B-side (if the TIEn bit in the BCR register is set to “1”).</li> <li>TEEn bit is cleared after the BTRn register is written on the Processor B-side.</li> <li>TEEn bit is set to “1” when the MU is reset.</li> </ul> <p>0 BTRn register is not empty. 1 BTRn register is empty (default).</p>

1	Sets the Fn bit in the ASR register.

## 4.4 Semaphore (SEMA4)

### 4.4.1 Overview

The IPS\_Semaphores module provides a platform IPS slave device which implements 16 hardware-enforced gates with the following features:

- Module definition supports 16 hardware-enforced gates in a dual-processor configuration, where cp0 is core processor 0 and cp1 is core processor 1
  - Hardware gates appear as a 16-entry byte-size array with read and write accesses
    - Processors lock gates by writing "processor\_number+1" to the appropriate gate and must read back the gate value to verify the lock operation was successful
    - Once locked, the gate is unlocked by a write of zeroes from the locking processor
  - Optional interrupt notification after a failed lock write provides a mechanism to indicate when the gate is unlocked
  - Secure reset mechanisms are supported to clear the contents of individual semaphore gates or notification logic, as well as a clear\_all capability
  - Programming model allocates memory space to support up to 8 processors and up to 64 gates

A simplified block diagram of the Semaphores module is shown in [Figure 4-10](#). In the diagram, the register blocks named gate0, gate1, ..., gate 15 include the finite state machines implementing the semaphore gates plus the interrupt notification logic.

Figure 4-10. IPS\_Semaphores Block Diagram

#### 4.4.1.1 Features

The Semaphores module implements hardware-enforced semaphores as an IPS-mapped slave peripheral device. The feature set includes:

- Support for 16 hardware-enforced gates in a dual-processor configuration
  - Each hardware gate appears as a 3-state, 2-bit state machine, with all 16 gates mapped as a byte-size array
    - 3-state implementation

if gate = 0b00, then state = unlocked

if gate = 0b01, then state = locked by processor 0

if gate = 0b10, then state = locked by processor 1

- Uses the bus master number as a reference attribute plus the specified data patterns to validate all write operations
- Once locked, the gate can (and must) be unlocked by a write of zeroes from the locking processor
- Optional interrupt notification after a failed lock write provides a mechanism to indicate when the gate is unlocked
- Secure reset mechanisms are supported to clear the contents of individual gates or notification logic, as well as a clear\_all capability
- Memory-mapped IPS slave peripheral platform module
  - Interface to the IPS bus for programming-model accesses
  - Two outputs (one per processor) for interrupt notification of failed lock writes

#### 4.4.1.2 Modes of Operation

The Semaphores module does not support any special modes of operation. As a slave peripheral memory-mapped device located on the platform's IPS slave bus, it responds based strictly on the memory addresses of the connected bus. The IPS bus is used to access the Semaphores ' programming model.

#### 4.4.2 External Signal Description

The Semaphores module does not include any external interfaces.

#### 4.4.3 Functional Description

In this section, the functional operation of the Semaphores module, specifically the state machines of the SEMA4\_GATE<sub>n</sub> and SEMA4\_CP<sub>n</sub>NTF registers are detailed.

##### 4.4.3.1 SEMA4\_GATE<sub>n</sub> Operation

Recall each of the SEMA4\_GATE<sub>n</sub> registers implements a 2-bit, 3-state machine. The state transitions for each gate are shown in the following figure.

Figure 4-11. SEMA4\_GATEn State Machine

The bus master number is used to identify core processor 0 (cp0) or core processor 1 (cp1). The Standard (or Reduced) Product Platform passes the AHB bus master number (`hmaster[2:0]`) through the AIPS (or AIPS-Lite) controller and drives an `aips_master[2:0]` output to the Semaphores module as an IPS sideband signal.

The state transitions for SEMA4\_GATEn are defined in the following table.

Table 4-20. SEMA4\_GATEn State Transitions

Current State	Next State	Transition	Description
-	idle	1	Any reset, whether a system reset or an individual gate reset, unconditionally forces the gate into the idle state.
idle	idle	2	Unless a write of the appropriate lock value from the corresponding processor occurs, the gate remains in the idle state.
idle	cp0_lock	3	When a write of the "cp0_lock" data value is initiated by processor 0, the gate transitions into the cp0_lock state.

Table continues on the next page...

**Table 4-20. SEMA4\_GATEn State Transitions  
(continued)**

Current State	Next State	Transition	Description
idle	cp1_lock	4	When a write of the "cp1_lock" value is initiated by processor 1, the gate transitions into the cp1_lock state.
cp0_lock	cp0_lock	5	Once in this state, the gate remains here if any attempted write is not from cp0 with the unlock data value.
cp0_lock	idle	6	The gate returns to the idle (unlocked) state once a write from cp0 with the unlock data value occurs.
cp1_lock	cp1_lock	7	Once in this state, the gate remains here if any attempted write is not from cp1 with the unlock data value.
cp1_lock	idle	8	The gate returns to the idle (unlocked) state once a write from cp1 with the unlock data value occurs.

#### 4.4.3.2 SEMA4\_CPnNTF Operation

The failed lock write notification interrupt request is implemented in a 3-bit, 5-state machine which records failed lock attempts and transitions based on gate locking and unlocking. Two specific states are encoded and program-visible as SEMA4\_CP0NTF[GNn] and SEMA4\_CP1NTF[GNn]. See the following figure.

**Figure 4-12. IRQ Notification State Machine**

The state transitions of the IRQ notification function are defined in the following. Specific states of this machine are program-visible as the SEMA4\_CPnNTF registers. In particular, two states are program-visible:

```

if state = wait4_cp0_lock (0b110) // generate cp0_semaphore_int if properly enabled
    then SEMA4_CP0NTF[Gn] = 1; else SEMA4_CP0NTF[Gn] = 0
if state = wait4_cp1_lock (0b101) // generate cp1_semaphore_int if properly enabled
    then SEMA4_CP1NTF[Gn] = 1; else SEMA4_CP1NTF[Gn] = 0
  
```

Table 4-21. IRQ Notification State Transitions

Current State	Next State	Transition	Description
–	idle	1	Any reset, including a system reset or an individual notification or secure gate reset, unconditionally forces the machine into the idle state.
idle	idle	2	Unless a write of the appropriate lock value from the corresponding processor to an already-locked gate occurs, the machine remains in the idle state.
idle	wait4_cp1_unlock	3	When a write of the "cp0_lock" data value is initiated by processor 0 but the gate is already locked by cp1, the machine transitions into this state, where it waits for cp1 to unlock the gate.
idle	wait4_cp0_unlock	4	When a write of the "cp1_lock" data value is initiated by processor 1 but the gate is already locked by cp0, the machine transitions into this state, where it waits for cp0 to unlock the gate.
wait4_cp1_unlock	wait4_cp1_unlock	5	Once in this state, the machine remains here until the gate is unlocked.
wait4_cp1_unlock	wait4_cp0_lock	6	From this state, the machine transitions into the next state, waiting for cp0 to lock the gate, once it has been unlocked.
wait4_cp0_unlock	wait4_cp0_unlock	7	Once in this state, the machine remains here until the gate is unlocked.
wait4_cp0_unlock	wait4_cp1_lock	8	From this state, the machine transitions into the next state, waiting for cp1 to lock the gate, once it has been unlocked.
wait4_cp0_lock	wait4_cp0_lock	9	In this state, the machine generates the notification interrupt (if properly-enabled) and remains here until the gate is locked by processor 0 or the gate is again locked by processor 1.
wait4_cp0_lock	wait4_cp1_unlock	10	In this state, the machine generates the notification interrupt (if properly-enabled) and transitions if the gate is again locked by processor 1. With this transition, the notification interrupt request is negated.
wait4_cp0_lock	idle	11	In this state, the machine generates the notification interrupt (if properly-enabled) and transitions if the gate is finally locked by processor 0. With this transition, the notification interrupt request is negated.
wait4_cp1_lock	wait4_cp1_lock	12	In this state, the machine generates the notification interrupt (if properly-enabled) and remains here until the gate is locked by processor 1 or the gate is again locked by processor 0.
wait4_cp1_lock	wait4_cp0_unlock	13	In this state, the machine generates the notification interrupt (if properly-enabled) and transitions if the gate is again locked by processor 0. With this transition, the notification interrupt request is negated.
wait4_cp1_lock	idle	14	In this state, the machine generates the notification interrupt (if properly-enabled) and transitions if the gate is finally locked by processor 1. With this transition, the notification interrupt request is negated.

The Semaphores module generates two interrupt request output signals, one per processor, combining the SEMA4\_CPnINE and SEMA4\_CPnNTF registers, where the boolean equations are:

```

cp0_semaphore_int
=   sema4_cp0ine[ine0]   &   sema4_cp0ntf[gn0]
  |   sema4_cp0ine[ine1]   &   sema4_cp0ntf[gn1]
  |   sema4_cp0ine[ine2]   &   sema4_cp0ntf[gn2]
  |   ...
  |   sema4_cp0ine[ine15]   &   sema4_cp0ntf[gn15]
cp1_semaphore_int
=   sema4_cp1ine[ine0]   &   sema4_cp1ntf[gn0]
  |   sema4_cp1ine[ine1]   &   sema4_cp1ntf[gn1]
  |   sema4_cp1ine[ine2]   &   sema4_cp1ntf[gn2]
  |   ...
  |   sema4_cp1ine[ine15]   &   sema4_cp1ntf[gn15]

```

#### 4.4.4 Initialization Information

The reset state of the IPS\_Semaphores module allows it to begin operation without the need for any further initialization. All the internal state machines are cleared by any reset event, allowing the module to immediately begin operation.

#### 4.4.5 Application Information

In an operational multi-core system, most interactions involving the Semaphores module involves reads and writes to the SEMA4\_GATE<sub>n</sub> registers for implementation of the hardware-enforced software gate functions. Typical code segments for gate functions perform the following operations:

- To lock (close) a gate
  - The processor performs a byte write of "logical\_processor\_number + 1" to gate[i]
  - The processor reads back gate[i] and checks for a value of "logical\_processor\_number + 1"

If the compare indicates the expected value, then the gate is locked; proceed with the protected code segment. If the compare does not indicate the expected value, the lock operation failed; repeat the process beginning with byte write to gate[i] in spin-wait loop, or proceed with another execution path and wait for failed lock interrupt notification.

A simple C-language example of a `gateLock` function is shown in the following figure. This function follows the Hennessy/Patterson example described in [Multi-Core Programming 101: Software Gates](#).

## Semaphore (SEMA4)

```
#define UNLOCK    0
#define CP0_LOCK 1
#define CP2_LOCK 2

void gateLock (n)
int  n;                /* gate number to lock */
{
    int i;
    int current_value;
    int locked_value;

    i = processor_number(); /* obtain logical CPU number */

    if (i == 0)
        locked_value = CP0_LOCK;
    else
        locked_value = CP1_LOCK;

    /* read the current value of the gate and wait until the state == UNLOCK */
    do {
        current_value = gate[n];
    } while (current_value != UNLOCK);

    /* the current value of the gate == UNLOCK. attempt to lock the gate for this
       processor. spin-wait in this loop until gate ownership is obtained */
    do {
        gate[n] = locked_value; /* write gate with processor_number + 1 */
        current_value = gate[n]; /* read gate to verify ownership was obtained */
    } while (current_value != locked_value);
}
```

**Figure 4-13. Sample gateLock Function**

- To unlock (open) a gate
  - After completing the protected code segment, the locking processor performs a byte write of zeroes to gate[i], opening (unlocking) the gate

A few comments on the logical CPU number are appropriate. In this example, a reference to `processor_number()` is used to retrieve this hardware configuration value. Typically, the logical processor numbers are defined by a hardwired input vector to the individual cores. The exact method for accessing the logical processor number varies by architecture. For PowerPC cores, there is a processor ID register (PIR) which is SPR 286 and contains this value. A single instruction can be used to move the contents of the PIR into a general-purpose register: `mf spr rx,286` where `rx` is the destination GPRn. Other architectures may support a specific instruction to move the contents of the logical processor number into a general-purpose register, e.g., `rdcpn rx` for a "read CPU number" instruction.

If the optional failed lock IRQ notification mechanisms are used, then accesses to the related registers (`SEMA4_CPnINE`, `SEMA4_CPnNTF`) are required. Note that there is no required negation of the failed lock write notification interrupt as the request is automatically negated by the Semaphores module once the gate has been successfully locked by the "failing" processor.

Finally, in the event a system state requires a software-controlled reset of a gate or IRQ notification register(s), accesses to the secure reset control registers (SEMA4\_RSTGT, SEMA4\_RSTNTF) are required. For these situations, it is recommended that the appropriate IRQ notification enable(s) (SEMA4\_CPnINE) bits be disabled *before* initiating the secure reset 2-write sequence to avoid any race conditions involving spurious notification interrupt requests.

## 4.4.6 Memory map and register definition

The Semaphores module provides an IPS programming model mapped to an SPP-standard on-platform 16 KB space. The description here specifies a dual-core configuration with 16 semaphore gates. All the register names are prefixed with "Sema4" as an abbreviation for the full module name.

The programming model is referenced using 8-, 16- and 32-bit accesses. Reads can use any reference size, while writes are generally restricted to the size of the register. Exceptions to the write size restrictions are detailed in the individual register descriptions. Attempted references using inappropriate access sizes, to undefined (reserved) addresses, or with a non-supported access type (for example, a write to a read-only register) generate an IPS error termination.

Finally, the programming model allocates space for a definition with up to 64 gates and up to 8 processor cores, even though this definition is considerably larger than any currently-planned module implementations. The number of gates and supported processor cores are independent; there is no relationship between these two system variables.

The 16 KB Semaphores programming model map is shown in the following table.

**SEMA4 memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

**4.4.6.1 Semaphores Gate 0 Register (SEMA4\_Gate00)**

Each semaphore gate is implemented in a 2-bit finite state machine, right-justified in a byte data structure. The hardware uses the bus master number in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. 16- and 32-bit writes to multiple gates are allowed, but the write data operand must only update the state of a single gate. A byte write data value of 0x03 is defined as "no operation" and does not affect the state of the corresponding gate

register. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes

Address: 30AC\_0000h base + 0h offset = 30AC\_0000h

Field	Description
6-7 GTFSM	<p>Gate Finite State Machine.</p> <p>Gate Finite State Machine. The hardware gate is maintained in a 3-state implementation-unlocked, locked by processor 0 or locked by processor 1. For more details, see <a href="#">SEMA4_GATEn Operation</a> .</p> <p><b>NOTE:</b> The state of the gate reflects the last processor that locked it, which can be useful during system debug.</p> <p>00 The gate is unlocked (free).                      01 The gate has been locked by processor 0.                      10 The gate has been locked by processor 1.                      11 This state encoding is never used and therefore reserved. Attempted writes of 0x03 are treated as "no operation" and do not affect the gate state machine.</p>

**4.4.6.5 Semaphores Gate 4 Register (SEMA4\_Gate04)**

Each semaphore gate is implemented in a 2-bit finite state machine, right-justified in a byte data structure. The hardware uses the bus master number in conjunction with the data patterns to validate all attempted write operations. Only processor bus masters can modify the gate registers. Once locked, a gate can (and must) be opened (unlocked) by the locking processor core.

Multiple gate values can be read in a single access, but only a single gate can be updated via a write operation at a time. 16- and 32-bit writes to multiple gates are allowed, but the write data operand must only update the state of a single gate. A byte write data value of 0x03 is defined as "no operation" and does not affect the state of the corresponding gate register. Attempts to write multiple gates in a single aligned access with a size larger than an 8-bit (byte) reference generate an error termination and do not allow any gate state changes

Address: 30AC\_0000h base + 4h offset = 30AC\_0004h

Attempted writes of 0x03 are treated as "no operation" and do not affect the gate state machine.

#### 4.4.6.17 Semaphores Processor n IRQ Notification Enable (SEMA4\_CPnINE)

The application of a hardware semaphore module provides an opportunity for implementation of helpful system-level features. An example is an optional mechanism to generate a processor interrupt after a failed lock attempt. Recall traditional software gate functions execute a spin-wait loop in an effort to obtain and lock the referenced gate. With this module, the processor that fails in the lock attempt could continue with other tasks and allow a properly-enabled notification interrupt to return its execution to the original lock function.

The optional notification interrupt function consists of two registers for each processor: an interrupt notification enable register (SEMA4\_CPnINE) and the interrupt request register (SEMA4\_CPnNTF). To support implementations with more than 16 gates, these registers can be referenced with aligned 16- or 32-bit accesses. For the SEMA4\_CPnINE registers, unimplemented bits read as zeroes, and writes are ignored.

Address: 30AC\_0000h base + 40h offset + (8d × i), where i=0d to 1d

**4.4.6.18 Semaphores Processor n IRQ Notification (SEMA4\_CPnNTF)**

The Semaphores module optionally allows the processor that fails in the lock attempt to continue with other tasks and allow a properly-enabled notification interrupt to return its execution to the original lock function rather than simply execute in a spin-wait loop.

The optional notification interrupt mechanism consists of two registers for each processor: an interrupt notification enable register (SEMA4\_CPnINE) and the read-only notification interrupt request register (SEMA4\_CPnNTF). To support implementations with more than 16 gates, these registers can be referenced with aligned 16- or 32-bit accesses. For the SEMA4\_CPnNTF registers, unimplemented bits read as zeroes.

The notification interrupt is generated via a unique finite state machine, one per hardware gate. This machine operates in the following manner:

1. When an attempted lock fails, the FSM enters a first state where it waits until the gate is unlocked.
2. Once unlocked, the FSM enters a second state where it generates an interrupt request to the “failed lock” processor.
3. When the “failed lock” processor succeeds in locking the gate, the IRQ is automatically negated and the FSM returns to the idle state. However, if the other processor again locks the gate, the FSM returns to the first state, negates the interrupt request, and then waits for the gate to be unlocked (again).

The notification interrupt request is implemented in a 3-bit, 5-state machine, where two specific states are encoded and program-visible as SEMA4\_CP0NTF[GNn] and SEMA4\_CP1NTF[GNn].

### SEMA4\_CPnNTF field descriptions

Field	Description
15 GN8	Gate 8 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 8. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
14 GN9	Gate 9 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 9. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
13 GN10	Gate 10 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 10. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
12 GN11	Gate 11 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 11. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
11 GN12	Gate 12 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 12. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
10 GN13	Gate 13 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 13. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
9 GN14	Gate 14 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 14. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
8 GN15	Gate 15 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 15. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
7 GN0	Gate 0 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 0. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
6 GN1	Gate 1 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 1. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
5 GN2	Gate 2 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 2. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
4 GN3	Gate 3 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 3. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
3 GN4	Gate 4 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 4. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
2 GN5	Gate 5 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 5. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
1 GN6	Gate 6 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 6. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .
0 GN7	Gate 7 Notification. This read-only field is a bitmap of the interrupt request notification from a failed attempt to lock gate 7. For more details, see <a href="#">SEMA4_CPnNTF Operation</a> .

### 4.4.6.19 Semaphores (Secure) Reset Gate n (SEMA4\_RSTGT)

Although the intent of the hardware gate implementation specifies a protocol where the locking processor must unlock the gate, it is recognized that system operation may require a reset function to re-initialize the state of any gate(s) without requiring a system-level reset.

To support this special gate reset requirement, the Semaphores module implements a "secure" reset mechanism which allows a hardware gate (or all the gates) to be initialized by following a specific dual-write access pattern. Using a technique similar to that required for the servicing of a software watchdog timer, the secure gate reset requires two consecutive writes with predefined data patterns from the same processor to force the clearing of the specified gate(s). The required access pattern is:

1. A processor performs a 16-bit write to the SEMA4\_RSTGT memory location. The most significant byte (SEMA4\_RSTGT[RSTGDP]) must be 0xe2; the least significant byte is a "don't\_care" for this reference.
2. The same processor then performs a second 16-bit write to the SEMA4\_RSTGT location. For this write, the upper byte (SEMA4\_RSTGT[RSTGDP]) is the logical complement of the first data pattern (0x1d) and the lower byte (SEMA4\_RSTGT[RSTGTN]) specifies the gate(s) to be reset. This gate field can specify a single gate be cleared, or that all gates are cleared.
3. Reads of the SEMA4\_RSTGT location return information on the 2-bit state machine (SEMA4\_RSTGT[RSTGSM]) which implements this function, the bus master performing the reset (SEMA4\_RSTGT[RSTGMS]) and the gate number(s) last cleared (SEMA4\_RSTGT[RSTGTN]). Reads of the SEMA4\_RSTGT register do not affect the secure reset finite state machine in any manner.

Address: 30AC\_0000h base + 100h offset = 30AC\_0100h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	RSTGTN								RSTGSM_RSTGMS_RSTGDP							
Write	RSTGTN								RSTGSM_RSTGMS_RSTGDP							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### SEMA4\_RSTGT field descriptions

Field	Description
15–8 RSTGTN	Reset Gate Number. This 8-bit field specifies the specific hardware gate to be reset. This field is updated by the second write.  If RSTGTN < 64, then reset the single gate defined by RSTGTN, else reset all the gates. The corresponding secure IRQ notification state machine(s) are also reset.
RSTGSM_ RSTGMS_ RSTGDP	<b>NOTE:</b> This field contains subfields that vary depending on whether it is being read or written. Sub-fields indicated as having read access are valid only for read operations. Sub-fields indicated as having

*Table continues on the next page...*

**SEMA4\_RSTGT field descriptions (continued)**

Field	Description		
	write access are valid only for write operations. Bit numbering in the descriptions begins with the most significant bit numbered 0. See the following table for details.		
	<b>Access</b>	<b>Sub-Field</b>	<b>Description</b>
	Read-Only	7-6 Reserved	Reserved. Always reads 0.
		5-4 RSTGSM	Reset Gate Finite State Machine. Reads of the SEMA4_RSTGT register return the encoded state machine value. The reset state machine is maintained in a 2-bit, 3-state implementation, defined as: 00 Idle, waiting for the first data pattern write. 01 Waiting for the second data pattern write. 10 The 2-write sequence has completed. Generate the specified gate reset(s). After the reset is performed, this machine returns to the idle (waiting for first data pattern write) state. Note that the RSTGSM = 0b10 state is valid for only a single machine cycle, so it is impossible for a read to return this value 11 This state encoding is never used and therefore reserved.
		3 Reserved	Reserved. Always reads 0.
		2-0 RSTGMS	Reset Gate Bus Master. This 3-bit read-only field records the logical number of the bus master performing the gate reset function. The reset function requires that the two consecutive writes to this register be initiated by the same bus master to succeed. This field is updated each time a write to this register occurs. The association between system bus master port numbers, the associated bus master device and the logical processor number is SoC-specific. See the chip configuration chapter for this information.
	Write-Only	7-0 RSTGDP	Reset Gate Data Pattern. This write-only field is accessed with the specified data patterns on the two consecutive writes to enable the gate reset mechanism. For the first write, RSTGDP = 0xe2 while the second write requires RSTGDP = 0x1d.

**4.4.6.20 Semaphores (Secure) Reset IRQ Notification (SEMA4\_RSTNTF)**

As with the case of the secure reset function and the hardware gates, it is recognized that system operation may require a reset function to re-initialize the state of the IRQ notification logic without requiring a system-level reset.

To support this special notification reset requirement, the Semaphores module implements a "secure" reset mechanism which allows an IRQ notification (or all the notifications) to be initialized by following a specific dual-write access pattern. When successful, the specified IRQ notification state machine(s) are reset. Using a technique

similar to that required for the servicing of a software watchdog timer, the secure reset mechanism requires two consecutive writes with predefined data patterns from the same processor to force the clearing of the IRQ notification(s). The required access pattern is:

1. A processor performs a 16-bit write to the SEMA4\_RSTNTF memory location. The most significant byte (SEMA4\_RSTNTF[RSTNDP]) must be 0x47; the least significant byte is a "don't\_care" for this reference.
2. The same processor then performs a second 16-bit write to the SEMA4\_RSTNTF location. For this write, the upper byte (SEMA4\_RSTNTF[RSTNDP]) is the logical complement of the first data pattern (0xb8) and the lower byte (SEMA4\_RSTNTF[RSTNTN]) specifies the notification(s) to be reset. This field can specify a single notification be cleared, or that all notifications are cleared.
3. Reads of the SEMA4\_RSTNTF location return information on the 2-bit state machine (SEMA4\_RSTNTF[RSTNSM]) which implements this function, the bus master performing the reset (SEMA4\_RSTNTF[RSTNMS]) and the notification number(s) last cleared (SEMA4\_RSTNTF[RSTNTN]). Reads of the SEMA4\_RSTNTF register do not affect the secure reset finite state machine in any manner.

Address: 30AC\_0000h base + 104h offset = 30AC\_0104h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

The reset function requires that the two consecutive writes to this register be initiated by the same bus master to succeed. This field is updated each time a write to this register occurs. The association between system bus master port numbers, the associated bus master device and the logical processor number is SoC-specific. See the chip configuration chapter for this information.	
Write-Only	7-0 RSTNDP	Reset Notification Data Pattern. This write-only field is accessed with the specified data patterns on the two consecutive writes to enable the notification reset mechanism. For the first write, RSTNDP = 0x47 while the second write requires RSTNDP = 0xb8.	

## 4.5 On-Chip RAM Memory Controller (OCRAM)

### 4.5.1 Overview

There is 1 OCRAM controller implemented in i.MX 6UltraLite. One controller is for the 128KB on-chip RAM.

Various options are provided for adding a pipeline or wait-states in a read/write access, in order to ensure flexible timing control at both high and low frequencies.

The internal block diagram is shown in the figure below.

**Figure 4-14. On-chip RAM Block Diagram**

### 4.5.2 Basic Functions

### 4.5.2.1 Read/Write Arbitration

The detailed rules used in arbitration are as follows:

- If there is no granted read or write in the last cycle, and there is only a read request or a write request, the request will be granted.
- If there is no granted read or write in the last cycle, and there are both read or write requests coming in at the same time, the read request will be granted first.
- If a granted read/write transaction has just finished, the write/read request will have the higher priority in the next cycle.
- If the first read/write access request in a transaction is granted, all the data transfer in this burst will be finished before the next arbitration begins, that is, the round-robin arbitration mechanism is based on AXI transaction, not data access.

### 4.5.3 Advanced Features

This section describes some advanced features designed to avoid timing issues when the on-chip RAM is working at high frequency.

#### 4.5.3.1 Read Data Wait State

When the wait state is enabled, it will take 2 cycles for each read access (each beat of a read burst).

This can avoid the potential timing problem caused by the longer memory access time at higher frequency.

When this feature is disabled, it only takes 1 clock cycle to finish a read transaction. That is, read data is available in the next cycle of read request becomes valid on the bus.

#### 4.5.3.2 Read Address Pipeline

When this feature is enabled, the read address from the AXI master is delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issues for the read access on the memory cell at high frequency. Enabling this feature can cost, at most, 1 more clock cycle for each AXI read transaction, that is, at most 1 more clock cycle for each read burst with multiple beats of data.

When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).

### 4.5.3.3 Write Data Pipeline

When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle).

### 4.5.3.4 Write Address Pipeline

When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would take at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle).

## 4.5.4 Programmable Registers

There are no programmable registers in this block;

## 4.6 Network Interconnect Bus System (NIC-301)

### 4.6.1 Overview

This section provides an overview of the NIC-301 (Network Inter-Connect) AXI arbiter IP.

The NIC-301 (by ARM Ltd.) is a configurable AXI arbiter between several masters and slaves. The NIC-301 IP is designed so that many configuration options are selected at the hardware design stage, determined by SoC characteristics and needs, while several other configuration options are software-controlled.

This chapter covers in brief the NIC-301 functionality, while providing configuration details on the NIC-301 instances used in the chip. For complete details on the NIC-301 design, see the ARM specification, *AMBA® Network Interconnect (NIC-301) Technical Reference Manual, version r2p3*.

#### NOTE

The NIC-301 default settings are configured by Freescale's board support package (BSP), and in most cases should not be modified by the customer. The default settings have gone through exhaustive testing during the validation of the part, and have proven to work well for the part's intended target applications. Changes to the default settings may result in a degradation in system performance.

#### 4.6.1.1 Block diagram

The NIC-301 AXI arbiter (or "CoreLink Network Interconnect") by ARM, provides configurable AXI-based interconnect logic, for connecting a number of masters (initiators) to several slaves (targets), via a configurable bus switches and bridging components.

The bus system is composed of

Each instance can include one or more bus switches, with additional logic.

This chapter provides details of the various instances and the selected configuration parameters.

The top level diagram of the bus system is shown in the following figure.

### 4.6.1.2 NIC-301 Main Features

Key features of the NIC-301 module include the following:

- Address space memory mapping, including 'remap' functions.
- Programmer's view, for software-configured parameters, via "GPV" ports.
- Support for cross-clock domain synchronization.

### 4.6.1.3 Modes and Operations

The NIC-301 supports a normal functional mode only.

## 4.6.2 External Signals

There are no external I/O interfaces for NIC-301 .

## 4.6.3 Memory Map and Register Definition

This section includes the block memory map and detailed register descriptions.

Access to NIC-301 registers is provided through the global programmer's view (GPV) ports. Each GPV port provides access to the configuration registers of certain IP . The GPV base addresses are listed in the table below:

### 4.6.3.1 Memory Map

The NIC-301 memory map, is dependent on the selected configuration option at time of creation.

A "template" map is provided in [Table 4-22](#) below.

### 4.6.3.2 Configuration programmers model

The GPV's contain configuration registers, partitioned into a number of individual 4KB blocks.

The general structure of the registers is provided by the following tables:

- Address map of the programmers model, [Table 4-22](#)
- AMIB Registers, [Table 4-23](#)
- ASIB Registers, [Table 4-24](#)

**Table 4-22. Address map of the programmers model**

Address Offset from Base Address	Registers	Notes
0x000F_F000	Internal interface p registers	Maximum p = 61 Note <sup>1</sup>
	...	
0x000C_4000	Internal interface 2 registers	
0x000C_3000	Internal interface 1 registers	
0x000C_2000	Internal interface 0 registers	
0x000C_1000	Slave interface m registers	Maximum m = 127 Note <sup>2</sup>
	...	
0x0004_4000	Slave interface 2 registers	
0x0004_3000	Slave interface 1 registers	
0x0004_2000	Slave interface 0 registers	
0x0004_1000	Master interface n registers	Maximum n = 63 Note <sup>3</sup>
	...	
0x0000_4000	Master interface 2 registers	
0x0000_3000	Master interface 1 registers	
0x0000_2000	Master interface 0 registers	
0x0000_1000	ID registers	
0x0000_0000	Address control registers	Configurable base address <sup>4</sup>

1. Index refers to BI registers index
2. Index refer to ASIB registers index
3. Index refer to AMIB registers index
4. Reserved for internal use

#### 4.6.3.2.1 Address control and ID registers

Registers at offsets 0x0–0xFFC are reserved for internal use.

#### 4.6.3.2.2 AMBA master interface block (AMIB) configuration registers

The table below lists only the registers that affect the user. All other addresses are treated as "reserved". Non-implemented or reserved addresses inside NIC domains are read as ZEROS and writes operations are ignored.

**Table 4-23. AMIB Registers**

Offset	Register	Access	Width	Reset Value
0x024	fn_mod2	RW	1	0

*Table continues on the next page...*

**Table 4-23. AMIB Registers (continued)**

Offset	Register	Access	Width	Reset Value
	Bypass merge. This register is only present if upsizing or downsizing. See upsizing/downsizing data width functions in AMBA Network Interconnect TRM.			
0x040	wr_tidemark	RW	4	Note <sup>1</sup>

1. Reset value varies, default value chosen at RTL creation time is designed to suit normal operation.

#### 4.6.3.2.3 ASIB (AMBA slave interface block) configuration registers

The table below lists only the registers that affect the user. All other addresses are treated as "reserved". Non-implemented or reserved addresses inside NIC domains are read as ZEROS and writes operations are ignored.

**Table 4-24. ASIB Registers**

Offset	Register	Access	Width	Reset Value
0x040	wr_tidemark Valid only for AXI slaves with WFIFO >=4.	RW	1	Note <sup>1</sup>
0x100	read_qos	RW	4	Note <sup>2</sup>
0x104	write_qos	RW	4	Note <sup>2</sup>

1. Reset value varies, default value chosen at RTL creation time is designed to suit typical operation cases.
2. QoS default is set at RTL creation time, and is listed in specific NIC-301 configuration tables in [NIC-specific parameters](#), as parameters "QoS qv\_value" in ASIB / AMIB parameter tables.

#### 4.6.3.3 Register Descriptions

The NIC-301 registers are dependent upon the selected configuration, the type of ports, hardware-selected features and whether they have a GPV view. The addressing is associated to a specific port, by looking at the port's index number, under "apb\_slave" column.

The memory map template is provided in the [Configuration programmers model](#) above.

## 4.7 AHB to IP Bridge (AIPSTZ)

### 4.7.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

#### 4.7.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 64-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. Access permissions are based on bus master (e.g. DMA or core) privilege levels and resource domain. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

### 4.7.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 4-25. AIPSTZ Clocks**

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

### 4.7.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has three separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, n-2, and n-3 for AIPS-1, AIPS-2, and AIPS-3 respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 64-Kbyte boundaries. Each IPS peripheral is allocated one 64-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 64-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 64-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

The AIPSTZ prevents access to a peripheral if the transaction originated from a source from a resource domain that has been explicitly omitted. Resource domains are assigned in the RDC submodule. Please refer to the RDC chapter for programming details.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

#### **4.7.4 Access Protections**

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

Masters and peripherals are assigned to one or more resource domains in the RDC submodule (see the RDC chapter for details). Depending on RDC programming, masters transactions through the AIPSTZ may or may not be allowed access to peripherals in different resource domains.

#### **4.7.5 Access Support**

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

## 4.7.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ\_MPRs), the Peripheral Access Control registers (AIPSTZ\_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ\_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

### 4.7.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

**Table 4-26. Peripheral Access Configuration options**

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec\_config\_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 4-26](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

```
sec_config_0 [7:0] = 8'b0011_0011
```

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

**Table 4-27. Security Levels**

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu\_sec\_level[2:0]' corresponding to each peripheral X.

### 4.7.7 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

**AIPSTZ memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
0	Master Priviledge Registers (AIPSTZ_MPR)	32	R/W	7700_0000h	<a href="#">4.7.7.1/371</a>

*Table continues on the next page...*

## AIPSTZ memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
40	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR)	32	R/W	4444_4444h	<a href="#">4.7.7.2/373</a>
44	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR1)	32	R/W	4444_4444h	<a href="#">4.7.7.3/377</a>
48	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR2)	32	R/W	4444_4444h	<a href="#">4.7.7.4/380</a>
4C	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR3)	32	R/W	4444_4444h	<a href="#">4.7.7.5/383</a>
50	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR4)	32	R/W	4444_4444h	<a href="#">4.7.7.6/386</a>

#### 4.7.7.1 Master Privilege Registers (AIPSTZ\_MPR)

Each AIPSTZ\_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 4-28](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 4-29](#).

**Table 4-28. MPROT Field**

Bit	Field	Description
3	MBW	<b>Master Buffer Writes</b> - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	<b>Master Trusted for Reads</b> - This bit determines whether the master is trusted for read accesses.
1	MTW	<b>Master Trusted for Writes</b> - This bit determines whether the master is trusted for write accesses.
0	MPL	<b>Master Privilege Level</b> - This bit determines how the privilege level of the master is determined.

#### NOTE

The reset value is set to 0000\_0000\_7700\_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

**Table 4-29. Master Index Allocation**

Master Index	Master Name	Comments
Master 0	All masters excluding ARM core	Share the same number allocation.
Master 1	ARM A7 CORE	
Master 3	SDMA	

Address: 0h base + 0h offset = 0h

#### 4.7.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZ\_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ\_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ\_OPACR has the following format shown in [Table 4-30](#)

**Table 4-30. OPAC Field**

Bit	Field	Description
3	BW	<b>Buffer Writes</b> - This bit determines whether write accesses to this peripheral are allowed to be buffered. <sup>1</sup>

*Table continues on the next page...*

**Table 4-30. OPAC Field (continued)**

Bit	Field	Description
2	SP	<b>Supervisor Protect</b> - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	<b>Write Protect</b> - This bit determines whether the peripheral allows write accesses.
0	TP	<b>Trusted Protect</b> - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

Address: 0h base + 40h offset = 40h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 4.7.7.4 Off-Platform Peripheral Access Control Registers (AIPSTZ\_OPACR2)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ\_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ\_OPACR has the following format shown in [Table 4-30](#)

Address: 0h base + 48h offset = 48h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 4.8 Shared Peripheral Bus Arbiter (SPBA)

### 4.8.1 Overview

The Shared Peripheral Bus Arbiter (SPBA) is a three-to-one IP Bus interface arbiter. Three masters arbitrate for shared peripheral access through the SPBA.

The SPBA has three primary functions:

- The IP Bus Line switches a master to one peripheral
- The Masters arbiter arbitrates between the three masters to solve concurrent access or restricted access to peripherals
- The Control Registers and Ownership Control includes a set of registers which are reachable through software and permit the access scheme to be defined for each peripheral (Resource Ownership and Access Control). It generates signals for the external steering logic of interrupts and DMA signals.

The figure below shows the SPBA block diagram

Figure 4-15. SPBA Block Diagram

### 4.8.1.1 Features

The SPBA includes the following features:

- Three IP Bus masters arbitration: Master A, B and C
- Support for DMA masters
- 32-bit data
- Supports up to 31 shared peripherals, each consuming 64 kilobytes of address space
- SPBA can be considered the 32nd peripheral, used for resource ownership and access control of the 31 peripherals
- Provides 31 sets of out of band steering control (OBSC) signals to the off-block steering logic
- Operating frequency up to 67 MHz
- Clocks: ipg\_clk, ipg\_clk\_s

### 4.8.1.2 Modes of operation

SPBA behavior is transparent when accessing a peripheral, though it has these distinct modes of operation.

#### Reset/Abort

The SPBA has a hardware reset which initializes all registers, arbitration and peripherals rights registers (PRRs).

An abort signal input is provided allowing each master to abort its current access and release ownership (in case of master reset sequence).

#### Functional

Once a master request is granted, its IP Bus signals are steered to the requested peripheral.

#### Standby

No clock needed. The SPBA needs clocks only during access to the PRRs, arbitration, and abort phases. It generates two clock enable signals indicating when the clocks must be provided.

#### Configuration

During this phase, a master accesses the SPBA PRRs. The SPBA memory-mapped registers are seen as a shared peripheral.

## 4.8.2 Clocks

The table found here describes the clock sources for SPBA.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 4-31. SPBA Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 4.8.3 Functional description

### 4.8.3.1 Masters arbitration

The arbitration mechanism determines which port will control the master port, based on a simple round-robin arbitration scheme.

There are several use cases to consider.

- Only one master request per access. The master is switched to the shared peripheral bus, without arbitration. [Figure 4-16](#) shows the MB request on the global module enable signal, served without wait state.
- If two masters simultaneously access SPBA, the last granted master is held off using the <master>\_ips\_xfr\_wait output signal (default value is high). When the master is granted sips\_xfr\_wait, shared IP Bus peripheral is connected to <master>\_ips\_xfr\_wait outputs.
- If three masters simultaneously access SPBA, then the last two granted masters are held off using <master>\_ips\_xfr\_wait. [Figure 4-17](#) shows a case in which the last two accesses granted are MA and MB. The requests are used even if they are in the same cycle.
- If after reset, at the first multiple access, no master has been granted, the priority is static: Master A (MA), Master B (MB) and last Master C (MC) port.
- No master request. No master switch to shared peripherals.

**Figure 4-16. Example of one master request, no SPBA arbitration**

The following figure assumes MA and MB have been the last two masters granted in the previous transfers (MA then MB).

## Shared Peripheral Bus Arbiter (SPBA)

**Figure 4-17. Example of three master requests: Masters already granted are "waited";**

## 4.8.4 Resource ownership control

The resource ownership control regulates access to the shared peripherals and determines the steering of out-of-band signals.

### 4.8.4.1 Access control

### 4.8.4.1.1 Peripheral access

The peripheral access (resource access) of the requesting master is given by the corresponding RAR bit of the Peripheral Right Register. It determines if the master has access privilege to the resource.

Any attempt at access made by a requesting master whose access privilege bit is not set (in the PRR) is terminated with a bus error (<master>\_ips\_xfr\_err is asserted by SPBA logic). The master that owns the resource can lock the peripheral for itself and/or grant other masters access to the peripheral by setting the appropriate bit(s) in the RAR field.

Master B is taking ownership of peripheral 2 by writing 3'b010 in the SPBA peripheral 2 right register (rarfield)  
 This ownership can be checked on obsc2 output as roi2[1:0] = 2'b10 and rar2[2:0] = 3'b010  
 (obsc[4:0] = {roi2[1], roi2[0], rar2[2], rar2[1], rar2[0]})

**Figure 4-18. Example of one master B gaining ownership of peripheral 2**

### 4.8.4.1.2 Peripheral Right Register access

The ROI bits of the Peripheral Right Register (PRR) determine which master is allowed to make write access to PRR. The identification of the requesting master is compared to the ROI bits of the PRR to determine if the master has ownership of the corresponding register.

Any attempted write access to a PRR already owned by another master will be ignored.

### 4.8.4.2 Owner election

When the peripheral is not owned by any master (ROI="00", after coming out of reset for instance), the first master to perform successfully a write to the RAR bits of the PRR is granted ownership of the peripheral and its associated PRR.

After writing to the PRR (RAR bit(s)), the master must read it back to make sure that it was granted ownership. If the RMO field is 2'b11, then the ownership claim is successful. If RMO is 2'b10, another master claimed ownership before this master was able to complete its write. This resolves the case in which two or more masters attempt to write the PRR at the same time; only the first master will be granted ownership. However all masters must read the PRR to determine if this case occurred, and if so, whether they were the first master which was granted ownership.

#### NOTE

A master that has been granted ownership of the PRR does not automatically have the right access to the peripheral; it must still set its own RAR bits in the PRR to access the peripheral.

### 4.8.4.3 Ending ownership

Ownership may be voluntarily ended by the owning master, or automatically upon assertion of a master-specific dead\_owner signal.

The former is appropriate for software-controlled yielding of ownership. The latter is appropriate for automatic yielding of ownership when the owner has gone into reset.

When a master is reset, it clears the ROI bits of the PRRs owned by the corresponding master. When the owner is dead (in reset), all peripherals previously owned by that master must be changed to the un-owned state.

#### NOTE

It is the programmer's responsibility to make sure the peripherals are placed in an appropriate state before ending ownership.

#### 4.8.4.3.1 Software Controlled Ownership Ending

The ROI bits will be automatically cleared when the master that owns the PRR access right clears (write) the RAR bits ([Table 2](#)).

It will then end the ownership of the PRR.

#### 4.8.4.4 The Un-owned State

During the time when the peripheral is un-owned (i.e the ROI field contains all 0's), all masters have full access to it (RAR bits can then be modified by a master if ROI[1:0] = 2'b0).

In such cases it is necessary for software to ensure any necessary coherency in the resource, there is no hardware protection.

#### 4.8.5 SPBA Memory Map/Register Definition

The SPBA control registers (Peripheral Right Registers) are mapped as a virtual shared peripheral.

SPBA can support up to 31 shared peripherals. Each of them has its own Peripheral Right Register (PRR) accessible within the SPBA memory-mapped registers, and consists of the Requesting Master Owner, the Resource Owner ID and the Resource Access Right fields.

**SPBA memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 4.8.5.1 Peripheral Rights Register (SPBA\_PRRn)

This register controls master ownership and access for a peripheral.

Address: 308F\_0000h base + 0h offset + (4d × i), where i=0d to 31d

**SPBA\_PRRn field descriptions**

Field	Description
31–30 RMO	Requesting Master Owner. This 2-bit register field indicates if the corresponding resource is owned by the requesting master or not. This register is reset to 2'b0 if ROI = 2'b0.  00 <b>UNOWNED</b> — The resource is unowned. 01 Reserved. 10 <b>ANOTHER_MASTER</b> — The resource is owned by another master. 11 <b>REQUESTING_MASTER</b> — The resource is owned by the requesting master.
29–18 -	This field is reserved. Reserved
17–16 ROI	Resource Owner ID. This field indicates which master (one at a time) can access to the PRR for rights modification. This is a read-only register.  After reset, ROI bits are cleared ("00" -> un-owned resource).

*Table continues on the next page...*

SPBA\_PRR<sub>n</sub> field descriptions (continued)

Field	Description
	<p>A master performing a write access to the an un-owned PRR will get its ID automatically written into ROI, while modifying RARx bits. It can then read back the RMO, RAR, ROI bits to make sure RMO returns the right value, ROI bits contain its ID and RARx bits are correctly asserted. Then no other master (whom ID is different from the one stored in ROI) will be able to modify RAR fields.</p> <p>Owner master of a peripheral can assert its dead_owner signal, or write 1'b0 in the RARx to release the ownership (ROI[1:0] reset to 2'b0).</p> <p>00 <b>UNOWNED</b> — Unowned resource.  01 <b>MASTER_A</b> — The resource is owned by master A port.  10 <b>MASTER_B</b> — The resource is owned by master B port.  11 <b>MASTER_C</b> — The resource is owned by master C port.</p>
15–3 -	This field is reserved. Reserved
2 RARC	<p>Resource Access Right. Control and Status bit for master C.</p> <p>This field indicates whether master C can access the peripheral. From 0 up to 3 masters can have permission to access a resource (all the master can be granted on a peripheral, but only one access at a time will be granted by SPBA).</p> <p>0 <b>PROHIBITED</b> — Access to peripheral is not allowed.  1 <b>ALLOWED</b> — Access to peripheral is granted.</p>
1 RARB	<p>Resource Access Right. Control and Status bit for master B.</p> <p>This field indicates whether master B can access the peripheral. From 0 up to 3 masters can have permission to access a resource (all the master can be granted on a peripheral, but only one access at a time will be granted by SPBA).</p> <p>0 <b>PROHIBITED</b> — Access to peripheral is not allowed.  1 <b>ALLOWED</b> — Access to peripheral is granted.</p>
0 RARA	<p>Resource Access Right. Control and Status bit for master A.</p> <p>This field indicates whether master A can access the peripheral. From 0 up to 3 masters can have permission to access a resource (all the master can be granted on a peripheral, but only one access at a time will be granted by SPBA).</p> <p>0 <b>PROHIBITED</b> — Access to peripheral is not allowed.  1 <b>ALLOWED</b> — Access to peripheral is granted.</p>

## 4.9 ROM Controller with Patch (ROMCP)

### 4.9.1 Overview

The Read Only Memory Controller with ROM Patch (ROMC) acts as an interface between the ARM advanced high-performance bus (AHB - Lite) and the Read Only Memory. The ROMC consists of a ROM Controller and a ROM Patch. The ROM Patch

is used to either patch code routines or fix data tables in the ROM area. There is an IP Bus interface to access the ROM Patch Registers . The figure below depicts the main functional sub-blocks of the ROMC.

**Figure 4-19. ROMC Block Diagram**

**4.9.1.1 Features**

- Supports ROM size ranges from 16 Kbyte up to 4 Mbyte with increments of 1 Kbyte
- Supports opcode patching for a maximum of 16 different addresses in 4 Mbytes of ROM space
- Supports one-word data fixes for a max of 8 memory locations in 4 Mbytes of ROM space
- Supports patching of the Reset Vector (at 0x0000\_0000) to allow external booting

### 4.9.1.2 Modes of Operation

There are two modes of operation: normal mode and BIST mode. In normal mode, the ROMC ensures correct reads from the ROM, assuming the memory complies with the characteristics and requirements for which the ROMC was designed.

#### 4.9.1.2.1 Low Power Mode

There are two clock enables that are used to switch off parts of the ROMC logic when inactive. The first clock enable is used to disable the ROM Controller when the master connected to the AHB interface is not initiating a read to the ROM. The second clock enable is used to disable the registers used to program the ROM patch feature when the registers are not being accessed.

## 4.9.2 Clocks

The table found here describes the clock sources for ROMCP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 4-32. ROMCP Clocks**

Clock name	Clock Root	Description
hclk	ahb_clk_root	System / bus clock
hclk_reg	ipg_clk_root	System access clock
96krom_CLK	ahb_clk_root	ROM clock

## 4.9.3 Memory Map

### 4.9.3.1 ROM Memory Map in detail

The ROMC supports ROM sizes with a range of 16 Kbyte to 4 Mbyte with an increment of 1 Kbyte. The 16 Kbyte lower limit was chosen because the minimum size of security code on an ARM platform is approximately 16 Kbyte of code, which is only accessible in supervisor mode. Note that it is the MMU that controls whether any region of memory is secure.

The exception vectors must be secured as well, and must be put in the same area as the security code. Since they must reside at address 0x0000\_0000, the entire 16 Kbyte of ROM which can only be accessible in supervisor mode is located at the very beginning of the platform memory map.

If the user chooses not to use the security code, a memory size smaller than 16 Kbyte can be connected to the platform (minimum of 1 Kbyte). The MMU can be programmed to allow any kind of access into this memory. However, if the ROM size is less than 16 Kbyte, memory aliasing will occur for all invalid addresses greater than the memory size but within the 16 Kbyte of space.

For ROM sizes bigger than 16 Kbyte, the rest of its physical size resides at the address starting at 0x0040\_4000 (4 M+16 Kbyte) going up to [0x0040\_4000 + (mem. size - 16Kbyte)]. .

### 4.9.4 Functional Description

This section is divided up into the ROM Controller Functional Description and the ROMC functional description.

#### 4.9.4.1 ROM Controller (ROMC) Functional Description

##### 4.9.4.1.1 Functionality overview

The ROMC serves two main functions. First, as an interface between the AHB-Lite bus on an ARM platform and the ROM. Second, it drives and receives several signals for the BIST engine. In normal mode of operation, the ROMC monitors the AHB-Lite for memory access requests and performs the memory operation to the ROM.

The ROMC includes the option to wait state all accesses from either the ARM or non-ARM masters to ROM in the event that timing requirements will not allow single HCLK clock cycle reads. If a wait state is required, the static inputs `rom_wait_arm` or `rom_wait_alt_mstr` can be set to 1 and accesses will take two HCLK clock cycles. If wait states are not required, `rom_wait_arm` or `rom_wait_alt_mstr` can be set to 0 and accesses will take one HCLK clock cycle to complete.

#### 4.9.4.2 ROMC Functional Description

### 4.9.4.2.1 ROMC Disabling

All the bits in the ROMC\_ROMPATCHENL register are cleared on Reset, disabling all the address comparators. Once the comparators have been enabled, the ROMC functions of data fixing and opcode patching can be quickly disabled by setting the DIS bit in the ROMC\_ROMPATCHCNTL register. This bit is used to enable secure operations in which patching functions need to be disabled. This bit is cleared on Reset.

### 4.9.4.2.2 ROMC Event Priority

The ROMC has a total of 16 address comparators. The first 8 (0 through 7) comparators can be programmed for the data fixing function (through the 8 data fix enable bits in the ROMC\_ROMPATCHCNTL register) while the rest are for opcode patching by default. This allows for potential multiple matching events involving both data fixing and opcode patch types. In these cases the ROMC assigns the highest priority to a data fixing event.

For example, if the ROMC is set up to data fix a certain address with comparator 4 and also opcode patch the same address with comparator 7, it will let comparator 4 have higher priority in indicating a match, and data from ROMC\_ROMPATCHD4 will be put on the rompatch\_romc\_hrdata bus as the override value.

If multiple address matches of the same type level occur concurrently, then the ROMC will choose the source number based on the one with the highest source number. For example, the ROMC is setup to data fix the same location with address comparators 4 and 7, then address comparator 7 will have higher priority in indicating a match, and the value from ROMC\_ROMPATCHD7 will be put on the rompatch\_romc\_hrdata bus as the override value. The same priority applies for an opcode patch event, except the override data is in the form of an SWI instruction with the comment field set to the source number with the highest priority.

### 4.9.4.2.3 Data Fixing

The data fixing feature allows ROM data to be updated by direct replacement when it is being read. This data usually originates from data tables, but can include ARM instructions. To enable data fixing on a certain address, this address value is written in to one of the first eight (0 through 7) of ROMC\_ROMPATCHAxx registers and the same numbered bit set in the ROMC\_ROMPATCHENL and ROMC\_ROMPATCHCNTL registers. The data to be used for replacement is placed in the corresponding ROMC\_ROMPATCHDxx.

The ROMC looks for a read access to ROM (either code fetch or data load) by snooping the AHB interface for read transactions. The address is compared with the values stored in the ROMC\_ROMPATCHAxx[22:2] registers. If a match occurs from one of the

comparators, the ROMC places the value in the corresponding ROMC\_ROMPATCHD<sub>xx</sub> register on the read data bus by overriding the read data coming from the actual ROM (see the mux in [Figure 4-19](#)). The value on the read data bus is maintained until hready is asserted to terminate the access. In data fixing, the entire word is replaced so if a byte or half-word access occurs on a "data fix" location, the entire data word is replaced. The word being replaced is word aligned. (The two LSBs of the matching ROMC\_ROMPATCHA<sub>xx</sub> are ignored in the data fix operation.)

#### 4.9.4.2.4 Opcode Patching

The opcode patch feature provides the ARM core a mechanism to fetch updated versions of code routines that were originally programmed in ROM. This patching mechanism makes use of the SWI (software interrupt instruction) and a table of function pointers residing in writable memory. The opcode being patched is replaced with a SWI instruction by the ROMC. Subsequent processing of the SWI reads from a function pointers table to obtain the address of the replacement code. Execution resumes with this code patch.

To enable opcode patching of a certain address, this address value is written into one of the ROMPATCHA<sub>xx</sub> registers and the corresponding bit set in the ROMPATCHENL to enable the associated comparator. The register's LSB (ROMC\_ROMPATCH<sub>xx</sub>[0]) should be set if THUMB mode patching is in effect for this address. The ROMC identifies a ROM read access by snooping the AHB interface. The address is compared with the values stored in the ROMC\_ROMPATCHA<sub>xx</sub>[22:2] registers. If a match occurs from one of the comparators, the ROMC generates the opcode of a software interrupt (SWI) instruction with the comment field containing the number of the matching address comparator. This opcode and comment is placed on the read data bus until hready is asserted by the ROM controller to terminate the read access.

The type of SWI generated, (that is, either ARM or THUMB), is determined by the LSB of the ROMC\_ROMPATCHA<sub>xx</sub> register associated with the opcode patch. This bit is cleared for ARM mode (32 bits). The ROMC generates a 32-bit SWI (opcode field is 0xEF, occupying bits [31:24] of the word), with the least significant 5 bits of the 24-bit comment field (bits [23:0]) containing the number of the matching address comparator. The rest of the comment field is filled with zeros. This means that the ROMC will use 16 of the 16777216 possible software interrupts. The ROMC overrides the read data from the ROM.

If the LSB of the matching ROMC\_ROMPATCHA<sub>xx</sub> register is set, the opcode patch is in THUMB mode (16 bits or half word). The ROMC generates a 16-bit SWI instruction (opcode field is 0xDF, occupying bits [15:8] of the half word) with the least significant 5 bits of the 8-bit comment field containing with the source number of the address comparator. The rest of the comments field is filled with zeros. This means that the

ROMC will use 16 of the 256 possible software interrupts. The ROMC puts this 16 bit SWI instruction value on the proper half of the rompatch\_romc\_hrdata bus. The other half is zeroed out. Which half of the bus contains the SWI opcode and comment depends on the mode (Big Endian or Little Endian) and the bit 1 of the matching ROMC\_ROMPATCHAxx register. In Little Endian mode, the lower half is bits {15:0} and the upper half is bits {31:16}. The order is reversed in Big Endian mode.

In Little Endian mode (bigend signal negated), if bit 1 of the matching ROMC\_ROMPATCHAxx is cleared (lower half word selected) then the SWI instruction is put on the lower 16 bits of the read data bus and the upper 16 bits are zeroed out. Only the lower 16 bits of the read data bus is overwritten by the ROMC data. If ROMC\_ROMPATCHAxx[1] is set (upper half word selected), the SWI instruction is put on the upper 16 bits of the read data bus and the lower 16 bits are zeroed out. Only the upper 16 bits of the read data bus is overwritten.

In Big Endian mode (bigend asserted), if bit 1 of the matching ROMC\_ROMPATCHAxx is cleared (lower half word selected) then the SWI instruction is put on the upper 16 bits of the read data bus while the lower 16 bits are zeroed out. Only the upper 16 bits of the read data bus is overwritten. If ROMC\_ROMPATCHAxx[1] is set (upper word selected), the SWI instruction is put on the lower 16 bits and the upper 16 bits are zeroed out. Only the lower 16 bits of the read data bus is overwritten.

The eventual execution of the SWI causes the ARM to save the CPSR in SPSR\_SVC, the address of the next instruction after the SWI in R14\_SVC, enter Supervisor mode, and fetch the SWI vector at 0x8, which then takes it to a handler for further processing as described in the next section.

#### 4.9.4.2.4.1 Typical Software Response to Opcode Patch

When the SWI handler executes it needs to determine whether the SWI was generated by the ROMC. This is done by loading the SWI instruction and extracting its comment field. The state of the ARM core (ARM or THUMB) when the SWI was executed dictates whether to load the instruction word (ARM) or half word (THUMB). This state information can be determined by testing the T bit (bit 5) of the SPSR. If it's set, the execution was in THUMB mode.

By convention, if the comment field of the SWI is greater than 16, the software interrupt was initiated by software (i.e. an operating system call), and a branch is taken to the appropriate handler routine for further processing. If the comment field is less than 16, the SWI was generated by the ROMC performing a code patch operation. In this case, the software then reads from a table of function pointers, using the value in the SWI

comment field as the index into the table. The value that is read is the address of the code patch. This value is loaded into the PC to begin the execution of the code patch. The following code segment illustrates a typical handling of the SWI.

```

stmfd      sp!, {r0-r1,lr}          @ push register onto SWI stack
mrs       r0, spsr                 @ get saved status register
tst       r0, #0x20                @ check if call was in THUMB mode
ldrneh    r0, [lr,#-2]             @ yes: load opcode half-word and
bicne    r0, r0, #0xff00          @ yes: extract THUMB comment
ldreq     r0, [lr,#-4]             @ no: load opcode word and
biceq     r0, r0, #0xff000000     @ no: extract ARM comment
                                @ now r0 has comment field
cmp       r0, #16                  @ compare to 16 (maximum for ROMC)
ldrlt     lr, =rompatch_tbl_ptr @ < 16: get top of current ROMC
                                @ table; global variable which is
                                @ changeable per context
ldrlt     r1, [lr, r0, lsl #2]     @ < 16: read function pointer from
                                @ table assumed an array of pointers
                                @ patch functions
strlt     r1, [sp, #8]            @ < 16: store function pointer onto
                                @ stack in position of link register
ldmldfd   sp!, {r0-r1,pc}^        @ < 16: "fake" return from SWI, will
                                @ vector core to appropriate patch
                                @ function and set core back to previous
                                @ mode of operating
ldr       r1, =swi_hdlr           @ >= 16: pointer to standard SWI
                                @ handler
mov       lr, pc                   @ >= 16: set link register
bx       r1                        @ >= 16: jump to standard SWI
                                @ handler
ldmfd     sp!, {r0-r1,pc}^        @ >= 16: pop registers from stack

```

#### 4.9.4.2.5 External Boot Feature

Following a Reset event, the ARM issues an instruction fetch of the Reset Vector from address 0x0. This instruction, normally residing in ROM is usually a branch to a Reset handler or boot code which also normally resides in ROM. The ROMC external boot feature allows the bypassing of this code, using a different boot code residing perhaps in external memory.

This feature uses the data fix mechanism and works as follows: if the boot\_int signal is negated when a Reset event occurred, the ROMC will perform a data fix of the Reset Vector at 0x0 with the following instruction (opcode 0xE59FF00C):

```
ldr       pc, [pc, #12]           @ read 0x0000_0014 for reset_vector
```

The value of PC when this instruction is executed is 8 so that a PC relative offset of 12 makes the source address 20 or 0x14. When this instruction executes, the ARM core reads from address 0x0000\_0014, triggering a ROMC data fix operation which places the value taken from the external boot address on the read data bus, with the two LSBs zeroed out. This value is returned to the ARM to be placed in the PC causing code fetch and execution to start from that address.

#### 4.9.4.2.6 Alternate Masters and ROMC

The ROMC sits on the AHB bus of the internal ROM (ROMC). This means that the ROMC can modify values on the read data bus going to the master. Therefore, any master which reads an opcode patched or data patched location will read patched data.

### 4.9.5 ROMCP Memory Map/Register Definition

All registers are accessible through an IP Bus and can only be accessed in privileged mode. These registers can only be written with 32-bits stores and are clocked by `hclk_reg`.

The ROMC register placement was originated from the AWPT design used in the ARM7 platform of Neptune

**ROMC memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

**4.9.5.1 ROMC Data Registers (ROMC\_ROMPATCHnD)**

The ROMC data registers (ROMC\_ROMPATCH7D through ROMC\_ROMPATCH0D) store the data to use for the 8 1-word data fix events. Each register is associated with an address comparator (7 through 0). When a data fixing event occurs, the value in the data register corresponding to the comparator that has the address match is put on the romc\_hrdata[31:0] bus until romc\_hready is asserted by the ROM controller to terminate the access. A MUX external to the ROMC will select this data over that of romc\_hrdata[31:0] in returning read data to the ARM core. The selection is done with the control bus rompatch\_romc\_hrdata\_ovr[1:0] with both bits asserted by the ROMC.

If more than one address comparators match, the highest-numbered one takes precedence, and the value in corresponding data register is used for the patching event.

Address: 3031\_0000h base + D4h offset + (4d × i), where i=0d to 7d

**ROMC\_ROMPATCHnD field descriptions**

Field	Description
DATAx	<p>Data Fix Registers - Stores the data used for 1-word data fix operations.</p> <p>The values stored within these registers do not affect the writes to the memory system. They are selected over the read data from ROM when a data fix event occurs.</p> <p>If any part of the 1-word data fix is read, then the entire word is replaced. Therefore, a byte or half-word read will cause the ROMC to replace the entire word. The word is word address aligned.</p>

### 4.9.5.2 ROMC Control Register (ROMC\_ROMPATCHCNTL)

The ROMC control register (ROMC\_ROMPATCHCNTL) contains the block disable bit and the data fix enable bits. The block disable bit provides a means to disable the ROMC data fix and opcode patching functions, even when the address comparators are enabled. The External Boot feature is not affected by this bit. The eight data fix enable bits (0 through 7), when set, assign the associated address comparators to data fix operations

#### NOTE

Bits 27 and 22 always read as 1s.

Address: 3031\_0000h base + F4h offset = 3031\_00F4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved		DIS	Reserved												
W																
Reset	0	0	0	0	1	0	0	0	0	1	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								DATAFIX							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### ROMC\_ROMPATCHCNTL field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29 DIS	ROMC Disable -- This bit, when set, disables all ROMC operations. This bit is used to enable secure operations.  0 Does not affect any ROMC functions (default) 1 Disable all ROMC functions: data fixing, and opcode patching
28–8 -	This field is reserved. Reserved
DATAFIX	<b>Data Fix Enable - Controls the use of the first 8 address comparators for 1-word data fix or for code patch routine.</b>  0 Address comparator triggers a opcode patch 1 Address comparator triggers a data fix

### 4.9.5.3 ROMC Enable Register High (ROMC\_ROMPATCHENH)

The ROMC enable register high (ROMC\_ROMPATCHENH) and ROMC enable register low (ROMC\_ROMPATCHENL) control whether or not the associated address comparator can trigger a opcode patch or data fix event. This implementation of the ROMC only has 16 comparators, therefore ROMC\_ROMPATCHENH and the upper half of ROMC\_ROMPATCHENL are read-only. ROMC\_ROMPATCHENL[15:0] are associated with comparators 15 through 0. ROMC\_ROMPATCHENLH[31:0] would have been associated with comparators 63 through 32.

Address: 3031\_0000h base + F8h offset = 3031\_00F8h

#### ROMC\_ROMPATCHENH field descriptions

Field	Description
-	This field is reserved. Reserved

### 4.9.5.4 ROMC Enable Register Low (ROMC\_ROMPATCHENL)

The ROMC enable register high (ROMC\_ROMPATCHENH) and ROMC enable register low (ROMC\_ROMPATCHENL) control whether or not the associated address comparator can trigger a opcode patch or data fix event. This implementation of the ROMC only has 16 comparators, therefore ROMC\_ROMPATCHENH and the upper half of ROMC\_ROMPATCHENL are read-only. ROMC\_ROMPATCHENL[15:0] are associated with comparators 15 through 0. ROMC\_ROMPATCHENLH[31:0] would have been associated with comparators 63 through 32.

Address: 3031\_0000h base + FCh offset = 3031\_00FCh

### ROMC\_ROMPATCHENL field descriptions

Field	Description
31–16 Reserved	This field is reserved.
ENABLE	<p><b>Enable Address Comparator</b> - This bit enables the corresponding address comparator to trigger an event.</p> <p>0 Address comparator disabled</p> <p>1 Address comparator enabled, ROMC will trigger a opcode patch or data fix event upon matching of the associated address</p>

### 4.9.5.5 ROMC Address Registers (ROMC\_ROMPATCHnA)

The ROMC address registers (ROMC\_ROMPATCHA0 through ROMC\_ROMPATCHA15) store the memory addresses where opcode patching begins and data fixing occurs. The address registers ROMC\_ROMPATCHA0 through ROMC\_ROMPATCHA15 are each 21 bits wide and dedicated to one 4 Mbyte memory space. Bits 21 through 2 are address bits, to be compared with romc\_haddr[21:2] for a match; bit 1 is also an address bit used for half word selection. Bit 0 is the mode bit (set to 1 for THUMB mode). 1-word data fixing can only be used on the first 8 of the address comparators. ROMC\_ROMPATCHA0 through ROMC\_ROMPATCHA15 are associated each with address comparators 0 through 15.

Address: 3031\_0000h base + 100h offset + (4d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	Reserved									ADDRX

R	ADDRX															THUMBX	
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

### ROMC\_ROMPATCHnA field descriptions

Field	Description
31–23 -	This field is reserved. Reserved

Table continues on the next page...

**ROMC\_ROMPATCHnA field descriptions (continued)**

Field	Description
22–1 ADDRX	Address Comparator Registers - Indicates the memory address to be watched. All 16 registers can be used for code patch address comparison. Only the first 8 registers can be used for a 1-word data fix address comparison. Bit 1 is ignored if data fix. Only used in code patch
0 THUMBX	THUMB Comparator Select - Indicates that this address will trigger a THUMB opcode patch or an ARM opcode patch. If this watchpoint is selected to be a data fix, then this bit is ignored as all data fixes are 1-word data fixes.  0 ARM patch 1 THUMB patch (ignore if data fix)

**4.9.5.6 ROMC Status Register (ROMC\_ROMPATCHSR)**

The ROMC status register (ROMC\_ROMPATCHSR) indicates the current state of the ROMC and the source number of the most recent address comparator event.

Address: 3031\_0000h base + 208h offset = 3031\_0208h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved														SW	Reserved
W															w1c	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	Reserved										SOURCE					
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ROMC\_ROMPATCHSR field descriptions**

Field	Description
31–18 -	This field is reserved. Reserved
17 SW	ROMC AHB Multiple Address Comparator matches Indicator - Indicates that multiple address comparator matches occurred. Writing a 1 to this bit will clear this it.  0 no event or comparator collisions 1 a collision has occurred
16–6 -	This field is reserved. Reserved
SOURCE	ROMC Source Number - Binary encoding of the number of the address comparator which has an address match in the most recent patch event on ROMC AHB. If multiple matches occurred, the highest priority source number is used.

Table continues on the next page...

## ROMC\_ROMPATCHSR field descriptions (continued)

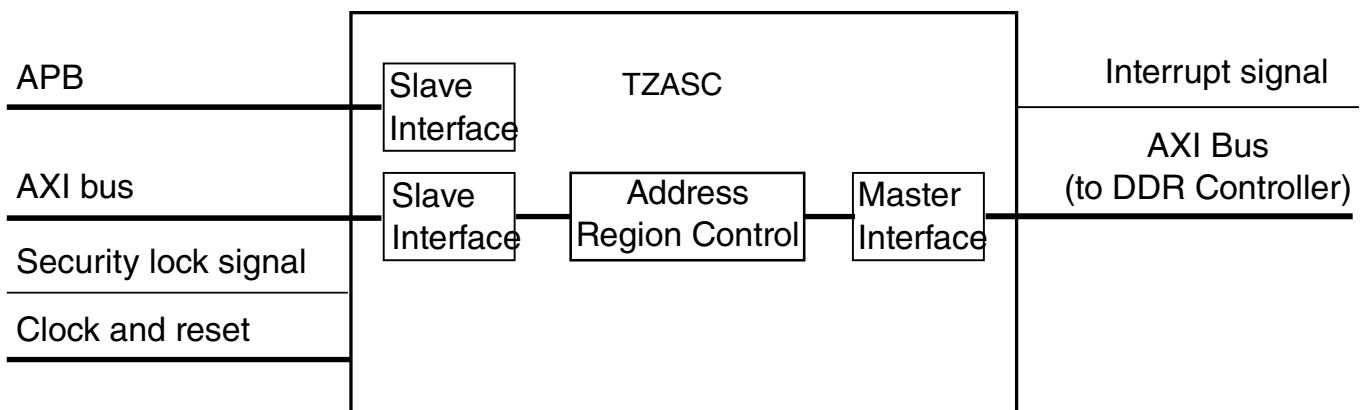

Field	Description
0	Address Comparator 0 matched
1	Address Comparator 1 matched
15	Address Comparator 15 matched

## 4.10 TrustZone Address Space Controller (TZASC)

### 4.10.1 Overview

The TrustZone Address Space Controller (TZASC) protects security-sensitive SW and data in a trusted execution environment against potentially compromised SW running on the platform.

The TZASC block diagram is shown in figure below.

**Figure 4-20. TZASC Block Diagram**

The TZASC is an IP by ARM ("CoreLink™ TrustZone Address Space Controller TZC-380"), designed to provide configurable protection over program (SW) memory space.

The main features of TZASC are:

- Supports 16 independent address regions
- Access controls are independently programmable for each address region
- Sensitive registers may be locked
- Host interrupt may be programmed to signal attempted access control violations
- AXI master/slave interfaces for transactions
- APB slave interface for configuration and status reporting

## 4.10.2 Clocks

The table found here describes the clock sources for TZASC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 4-33. TZASC Clocks**

Clock name	Clock Root	Description
aclk	mmdc_axi_clk_root	Module clock

## 4.10.3 Address Mapping in various memory mapping modes

The address configured to the TZASC controller(s) must match the "local addresses" as being passed on to the DDR controller(s).

Memory "aliasing" implications on TZASC settings - in systems which does not utilize the maximal supported DDR space the controller is designed for, the whole DDR memory map becomes "aliased" (replicated) by the size of the physical memory used. In such cases, the TZASC must be configured to protect all aliased regions as well (i.e. effectively reducing the number of available TZASC regions, since all aliased regions must be handled, for each "real" space needing protection).

For complete details on TZASC functionality and the programming model, see the ARM document, "CoreLink™ TrustZone Address Space Controller TZC-380 Technical Reference Manual, (Rev r0p1 or newer)", available at <http://infocenter.arm.com>.

## 4.11 System Debug

### 4.11.1 Debug Architecture

#### 4.11.1.1 i.MX7D debug architecture

The chapter describes the debug architecture of the i.MX7D.

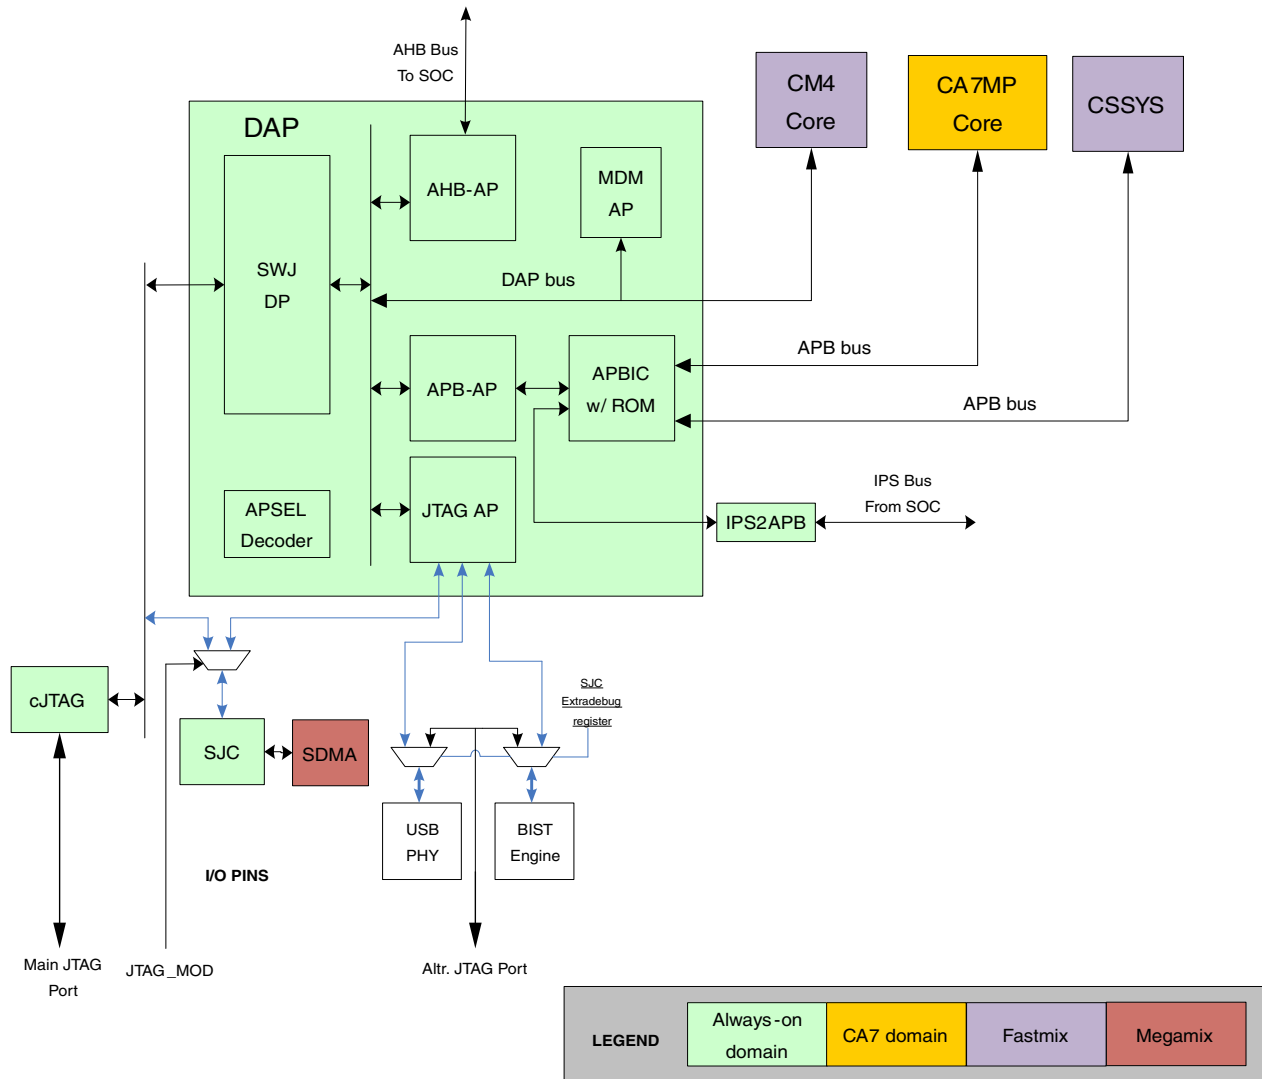

### 4.11.1.2 Main feature of i.MX7D debug system

The i.MX7D debug will be based on ARM's CoreSight "HUGO" platform, with support for Cortex-A7 and Cortex-M4 core from ARM.

- Support 5-pins (JTAG), 2-pins (cJTAG, ARM SWD) interface
- Support both non-intrusive and halt-mode trace / debug options
- MDM-AP registers for debugger to control mutli-core halt / resume cores
- Trace Memory Controller (TMC) is used to enable capturing trace
  - 4 KB in SOC trace block
  - ETR (4 G memory range, 64-bit wide at 266 MHz) is used to allow routing trace data to system memory
- Support ARM real time trace interface: TPIU (16-bit x 133 MHz)
- Support cross trigger between CA7 and CM4
- Four JTAG security levels, via SJC security functions together with e-Fuse (challenge response, field return, intrusive detection)

### 4.11.1.3 System level debug architecture

The i.MX7D debug architecture diagram is following:

**Figure 4-21. Debug Architecture Diagram**

- Two JTAG modes are supported. Select via the JTAG\_MOD pin.
  - Debug mode: JTAG\_MOD = 0, DAP is the only TAP controller in the daisy chain. SJC and SDMA will be attached to JTAG-AP of DAP.
  - Test mode: JTAG\_MOD = 1, SJC is the only TAP controller in the daisy chain. 1149.1-compliant, and support 1149.6 AC coupled test.

More detail JTAG topology, see [JTAG topology](#)

- DAP is in always-on domain, to make sure debugger never lose connection with the chip.
- CA7MPCore has one power domain, CM4 and other trace module in SOC fastmix power domain.

#### 4.11.1.4 JTAG topology

The following diagram shows the connectivity between TAP controllers—cJTAG, DAP, SJC, SDMA.

Figure 4-22. JTAG Chain in JTAG\_MOD = 0 / 1

- JTAG\_MOD = 0, Debug mode: DAP is the only TAP controller in the daisy chain. SJC and SDMA will be attached to JTAG-AP of DAP.
- JTAG\_MOD = 1, Test mode: SJC is the only TAP controller in the daisy chain. 1149.1-compliant, and support 1149.6 AC coupled test.
- This structure is IEEE 1149.1 compliant and can be automatically detected by debugger, such as ARM RVI.

#### 4.11.1.4.1 Debug Access Port (DAP) TAP

DAP is a standard ARM component. The DAP comprise a number of components. These components are used to access the DAP from an external debugger and Access Ports to access on-chip debug system resources.

The connectivity of the components in DAP is shown in Figure [Figure 4-21](#).

- AHB-AP, allow the debugger to access to all memory and registers in the system
- APB-AP, allow the debugger to access the Coresight components in CA7 and HUGO
- JTAG-AP, allow the debugger to access SJC, do challenge-response authentication
- Export DAP bus to CM4 to host AHB-AP access port
- MDM-AP, used to host system level JTAG status and control registers.

**Table 4-34. DAP Instruction Registers**

Code	DAP IR
4'b0000	FSL IDCODE (Freescale IDCODE, consistent with SJC IDCODE) Note that TARGETID input for SW-DP should also be consistent with SJC IDCODE.
4'b1000	ABORT
4'b1010	DPACC
4'b1011	APACC
4'b1110	IDCODE (ARM IDCODE, TDO 32-bit output is 0x5BA00477)
4'b1111	BYPASS
Others	Reserved

#### 4.11.1.5 Debug status and control registers

The Miscellaneous Debug Module (MDM-AP) is very useful in multi-processor run-control.

The debugger can write to MDM-AP control register only if the DBGEN is set. In case the debugger makes an access while DBGEN = 0, the access will be simply ignored and no error will be reported.

[Table 4-35](#) shows the MDM-AP register overview. Besides the registers in the table, there is an IDR at the end of the 4K address range, described in [Table 4-36](#). [Table 4-36](#) is the description and integration guide for MDM-AP registers.

Table 4-35. MDM-AP Registers

	Status (dap_status)	Control (dap_ctrl)	Core halt request (dap_ctrl_halt_req)	Core restart request (dap_ctrl_restart_req)	Core halt ack (dap_status_halt_ack)
0	—	—	CM4 EDBGREQ	CM4 DBGRESTART	CM4 HALTED
1	—	—	—	—	—

## 4.12 System JTAG Controller (SJC)

### 4.12.1 Overview

The System JTAG Controller (SJC) provides debug and test control with the maximum security.

The test access port (TAP) is designed to support features compatible with the IEEE Standard 1149.1 v2001 (JTAG).

The figure below shows an overview of the JTAG architecture.

**Figure 4-23. System JTAG Controller (SJC) Block Diagram**

#### 4.12.1.1 Features

The System JTAG Controller (SJC) provides the following capabilities:

- JTAG IEEE1149.1 mandatory instructions, see [EXTEST Instruction](#), [SAMPLE/PRELOAD Instruction](#) , and [BYPASS Instruction](#) .
- JTAG IEEE1149.1 optional instructions, see [ID\\_CODE Instruction \(IDCODE\)](#) , and [HIGHZ Instruction](#).
- JTAG IEEE P1149.1 (standard JTAG) interface to off-chip test and development equipment including an SJC-only mode for true IEEE 1149.1 compliance, used primarily for board-level implementation of boundary scan.
- IEEE P1149.6 (JTAG) mandatory instructions, see [EXTEST\\_PULSE instruction](#) and [EXTEST\\_TRAIN instruction](#). These two instructions enable edge-detecting behavior on the signal path containing AC pins.
- Debug-related control and status, such as putting selected cores into reset and/or debug mode and the ability to monitor individual core status signals via JTAG.
- Provides means for accessing each OnCE/ICE TAP controller independently to control a target system (see [Modes of Operation](#)).
- ExtraDebug logic (see [ENABLE\\_ExtraDebug Instruction](#) ).
- The maximum clock speed of the SJC is one-eighth of the lowest frequency of the accessed OnCE/ICE. For example in normal operation (no core in low-power mode), this frequency is one-eighth of the SDMA frequency if this core is present in the TDI-TDO chain (serially connected with other cores or standalone). The user must also consider the 25 MHz frequency limitation on the CE bus.
- Core compliant modes to support standalone core debuggers (see [Modes of Operation](#)).
- Multi-cores daisy chained mode (default one) to support multi-core debuggers (see [Modes of Operation](#)).

Detailed information about the SJC is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

### 4.12.1.2 Modes of Operation

The SJC modes are controlled through both the TAP select register (SJC\_TSR) and the MOD input port.

The MOD port (typically connected to pad of the same name) selects between two possible topologies of TAP connections, as seen at SoC level:

- Negating it (this should be the default state) selects all the TAPs ( SJC, SDMA, DAP and ARM/ETM) to be connected in the TDI-TDO chain, which is referred to as "daisy chain" mode, throughout this chapter.
- Asserting it only selects the SJC TAP to be connected in the TDI-TDO chain.

IEEE1149.1 standard features are enabled by configuring the SJC input pin: MOD. Refer to the following table for MOD settings details:

**Table 4-37. SJC Modes**

MOD	Name	Description
0	Daisy chain ALL	For common SW debug (High speed and production)
1	SJC only	IEEE 1149.1 JTAG compliant mode

The following figure shows the SJC mode selection flow. The numbers shown in parenthesis below each block name indicates the TAP's IR length.

**MOD = 0**

**MOD = 1**

(number in brackets lists IR length of given TAP)

**Figure 4-24. SJC Mode Selection Using MOD Pin Sampling**

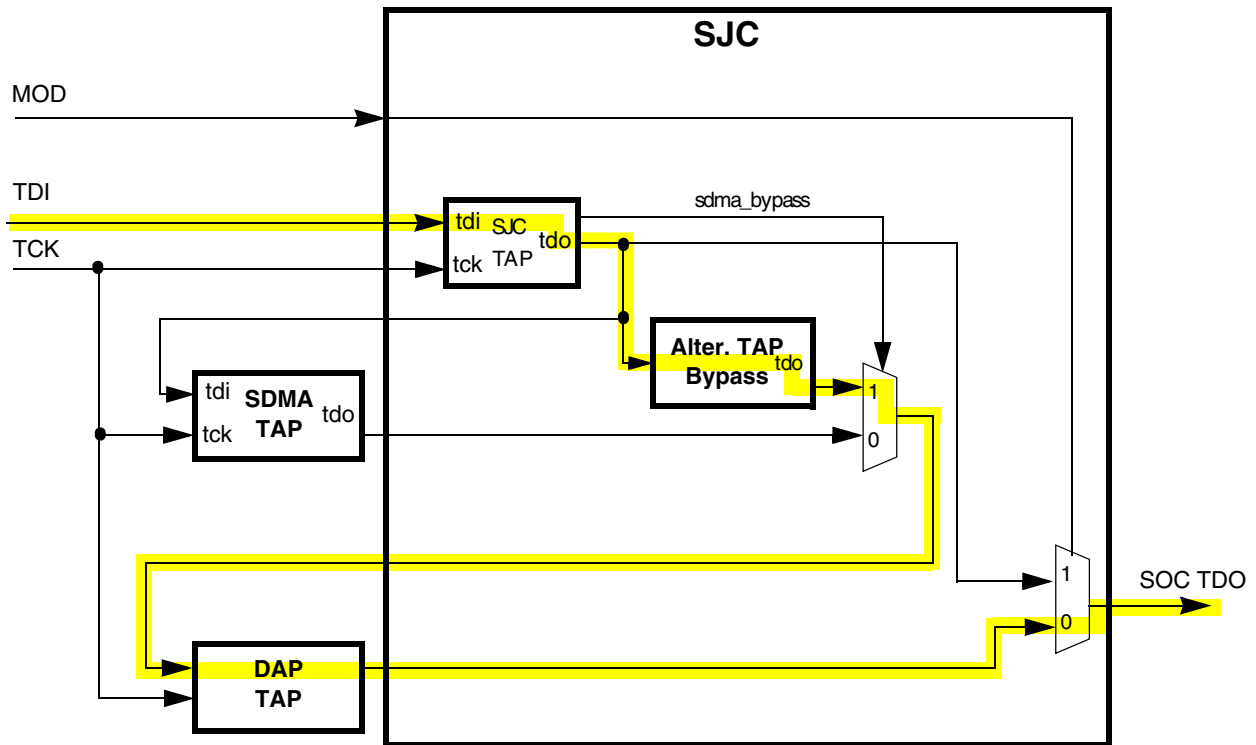

The Connect SDMA bit inside TAP select register controls the SDMA TAP bypass.

- When negated (should be the default state), the SDMA TAP is bypassed with a single D-FF (Flip-flop) during Shift-Dr path
- When asserted SDMA TAP is connected inside the chain
- When taking the SDMA into bypass or out of bypass (by writing to tapsel reg), additional cycle with TMS '0' should be given

The TAP selection block (TSB) provides a simple method of integrating various pieces of IP that have embedded TAPs.

- Provides a way to connect up multiple TAPs within a single SoC
- Identify the SJC TAP as the master TAP which controls the boundary chain (for IEEE 1149.1 standard compliance)
- Follow the state of SJC TAP, and when the Test-Logic-Reset (TLR) state is reached, reset all TAPs

The figure below shows the TAP Selection Block and SOC TAP Chain Scheme.

Note: The default daisy chain connectivity is highlighted in yellow

**Figure 4-25. TAP Selection Block and SoC TAP Chain Scheme**

**NOTE**

It is the responsibility of the user to ensure that in any configuration of the TAP controllers chosen, all of the TAPs in the chain comply with the demands of TCK clock frequency as well as the required ratio between TCK clock frequency and that of the core's to which the TAP refers.

**4.12.2 External Signals**

The table found here describes the external signals of SJC.

**4.12.2.1 External Signal Overview**

The SJC provides test and debug control with a minimum number of contacts.

The figure below shows SJC connections to external contacts and other chip blocks.

Figure 4-26. SJC Connections

#### 4.12.2.2 TAP Controller

The TAP controller is responsible for interpreting the sequence of logical values on the TMS signal. It is a synchronous state machine that controls the operation of the JTAG logic. The value shown adjacent to each arc represents the value of the TMS signal sampled on the rising edge of TCK signal. For a description of the TAP controller states, refer to the appropriate IEEE 1149.1 document.

The state machine is shown in the following figure.

**Figure 4-27. TAP Controller State Machine**

The change of the JTAG state machine occurs on the rising edge of TCK. TMS and TDI change on the falling edge of TCK. TDO also changes on the falling edge of TCK following entry into the Shift\_DR or Shift\_IR states (TDO\_EN is the enable of the tristate buffer driving the TDO output).

The figure below shows the timings of the SJC signals.

**Figure 4-28. SJC Signals Timing Diagram**

### 4.12.2.3 Accessing ExtraDebug Registers

Accessed through the Select-DR-Scan path, the ExtraDebug shift register consists of 39 bits (maximum) comprising a 32-bit data field (max length, see extradebug register description), a 5 bit address field and read/write bit.

The write actually takes place when the JTAG TAP controller enters the Update-DR state. On a read, the data field is ignored (the user should shift only 5 times to enter Read=1 and the address), the read takes place on the next path through DR at the Capture-DR state, the data is shifted-out during the Shift-DR state.

On the second path for a read access, simultaneous write access is not supported: command converter software shifts in zeros so the TAP decodes a write to the CSR (read-only register) which does not have any effect on the circuit.

The number of shift depends on the width of the accessed register as explained in the following diagrams.

First a write access (one path through Select-DR-Scan):

**Figure 4-29. TDI/TDO on write access**

Then a read access (requires two paths through Jtag DR Scan path):

*First path*

*Second path*

**Figure 4-30. TDI/TDO on Read Access**

For example, write value 0b1010\_1100 to Debug Control Register (address = 0b00110).

**Figure 4-31. Example: Write Access to DCR**

The SJC registers have different levels of security (Refer to [JTAG Security Modes](#)):

- Secured- accessible only in mode 2 (supposed correct response entered), mode 3 and mode 4.
- Unsecured- accessible in all modes

The level of security of each register is indicated in its name or description, in "Programmable Registers" section.

A single DE\_B pin is dedicated for debug request input/output in bidirectional open drain functionality (including an internal pull-up device).

Bits 6:5 in DCR register serve as mask bits, controlling the propagation of external debug request to each recipients (ARM Platform, SDMA).

The bits 1:0 define the propagation enable of IR debug request to recipient cores.

#### Figure 4-32. DE\_B Pin Select Logic

For security reasons, bits for output and input propagation control are at their negated values after reset. A user cannot put the cores in debug mode through DE\_B without any Jtag access.

The configuration after reset prevents propagation of debug requests / acknowledges to or from the cores.

### 4.12.3 TAP Selection Block (TSB)

As described in [Modes of Operation](#), the SJC can access cores in different modes selected through a TSB.

#### 4.12.3.1 Select Mode Using Software

Conceptually, the SJC\_TSR is a data register which is accessed through Access TSR IR instruction of SJC TAP.

The following figure shows the process of using reserved IR to access the SJC\_TSR.

**Figure 4-33. Using Reserved IR to Access the TAP Select Register (SJC\_TSR)**

The SJC\_TSR can only be changed during the update-DR state of the TSB JTAG state machine. This is necessary to prevent a TAP that is being selected from losing synchronization with the TSB state machine when the TSB state machine returns to run-test-idle. Therefore, an associated shift register for the SJC\_TSR is loaded into the SJC\_TSR during the update-DR state (see the figure above). The shift register must also capture the state of the SJC\_TSR when in the Capture-DR state for visibility of the contents of the SJC\_TSR. See [TAP Select Instruction](#) , for more information.

#### 4.12.4 Boundary Scan Register (BSR)

The Boundary Scan Register (BSR) in the JTAG implementation contains bits for all device signal and clock pins and associated control signals.

All SoC bidirectional pins have a single register bit in the boundary scan register for pin data, and are controlled by an associated control bit in the boundary scan register.

## 4.12.5 SoC JTAG Instruction Register (SJIR)

The SoC JTAG Instruction register can be found here.

The SoC JTAG Instruction register is 5 bits wide.

**Table 4-38. SoC JTAG Instruction Register (SJIR)**

Code					SJC IR
B4	B3	B2	B1	B0	
0	0	0	0	0	IDCODE
0	0	0	0	1	SAMPLE/PRELOAD
0	0	0	1	0	EXTEST
0	0	0	1	1	HI-Z
0	0	1	0	0	ENABLE_ExtraDebug
0	0	1	0	1	ENTER_DEBUG (secured)
0	0	1	1	0	Reserved
0	0	1	1	1	TAP select
0	1	0	0	0	EXTEST_PULSE
0	1	0	0	1	EXTEST_TRAIN
0	1	0	1	0	Reserved
0	1	0	1	1	Reserved
0	1	1	0	0	Security Output challenge
0	1	1	0	1	Security Enter response
-	-	-	-	-	Reserved
1	1	1	1	1	BYPASS

The instruction register is reset to 0b00000 in the test-logic-reset controller state which is equivalent to the IDCODE instruction.

During the capture-IR controller state, the parallel inputs to the instruction register are loaded with the code 01 in the least significant bits as required by the standard; the most significant bits are loaded with the values 00, leading to a capture value of 0b00001.

### 4.12.5.1 ID\_CODE Instruction (IDCODE)

Selects the ID register, and the system logic controls the I/O pins. This instruction is provided as a public instruction to allow the manufacturer, part number and version of a component to be determined through the TAP.

The table below shows the ID register configuration.

**Table 4-39. ID Configuration Register (IDCODE)**

IDCODE				ID Configuration Register												
	BIT 31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	BIT 16
	Version Information[3:0]			Part Number (Bits 27-16)												
TYPE	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
RESET	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x
Note:																
	BIT 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	BIT 0
	Part Number (Bits 15-12)				Manufacturer Identity											1
TYPE	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
RESET	x	x	x	x	0	0	0	0	0	0	0	1	1	1	0	1
Note:																

**Table 4-40. ID Configuration Register Description (IDCODE)**

Field	Description
31-28 Version Information	IC/SoC Version information number. Initial value: '0000' This number is subject to changes, for new IC/SoC (System On A Chip) revision releases.
27-12 Part Number	Customer Part Number The 16-bit Part Number value is unique for every Freescale's SoC / IC. See System Debug chapter for exact register value for a specific SoC.
11-1 Manufacturer Identity	Manufacturer Identity Freescale's Manufacturer Identity code. Bits [11:1] - 00000001110
0	Tied to logic 1.

One application of the ID register is to distinguish the manufacturer(s) of components on a board when multiple sourcing is used. As more components emerge which conform to the IEEE 1149.1 standard, it is desirable to allow for a system diagnostic controller unit to blindly interrogate a board design to determine the type of each component in each location. This information is also available for factory process monitoring and for failure mode analysis of assembled boards.

Once the IDCODE instruction is decoded, it selects the ID register which is a 32 Bit data register. Because the bypass register loads a logic 0 at the start of a scan cycle, whereas the ID register loads a logic 1 into its least significant bit, examination of the first bit of data shifted out of a component during a test data scan sequence immediate following exit from Test-Logic-Reset controller state shows whether such a register is included in

the design. When the IDCODE instruction is selected, the operation of the test logic has no effect on the operation of the on-chip system logic as required by the IEEE 1149.1 standard.

#### 4.12.5.2 SAMPLE/PRELOAD Instruction

Selects the boundary scan register and the system logic controls the I/O pins.

The SAMPLE/PRELOAD instruction provides two separate functions:

- First, it provides a means to obtain a snapshot of system data and control signals. The snapshot occurs on the rising edge of TCK in the capture-DR controller state. The data can be observed by shifting it transparently through the boundary scan register.
- The second function of SAMPLE/PRELOAD is to initialize the boundary scan register output cells prior to selection of EXTEST. This initialization ensures that known data appears on the outputs when entering the EXTEST instruction.

#### NOTE

Because there is no internal synchronization between the JTAG clock (TCK) and the system clock (CLK), the user must provide some form of external synchronization to achieve meaningful results.

For more details on the function and use of SAMPLE/PRELOAD, refer to the appropriate IEEE 1149.1 document.

#### 4.12.5.3 EXTEST Instruction

Selects the boundary scan register, and the 1149.1 test logic has control of the I/O pins.

By using the TAP controller, the register is capable of:

- Scanning user-defined values into the output buffers,
- Capturing values presented to input pins
- Controlling the direction of bidirectional pins,
- Controlling the output drive of tri-statable output pins.

For more details on the function and use of EXTEST, refer to the appropriate IEEE 1149.1 document.

The EXTEST instruction also asserts internal reset for the cores (through CCM, refer to [Figure 4-36](#)) to force a predictable internal state while performing external boundary scan operations.

#### 4.12.5.4 HIGHZ Instruction

All output drivers, including the two-state drivers, are turned off (that is, high impedance). The instruction selects the bypass register.

In this mode, all internal pullup resistors on all the pins (except for the TMS, TDI, TCK, TRSTB pins) are disabled. This disabling functionality is not built into SJC, but should be implemented by some logic in the SOC/IO Pads.

For more details on the function and use of HIGHZ, refer to the IEEE 1149.1 document.

The HIGHZ instruction also asserts internal reset for the cores (through CCM, refer to [Figure 4-36](#)) to force a predictable internal state while performing external boundary scan operations.

#### 4.12.5.5 BYPASS Instruction

Selects the single Bit bypass register and the system logic controls the I/O pins.

This creates a shift-register path from TDI to the bypass register and, finally, to TDO, circumventing the boundary scan register. This instruction is used to enhance test efficiency when a component other than the SoC Core based device becomes the device under test.

When the bypass register is selected by the current instruction, the shift-register stage is set to a logic zero on the rising edge of TCK in the capture-DR controller state. Therefore, the first bit to be shifted out after selecting the bypass register is always a logic zero.

For more details on the function and use of BYPASS, refer to the appropriate IEEE 1149.1 document.

#### 4.12.5.6 ENABLE\_ExtraDebug Instruction

The TDI and TDO pins are connected directly to the ExtraDebug registers, the SJC TAP controller remaining connected to TDI and TMS.

The ExtraDebug shift register consists of 38 bits (maximum) comprising a 32-bits data field (maximum length, see [Accessing ExtraDebug Registers](#)), a 5 bits address field and read/write bit. On a register read, the data field does not need to be filled in. The particular ExtraDebug register connected between TDI and TDO at a given time is

selected by the ExtraDebug controller depending on the ExtraDebug Address being currently decoded. All communication with the ExtraDebug controller is done through the Select-DR-Scan path of the JTAG TAP Controller.

#### 4.12.5.7 ENTER\_DEBUG instruction

The ENTER\_DEBUG instruction is used to generate a debug request event to SDMA and the ARM Core Platform simultaneously (practically, inherited minimal skew is expected, due to difference in event signal propagation in the different modules).

The TDI and TDO are connected to the Instruction Register (IR). After the acknowledgment of the Debug Mode is received (can be checked by reading the Core Status Register part of the ExtraDebug logic), the user can perform system debug functions on the cores.

#### NOTE

The ENTER\_DEBUG event issue to the cores, can be masked, by bits in DCR register.

#### NOTE

It is user's responsibility to shift-in another IR value (like IDCODE) before trying to bring the cores out of debug mode, as the debug request signals to the cores remains asserted as long as ENTER\_DEBUG IR is in place.

#### NOTE

The user need to check that cores are in debug mode (watching debug acknowledge signal) before leaving ENTER\_DEBUG instruction, otherwise debug request might not take affect.

#### 4.12.5.8 TAP Select Instruction

By means of TAP select instruction a user can access TAP select register and by controlling its only bit SDMA Bypass, control whether SDMA TAP is bypassed or not.

**Table 4-41. TAP Select Register (TSR)**

	TAP Select Register
	BIT 0
	Connect SDMA
TYPE	rw
RESET	0
Note:	

**Table 4-42. TAP Select Register Description**

Field	Description
0 SDMA Bypass	Connect SDMA Control whether SDMA TAP is bypassed or not: <ul style="list-style-type: none"> <li>• 0 - SDMA TAP is bypassed by the alternate TAP inside SJC (emulating 4-bit IR and 1-bit bypass path).</li> <li>• 1 - SDMA TAP is connected to the TDI-TDO chain.</li> </ul> <p><b>NOTE:</b> Additional cycle with TMS '0' should be inserted, after writing to this register, to allow the SDMA tap be sync before SDMA get into / out of bypass.</p>

#### 4.12.5.9 EXTEST\_PULSE instruction

The EXTEST\_PULSE instruction implements new test behaviors for AC pins and simultaneously behaves identically to IEEE Std 1149.1 EXTEST for DC pins.

#### 4.12.5.10 EXTEST\_TRAIN instruction

The EXTEST\_TRAIN instruction implements new test behaviors for AC pins and simultaneously behaves identically to IEEE Std 1149.1 EXTEST for DC pins.

### 4.12.6 Security

JTAG manipulation is one of the known hackers' ways of executing unauthorized program code, getting control over the OS and run code in privileged modes.

The SJC provides a debug access to several H/W blocks including the ARM processor and the system bus. This allows for program control and manipulation as well as visibility into system peripherals and memory. The ETM and NEXUS interfaces allow bus transactions to be traced. Together these tools provide the hacker all the access needed to completely comprise the system. Means must be provided to block any malicious JTAG access.

The SJC provides a way of regulating the JTAG access.

The following are the different JTAG security modes:

- **Mode #1: No Debug**-Maximum Security. All security sensitive JTAG features are permanently blocked.

- **Mode #2: Secure JTAG**-High security. JTAG use is regulated by secret key based authentication mechanism.
- **Mode #3: JTAG Enabled**-Low security. JTAG always enabled.

The JTAG security modes are configured using eFUSES which can be burned after packaging by applying electrical signals. The fuse burning is an irreversible process, once a fuse is burned (e-fuse or laser fuse) it is impossible to change the fuse back to the unburned state.

### 4.12.6.1 JTAG Security Modes

JTAG can be in one of JTAG security modes which is selected by setting the SJC eFUSE configuration. The physical location of the fuses is not in the SJC.

#### 4.12.6.1.1 Mode 1: No Debug - Maximum Security

No Debug JTAG security mode provides the highest security level.

In this mode, all JTAG features are disabled except for:

- ScanBoundary Scan
- MBIST, all modes except for debug modes which enable controlled memory contents output
- PLL BIST
- BIST monitor mode, allowing routing to external pins BIST pass/fail/invoke information
- PLL bypass- Bypass ARM or/and USB PLL.
- Visibility of the following status bits: power mode - normal, standby, stop, shutdown, and so on

These features do not reduce the security level of the product, and they allow to perform important tests and board connectivity checks.

#### 4.12.6.1.2 Mode 2: Secure JTAG - High Security

The Secure JTAG mode limits the JTAG access by using challenge/response based authentication mechanism. Any access to JTAG port is being checked. Only authorized debug devices (that is, devices having the right response) can access the JTAG, unauthorized JTAG access attempts are denied.

The intent of this mode is to allow return field testing. When a secured JTAG device is being returned for debugging, this mode allows authorized re-activation of the JTAG.

#### 4.12.6.1.2.1 Challenge/Response Mechanism in System JTAG Mode

When SJC is in System JTAG mode the authentication process is as follows:

1. Shift Output Challenge instruction to IR.
2. Passing through Capture-DR state of the SJC and by performing Shift-DR operations Challenge code can be accessed from TDO.
3. Shift Enter Response instruction to IR. By performing Shift-DR, operations enter Response code value through TDI. As Update-DR state is entered, Response code is compared with the correct one.

In Fixed challenge-response pair mode, each part has its individual challenge - response pair which is determined at manufacturing time, and does not change later on. The SJC compares the user's response to the expected response.

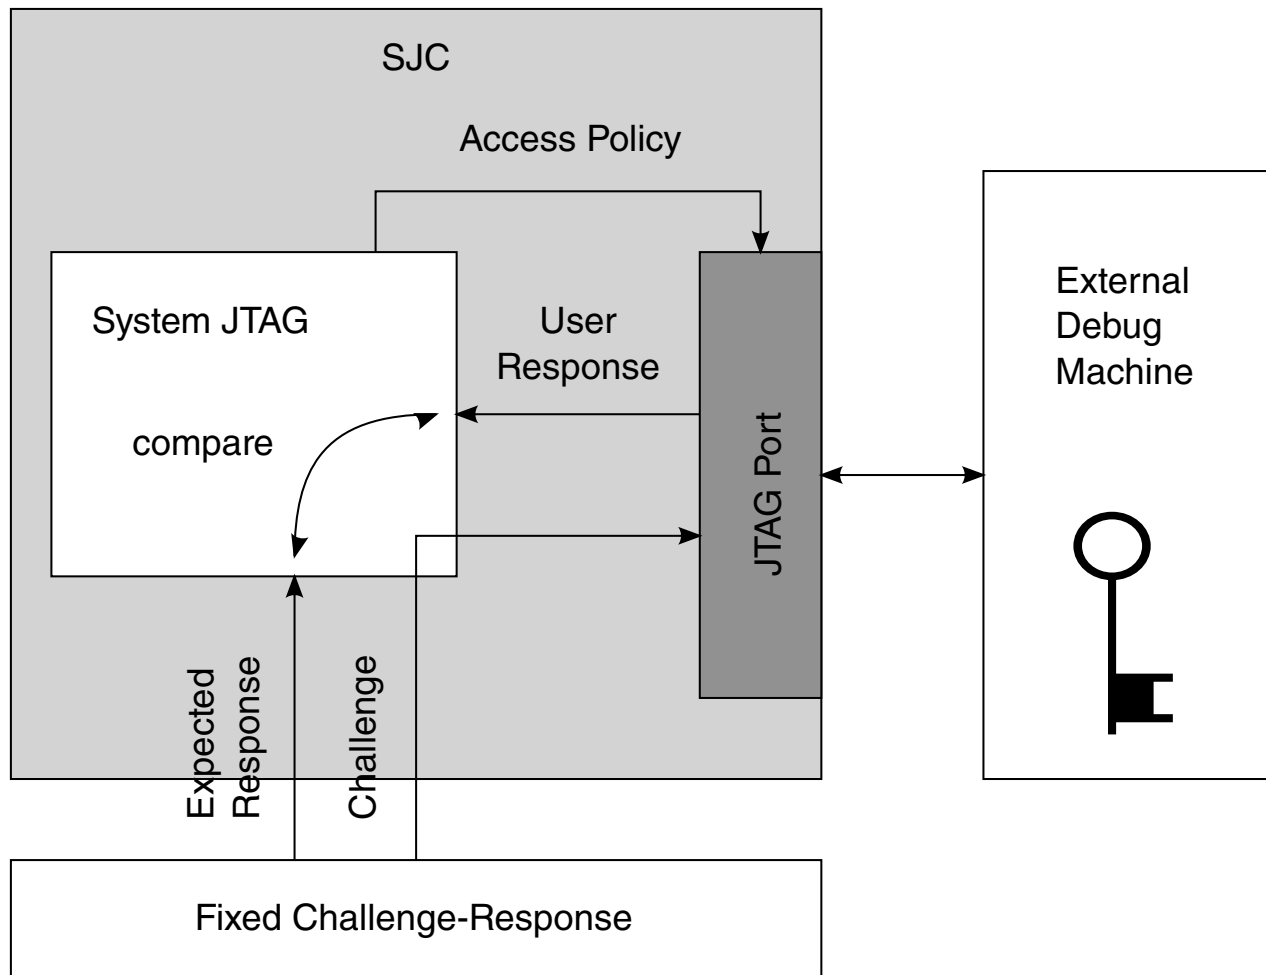

Figure 4-34. Mode #2 - Secure JTAG with Fixed Challenge-response Pair

### 4.12.6.1.3 Mode 3: JTAG Enabled - Low Security

In the JTAG Enabled JTAG security mode, all JTAG features are enabled.

### 4.12.6.2 Software Enabled JTAG

To increase the flexibility of the SJC, an option to enable the JTAG via software is added and is available only in Secure JTAG mode. By writing '1' to HAB\_JDE (HAB JTAG DEBUG ENABLE) bit in the e-fuse controller module, the JTAG is opened, regardless of its security mode. It is the responsibility of software to assert or negate this bit.

Additionally, a corresponding lock bit is available (in the e-fuse control module) to ensure that only trusted software is able to set the JDE bit. When the LOCK bit is set, no future change of JDE is possible, until the next POR (power-on-reset) cycle.

The platform initialization software should set the LOCK bit for JDE bit before transferring control to the application code.

The S/W JTAG enable allows JTAG enabling without activating the challenge-Response mechanism (which requires JTAG access tool enhancement or special H/W). The JTAG S/W enable does not allow debug in case of boot or memory fault as it requires reset before entering debug.

This feature can be permanently blocked by burning the dedicated e-fuse.

#### NOTE

The S/W enabled JTAG feature reduces the overall security level of the system as it relies on S/W protections. If this feature is not required, it is strongly recommended to burn the JTAG\_HEO e-fuse which disables this feature.

### 4.12.6.3 Kill Trace

The kill trace signal disables any output of the ETM block. The ETM can be accessed either via JTAG port and/or by direct software code. Blocking the JTAG port also yields assertion of the kill trace signal. This resulted in blocking of trace port. The intention of this action is to block any attempt to break into the system via software manipulation of the debug modules. The kill trace, when active, prevents trace output even in case where it can be activated via chip pin.

The kill trace feature needs to be activated by burning a dedicated e-fuse. If the fuse is left intact, kill trace is never activated as seen in [Figure 4-35](#).

**Figure 4-35. Kill Trace eFUSE**

The kill trace is asserted when "kill trace enable" fuse is burned and "ipt\_secur\_block" signal in SJC is asserted, which happens when at least one of the following is true:

- Mode #2 (Secure JTAG) and no code has been entered
- Mode #2 (Secure JTAG) with burned Bypass and Re-enable fuses
- Mode #2 (Secure JTAG) with incorrect response entered
- Mode #1 (No debug)
- TRST\_B signal is active
- POR has not ever been asserted

#### 4.12.6.4 SJC Disable Fuse

In addition to the different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by eFUSE configuration. This creates additional JTAG mode that is, JTAG Disabled with highest level of JTAG protection. In this mode all JTAG features are disabled.

Specifically, the following debug features are disabled in addition to the features that were already disabled in No Debug JTAG mode:

- Memory BIST
- Boundary scan register (SJC\_BSR)
- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

## 4.12.7 Functional Description

This section provides a complete functional description of the block.

### 4.12.7.1 Static Core Debug

The SJC JTAG TAP controller is fully compatible with the IEEE 1149.1a-2001 Standard Test Access Port and Boundary Scan Architecture specifications.

The ARM platform has an integrated JTAG interface and a TAP controller to manage its own ICE. Also it can access an embedded trace ETM interface, see ARM core and ETM Technical reference guide for more information.

The SDMA has a TAP controller to manage its own OnCE, see SDMA OnCE specifications for more details.

The OnCE and ICE provide a mean of interacting with the cores and their peripherals non-intrusively so that a user may examine registers, memories to facilitate hardware and software development. Refer to [TAP Selection Block \(TSB\)](#), for more information.

### 4.12.7.2 Reset Mechanism

The following figure shows the SJC reset logic

**Figure 4-36. SJC Reset Logic**

#### NOTE

- Asserting TRSTB in any scan mode resets the TCR losing the testmode configuration and selects default TAP.
- SJC generates an IEEE reset signal to the CCM when in one of the IEEE modes HIGHZ or EXTEST. This signal generates a system reset to the cores until exit from one of these modes.
- The TSB generates Once/ICE reset (either TRSTB if implemented or other) when its TAP state reaches Test-Logic-Reset (meaning that TAP accessed is also reaching Test-Logic-Reset).

### 4.12.8 Initialization/Application Information

The control afforded by the output enable signals using the boundary scan register and the EXTEST instruction requires a compatible circuit-board test environment to avoid device-destructive configurations. The user must avoid situations in which the SJC output drivers are enabled into actively driven networks.

There are two constraints related to the JTAG interface:

- Ensure that the JTAG test logic is kept transparent to the system logic by forcing TAP into the Test-Logic-Reset controller state. During power-up, SJC's internal TRSTB is asserted as IC's POR\_B is asserted which forces the TAP controller into this state. After that, if TMS either remains unconnected or is connected to VCC, then the TAP controller cannot leave the Test-Logic-Reset state, regardless of the state of TCK.
- DE\_B is an IO pin with pullup and care must be taken of the direction when driving this signal.

### 4.12.9 SJC Memory Map/Register Definition

In addition to the standard accessible JTAG registers (per IEEE1149.1 standard) listed in [SoC JTAG Instruction Register \(SJIR\)](#), the chip contains the following registers accessed using the ExtraDebug mechanism, controlled via "ENABLE\_ExtraDebug" IR instruction.

#### NOTE

SJC registers are only accessible by JTAG interface. They are not memory mapped to processor address space, so the absolute addresses provided by default in the SJC memory map are not valid.

This section assumes the JTAG controller is accessed in standalone mode or daisy chained (defined by TAP Selection Block) using the appropriate TSB configuration.

See "System Debug" chapter for more details about the general purpose register descriptions that are unique to this chip.

#### SJC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
0	General Purpose Unsecured Status Register 1 (SJC_GPUSR1)	32	R	0000_0000h	<a href="#">4.12.9.1/445</a>
1	General Purpose Unsecured Status Register 2 (SJC_GPUSR2)	32	R	0000_0000h	<a href="#">4.12.9.2/447</a>
2	General Purpose Unsecured Status Register 3 (SJC_GPUSR3)	32	R	0000_0000h	<a href="#">4.12.9.3/447</a>
3	General Purpose Secured Status Register (SJC_GPSSR)	32	R	0000_0000h	<a href="#">4.12.9.4/448</a>
4	Debug Control Register (SJC_DCR)	32	R/W	0000_0000h	<a href="#">4.12.9.5/449</a>

*Table continues on the next page...*

## SJC memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
5	Security Status Register (SJC_SSR)	32	R	<a href="#">See section</a>	<a href="#">4.12.9.6/451</a>
7	General Purpose Clocks Control Register (SJC_GPCCR)	32	R/W	0000_0000h	<a href="#">4.12.9.7/454</a>

### 4.12.9.1 General Purpose Unsecured Status Register 1 (SJC\_GPUSR1)

The General Purpose Unsecured Status Register 1 is a read only register used to check the status of the different Cores and of the PLL. The rest of its bits are for general purpose use.

Address: 0h base + 0h offset = 0h

## System JTAG Controller (SJC)

### SJC\_GPUSR1 field descriptions

Field	Description
31–9 -	This field is reserved. Reserved.
8 PLL_LOCK	PLL_LOCK A Combined PLL-Lock flag indicator, for all the PLL's.
7 -	This field is reserved. Reserved
6–5 -	This field is reserved. Reserved.
4–2 S_STAT	3 LSBits of SDMA core statusH.
1 A_WFI	ARM core wait-for interrupt bit Bit 1 is the ARM core standbywfi (stand by wait-for interrupt). When this bit is HIGH, ARM core is in wait for interrupt mode.
0 A_DBG	ARM core debug status bit Bit 0 is the ARM core DBGACK (debug acknowledge)  DBGACK can be overwritten in the ARM core DCR to force a particular DBGACK value. Consequently interpretation of the DBGACK value is highly dependent on the debug sequence. When this bit is HIGH, ARM core is in debug.

### 4.12.9.2 General Purpose Unsecured Status Register 2 (SJC\_GPUSR2)

Address: 0h base + 1h offset = 1h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### SJC\_GPUSR3 field descriptions

Field	Description
31–3 -	This field is reserved. Reserved

Table continues on the next page...

**SJC\_GPUSR3 field descriptions (continued)**

Field	Description
2 SYS_WAIT	System In wait Indication on System in wait mode (from CCM).
1 IPG_STOP	IPG_STOP CCM's "ipg_stop" signal indication
0 IPG_WAIT	IPG_WAIT CCM's "ipg_wait" signal indication

**4.12.9.4 General Purpose Secured Status Register (SJC\_GPSSR)**

The General Purpose Secured Status Register is a read-only register used to check the status of the different critical information in the SoC. This register cannot be accessed in secure modes.

Address: 0h base + 3h offset = 3h

**SJC\_GPSSR field descriptions**

Field	Description
GPSSR	General Purpose Secured Status Register Register is used for testing and debug.

### 4.12.9.5 Debug Control Register (SJC\_DCR)

This register is used to control propagation of debug request from DE\_B pad to the cores and debug signals from internal logic to the DE\_B pad.

Address: 0h base + 4h offset = 4h

**SJC\_DCR field descriptions**

Field	Description
31–7 -	This field is reserved. Reserved
6 DIRECT_ARM_REQ_EN	Pass Debug Enable event from DE_B pin to ARM platform debug request signal(s). This bit controls the propagation of debug request DE_B to the Arm platform. 0 Disable propagation of system debug to (DE_B pin) to Arm platform. 1 Enable propagation of system debug to (DE_B pin) to Arm platform.
5 DIRECT_SDMA_REQ_EN	Debug enable of the sdma debug request This bit controls the propagation of debug request DE_B to the sdma. 0 Disable propagation of system debug to (DE_B pin) to sdma. 1 Enable propagation of system debug to (DE_B pin) to sdma.
4 -	This field is reserved. Reserved

*Table continues on the next page...*

## SJC\_DCR field descriptions (continued)

Field	Description
3 DEBUG_OBS	<p>Debug observability</p> <p>This bit controls the propagation of the "system debug" input to SJC (driven by the ECT logic), to the DE_B pad.</p> <p>(This logic can be used to pass debug acknowledge event from ECT out to the PAD, for example).</p> <p>The SJC's "system_debug" input is tied to logic HIGH value, therefore, set of "debug_obs" bit, will result in unconditional assertion of DE_B pad.</p> <p>0 Disable propagation of system debug to DE_B pin 1 Unconditional assertion of pad DE_B</p>
2 -	<p>This field is reserved. Reserved</p>
1 DE_TO_SDMA	<p>SDMA debug request input propagation</p> <p>This bit controls the propagation of debug request to SDMA, when the JTAG state machine is put in "ENTER_DEBUG" IR instruction..</p> <p>0 Disable propagation of debug request to SDMA 1 Enable propagation of debug request to SDMA</p>
0 DE_TO_ARM	<p>ARM platform debug request input propagation</p> <p>This bit controls the propagation of debug request to ARM platform ("dbgreq"), when the JTAG state machine is put in "ENTER_DEBUG" IR instruction.</p> <p>0 Disable propagation of debug request to ARM platform 1 Enable propagation of debug request to ARM platform</p>

### 4.12.9.6 Security Status Register (SJC\_SSR)

Address: 0h base + 5h offset = 5h

## System JTAG Controller (SJC)

**\* Notes:**

- The SJM reset value, reflects the JTAG security state, as defined by status of JTAG\_SMODE[1:0] fuses. See the [SJM](#) bitfield description for details on valid values.

### SJC\_SSR field descriptions

Field	Description
31–17 -	Reserved.
16–15 -	This field is reserved. Reserved
14 BOOTIND	Boot Indication Inverted Internal Boot indication, i.e inverse of SRC: "src_int_boot" signal
13 -	This field is reserved. Reserved
12–11 RSSTAT	Response status Response status bits  00 Response wasn't entered 01 Response was entered but not verified

*Table continues on the next page...*

**SJC\_SSR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
	10 Response was entered and is incorrect 11 Response is correct
10–9 SJM	SJC Secure mode Secure JTAG mode, as set by external fuses.  00 No debug (#1) 01 Secure JTAG (#2) 10 Reserved 11 JTAG enabled (#3)
8 FT	Fuse type Fuse type bit - e-fuse or laser fuse  0 E-fuse technology 1 Laser fuse technology
7 -	This field is reserved. Reserved
6 -	This field is reserved. Reserved
5 EBG	External boot granted External boot enabled, requested and granted  1 granted 0 not granted
4 EBF	External Boot fuse Status of the external boot disable fuse  0 (intact) - external boot is allowed 1 (burned) - external boot is disabled
3 SWE	SW enable SW JTAG enable status  1 enabled 0 disabled
2 SWF	Software JTAG enable fuse Status of the no SW disable JTAG fuse  0 (intact) - SW enable possible 1 (intact) - no SW enable possible
1 KTA	Kill Trace is active  1 active 0 not active
0 KTF	Kill Trace Enable fuse value  0 (intact) - kill trace is never active 1 (burned) - kill trace functionality enabled

### 4.12.9.7 General Purpose Clocks Control Register (SJC\_GPCCR)

This register is used to configure clock related modes in SOC, see System Configuration chapter for more information. Those bits are directly connected to JTAG outputs. Bit 0 of GPCCR controls SDMA clocks invocation. When out of reset, the SDMA is in sleep mode with no SDMA clock running. Unlike events, debug requests does not wake SDMA if it is in sleep mode. The debug request is recognized by the SDMA only when it exits sleep mode upon reception of an event. To be able to enter debug mode even if no event is triggered, the SDMA clock on bit needs to be set prior to sending the debug request (clear at reset).

Address: 0h base + 7h offset = 7h

#### SJC\_GPCCR field descriptions

Field	Description
31-2 -	Reserved
1 ACLKOFFDIS	Disable/prevent ARM platform clock/power shutdown
0 SCLKR	SDMA Clock ON Register - This bit forces the clock on of the SDMA

# Chapter 5

## Clocks and Power Management

### 5.1 Clock, Reset, and Power Management

#### 5.1.1 Introduction

The i.MX 7Dual device targets many applications where low power consumption, long battery life, always-on and instant-on capabilities, and no need for active cooling are paramount. For this reason, the i.MX 7Dual design constantly focuses on reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the i.MX 7Dual architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter describes the Clock and Power Management architecture of the i.MX 7Dual device. It contains information about:

- Structural components of the power and clock management systems of the i.MX 7Dual device.
- Clock generation and distribution system of the i.MX7 Dual device.
- Power generation and distribution system of the i.MX7 Dual device.
- Power mode definition of the i.MX 7Dual device.
- Power and clock and management techniques supported by the i.MX 7Dual device.

#### **NOTE**

All the numerical values are typical or examples, for accurate values one should use the datasheet.

#### 5.1.2 Components of Clock and Power Management

The centralized clock generation, power generation and distribution are implemented by the following blocks:

- **Crystal OSC (XTALOSC):** The integrated crystal oscillators generate the 24MHz high speed clock and 32KHz low speed clock, these two clocks are used as the clock source for whole system. See Crystal Oscillator (XTALOSC) for details of the XTALOSC block.
- **PLLs and PFDs:** These modules generates the clocks with various frequencies required by different functional blocks. See the PLL and PFD section in Clock Controller Module (CCM)) for information on the PLL and PFD architecture, functional description and programming model.
- **CCM (Clock Control Module):** The CCM module provides control for clock generation, division, distribution, synchronization, and coarse-level gating. See Clock Controller Module (CCM)) for information on the CCM architecture, functional description and programming model.
- **LPCG (Low Power Clock Gating):** This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See Clock Controller Module (CCM) for information on the LPCG architecture and functional description.
- **GPC (General Power Controller):** This module controls the power state of the SoC. It handles the power gating under low power modes and also manages the power up / power down sequences. See General Power Controller (GPC) chapter for information on the GPC architecture, functional description and programming model.
- **SRC (System Reset Controller):** This module generates the reset signals to all the modules in the SoC. It will assert the reset signals at appropriate time such as power up. See System Reset Controller (SRC) chapter for information on the GPC architecture, functional description and programming model.
- **PMU (Integrated Power Management Unit):** This module generates the internal power supplies distribute them to the entire SoC. See Power Management Unit (PMU) chapter for information on the PMU architecture, functional description and programming model.

Together, the modules listed above provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals on the SoC.

### **5.1.3 Clock Generation**

The i.MX7D clock system is designed to provide a scalable, powerful but easy-to-use clock solution.

### 5.1.3.1 Overview

The overall clock system for the chip is shown in the diagram below.

**Figure 5-1. i.MX7Dual Clock System**

As shown in the diagram, the OSCs, PLLs, PFDs and Pre-Dividers generate the clock sources with fixed or variable frequency. Then the clock root generation logic inside CCM will generate various clock roots required for core, bus and peripheral blocks. These clock roots will be delivered to each module through LPCG, which contains the clock gating logic for each clock. The control signal for CCGRs in CCM will be the source for clock enable signals. Since some of the clocks need to be gated off during the reset, the SRC module will also send clock gate signals to the LPCG.

In low power mode, GPC will drive the low power mode state signal to CCM, then CCM will enable clock gating based on the configuration. At the same time, CCM may also deassert enable signals for PLLs and PFDs, so these modules can be power off during the low power mode. When the chip enters stop mode, GPC may deassert the OSC enable signal to ANATOP to shut off the OSC, it may also assert the stop mode signal to ANATOP to put the whole ANATOP into low power mode.

The detailed function description for each block will be described in following sections:

### 5.1.3.2 Oscillator

i.MX 7Dual has 4 integrated oscillators, two for high speed 24MHz clock and two for low speed 32KHz clock.

- 24MHz Crystal Oscillator (XTAL): High frequency oscillator (typical frequency is 24 MHz) used to generate the main system clock. It supplies the PLLs and other peripherals. The 24MHz XTAL clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier.
- 24MHz RC Oscillator (RCOSC): Low power RC oscillator used to generate 24MHz clock with less accuracy. It is intended to be used to replace the 24MHz XTAL in low power mode.
- 32KHz Crystal Oscillator (RTC\_XTAL): Low frequency real time clock oscillator (typical frequency is 32.768KHz) used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watchdog counters. The 32KHz RTC\_XTAL clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier.
- 40KHz Ring Oscillator (RingOSC): Internal ring oscillator (typical frequency is 40KHz) used to generate low speed clock when 32KHz RTC\_XTAL is not available. It has less accuracy than the 32KHz RTC\_XTAL but it starts up much faster.

Either the 24MHz XTAL or the 24MHz RCOSC can be used as the source of the 24MHz clock to CCM and then get delivered to the rest of the SoC. The 24MHz XTAL is selected by default on power up. The switching between 24MHz XTAL and 24MHz RCOSC is fully controlled by SW.

Either the 32KHz XTAL or the 40KHz RingOSC can be used as the source of the 32KHz clock to CCM and then get delivered to the rest of the SoC. Due to the 32KHz XTAL start up time, 40KHz RingOSC is selected as the default clock source during SoC power up. Once the 32KHz XTAL starts up, the clock source will be switched to it automatically and the 40KHz RingOSC will be shut off. If the 32KHz XTAL stops in some case, the 40KHz RingOSC will be enabled and selected as the source. The enable/disable of the 40KHz RingOSC and the clock source switching is done automatically in HW and there is no programmable register for SW to select the clock source. There is only one read-only register to show the current clock source.

When the SoC enters Deep Sleep Mode, the GPC will de-assert the osc\_enable signal to shut off the 24MHz XTAL for power saving. When exiting from this mode, GPC will wait for the osc\_lock signal to make sure the 24MHz clock source is ready.

See Crystal Oscillator (XTALOSC) chapter for details of the functional descriptions and programming model on these blocks.

### 5.1.3.3 Clock I/O Port

There are two dedicated IO ports on i.MX 7Dual used for clock generation:

- CLK1P/N: LVDS low jitter differential I/O ports for input or output clocks.
- CLK2: single-ended IO port for input or output clocks.

Both CLK1P/N and CLK2 can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or they can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

### 5.1.3.4 PLL and PFD

Six PLLs are used in i.MX 7Dual to generate the high speed clocks required by the modules in SoC. Among all the PLLs, the SYS\_PLL is equipped with eight Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

- ARM\_PLL, used to generate the clock for ARM Cortex-A7 platform. It is a programmable integer frequency multiplier capable of output frequency of up to 1.2GHz.
- SYS\_PLL with 8 PFDs, used to generate the clock sources for the whole system. By default, this PLL is a clock source for internal system buses, internal processing logic, NAND/NOR interface modules, etc. SYS\_PLL generally runs at a fixed multiplier of 20, producing 480MHz output frequency with 24MHz reference from XTAL. Besides the main output, this PLL drives eight PFDs (PFD0...PFD7). The PFD0, PFD1 and PFD2 will be fixed at 392MHz, 332MHz and 270MHz. With the Pre-Dividers on these PLL/PFD, it can provide clocks with frequency at 480MHz, 392MHz, 332MHz, 270MHz, 196MHz, 166MHz and 135MHz. These clock sources will be used for AXI/AHB bus in the chip, and also be used for those IP blocks that does not require an accurate frequency. The PFD3-PFD7 will be used by some IP blocks that need a programmable clock.
- ENET\_PLL, this PLL will have its VCO frequency fixed at 1GHz, the Pre-Dividers on this PLL will divide this clock down to 500MHz, 250MHz, 125MHz, 100MHz and etc. These clocks will be used for the IP blocks that requires a fixed and accurate clock, such as PCIe, Ethernet, Timer, etc.
- AUDIO\_PLL, used to generate reference clock for audio interface. This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for

external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency.

- VIDEO\_PLL, used to generate reference clock for display interface. This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency.
- DRAM\_PLL, used to generate reference clock for DRAM PHY and controller.

Among all the PLLs, the AUDIO\_PLL, VIDEO\_PLL and DRAM\_PLL has the capability to spread spectrum the generated signal. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure and/or can be spread-spectrum modulated.

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{vco}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

Reference input clock for any of the PLLs could be selected individually by the BYPASS\_CLK\_SRC feed of the PLL control register. Each PLL can use one of the following clock source as its reference clock:

- 24MHz clock from XTAL.
- External reference clock from CLK1P/N.
- External reference clock from CLK2.

A simple diagram for the PLLs, PFDs and Pre-Dividers are shown in the diagram below:

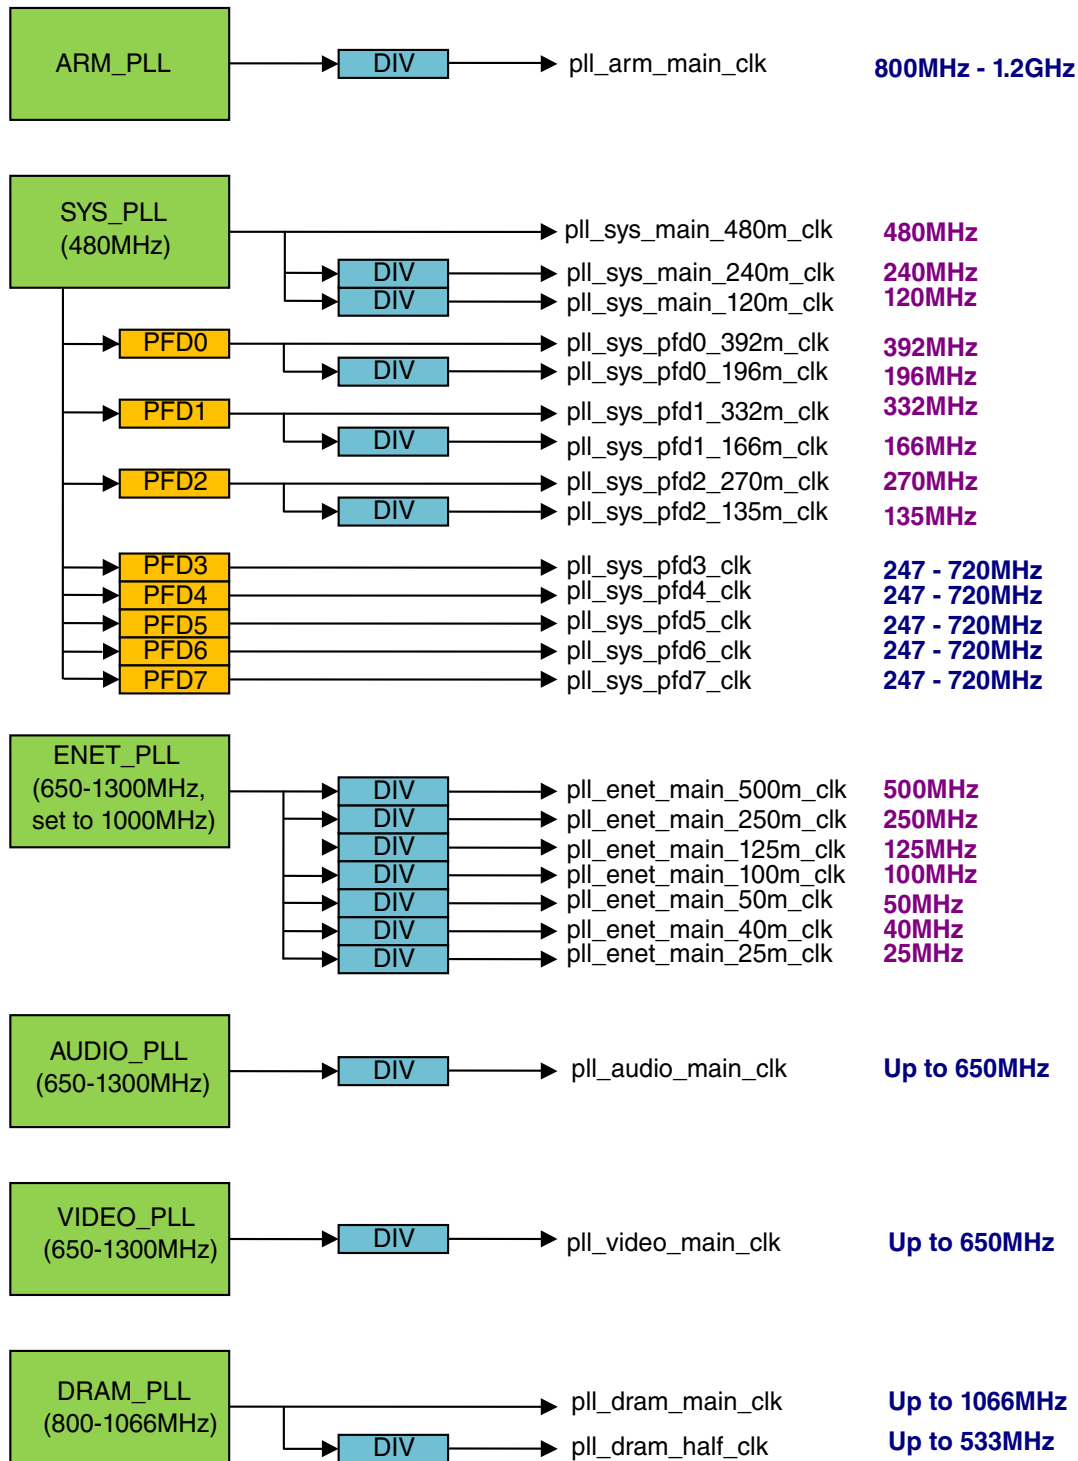

Figure 5-2. i.MX7Dual PLL and PFD

PLLs configuration and control functions are accessible via individual PLL and PFDs and global configuration and status registers.

Each of the PLLs could be individually configured to "Bypass", "Output Disabled" and "Power Down" modes.

- When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.
- When configured in "Output Disabled" mode, the PLLs output is completely gated and there is neither bypass clock nor PLL generated clock do propagated to PLL output. Main PLL output and PFD outputs have individual "Output Enable" control bits.
- When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period. Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges. For PFDs, if it is enabled, its output will be also gated during the "lock in" period.

In addition to the control register for each PLL/PFD, CCM will also have another group of registers dedicated for PLL and PFD enable/disable control in low power mode. Each PLL/PFD will have 2-bit control register as follows:

- 2'b'00: the PLL/PFD is always disabled.
- 2'b'01: the PLL/PFD will be disabled in STOP/WAIT mode.
- 2'b'10: the PLL/PFD will be disabled in STOP mode.
- 2'b'11: the PLL/PFD is always enabled.

Every PLL and PFD will have one hardware enable signal from CCM, and also provide one lock flag back to CCM. During the low power mode, GPC will send the WAIT/STOP mode signal to CCM. CCM can deassert the enable signal to PLL/PFD to disable them in low power mode. When exiting from low power mode, CCM needs to assert the enable signals and wait for the lock flag to make sure the clock is stable, and then provide a lock flag back to GPC as an acknowledge.

CCM Memory Map/Register Definition and CCM Analog Memory Map/Register Definition contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

### **5.1.3.5 Clock Root Generation**

The clock root generation in CCM will be implemented based on clock slices. Each clock root will have a dedicated clock slice, it takes the clock source from Oscillators, PLL/PFD or Pre-Dividers, and generate the clock root with required frequency.

**Figure 5-3. Clock Root Generation from Clock Slice**

The full clock root definition, which includes the clock slice type, clock source, and default setting, please refer to CCM chapter.

Clock slice is the basic element of the root clock generation. It has unified clock input MUX, Pre-Divider, Post-Divider and glitch-free MUX to generate clock root from clock sources. There are 3 types of clock slices used in the CCM:

- **Core clock slice**, used for ARM CPU cores.
- **Bus clock slice**, used for AXI/AHB bus fabric and bus interface for IP modules.
- **Peripheral clock slice**, used for peripheral IP modules.

The 3 types of clock slice will use a unified programming model to make the SW programming easy-to-use. The control for the MUX, CG and dividers are provided with two 32-bit registers. For details on the programming model of the clock slices, please refer to CCM Memory Map/Register Definition.

#### 5.1.3.5.1 Bus Clock Slice

From function point of view, the bus clock slice is a super-set for the core clock slice and the peripheral clock slice. The bus clock supports 8 functional clock inputs, which are fed into two source select MUX, named SEL\_A and SEL\_B. The selected clock source will be divided down by an integer pre-divider. To avoid glitches to the pre-dividers when switching clock source on the MUX, there is a clock gating cell used to shut off the clock. The output from the two pre-dividers is selected using a glitch-less MUX. In functional mode, the output of the glitch free MUX will be divided down by the post-divider and used as clock root.

The upper and lower part of the MUX, CG and pre-divider are identical. The duplicated source select MUX and pre-divider are mainly designed to support seamless clock source switching, in order to avoid stop clock. For example, if current clock source is clk0 on SEL\_A, and SW want to change clock source from clk0 to clk1, it can configure SEL\_B to use clk1 and use the glitch free MUX to switch it from SEL\_A to SEL\_B.

For bus clock, the clock frequency change needs to happen when the clock is still being used. The bus clock slice provided a mechanism to do handshake with IP modules through hardware signals. When the glitch free MUX or the post-divider is changed, the handshake will start and the change will only be held until an acknowledge is provided. The handshake function can be enabled/disable by register setting.

The AUTO-SLOW block on the final output path is used to automatically divide clock down for power saving based on the idle flag. For a bus block, the idle flag can be asserted when all the active transactions have finished, and be deasserted when there is a new transaction request.

There is also a bypass MUX before the post-divider to allow a bypass clock to be used instead of the 8 functional clock input. This is used during ATE test to take external clock input.

The key function of bus clock slice is shown in the diagram below:

**Figure 5-4. Bus Clock Slice**

### 5.1.3.5.2 Core Clock Slice

The core clock slice is a sub-set of the bus clock slice. Since the core clock runs up to 1GHz, the timing of core clock slice needs to be closed at higher frequency.

The key function of core clock slice is shown in the diagram below.

Figure 5-5. Core Clock Slice

### 5.1.3.5.3 Peripheral Clock Slice

For peripheral clocks, the clock frequency won't be changed when the clock is being used, so there is only one clock source select MUX, one pre-divider and one post divider. Most of the clock slices in CCM are peripheral clock slice.

The key function of peripheral clock slice is shown in the diagram below.

Figure 5-6. Peripheral Clock Slice

### 5.1.3.6 Low Power Clock Gating (LPCG)

The clock roots generated inside CCM are distributed to the entire SoC through LPCG. The LPCG block receives the root clocks from CCM and splits them to clock branches for each functional block. The clock branches are individually gated clocks. Each LPCG only has one clock root, while each clock root might drive multiple LPCGs.

The clock enables for the LPCG can come from following sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CCGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

For the clock enable signal from CCM, the 2-bit CG control register field for each clock is defined as:

- 2'b'00: the clock is always gated off.
- 2'b'01: the clock will be gated off in STOP/WAIT mode.
- 2'b'10: the clock will be gated off in STOP mode.
- 2'b'11: the clock is always on.

By proper setting of the CG control registers, the clocks to each functional block could be shut off automatically when chip enters low power mode.

### **5.1.3.7 DRAM Clock Generation**

The DRAM PHY and DRAM controller in i.MX 7Dual requires following clock input:

- PHY\_CLK, up to 533MHz, its frequency is the operating frequency of the DRAM interface.
- CONTROLLER\_CLK, synchronous to PHY\_CLK, always at 1/2 frequency of PHY\_CLK.
- PHY\_MCLK, 400MHz to 533MHz, asynchronous to PHY\_CLK, but has to be at least 400MHz, no matter what the DRAM frequency is.

To meet all these requirement, following clock structure is used:

**Figure 5-7. DRAM Clock Structure**

The dedicate DRAM\_PLL is used to generate 2x clock at 1066MHz, and use a divider to divide it by 2 to get 533MHz clock with good duty cycle. This 533MHz clock will be used as the PHY\_MCLK. Meanwhile, the 1066MHz clock will also be divided by 2 with the 1/N divider to get 533MHz as the PHY\_CLK, and then it will be divided by 2 to get 266MHz clock for the DRAM controller.

For DRAM low speed operations, there is a 1/N divider used to divide the PHY clock down to lower frequency such as 266MHz or 133MHz. The 1/N divider is a 3-bit divider so N can be 2 to 8. The PHY\_MCLK will still use the original 533MHz since it has to be 400MHz or higher.

The alternative solution to support DRAM low speed operation is to use the clock root generated from CCM. The dram\_phym\_alt\_clk\_root from CCM will be used as PHY\_MCLK, and it will be running at 400MHz or above. The dram\_alt\_clk\_root from CCM will be divided by N as the PHY\_CLK and also get divided by 2 to be the clock from controller. The advantage of doing this to allow the DRAM\_PLL to be shut off to save more power.

## 5.1.4 Power Management

### 5.1.4.1 Overview

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

**Figure 5-8. i.MX7Dual Power System**

The power generation and management system consists of the GPC, PMU, CCM and SRC.

- The PMU generates the power rails with LDOs or power switches from external power input.
- The GPC is the central controller for all the power system. The key roles of the GPC are chip power mode control and power domains management.
- The CCM generates the clock for modules in each power domain, and also enable/disable the clocks based on the power mode from GPC.
- The SRC generates the reset signal for each power domain during the power up of a domain.

## 5.1.4.2 PMU

The integrated PMU is designed to simplify the external power interface. It help to reduce the number of external power supplies required, and also manages the power up/power down sequence for integrated PHY and IO pads.

### 5.1.4.2.1 PMU Components

The PMU in i.MX 7Dual has following components integrated for power management:

- LDOs
- Power Switches
- PVCC Generator

There are 6 integrated LDO on i.MX 7Dual device:

- LDO\_1P0A, 1.0V LDOs for analog modules, including XTAL and PLL.
- LDO\_1P1D, 1.0V LDO for MIPI PHY and PCIe PHY.
- LDO\_1P2, 1.2V LDO for USB HSIC PHY.
- LDO\_USB1/2\_1P0, 1.0V LDO for USB PHY1 and USB PHY2.
- LDO\_SVNS\_1P8, 1.8V LDO from coin cell to generate 1.8V power for SNVS and 32K RTC.

There are 8 integrated power switches on i.MX 7Dual device:

- SW\_CPU0, Power switch for ARM Cortex-A7 CPU0.
- SW\_CPU1, Power switch for ARM Cortex-A7 CPU1.
- SW\_SCU, Power switch for ARM Cortex-A7 Platform (SCU).
- SW\_L2, Power switch for ARM Cortex-A7 L2 Cache memory.
- SW\_SOC\_PD, Power switch for the power down domain in VDD\_SOC.
- SW\_FUSE, Power switch for the eFuse programming power supply.
- SW\_HSIC\_1P0, Power switch for the USB HSIC PHY 1.0V power supply.
- SW\_PHY\_1P8, Power switch for PCIe and MIPI PHY 1.8V power supply.

The GPIO pads in i.MX7D requires an 1.8V PVCC supply for its pre-driver circuit. In order to simplify the power up/power down sequence, each GPIO bank has a dedicated bias generator circuit to generate PVCC from NVCC. There are a total of 13 PVCC Generators on the i.MX 7Dual device.

### NOTE

Due to the pad limitation on the package, the PVCC power generated from different GPIO bank are shorted together into 5 groups.

- NVCC\_GPIO1/2 banks share on PVCC supply, named as PVCC\_GPIO\_1P8\_CAP.
- NVCC\_ENET1 bank takes on dedicated PVCC supply, named as PVCC\_ENET\_CAP.
- NVCC\_SAI, NVCC\_SD1/2/3 banks share one PVCC supply, named as PVCC\_SAI\_SD\_CAP.
- NVCC\_I2C, NVCC\_SPI, NVCC\_UART banks share one PVCC supply, named as PVCC\_I2C\_SPI\_UART\_CAP.
- NVCC\_EPDC1/2, NVCC\_LCD banks share one PVCC supply, named as PVCC\_EPDC\_LCD\_CAP.

### 5.1.4.2.2 Power Distribution

The block diagram below shows the power distribution tree of i.MX 7Dual i.MX7Dual processor, including all the LDOs, power switches and PVCC generators.

The power rails on the left side are external power rails supplied to the SoC, while the power rails on the right side are generated by the integrated PMU.

Some of the external power rails are combined together to reduce the total number of external power supplies. For more details on the rules and recommendation on power rails, please refer to “Manage Power Rails and Power Domains”.

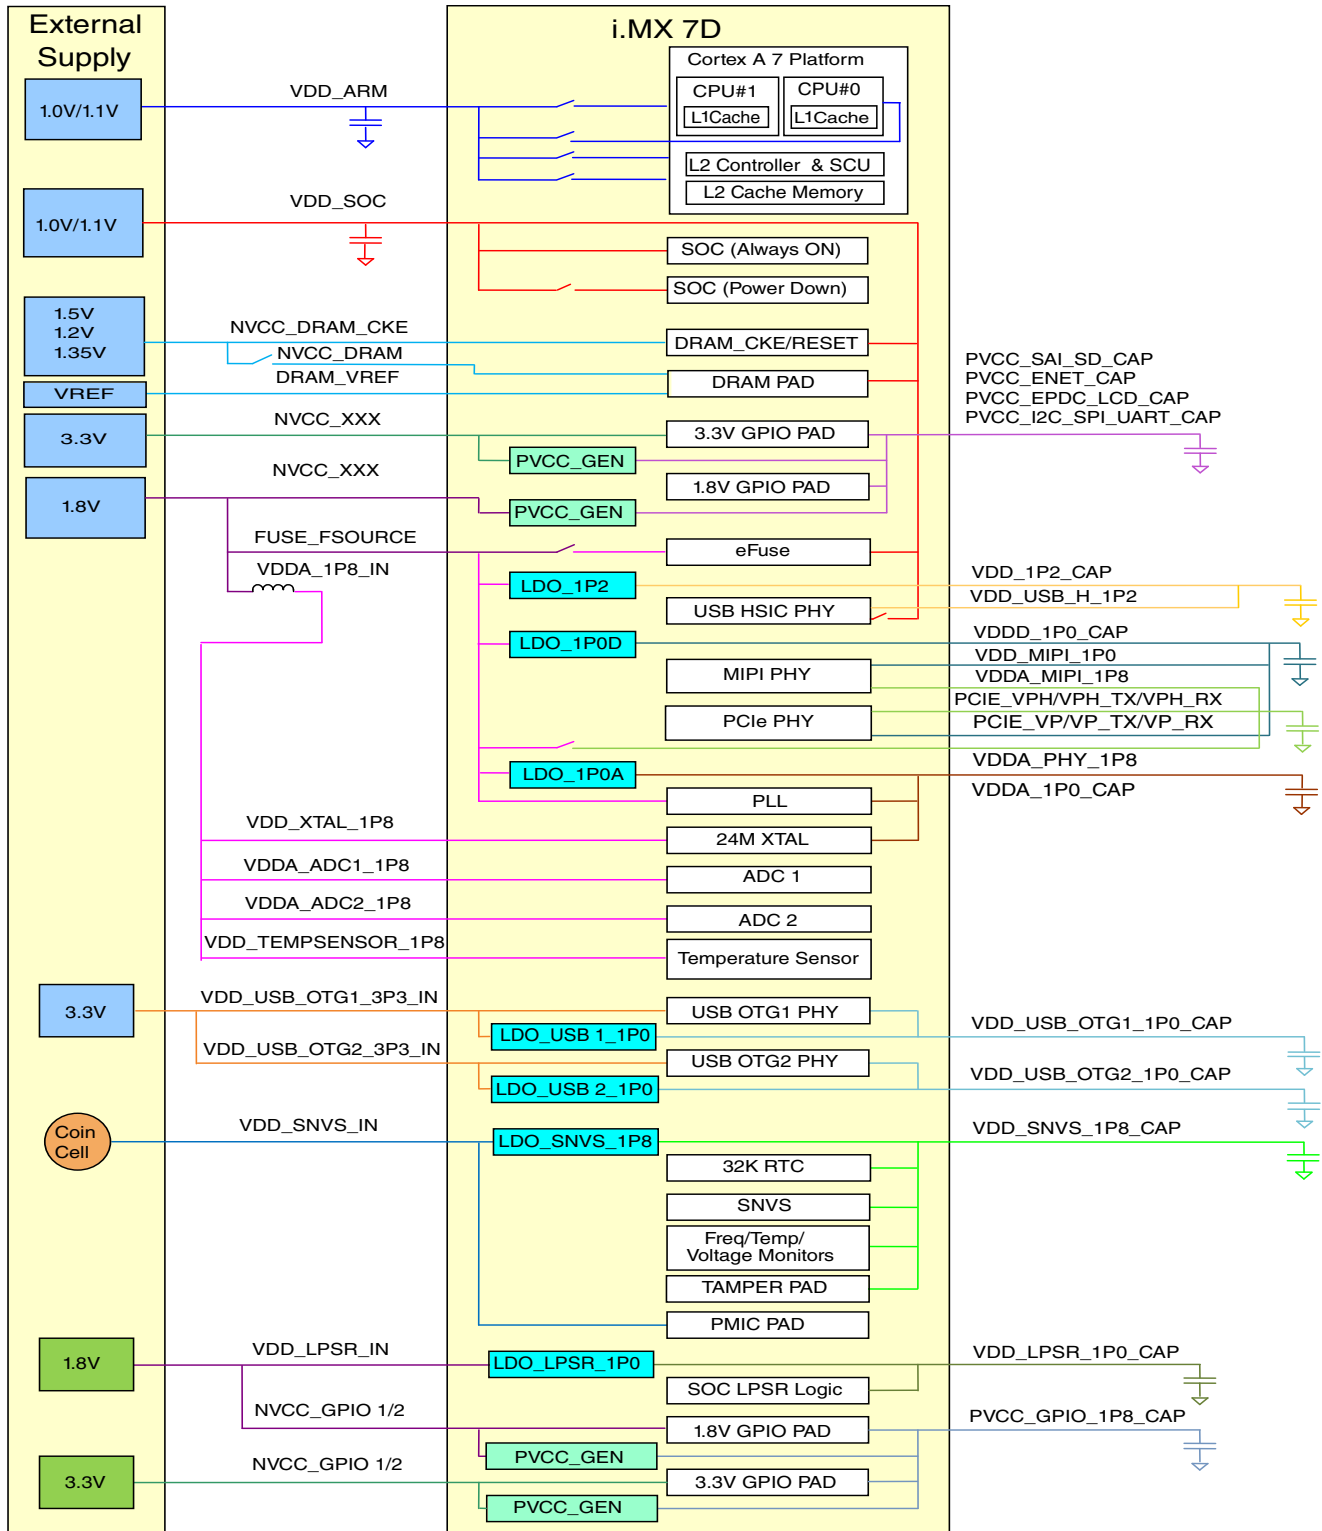

Figure 5-9. i.MX7Dual Power Diagram

### 5.1.4.2.3 External Power Supplies

The table below summarizes all the external power rails supplied to the SoC.

**Table 5-1. External Power Supply**

Power rail	Voltage(V)	Description
VDD_ARM	1.0/1.1	Power supply for ARM A7 platform.
VDD_SOC	1.0/1.1	Power supply for all SOC digital logic except ARM A7
VDDA_1P8	1.8	Power supply for analog modules, also used as the input power source for internal analog LDOs
VDDA_XTAL_1P8	1.8	Power supply for the analog portion of the 24MHz XTAL.
VDDA_ADC1_1P8	1.8	Power supply for the analog portion of the ADC1.
VDDA_ADC2_1P8	1.8	Power supply for the analog portion of the ADC2.
VDDA_TEMPSENSOR_1P8	1.8	Power supply for the analog portion of the Temperature Sensor.
FUSE_FSOURCE	1.8	Power supply for the programming power of FUSE box.
VDD_SNVS_IN	3.0	Power supply for RTC and tamper detection logic, usually supplied by coin cell
VDD_LPSR_IN	1.8	Power supply for low power state retention domain
NVCC_GPIO1	1.8/3.3	Power supply for GPIO bank1 in state retention domain
NVCC_GPIO2	1.8/3.3	Power supply for GPIO bank2 in state retention domain
NVCC_DRAM	1.2/1.35/1.5	DRAM IO power supply 1.2V for LPDDR2/LPDDR3, 1.35V for DDR3L, 1.5V for DDR3
NVCC_DRAM_CKE	1.2/1.35/1.5	DRAM IO power supply for CKE and RESET pad
DRAM_VREF	0.6/0.675/0.75	DRAM IO reference voltage
NVCC_EPDC1/2 NVCC_ENET1 NVCC_I2C NVCC_SPI NVCC_UART NVCC_SAI NVCC_LCD NVCC_SD1/2/3	1.8/2.5/3.3	Power supply for GPIO banks outside of state retention domain  (Referred as NVCC_XXX in this document)
VDD_USB_OTG1_3P3_IN	3.3	Power supply for USB OTG1 PHY
VDD_USB_OTG2_3P3_IN	3.3	Power supply for USB OTG2 PHY

### 5.1.4.2.4 Generated Power Supplies

The table below summarizes the power rails generated by integrated PMU

**Table 5-2. Generated Power Supply**

Power rail	Vtyp	Source	Def	Description
VDDD_1P0_CAP	1.0	LDO_1P0D	OFF	
VDDA_1P0_CAP	1.0	LDO_1P0A	ON	
VDD_1P2_CAP	1.2	LDO_1P2	OFF	
VDD_USB_OTG1_1P0_CAP	1.0	LDO_USB1_1P0	ON	On when VDD_USB_OTG1_3P3_IN is active.
VDD_USB_OTG2_1P0_CAP	1.0	LDO_USB2_1P0	ON	On when VDD_USB_OTG2_3P3_IN is active.
VDD_SNVS_1P8_CAP	1.8	LDO_SNVS_1P8	ON	On when VDD_SNVS_IN active.
VDD_LPSR_1P0_CAP	1.0	LDO_LPSR_1P0	ON	On when VDD_LPSR_IN active.
VDDA_1P8_PHY	1.8	SW_PHY_1P8	OFF	
VDD_ARM_CPU0	1.0	SW_CPU0	ON	Not visible on pads
VDD_ARM_CPU1	1.0	SW_CPU1	ON	Not visible on pads
VDD_ARM_SCU	1.0	SW_SCU	ON	Not visible on pads
VDD_ARM_L2	1.0	SW_L2	ON	Not visible on pads
VDD_SOC_PD	1.0	SW_SOC_PD	ON	Not visible on pads
VDD_USB_H_1P0	1.0	SW_HSIC_1P0	OFF	Not visible on pads
VDD_FUSE	1.8	SW_FUSE	OFF	Not visible on pads
PVCC_GPIO_1P8_CAP	1.8	PVCC_GEN_GPIO1 PVCC_GEN_GPIO2	ON	On when any of the NVCC_GPIO1/2 is active.
PVCC_ENET_CAP	1.8	PVCC_GEN_ENET	ON	On when NVCC_ENET is active.
PVCC_EPDC_LCD_CAP	1.8	PVCC_GEN_EPDC1 PVCC_GEN_EPDC2 PVCC_GEN_LCD	ON	On when any of the NVCC_EPDC1/2 or NVCC_LCD is active.
PVCC_SAI_SD_CAP	1.8	PVCC_GEN_SAI PVCC_GEN_SD1 PVCC_GEN_SD2 PVCC_GEN_SD3	ON	On when any of the NVCC_SAI or NVCC_SD1/2/3 is active.
PVCC_I2C_SPI_UART_CAP	1.8	PVCC_GEN_I2C PVCC_GEN_SPI PVCC_GEN_UART	ON	On when any of the NVCC_I2C, NVCC_SPI, or NVCC_UART is active.

### 5.1.4.3 Power Domains

A power domain is a group of blocks or sub-blocks fed by the same power source. The whole chip is built up with a number of power domains, each power domain has one or multiple functional blocks. Each domain has its own power supply, either from external power directly or generated by integrated PMU.

According to the functional blocks inside them, the power domains on the chip can be divided into 3 groups: digital domain, analog domain and IO domain. The domains are named with the same name as its power supply.

The table below summarizes all the power domains on the chip.

Domain	Type	Blocks Inside the Domain
VDD_ARM_CPU0	Digital	ARM Cortex-A7 Core0
VDD_ARM_CPU1	Digital	ARM Cortex-A7 Core1
VDD_ARM_SCU	Digital	ARM Cortex-A7 SCU & L2 Controller
VDD_ARM_L2	Digital	ARM Cortex-A7 L2 memory
VDD_SOC	Digital	See the diagram below
VDD_SOC_PD	Digital	See the diagram below
VDD_LPSR_1P0_CAP	Digital	GPIO-1 controller
VDD_SNVS_IN	IO	PMIC_ON_REQ, PMIC_STBY_REQ, ONOFF pad
VDD_SNVS_1P8_CAP	Analog	SNVS_LP, tamper detection, 32K RTC
VDDA_1P8_IN	Analog	XTAL, ADC1/2, Temperature Sensor, PLL, bandpab
VDD_1P0A_CAP	Digital	XTAL, ADC1/2, Temperature Sensor, PLL
VDD_FUSE	Analog	FUSE
VDD_MIPI_1P0	Digital	MIPI PHY
VDDA_MIPI_1P8	Analog	MIPI PHY
PCIE_VP/VP_TX/VP_RX	Digital	PCIe PHY
PCIE_VPH/VPH_TX/VPH_RX	Analog	PCIe PHY
USB_OTG1_3P 3	Analog	USB OTG1 PHY
USB_OTG2_3P 3	Analog	USB OTG2 PHY
USB_OTG1_1P0	Digital	USB OTG1 PHY
USB_OTG2_1P0	Digital	USB OTG2 PHY
VDD_USB_H_1P2	Analog	USB HSIC PHY
VDD_USB_H_1P0	Digital	USB HSIC PHY
NVCC_DRAM	IO	DRAM IO except DRAM_CKE and DRAM_RESET
NVCC_DRAM_CKE	IO	DRAM_RESET and DRAM CKE

Table continues on the next page...

Domain	Type	Blocks Inside the Domain
NVCC_GPIO1	IO	GPIO in NVCC_GPIO1 bank
NVCC_GPIO2	IO	GPIO in NVCC_GPIO2 bank
PVCC_GPIO_1P8_CAP	IO	GPIO in NVCC_GPIO1 and NVCC_GPIO2 bank
NVCC_EPDC1	IO	GPIO in NVCC_EPDC1 bank
NVCC_EPDC2	IO	GPIO in NVCC_EPDC2 bank
NVCC_ENET1	IO	GPIO in NVCC_ENET1 bank
NVCC_I2C	IO	GPIO in NVCC_I2C bank
NVCC_SPI	IO	GPIO in NVCC_SPI bank
NVCC_UART	IO	GPIO in NVCC_UART bank
NVCC_SAI	IO	GPIO in NVCC_SAI bank
NVCC_LCD	IO	GPIO in NVCC_LCD bank
NVCC_SD1	IO	GPIO in NVCC_SD1 bank
NVCC_SD2	IO	GPIO in NVCC_SD2 bank
NVCC_SD3	IO	GPIO in NVCC_SD3 bank
PVCC_EPDC_LCD_CAP	IO	GPIO in NVCC_EPDC1, NVCC_EPDC2 and NVCC_LCD bank
PVCC_ENET_CAP	IO	GPIO in NVCC_ENET1 bank
PVCC_SAI_SD_CAP	IO	GPIO in NVCC_SAI, NVCC_SD1, NVCC_SD2 and NVCC_SD3 bank
PVCC_I2C_SPI_UART_CAP	IO	GPIO in NVCC_I2C, NVCC_SPI and NVCC_UART bank

The diagram below shows the functional block in the main power domains.

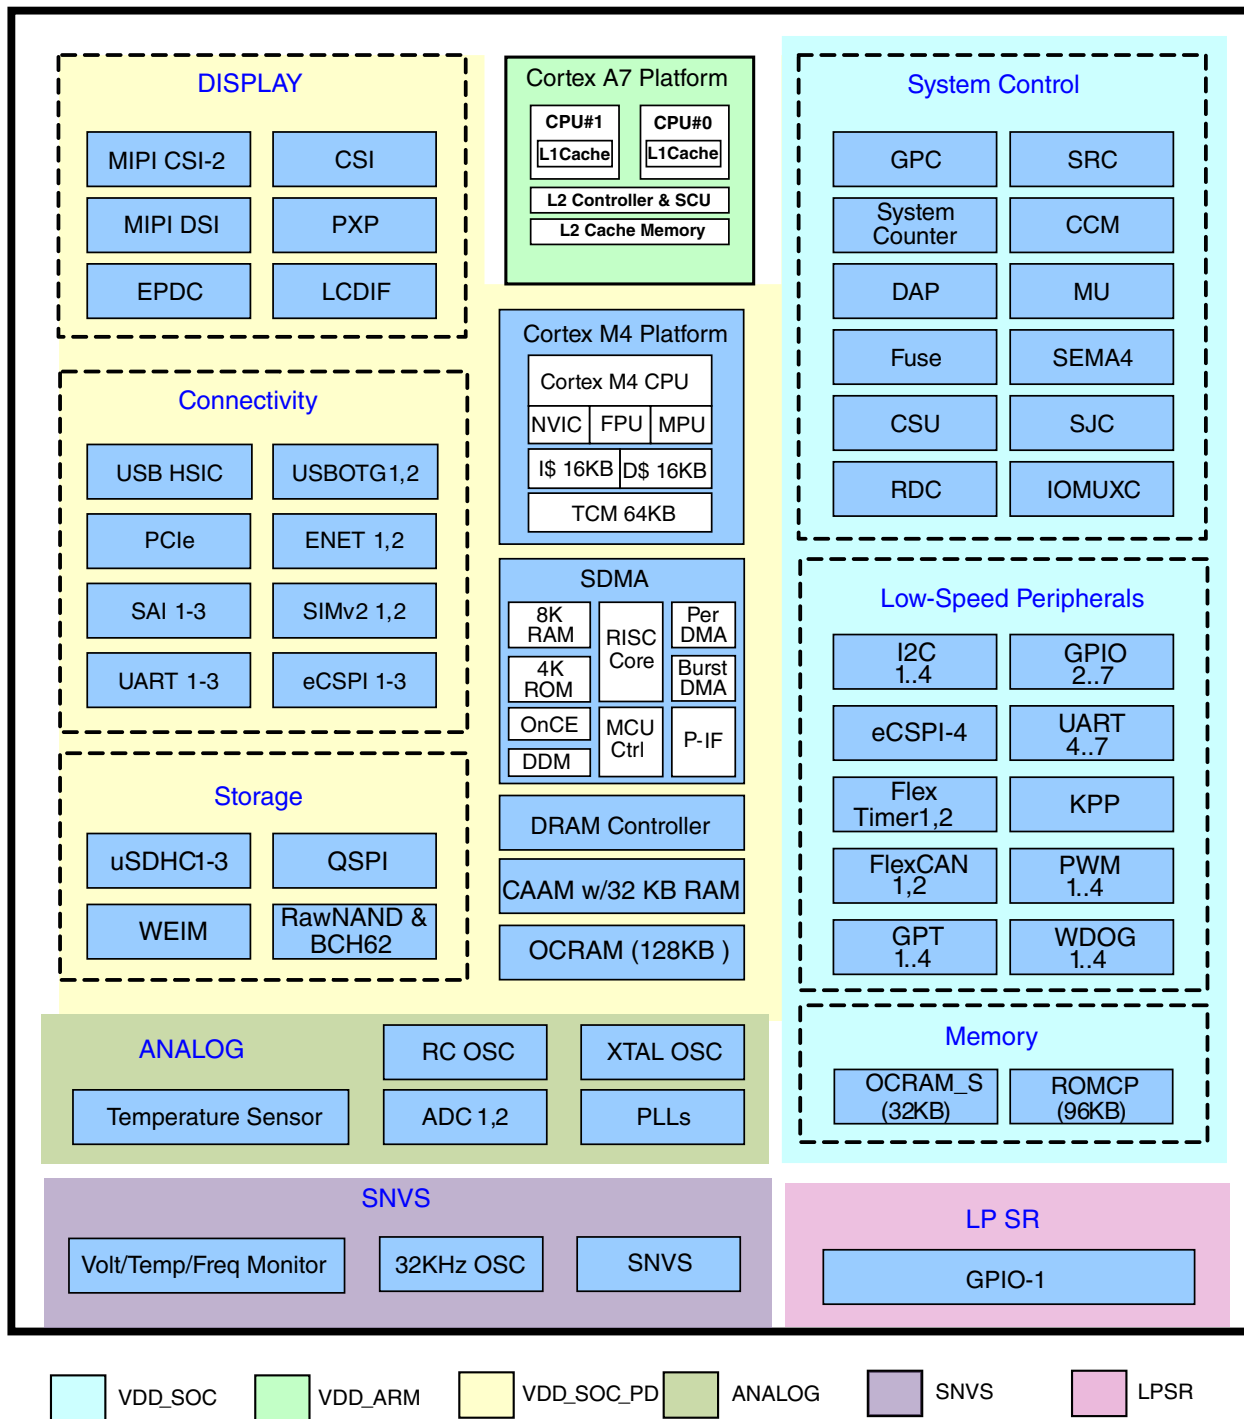

Figure 5-10. i.MX7Dual Power Domains

**NOTE**

The integrated PHYs are not shown in the diagram. The USB, PCIe, MIPI mentioned in the diagram is only the digital controller of these modules.

### 5.1.4.4 Power Modes

i.MX7Dual has following power modes:

- OFF Mode: all power rails are off.
- SNVS Mode: only RTC and tamper detection logic is active.
- LPSR Mode: an extension of SNVS mode, with 16 GPIOs in low power state retention mode.
- RUN Mode: all external power rails are on, CPU is active and running, other internal module can be on/off based on application.
- Low Power Mode: most external power rails are still on, CPU is in WFI state or power gated, most of the internal modules are clock gated or power gated. Typically there are 3 low power modes used, System IDLE, Low Power IDLE and SUSPEND.

The valid power mode transition is shown in the diagram below:

**Figure 5-11. i.MX7Dual Power Modes**

The power mode transition condition is defined in the table below:

**Table 5-3. Power Mode Transition**

Transition	From	To	Condition
1	OFF	RUN	VDD_SVNS_IN supply present.
2	SNVS	OFF	VDD_SVNS_IN supply removal.
3	RUN	SNVS	ONOFF long press, or SW.
4	SNVS	RUN	ONOFF press, or RTC, or tamper event.
5	RUN	LPSR	SW.
6	LPSR	RUN	ONOFF press, or RTC, or tamper event, or GPIO event.
7	RUN	Low Power	SW (CPU execute WFI)
8	Low Power	RUN	RTC, tamper event, IRQ.

The table below summarizes the external power supply state in all the power modes:

**Table 5-4. Power Mode**

Power rail	OFF	SNVS	LPSR	RUN	Lower Power
VDD_ARM	OFF	OFF	OFF	ON	ON/OFF
VDD_SOC	OFF	OFF	OFF	ON	ON
VDDA_1P8_IN	OFF	OFF	OFF	ON	ON
VDD_SNVS_IN	OFF	ON	ON	ON	ON
VDD_LPSR_IN	OFF	OFF	ON	ON	ON
NVCC_GPIO1/2	OFF	OFF	ON	ON	ON
NVCC_DRAM	OFF	OFF	OFF	ON	ON
NVCC_DRAM_CKE	OFF	OFF/ON	OFF/ON	ON	ON
NVCC_XXX	OFF	OFF	OFF	ON/OFF	ON/OFF
VDD_USB_OTG1_3P3_IN	OFF / ON	OFF / ON	OFF / ON	ON / OFF	ON / OFF
VDD_USB_OTG2_3P3_IN					

The NVCC\_DRAM\_CKE can be still ON during SNVS/LPSR mode to keep the CKE/RESET pad in correct state to hold DRAM device in self-refresh mode.

The NVCC\_XXX can be off in RUN mode / Low Power mode if all the pads in that IO bank is not used in the application, the NVCC\_XXX supply could be tied to GND.

The VDD\_USB\_OTG1\_3P3\_IN and VDD\_USB\_OTG2\_3P3\_IN are fully asynchronous to other power rails, so it can be either ON/OFF in any of the power modes.

#### 5.1.4.4.1 OFF Mode

In OFF mode, all the power rails are shut off.

#### 5.1.4.4.2 SNVS Mode

SNVS mode is also called RTC mode, where only the power for the SNVS domain remain on. In this mode, only the RTC and tamper detection logic is still active.

The external DRAM device can keep in self-refresh when the chip stays in SNVS mode with NVCC\_DRAM\_CKE still powered. During the state transition between SNVS mode to/from ON mode, the DRAM\_CKE pad and DRAM\_RESET pad has to always stay in correct state to keep DRAM in self-refresh mode. No glitch / floating is allowed.

### 5.1.4.4.3 LPSR Mode

LPSR is considered as an extension of the SNVS mode. All the features supported in SNVS mode is also supported in LPSR mode, including the capability of keeping DRAM device in self-refresh.

In LPSR mode, three additional power rails will remain on: the VDD\_LPSR\_IN, NVCC\_GPIO1 and NVCC\_GPIO2. These two power rails are used to supply the logic and IO pads in the LPSR domain. The purpose of this mode is to retain the state of 16 GPIO pads, so the other components in the whole system will have their control signal in correct state.

Among all the 16 GPIO pads, the NVCC\_GPIO1 supply the power for 8 GPIO pads, and the NVCC\_GPIO2 supply the power for the other 8 GPIO pads. This allows the SoC to have some of its GPIO working at 1.8V while others working at 3.3V in the LPSR mode.

When LPSR mode is not needed for the application, the VDD\_LPSR can be connected to VDDA\_1P8 and NVCC\_GPIO1/2 can be connected to the same power supply as NVCC\_XXX for other GPIO banks.

In LPSR mode, the supported wakeup source are RTC alarm, ONOFF event, security/tamper and also the 16 GPIO pads.

### 5.1.4.4.4 RUN Mode

In RUN mode, CPU is active and running, and the analog / digital peripheral modules inside the processor will be enabled. In this mode, the VDD\_SOC, VDD\_ARM, VDDA\_1P8, VDD\_LPSR\_IN, VDD\_SNVS\_IN, NVCC\_DRAM, NVCC\_DRAM\_CKE and NVCC\_GPIO1 has to be ON. The other power rails can be ON/OFF based on applications.

Some of the blocks such as USB OTG, USB HSIC, MIPI and PCIe can be shut off in the RUN mode if they are not active.

In this mode, the PMIC should allow SoC to change voltage of power rails through I2C/SPI interface. Typically, when CPU is doing DVFS, it will switch the VDD\_ARM voltage between 1.1V and 1.0V when CPU is frequency is switching between 1GHz and 800MHz(or below).

### 5.1.4.4.5 Low Power Mode

When the CPU is not running, the processor can enter low power mode. i.MX7Dual processor supports a very flexible set of power mode configurations in low power mode.

Typically there are 3 low power modes used, System IDLE, Low Power IDLE and SUSPEND:

- **System IDLE** - This mode is defined as a mode which CPU can automatically enter when there is no thread running. All the peripheral can still keep working and the CPU will have its state retained so the interrupt response can be very short. The cores shall be able to individually enter the WAIT state.
- **Low Power IDLE** - This mode is defined for the case when the system wants to have lower power but still needs to keep some of the peripheral alive. Most of the peripherals and analog module and PHYs are shut off. The interrupt response in this mode is expected to be longer than the System IDLE, but its power would be much lower.
- **Suspend** - This mode is defined as the most power saving mode where all the clocks are off and all the unused analog/PHY and peripherals are off. The external DRAM will stay in self-refresh mode. The exit time from this mode will be much longer.

In System IDLE and Low Power IDLE mode, the voltage on external power supplies remain the same as RUN mode, so the external PMIC is not aware of the state of the processor. If there is any low power setting need to be applied to PMIC, it will be done through I2C/SPI interface before the processor enters low power mode.

When the processor enters SUSPEND mode, it will assert the PMIC\_STBY\_REQ signal to PMIC. When this signal is asserted, the processor allows the PMIC to shut off VDD\_ARM externally. However, in some application scenario, SW want to keep the data in L2 Cache to avoid performance impact on cache miss. In this case, the VDD\_ARM cannot be shut off. To support both scenarios, the PMIC should have an option to shut off or keep VDD\_ARM when it receives the PMIC\_STBY\_REQ. This should be configured through I2C/SPI interface before the processor enters SUSPEND mode.

Except the VDD\_ARM, the other power rails have to keep active in SUSPEND mode. Since the current on each power rail is greatly reduced in this mode, PMIC can enter its own low power mode to get extra power saving. For example, the PMIC can change the DCDC rails to PFM mode to reduce the power consumption.

The System IDLE, Low Power IDLE and SUSPEND mode are defined as in the table below.

**Table 5-5. Low Power Mode Definition**

	<b>System IDLE</b>	<b>Low Power IDLE</b>	<b>SUSPEND</b>
LPM Mode	WAIT	WAIT	STOP
ARM A7 CPU0	Clock Gated	OFF	OFF
ARM A7 CPU1	OFF	OFF	OFF

*Table continues on the next page...*

**Table 5-5. Low Power Mode Definition (continued)**

	System IDLE	Low Power IDLE	SUSPEND
ARM A7 SCU	ON	OFF	OFF
L2 Cache	ON	ON	OFF
VDD_ARM	ON	ON	OFF <sup>1</sup>
SOC	ON	ON	ON
SOC_PD	ON	ON/OFF	ON/OFF
M4 Core (inside SOC_PD)	Clock Gated	ON/OFF	ON/OFF
PLL	On as needed	OFF	OFF
24MHz XTAL	ON	OFF	OFF
24MHz RCOSC	OFF	ON	OFF
DRAM	Self-Refresh <sup>2</sup>	Self-Refresh	Self-Refresh
DRAM IO Low Power	No	Yes	Yes
NVCC_DRAM	ON	ON	ON
NVCC_DRAM_CKE	ON	ON	ON
LDO_1P0D	On as needed	OFF	OFF
LDO_1P0A	ON	In weak mode	OFF
LDO_1P2	On as needed	OFF	OFF
FUSE	OFF	OFF	OFF
LDO_SNVS	ON	ON	ON
Bandgap	ON	OFF	OFF
DRAM clock	24MHz	OFF	OFF
Main Fabric clock	24MHz	3MHz	OFF
AHB clock	24MHz	3MHz	OFF
IPG clock	12MHz	1.5MHz	OFF
Module clocks	On as needed	On as needed	OFF
MIPI	On as needed	OFF	OFF
PCIe	On as needed	OFF	OFF
USB HSIC	On as needed	OFF or SUSPEND	OFF or SUSPEND
USB OTG1/2	On as needed	OFF or SUSPEND	OFF or SUSPEND
GPIO wakeup	Yes	Yes	Yes
RTC Wakeup	Yes	Yes	Yes
USB Remote Wakeup	Yes	Yes	Yes <sup>3</sup>
Other wakeup source	Yes	Yes <sup>4</sup>	No

1. Turn off by PMIC when PMIC\_STBY\_REQ asserted.

2. Automatic enter self-refresh when there is no DRAM access.

3. Need LDO\_1P0A and LDO\_1P2 when wakeup from USB HSIC.

4. When a module is inside VDD\_SOC\_PD domain, the VDD\_SOC\_PD power needs to be on to support wakeup from it.

#### 5.1.4.4.6 Low Power Target

The power consumption for the low power modes are available in the datasheet.

### 5.1.4.4.7 Exit Time

The exit time for each low power modes are defined as follows. The exit time includes the time needed by SoC power/clock sequence and also the time needed for ARM core state restore, but it does not include the time for any additional OS-level SW operation.

**Table 5-6. Low Power Mode Exit Time Target**

	System IDLE	Low Power IDLE	SUSPEND
Exit with RCOSC	N/A <sup>1</sup>	500us	N/A <sup>2</sup>
Exit with XTAL <sup>3</sup>	100us	2.5ms	5ms

1. The XTAL is ON in System IDLE mode.
2. Compared with the total exit time from SUSPEND mode, the saving by using RCOSC is not significant. And the flow of enter/exit from STOP mode with RCOSC is very complicated. So exit with RCOSC is not recommended for SUSPEND mode.
3. Assume 1.5ms XTAL lock time.

## 5.1.4.5 Managing Power Rails and Power Domains

### 5.1.4.5.1 General Rules

Below are some general rules / recommendations on the power supplies.

The following power rails need to be shorted together:

- VDDA\_1P8, VDDA\_XTAL\_1P8, VDDA\_ADC1\_1P8, VDDA\_ADC2\_1P8, VDDA\_TEMPSENSEOR\_1P8 and FUSE\_FSOURCE.

The following power rails can also be shorted together to reduce the external power rails in some applications:

- NVCC\_XXX and VDDA\_1P8, when the GPIO group is using 1.8V IO power, power filter is needed for the VDDA\_1P8 to make sure the noise on IO pads does not go into analog modules.
- VDD\_LPSR\_IN and NVCC\_GPIO1/2, when the GPIO bank1/2 in LPSR domain use 1.8V IO power.
- VDDA\_1P8 and VDD\_LPSR\_IN, when GPIO state retention function is not needed in the application.
- NVCC\_GPIO1/2, when these two GPIO banks runs at same IO voltage.
- NVCC\_DRAM and NVCC\_DRAM\_CKE, when DRAM state retention in LPSR/ SNVS mode is not needed in application.

For the power supplies which has a \*\_CAP pad on the chip, external capacitor(s) is required in one of the follow conditions: (The recommended size/type of the capacitors could be found in the datasheet.)

- This power supply is ON by default.
- This power supply is OFF by default, but will be turned on in the application.

#### 5.1.4.5.2 ARM and SOC Power

ARM and SOC power directly supplied externally through power pads. The ARM supply is separated with SOC because ARM requires 1.1V to run at 1GHz.

The recommended power supply scheme for ARM and SoC is:

- For applications which are very sensitive to power consumption, the VDD\_SOC should be always supplied with 1.0V and VDD\_ARM should be supplied with 1.1V when it runs at 1GHz and 1.0V when it runs at 800MHz and below.
- For any application that not sensitive to power consumption, these two rails can be connected together and supplied with 1.1V. In this case, ARM CPU can run up to 1GHz.
- For any application that only runs ARM core 800MHz or below, these two power rails can be connected together and supplied with 1.0V.

Both ARM and SOC has integrated power switches to shut off internal modules for power saving in low power modes.

#### 5.1.4.5.3 MIPI PHY and PCIe PHY Power

The recommended power supply for integrated MIPI and PCIe PHYs are shown in the table below.

**Table 5-7. Integrated MIPI and PCIe PHY Power Supply**

Module	Vtyp(V)	Recommended Supply	PAD Name
MIPI PHY	1.0	VDDD_1P0_CAP	VDD_MIPI_1P0
MIPI PHY	1.8	VDDA_1P8_PHY	VDDA_MIPI_1P8
PCIe PHY	1.0	VDDD_1P0_CAP	PCIE_VP/PCIE_VP_RX/ PCIE_VP_TX
PCIe PHY	1.8	VDDA_1P8_PHY	PCIE_VPH/PCIE_VPH_RX/ PCIE_VPH_TX

If MIPI is not used in the application, VDD\_MIPI\_1P0 and VDDA\_MIPI\_1P8 should be tied to ground.

If PCIe is not used in the application, the PCIE\_VP/PCIE\_VP\_RX/PCIE\_VP\_TX and PCIE\_VPH/PCIE\_VPH\_RX/PCIE\_VPH\_TX should be tie to ground.

If both MIPI and PCIe are not used in the application and the LDO\_1P0D and SW\_PHY\_1P8 are always turned off, then no external caps are required on VDDD\_1P0\_CAP and VDDA\_1P8\_PHY.

#### 5.1.4.5.4 USB HSIC PHY Power Supply

The recommended power supply for integrated USB HSIC PHYs are shown in the table below.

**Table 5-8. Integrated USB HSIC PHY Power Supply**

Module	Vtyp(V)	Recommended Supply	PAD name
USB HSIC PHY	1.2	VDD_1P2_CAP	VDD_USB_H_1P2
USB HSIC PHY	1.0	VDD_HSIC_1P0	N/A

The VDD\_HSIC\_1P0 is supplied internally inside the chip from VDD\_SOC through the SW\_HSIC\_1P0 power switch.

If USB HSIC is not used in the application, the VDD\_USB\_H\_1P2 should be tie to ground and the SW\_HSIC\_1P0 power switch should always keep off.

#### 5.1.4.5.5 USB OTG PHY Power

The recommended power supply for integrated USB OTG PHYs are shown in the table below.

**Table 5-9. Integrated USB OTG PHY Power Supply**

Module	Vtyp(V)	Recommended Supply	PAD name
USB OTG1 PHY	1.0	VDD_USB_OTG1_1P0_CAP	VDD_USB_OTG1_1P0_CAP
USB OTG1 PHY	3.3	VDD_USB_OTG1_3P3_IN	VDD_USB_OTG1_3P3_IN
USB OTG2 PHY	1.0	VDD_USB_OTG2_1P0_CAP	VDD_USB_OTG2_1P0_CAP
USB OTG2 PHY	3.3	VDD_USB_OTG2_3P3_IN	VDD_USB_OTG2_3P3_IN

If USB OTG1 is not used in the application, both the VDD\_OTG1\_1P0\_CAP and VDD\_OTG1\_3P3\_IN should be tie to ground. Same for USB\_OTG2.

### 5.1.4.5.6 GPIO Power

For the NVCC supplies with same voltage level, they can share the same external power supply rail. However, this implies these NVCC supplies are always ON/OFF at the same time.

All the PVCC supplies are 1.8V and it is possible to short them together on the board. One of the reasons to keep PVCC supplies into several groups is to totally shut off both the PVCC and NVCC supplies to the IO bank for power saving.

For example, when PVCC\_ENET\_CAP is separated with other PVCC pads, it will be off when NVCC\_ENET is off. So the PVCC/NVCC supply for the ENET IO bank is both off. When PVCC\_ENET\_CAP is shorted to PVCC\_EPDC\_LCD\_CAP, if NVCC\_ENET is off and NVCC\_LCD is on, the PVCC\_ENET\_CAP will still be on. There will be leakage current on the PVCC\_ENET\_CAP for ENET IO bank.

The recommended NVCC/PVCC supply scheme is:

- If LPSR mode is used in the application, the NVCC\_GPIO1/2 should be separated with other NVCC supplies, the PVCC\_GPIO\_1P8\_CAP should be separated with other PVCC supplies.
- For applications which is very sensitive to power consumption, if one NVCC supply will be shut off while the other NVCC supplies might be on, keep this NVCC supply separate from other NVCC supplies.
- For applications which is very sensitive to power consumption, if one PVCC supply will be shut off while the other PVCC supplies might be on, keep this PVCC supply separate from other PVCC supplies.

There is one restriction on NVCC\_XXX. When more than one NVCC\_XXX are supplied by 1.8V, the voltage on these rails has to be the same. It is recommended to use same 1.8V source for these rails.

### 5.1.4.5.7 DRAM IO Power

In LPSR mode or SNVS mode, the processor support DRAM data retention mode to keep external DRAM device in self-refresh mode. In this mode, NVCC\_DRAM is OFF, NVCC\_DRAM\_CKE is ON and the power to the DRAM chip is ON. Since PMIC usually only has one power rail for DRAM power, an PFET power switch is required to shut off the power from PMIC to NVCC\_DRAM. The switch control signal is provided by the processor on its TAMPER9 pad.

The power connection between PMIC, processor and DRAM device is show in the diagram below:

**Figure 5-12. DRAM IO Power Connection**

To support DRAM data retention, PMIC need to leave DRAM power rail ON in SNVS/LPSR mode. It is recommended for the PMIC to have configurable register through I2C/SPI interface, to control the ON/OFF state of DRAM power rail when PMIC\_ON\_REQ signal is de-asserted.

When DRAM data retention is not needed in the application, both NVCC\_DRAM\_CKE and power to the DRAM chip can be off in LPSR/SNVS mode. In this scenario, the power switch is not required.

#### 5.1.4.5.8 Power Up and Power Down Sequence

For the external power supplies, please refer to the datasheet for details on power sequence requirement. With the integrated PMU, the power up and power down sequence in i.MX7D is simplified to allow customer to use discrete DC-DC/LDO as external power supply. It only have very limited power up/down sequence requirement on some of the rails.

For generated power supplies, the current power architecture guarantees the power up / power down sequence of the integrated PHY/IO when the recommended supply is used. If customer use external PMIC/LDO to supply these modules, the external power supply has to follow the power up / power down sequence required by the PHY/IO.

## 5.2 Clock Control Module (CCM)

### 5.2.1 Overview

Clock Control Module (CCM) manages the on-chip module clocks. CCM receives clocks from PLLs and oscillators and creates clocks for on-chip peripherals through a set of multiplexers, dividers and gates. When entering or exiting a low power mode, CCM automatically turns on and off PLLs and peripheral clocks.

Figure 5-13. CCM Block Diagram

## 5.2.2 External Signals

The following table describes the external signals of CCM:

**Table 5-10. CCM External Signals**

Signal	Description	Pad	Mode	Direction
CCM_CLK1_N	Differential Clock 1 Input	CCM_CLK1_N	No muxing	I
CCM_CLK1_P	Differential Clock 1 Output	CCM_CLK1_P	No muxing	O
CCM_CLK2	Clock 2 Output	CCM_CLK2	No muxing	O
CCM_PMIC_STBY_REQ	Goes to PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	CCM_PMIC_STBY_REQ	No muxing	O
CCM_CLKO1	Clock 1 output for off-chip devices	GPIO1_IO02	ALT5	O
		SD1_CD_B	ALT6	
CCM_CLKO2	Clock 2 output for off-chip devices	GPIO1_IO03	ALT5	O
		SD1_WP	ALT6	
CCM_ENET1_REF_CLK	ENET Reference Clock 1	ENET1_TX_CLK	ALT1	O
		GPIO1_IO02	ALT2	
		GPIO1_IO12	ALT2	
		I2C1_SDA	ALT4	
CCM_ENET2_REF_CLK	ENET Reference Clock 2	EPDC1_BDR0	ALT3	O
		GPIO1_IO03	ALT2	
		GPIO1_IO13	ALT2	
		I2C2_SCL	ALT4	
CCM_ENET3_REF_CLK	ENET Reference Clock 3	GPIO1_IO01	ALT2	O
		GPIO1_IO09	ALT2	
		I2C2_SDA	ALT4	
CCM_EXT_CLK1	External Clock 1	ENET1_TX_CLK	ALT6	I
		GPIO1_IO12	ALT5	
		SD1_DATA0	ALT6	
CCM_EXT_CLK2	External Clock 2	ENET1_RX_CLK	ALT6	I
		GPIO1_IO13	ALT5	
		SD1_DATA1	ALT6	
CCM_EXT_CLK3	External Clock 3	ENET1_CRS	ALT6	I
		GPIO1_IO14	ALT5	
		SD1_DATA2	ALT6	
CCM_EXT_CLK4	External Clock 4	ENET1_COL	ALT6	I
		GPIO1_IO15	ALT5	
		SD1_DATA3	ALT6	

Table continues on the next page...

**Table 5-10. CCM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
CCM_PMIC_READY	Signal coming from PMIC to indicate that the voltage started to change as result of change in CCM_PMIC_STBY_REQ	GPIO1_IO09	ALT5	I
		GPIO1_IO13	ALT4	
		SAI1_MCLK	ALT3	
		UART1_RXD	ALT2	

### 5.2.3 Clock Root Selects

The table below details the clock root slices and clock source inputs.

#### NOTE

The value of all clock root slice registers are zero after POR with the exception of DRAM clock. Please see System Boot for ROM reset values and default frequency settings for the clock root slices.

**Table 5-11. Clock Root Table**

Offset	Clock Root	Max Frequency (MHz)	Source Select (CCM_TARGET_ROOT[MUX])
0x8000	ARM_A7_CLK_ROOT	1000	000 - OSC_24M 001 - ARM_PLL 010 - ENET_PLL_DIV2 011 - DDR_PLL 100 - SYS_PLL 101 - SYS_PLL_PFD0 110 - AUDIO_PLL 111 - USB_PLL

### 5.2.4 Clock Tree

The figure below illustrates the clock sources from the PLLs.

Figure 5-14. CCM input clock sources

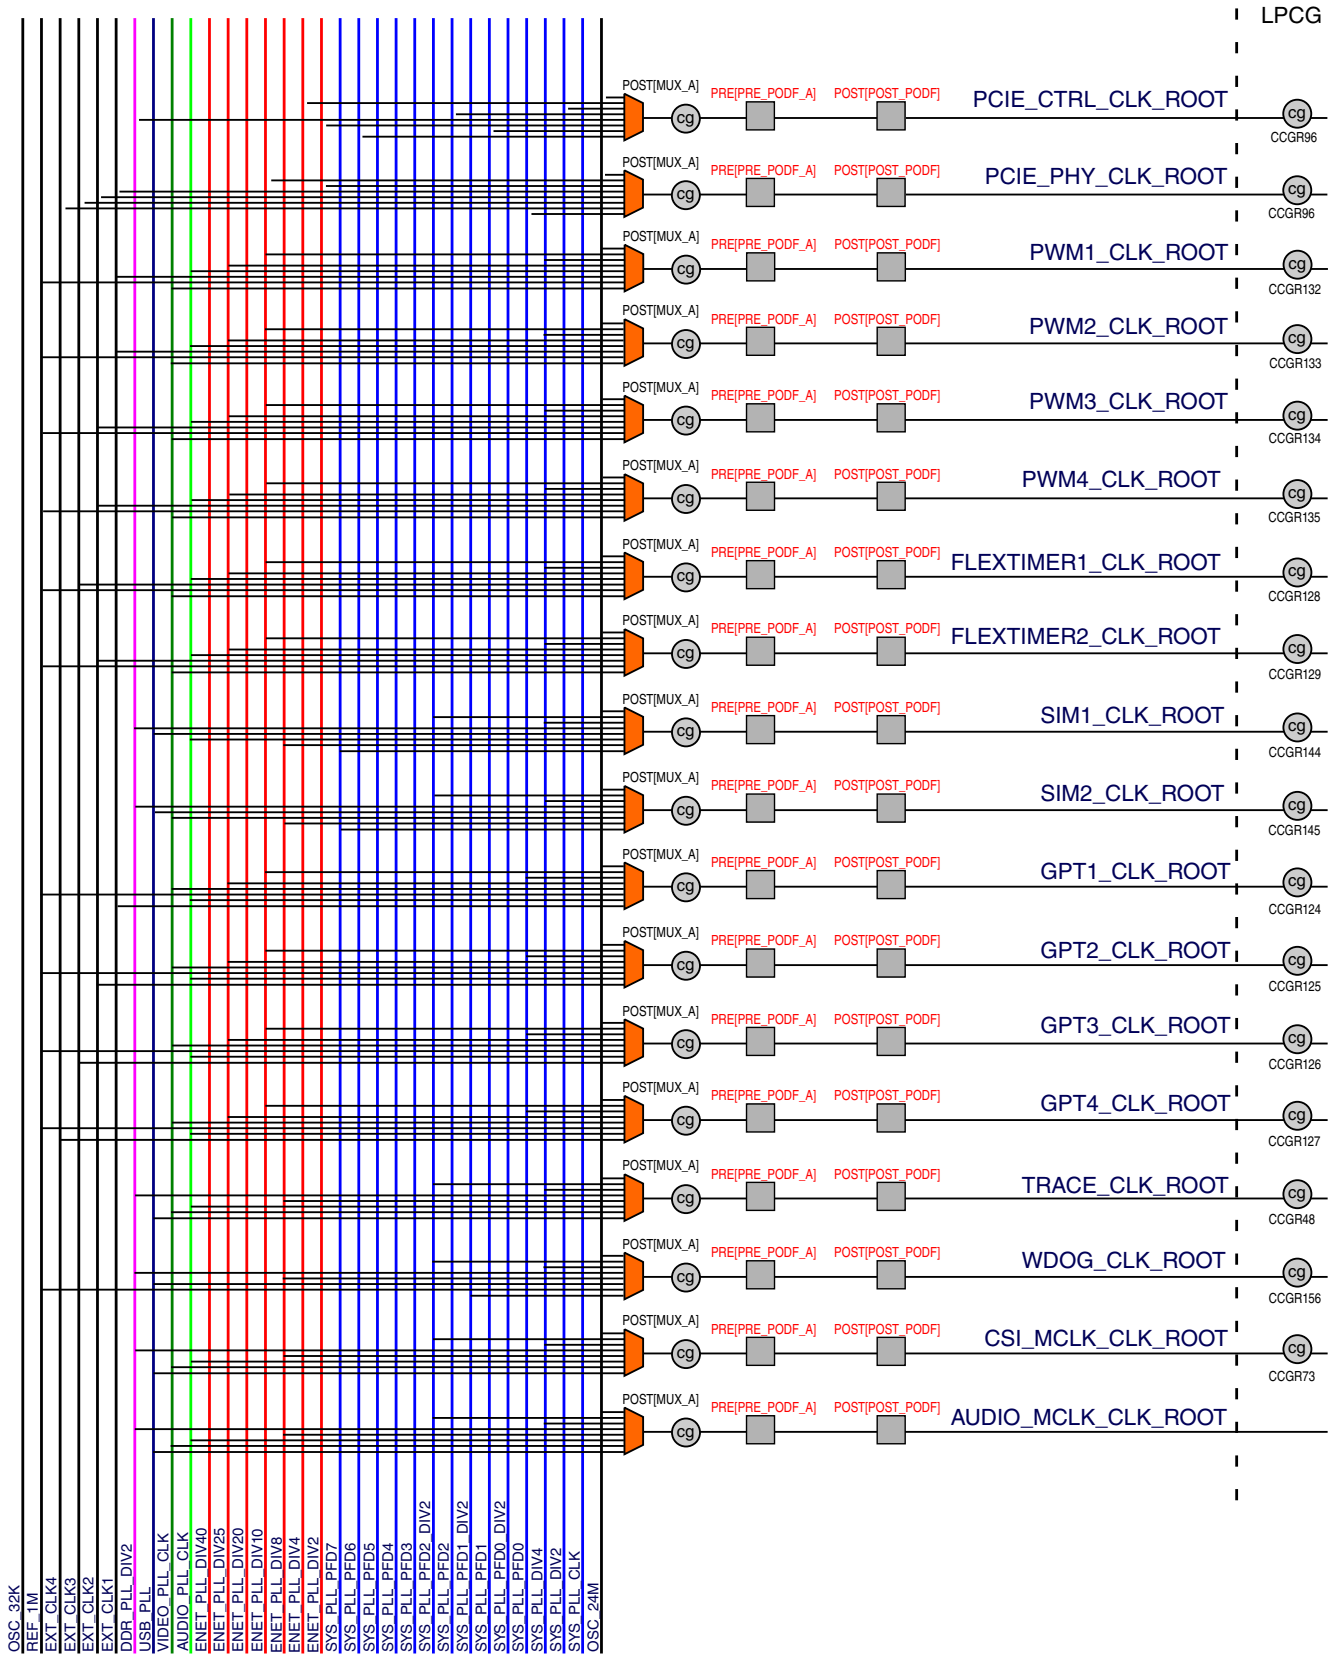

The figure below illustrates the clock slices of CCM and clock root generation.

# Clock Control Module (CCM)

**Clock Control Module (CCM)**

**Figure 5-15. CCM Clock Tree Root Slices**

## 5.2.5 System Clocks

The table below shows the CCM output module clock connectivity and gating.

**Table 5-12. System Clocks and Gating**

Module	Module Clock (instance.clock)	Clock Root	Module Clock Gating Enable (CCGR)
ADC	adc1.ipg_slave_clk	XTALOSC_OUT (OSC_24M)	clk_enable_adc (CCGR32)
	adc1.slave_clk	XTALOSC_OUT (OSC_24M)	clk_enable_adc (CCGR32)
	adc2.ipg_slave_clk	XTALOSC_OUT (OSC_24M)	clk_enable_adc (CCGR32)
	adc2.slave_clk	XTALOSC_OUT (OSC_24M)	clk_enable_adc (CCGR32)
	adc1.ipg_master_clk	IPG_CLK_ROOT	clk_enable_adc (CCGR32)
	adc1.master_clk	IPG_CLK_ROOT	clk_enable_adc (CCGR32)
	adc2.ipg_master_clk	IPG_CLK_ROOT	clk_enable_adc (CCGR32)
	adc2.master_clk	IPG_CLK_ROOT	clk_enable_adc (CCGR32)
	adc.ipg_clk_24mhz	XTALOSC_OUT (OSC_24M)	clk_enable_adc (CCGR32)
	adc.ipg_clk_24mhz_s	XTALOSC_OUT (OSC_24M)	clk_enable_adc (CCGR32)
AIPSTZ	aips_tz1.hclk	AHB_CLK_ROOT	clk_enable_ipmux1 (CCGR10)
	ipmux1.master_clk	AHB_CLK_ROOT	clk_enable_ipmux1 (CCGR10)

## 5.2.6 Functional Description

The following sections describe the functional details of CCM.

### 5.2.6.1 Input Clocks

The table below describes the input clock sources that supply the muxes to the clock slices in the clock root generator. Please see [PLL Interface](#) for PLL programming information.

Control Register	Input Clock	Offset	Frequency (MHz)	Description
CCM_PLL_CTRL0	CKIL_SYNC	0x800	0.032	CKIL synchronizer
CCM_PLL_CTRL1	ARM_PLL	0x810	800	ARM PLL
CCM_PLL_CTRL2	ARM_PLL_CLK	0x820	800	ARM PLL main output clock
CCM_PLL_CTRL3	DDR_PLL	0x830	1066	DDR PLL
CCM_PLL_CTRL4	DDR_PLL_DIV2	0x840	533	DDR PLL divided 2 clock output
CCM_PLL_CTRL5	DDR_PLL_CLK	0x850	1066	DDR PLL main output clock
CCM_PLL_CTRL6	SYS_PLL	0x860	480	System PLL
CCM_PLL_CTRL7	SYS_PLL_CLK	0x870	480	System PLL main output clock
CCM_PLL_CTRL8	SYS_PLL_DIV2	0x880	240	System PLL divided 2 clock output
CCM_PLL_CTRL9	SYS_PLL_Div4	0x890	120	System PLL divided 4 clock output
CCM_PLL_CTRL10	SYS_PLL_PFD0	0x8A0	392	System PLL PFD0 clock
CCM_PLL_CTRL11	SYS_PLL_PFD0_DIV2	0x8B0	196	System PLL PFD0 divided 2 clock
CCM_PLL_CTRL12	SYS_PLL_PFD1	0x8C0	332	System PLL PFD1 clock
CCM_PLL_CTRL13	SYS_PLL_PFD1_DIV2	0x8D0	166	System PLL PFD1 divided 2 clock
CCM_PLL_CTRL14	SYS_PLL_PFD2	0x8E0	270	System PLL PFD2 clock
CCM_PLL_CTRL15	SYS_PLL_PFD2_DIV2	0x8F0	135	System PLL PFD2 divided 2 clock
CCM_PLL_CTRL16	SYS_PLL_PFD3	0x900	-	System PLL PFD3 clock
CCM_PLL_CTRL17	SYS_PLL_PFD4	0x910	-	System PLL PFD4 clock
CCM_PLL_CTRL18	SYS_PLL_PFD5	0x920	-	System PLL PFD5 clock
CCM_PLL_CTRL19	SYS_PLL_PFD6	0x930	-	System PLL PFD6 clock

*Table continues on the next page...*

Control Register	Input Clock	Offset	Frequency (MHz)	Description
CCM_PLL_CTRL20	SYS_PLL_PFD7	0x940	-	System PLL PFD7 clock
CCM_PLL_CTRL21	ENET_PLL	0x950	1000	ENET PLL
CCM_PLL_CTRL22	ENET_PLL_DIV2	0x960	500	Ethernet PLL divided 2 clock
CCM_PLL_CTRL23	ENET_PLL_DIV4	0x970	250	Ethernet PLL divided 4 clock
CCM_PLL_CTRL24	ENET_PLL_DIV8	0x980	125	Ethernet PLL divided 8 clock
CCM_PLL_CTRL25	ENET_PLL_DIV10	0x990	100	Ethernet PLL divided 10 clock
CCM_PLL_CTRL26	ENET_PLL_DIV20	0x9A0	50	Ethernet PLL divided 20 clock
CCM_PLL_CTRL27	ENET_PLL_DIV25	0x9B0	40	Ethernet PLL divided 25 clock
CCM_PLL_CTRL28	ENET_PLL_DIV40	0x9C0	25	Ethernet PLL divided 40 clock
CCM_PLL_CTRL29	AUDIO_PLL	0x9D0	66	Audio PLL
CCM_PLL_CTRL30	AUDIO_PLL_CLK	0x9E0	66	Audio PLL clock output
CCM_PLL_CTRL31	VIDEO_PLL	0x9F0	66	Video PLL
CCM_PLL_CTRL32	VIDEO_PLL_CLK	0xA00	66	Video PLL clock output
USB_OTG2_PHY	USB_PLL		480	USB PHY clock output
XTALOSC	REF_1M		1	1M reference clock sourced from XTALOSC (sync with RCOSC 24M). REF_1M is also tied to 32K XTALOSC source.
external source	OSC_24M		24	Clock output of 24MHz crystal oscillator
external source	OSC_32K		0.032	32K oscillator clock output
external source	EXT_CLK1		-	Clock input from external IO
external source	EXT_CLK2		-	Clock input from external IO
external source	EXT_CLK3		-	Clock input from external IO
external source	EXT_CLK4		-	Clock input from external IO

**NOTE**

CKIL\_SYNC needs to be configured the same as the PLL for ipg\_clk

**5.2.6.2 CKIL Synchronizer**

Some on-chip peripherals need synchronization between their 32K clock inputs and ipg\_clk inputs. When ipg\_clk on peripheral is to be stopped, the synchronizer must be bypassed to avoid CKIL\_SYNC stop. In bypass, the CKIL\_SYNC comes directly from oscillator inside anatop.

CCM provide a synchronized version of 32K clock(CKIL\_SYNC), which is generated by system IPG\_CLK\_ROOT. CKIL\_SYNC is synchronized to IPG\_CLK\_ROOT when system is in functional mode. When the system entering low power mode that shutdown IPG\_CLK\_ROOT CKIL synchronizer need to be bypassed, and raw CKIL is supplied to the system.

Bypass signal control of 32K clock synchronizer comes from source control channel 0. This channel need to be configured exactly the same as the channel that control PLL output that used to generate IPG\_CLK\_ROOT. Typically, the PLL output is pll\_sys\_pfd2\_135m\_clk on channel 15.

Peripherals that use ip\_sync may not run their ipg\_clk on IPG\_CLK\_ROOT. So they cannot use synchronized 32K clock provided by CCM. Instead, they synchronized 32K clock use its ipg\_clk. Bypass signal on these peripherals on 32K clock synchronizer comes from LPCG control of their ipg\_clk. So in this case, to avoid problem on 32K input, LPCG must shutdown together with PLL clock output, which used for the ipg\_clk generation.

### 5.2.6.3 Clock Components

The details of the CCM clock components are detailed below.

#### 5.2.6.3.1 Clock Divider

Synchronized clock dividers can be used to make integer division on source clock frequency. The divider guarantees a clean clock signal on its output during the change of the divide factor. Dividers are performing  $1/(N+1)$  divide. A glitch can cause a sync-divider to go into an unrecoverable state, therefore a clean clock signal must be provided to a sync-divider.

When updating the divider value, a read\_en signal should be deasserted to stop the fetch divider value from the related control registers. To change a divider factor value, the bus may enter a transition state and latch into the divide logic. After the divide value is changed, read\_en needs to be reasserted. The divider will begin to update its internal divide logic. After it finishes updating, the divider will send a sw\_ack signal to inform new value is in effect.

### 5.2.6.3.2 Safe Multiplexer

Safe multiplexers can guarantee a clean clock signal when switching between 2 clock sources. Both clock inputs must be active when switching. Glitches in the selected source may be transferred to the output clock while the de-selected source is blocked. Glitches that occur during switching may cause an unpredictable state, and will recover in 2~3 cycles.

Safe multiplexers first shutdown the current active clock, then switch. After receiving an acknowledge that the current clock stopped. The multiplexer turns on the new selected clock source. As the acknowledge of turning on the new clock source is received, the source switch finishes.

### 5.2.6.3.3 Clock Gate

A clock gate cell is used to gate clocks. When gated, the clock will stop at 0. A clock gate cell can accept glitches on its clock inputs. If the gate cell is off, it will block or absorb glitches. If the gate cell is on, it may pass glitches to its output. A gate cell needs 2~3 clock cycles to change states. The state during this period is either on or off and will recover in 2~3 cycles, but cannot be predicted which state it is in during this period.

### 5.2.6.3.4 8 to 1 Multiplexer

The 8-to-1 multiplexer is a combinational multiplexer that can switch anytime. The multiplexer output does not guarantee a clean clock signal. During switching, the output must be gated or all 8 inputs will require the same value.

### 5.2.6.4 Clock Slices

There are several types of clock generation slices in CCM. The slices are categorized as Core, Bus, Peripheral (IP), and DRAM.

Figure 5-16. Clock Slices

### 5.2.6.4.1 Core clock slice

Core clock slices are designed for high speed, non-stop clock generation, typically for ARM core. Core clock slice is comprised of a post divider and safe multiplexer. Each has a clock gate and a clock multiplexer inside. To run at high frequency, post divider is 3 bits, which is half the bit width of other slices. The two 8-to-1 multiplexers are not glitchless, so switching them should only be done when their output is not routed to a clock output.

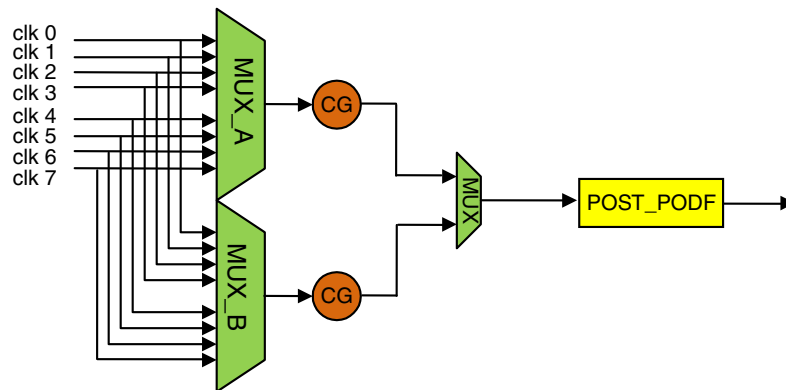

Figure 5-17. Core clock slice

### 5.2.6.4.2 Bus clock slice

Bus clock slices are comprised of post divider and a safe multiplexer. Each has a pre-divider, clock gate and a clock multiplexer inside. The pre-divider is three bits and provides a maximum division factor of 8. The post-divider is six bits and can divide

down the clock input to 1MHz on clock output. The two 8-to-1 multiplexers are not glitch-less, so switching should only be done when their output is not routed to clock output.

Figure 5-18. Bus clock slice

#### 5.2.6.4.3 Peripheral clock slice

IP peripheral clock slices are comprised of a post-divider, pre-divider, clock gate and a clock multiplexer. The pre-divider is three bit and can divide down by a factor of 8. The post-divider is six bit and can divide down the input clock to 1MHz on clock output. The 8-to-1 multiplexer is not glitch-less, so switching should only be done when their output is not routed to clock output.

IP clock slices must be stopped to change the clock source.

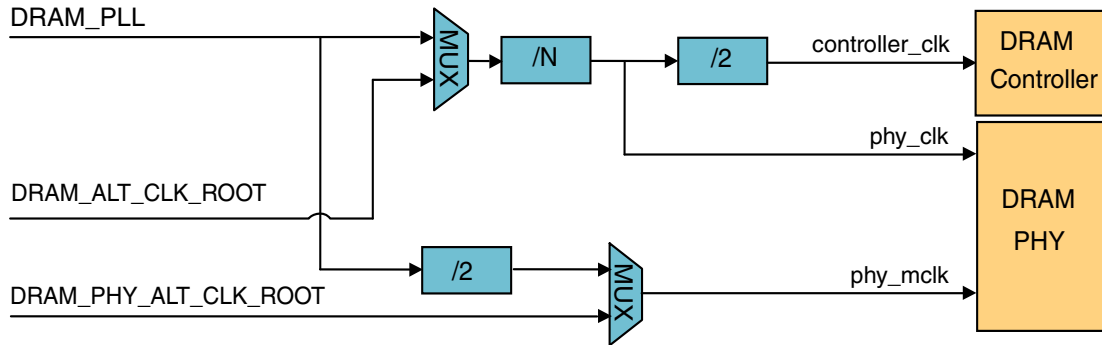

Figure 5-19. Peripheral clock slice

#### 5.2.6.4.4 DRAM clock slice

DRAM clock slice is comprised of a safe multiplexer and a post-divider. The post-divider is a three bit width synchronized divider. This slice generates clock 2x for the DDR controller. `Dram_alt_clk` is a CCM generated clock while `PLL_DRAM` comes directly from the PLL, which may ensure a better duty-cycle on clock output.

DRAM PHYM clock slice is comprised of a safe multiplexer and a fixed divider with a divide factor of two. The PHYM slice generates the phy\_clkm for DDR PHY. Dram\_phym\_alt\_clk is a CCM generated clock while PLL\_DRAM comes directly from the PLL, which may ensure a better duty-cycle on clock output.

**Figure 5-20. DRAM clock slice**

### 5.2.6.5 Clock gate control

CCM can perform automatic clock shutdown of on-chip peripherals according to system low power mode. Each logic domain can respectively declare its dependency level on each clock. If a clock is detected not dependant on any domain, it will be shutdown to save power.

Clock generation inside CCM creates clock root for on-chip peripherals. Before clock root goes into peripherals via low power clock gating cells. By controlling these LPCGs, CCM can manage on-chip peripheral clocks.

Clock gate controls are active clock gating, which means it needs the clock root to be active while low power clock gating. Clock generation module does only multiplexing, gating and dividing on clock sources. So, clock root from generation module will stop when the corresponding clock source stops.

It is important that software maintains the clock source driving the LPCG stay active while the LPCG is turned on or off.

### 5.2.6.6 Clock source control

CCM can perform automatic PLL shutdown of ANATOP according to system low power mode. Each logic domain can respectively declare its dependency level on each clock. If a PLL is detected not depended by any domain, it will be shutdown to save power.

PLL in ANATOP can be set to be controlled by CCM via setting some CCM override bits. Also there is control on 32K IPG\_CLK\_ROOT synchronized version inside clock source control module.

For PLLs, we have channel on every PLL, every PFD and every divider. PLL is the source of PFDs and dividers. For any clock, its source must be left on when it is kept on. Behavior is undefined if this rule is violated.

For a shutdown clock source, if it is declared depended by writing clock source control registers, the controlling logic will turn on the source immediately, while the setting goes into a shadow register. After clock source get ready, the setting will be accepted by source control logic, and copied from shadow register to setting register.

### 5.2.6.7 Access control

CCM can implement its own access control based on domain, to provide more precise control on shared resource. Access controls are implemented on clock root generation, clock gate control, and clock source control. Access control logic will never impact on read access, but will block unauthentic write access.

Access controls on clock root generation are independent between every clock root. A sticky authentic fail flag will be set if authentic check failed when a domain is trying to write to some register. There are a whitelist and a semaphore inside access control logic. For each clock root, access control logics are default disabled, after power on reset. Software can enable access control anytime after that. But once access logic is enabled, it cannot be disabled until next power on reset.

**Table 5-13. Whitelist**

Enabled	Write access will be authenticated before being performed.
Disabled	every access on protected item will be performed.

#### NOTE

Only domains that are on the whitelist can perform write access to this clock root when access control is enabled.

**Table 5-14. Semaphore**

Enabled	A domain must obtain the semaphore's ownership before its write access can be authenticated. Only a domain on the whitelist can obtain the ownership and the ownership will last until the domain explicitly releases the ownership. Semaphore obtain will fail if it is already fetched by some other domain.
Disabled	Authentic check will check only on whitelist.

**NOTE**

Semaphore is intended to help software keep clock root from unexpectedly changing or keep operation.

Access control of clock gate and clock source control is performed in a simple operation. Every domain can only write on the bits for it's own setting. Any write to irrespective domain will be ignored.

**5.2.6.8 System level considerations****Clock shutdown strategy**

Any a clock shutdown should be first LPCG, then PLL. If LPCG is configured not to shutdown, clock root for then LPCG should not stop either. Violation of this rule will lead system into an unpredictable state.

**Core clock root frequency**

If core clock is set lower that one third of IPG clock, SRC needs to generate a longer reset signal to match requirement from ARM core. This typically happened when run ARM core at some divided XTAL 24M while IPG clock is supplied by PLL.

**DRAM clock**

DRAM PHYM clock needs a clock faster that 400MHz.

**USB OTG CLOCK**

USB clock may not be a reliable clock source in some applications. This clock may stop when USB cable is disconnected.

**5.2.7 Programming Guide****5.2.7.1 Set, Clear, and Toggle register features**

Every register of CCM have set, clear, toggle feature. Set register locate at address of register base address + 0x04, clear register locate at register base address + 0x08, and toggle located at base address + 0x0c. Read from all 4 registers to get the current register value. Write to base register will set register to write value. Write 1 to set register bits will set them to 1, while write 0 have no effect. Write 1 to clear register bits will clear them to 0, while write 0 have no effect. Write 1 to set register bits will set them to invert value, while write 0 have no effect.

### 5.2.7.2 PLL Interface

CCM can control PLLs inside CCM\_ANALOG when entering or leaving low-power mode. Software must set the PLL override inside CCM\_ANALOG before entering low-power mode after power-on reset (POR).

There are four levels of low-power modes in a logic domain:

- Not needed
- Needed in RUN
- Needed in RUN and WAIT
- Needed in RUN, WAIT, and STOP

CCM only takes action while domain status are switching between STOP (DEEP SLEEP mode is considered the same as STOP). There are 4 domains that can be assigned. Any CPU platform can be assigned to any domain by RDC. If a domain is empty, the domain is considered as STOP.

Each domain can declare its dependency to CCM. The use of any clock, without declaring it in its own domain, is not permitted. A domain declares its dependency on a clock by writing the dependency level. Settings against behavior in low-power mode are as follows:

**Table 5-15. Domain Dependency**

Domain Level	Run	Wait	Stop / Deep sleep
0			
1	Required		
2	Required	Required	
3	Required	Required	Required

**Table 5-16. CCGR Program Interface**

CC GR	Domain3				Domain2				Domain1				Domain0				
	31-16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
				Level1	Level0			Level1	Level0			Level1	Level0			Level1	Level0

Each domain can change only bits assigned to control access. Any irrelevant write to it will be ignored. For example, Domain 0 can only write to bits [1:0]. Any bits written to, other than bits [1:0], will be ignored. Other domains can read all of the other domain settings. The default value for domain 0 is 2, and will enter STOP mode after shutting down. When the default value of the other domain setting is 0, it will not be required.

When setting clock source, the settings will not take effect immediately. The setting will enter the shadow register first. If a PLL shutdown or new setting enters the shadow register to declare dependency on the PLL, the PLL will turn on immediately. When the PLL is ready, the setting in shadow register will be updated to the new setting. During this period, the pending bit will be set and cleared. Then CCM will send the PLL control signal as a shadow register and inform GPC the PLL status according to the setting register. In other cases, the setting will be updated from the shadow register immediately. Clock sources have dependency on each other.

**NOTE**

Do not shutdown the parent clock when the required child clock is active. Attempting to do so will lead to unpredictable and unrecoverable behavior. It is recommended to shutdown the parent clock and child clock together.

**5.2.7.3 CCGR Interface**

Before a clock root goes to on-chip peripherals, the clock root is distributed through low power clock gates (LPCG). These LPCG are implemented to automatically perform clock shutdown when a domain enters and leaves a low-power state.

There are four levels of low-power modes in a logic domain:

- Not needed
- Needed in RUN
- Needed in RUN and WAIT
- Needed in RUN, WAIT, and STOP

CCM only takes action while domain status are switching between STOP (DEEP SLEEP mode is considered the same as STOP). There are 4 domains that can be assigned. Any CPU platform can be assigned to any domain by RDC. If a domain is empty, the domain is considered as STOP.

Each domain can declare its dependency to CCM. The use of any clock, without declaring it in its own domain, is not permitted. A domain declares its dependency on a clock by writing the dependency level. Settings against behavior in low-power mode are as follows:

**Table 5-17. Domain Dependency**

Domain Level	Run	Wait	Stop / Deep sleep
0			
1	Required		
2	Required	Required	

*Table continues on the next page...*

**Table 5-17. Domain Dependency (continued)**

3	Required	Required	Required
---	----------	----------	----------

**Table 5-18. CCGR Program Interface**

CC GR	Domain3				Domain2				Domain1				Domain0				
	31-16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
				Level1	Level0			Level1	Level0			Level1	Level0			Level1	Level0

Each domain can change only bits assigned to control access. Any irrelevant write to it will be ignored. For example, Domain 0 can only write to bits [1:0]. Any bits written to, other than bits [1:0], will be ignored. Other domains can read all of the other domain settings. The default value for domain 0 is 2, and will enter STOP mode after shutting down. When the default value of the other domain setting is 0, it will not be required.

The table below lists the CCM Clock Gating Register (CCGR) and associated offset for each LPCG enable.

**NOTE**

Not all CCGRs are mapped.

### 5.2.7.4 Target Interface

Target interface is optimized to simplify software operation. Using this interface, all clock roots are in the same program model with the same register bit field mapping. Software need not care any detail inside clock slice, even clock slice types. Software just writes to the register the settings it desired, and internal hardware logic will generate a safe sequence to achieve that setting.

Target interface needs software provide whether this clock need active, clock source number to be selected, pre divider value, and post divide value. If a clock slice does not support some setting, the setting is simply ignored, and will not do any harm to supported fields.

$$\text{Freq} = (\text{clock source freq}) / (\text{pre\_div} + 1) / (\text{post\_div} + 1)$$

Internal logic sequence of target interface guarantees a clean clock on output without frequency overshoot. But needs software to guarantee at least current selecting and target clock source is active.

Sequence does not variant against current state and target setting. It always take as worst case on every filed. It first open all clocks, then apply slow down change on divider values, the switch to new selected clock source, then change on speed up dividers, finally shutdown it if new setting request that.

Do during change setting via target interface, clock output are always active. For intermediate frequency, it always chooses the lower one to avoid frequency overshoot for ip clock root. For bus, core, and ahb slice, there is an safe multiplexer and two clock arms, the pre divider on current setting will not be changed. If user keeps frequency in safe multiplexer close, the output will be smooth when switching.

The write operation on a target interface will never return until output clock is running at desired setting. Software does not need polling or read any register for clock stable.

STEP	STATE	OPERATION
------	-------	-----------

*Table continues on the next page...*

0	SMART_IDLE	Idle state, no write operation is pending
1	SMART_WAIT_READY	State get this state when receive write access, wait for every field ready
2	SMART_APPLY_GATE1	open all branched, all gates inside clock slices
3	SMART_WAIT_GATE1	Wait for gate applied
4	SMART_APPLY_PODF1	apply post divider and post divider for if new value generate slower clock
5	SMART_WAIT_PODF1	Wait for divider accept new value
6	SMART_APPLY_GATE2	shutdown spare branch if exist, else shutdown working branch
7	SMART_WAIT_GATE2	Wait for shutdown operation complete
8	SMART_APPLY_MUX	Change multiplexer to new source on spare branch if exist, else switch working one
9	SMART_APPLY_GATE3	open gates on all branches
10	SMART_WAIT_GATE3	Wait for gates opened
11	SMART_APPLY_SWITCH	Switch safe multiplexer if there is one
12	SMART_WAIT_SWITCH	Wait for safe multiplexer switch
13	SMART_APPLY_PODF2	apply post divider and post divider for if new value generate faster clock
14	SMART_WAIT_PODF2	Wait for divider accept new value
15	SMART_APPLY_GATE4	apply clock gate setting, shutdown spare one if there is
16	SMART_WAIT_GATE4	Wait for gate applied
17	SMART_APPLY_AUTO	apply auto and auto divider
18	SMART_DONE	Finish, wait for bus operation complete

### 5.2.7.5 Normal Interface

Normal interface provide more controllable thing that target interface. And also provide protections against dangerous operation.

Normal interface provides safe sequences to handle each clock component, divider, gate, multiplexer. But it is software that needs to care the order and relationship between updating components.

Writing to this interface will complete immediately, and internal logic will continue try to apply written values to clock components. A busy flag will be assert during applying.

Field access rule:

1. Only one field can be modified a time
2. No field can be modified when any field pending
3. Not violate change condition in following table

## CCM Memory Map/Register Definition

FIELD	CHANGE CONDITION	FINISH CONDITION
Auto		immediate
Auto-divider		immediate
Bypass	Gatea active and gateb active	Bypass switch complete
Post-divider		New divider value applied
Gate B	Bypass disable	New gate value active
Pre-divider B	Bypass disable and gateb not gated	New divider value applied
MUX B	Bypass disable and gateb gating	immediate
Gate A	Bypass	New gate value active
Pre-divider A	Bypass and gatea not gated	New divider value applied
MUX A	Bypass and gatea gating	immediate

- Error will be reported if access rules violated.
- Unsafe or ambiguous access will be ignored.

If a write access as blocked by normal interface, the write operation will be ignored. And a sticky bit “violate” will be set. The bit will last until software clears it explicitly. The violate bit is 4 bits inside CCM, each for a logic domain. Each domain can read and clear the bit for itself, the bits for other domain is neither visible nor clearable.

## 5.2.8 CCM Memory Map/Register Definition

The Memory Map below represents the full array for CCM.

### NOTE

Not all mapped Clock Slices and CCGRs are tied to functional components.

Please see the following for the functional mapping tables and information:

- CCM\_PLL\_CTRL - [Input Clocks](#)
- CCM\_TARGET\_ROOT - [Clock Root Selects](#)
- CCM\_CCGR - [CCGR Interface](#)

### 5.2.8.1 General Purpose Register (CCM\_GPR0n)

#### GPR0

Address: 3038\_0000h base + 0h offset + (4d × i), where i=0d to 3d

#### CCM\_GPR0n field descriptions

Field	Description
GP0	Timeout cycle count of ipg_clk, when perform read and write.

### 5.2.8.2 CCM PLL Control Register (CCM\_PLL\_CTRLn)

See [Input Clocks](#) for PLL control mapping.

#### NOTE

For the SoC to correctly power up after entering DSM, CCM\_PLL\_CTRLx must not be set to 0x0 or 0x3 for any domain in use.

Address: 3038\_0000h base + 800h offset + (16d × i), where i=0d to 32d

**CCM\_PLL\_CTRLn field descriptions**

Field	Description
31–16 -	This field is reserved. Reserved
15 -	This field is reserved. Reserved
14 -	This field is reserved. Reserved
13–12 SETTING3	Clock gate control setting for domain 3. This field can only be written by domain 3  00 Domain clocks not needed

*Table continues on the next page...*

5–4 SETTING1	Clock gate control setting for domain 1. This field can only be written by domain 1.  00 Domain clocks not needed 01 Domain clocks needed when in RUN 10 Domain clocks needed when in RUN and WAIT 11 Domain clocks needed all the time
3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
SETTING0	Clock gate control setting for domain 0. This field can only be written by domain 0.  00 Domain clocks not needed 01 Domain clocks needed when in RUN 10 Domain clocks needed when in RUN and WAIT 11 Domain clocks needed all the time

### 5.2.8.9 CCM Clock Gating Register (CCM\_CCGRn\_TOG)

**NOTE**

Not all CCGRs are mapped. See [CCGR Interface](#) for CCGR mapping and clock gating information.

Address: 3038\_0000h base + 400Ch offset + (16d × i), where i=0d to 190d

**CCM\_CCGRn\_TOG field descriptions**

Field	Description
31–16 -	This field is reserved. Reserved
15 -	This field is reserved. Reserved
14 -	This field is reserved. Reserved
13–12 SETTING3	Clock gate control setting for domain 3. This field can only be written by domain 3  00 Domain clocks not needed 01 Domain clocks needed when in RUN 10 Domain clocks needed when in RUN and WAIT 11 Domain clocks needed all the time

Table continues on the next page...

## CCM\_CCGRn\_TOG field descriptions (continued)

Field	Description
11 -	This field is reserved. Reserved
10 -	This field is reserved. Reserved
9–8 SETTING2	Clock gate control setting for domain 2. This field can only be written by domain 2  00 Domain clocks not needed 01 Domain clocks needed when in RUN 10 Domain clocks needed when in RUN and WAIT 11 Domain clocks needed all the time
7 -	This field is reserved. Reserved
6 -	This field is reserved. Reserved
5–4 SETTING1	Clock gate control setting for domain 1. This field can only be written by domain 1.  00 Domain clocks not needed 01 Domain clocks needed when in RUN 10 Domain clocks needed when in RUN and WAIT 11 Domain clocks needed all the time
3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
SETTING0	Clock gate control setting for domain 0. This field can only be written by domain 0.  00 Domain clocks not needed 01 Domain clocks needed when in RUN 10 Domain clocks needed when in RUN and WAIT 11 Domain clocks needed all the time

### 5.2.8.10 Target Register (CCM\_TARGET\_ROOT $n$ )

See [Target Interface](#) for more information.

#### NOTE

See [Clock Root Selects](#) for clock root offsets and muxing information.

Address: 3038\_0000h base + 8000h offset + (128d × i), where i=0d to 120d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved			ENABLE	Reserved	MUX			Reserved					PRE_PODF

**CCM\_TARGET\_ROOT $n$  field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved
28 ENABLE	Enable this clock 0 clock root is OFF 1 clock root is ON
27 -	This field is reserved. Reserved
26–24 MUX	Selection of clock sources This field is 1 bit long for DRAM and DRAM_PHYM

*Table continues on the next page...*

**CCM\_TARGET\_ROOT $n$  field descriptions (continued)**

Field	Description
23–19 -	This field is reserved. Reserved
18–16 PRE_PODF	Pre divider divide the number Divider value is n+1 This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8
15–6 -	This field is reserved. Reserved
POST_PODF	Post divider divide number Divider value is n + 1. For CORE, DRAM, this field is 3 bit long. This field does not apply to DRAM_PHYM  000000 Divide by 1 000001 Divide by 2 000010 Divide by 3 000011 Divide by 4 000100 Divide by 5 000101 Divide by 6 : 111111 Divide by 64

### 5.2.8.11 Target Register (CCM\_TARGET\_ROOT $n$ \_SET)

See [Target Interface](#) for more information.

#### NOTE

See [Clock Root Selects](#) for clock root offsets and muxing information.

Address: 3038\_0000h base + 8004h offset + (128d × i), where i=0d to 120d

**CCM\_TARGET\_ROOT $n$ \_SET field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved
28 ENABLE	Enable this clock  0 clock root is OFF 1 clock root is ON
27 -	This field is reserved. Reserved
26–24 MUX	Selection of clock sources  This field is 1 bit long for DRAM and DRAM_PHYM

*Table continues on the next page...*

**CCM\_TARGET\_ROOTn\_SET field descriptions (continued)**

Field	Description
23–19 -	This field is reserved. Reserved
18–16 PRE_PODF	Pre divider divide the number Divider value is n+1 This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8
15–6 -	This field is reserved. Reserved
POST_PODF	Post divider divide the number Divider value is n + 1. For CORE, DRAM, this field is 3 bit long. This field does not apply to DRAM_PHYM  000000 Divide by 1 000001 Divide by 2 000010 Divide by 3 000011 Divide by 4 000100 Divide by 5 000101 Divide by 6 : 111111 Divide by 64

### 5.2.8.12 Target Register (CCM\_TARGET\_ROOT $n$ \_CLR)

See [Target Interface](#) for more information.

#### NOTE

See [Clock Root Selects](#) for clock root offsets and muxing information.

Address: 3038\_0000h base + 8008h offset + (128d × i), where i=0d to 120d

**CCM\_TARGET\_ROOT $n$ \_CLR field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved
28 ENABLE	Enable this clock 0 clock root is OFF 1 clock root is ON
27 -	This field is reserved. Reserved
26–24 MUX	Selection of clock sources This field is 1 bit long for DRAM and DRAM_PHYM

*Table continues on the next page...*

CCM\_TARGET\_ROOT $n$ \_CLR field descriptions (continued)

Field	Description
23–19 -	This field is reserved. Reserved
18–16 PRE_PODF	Pre divider divide the number Divider value is $n+1$ This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8
15–6 -	This field is reserved. Reserved
POST_PODF	Post divider divide the number Divider value is $n + 1$ . For CORE, DRAM, this field is 3 bit long. This field does not apply to DRAM_PHYM  000000 Divide by 1 000001 Divide by 2 000010 Divide by 3 000011 Divide by 4 000100 Divide by 5 000101 Divide by 6 : 111111 Divide by 64

### 5.2.8.13 Target Register (CCM\_TARGET\_ROOT $n$ \_TOG)

See [Target Interface](#) for more information.

#### NOTE

See [Clock Root Selects](#) for clock root offsets and muxing information.

Address: 3038\_0000h base + 800Ch offset + (128d × i), where i=0d to 120d

**CCM\_TARGET\_ROOT $n$ \_TOG field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved
28 ENABLE	Enable this clock  0 clock root is OFF 1 clock root is ON
27 -	This field is reserved. Reserved
26–24 MUX	Selection of clock sources  This field is 1 bit long for DRAM and DRAM_PHYM

*Table continues on the next page...*

CCM\_TARGET\_ROOT $n$ \_TOG field descriptions (continued)

Field	Description
23–19 -	This field is reserved. Reserved
18–16 PRE_PODF	Pre divide divide number Divider value is $n+1$ This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8
15–6 -	This field is reserved. Reserved
POST_PODF	Post divider divide number Divider value is $n + 1$ . For CORE, DRAM, this field is 3 bit long. This field does not apply to DRAM_PHYM  000000 Divide by 1 000001 Divide by 2 000010 Divide by 3 000011 Divide by 4 000100 Divide by 5 000101 Divide by 6 : 111111 Divide by 64

### 5.2.8.14 Miscellaneous Register (CCM\_MISCN)

#### MISC

Address: 3038\_0000h base + 8010h offset + (128d × i), where i=0d to 120d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
R	Reserved																	
W	Reserved																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	Reserved								VIOLATE	Reserved				TIMEOUT	Reserved			AUTHEN_FAIL
W	Reserved								VIOLATE	Reserved				TIMEOUT	Reserved			AUTHEN_FAIL
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

#### CCM\_MISCN field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
8 VIOLATE	This sticky bit reflects access violation in normal interface of this clock. This bit has internal 4 bits, one for each domain. Violation from other domain is not visible or clearable. This file is cleared to 0 while write 1.
7–5 -	This field is reserved. Reserved
4 TIMEOUT	This sticky bit reflects time out happened during accessing this clock. This bit has internal 4 bits, one for each domain. Timeout from other domain is not visible or clearable. This file is cleared to 0 while write 1.
3–1 -	This field is reserved. Reserved
0 AUTHEN_FAIL	This sticky bit reflects access restricted by access control of this clock. This bit has internal 4 bits, one for each domain. Authentic fail from other domain is not visible or clearable. This file is cleared to 0 while write 1

### 5.2.8.15 Miscellaneous Register (CCM\_MISC\_ROOTn\_SET)

#### Misc

Address: 3038\_0000h base + 8014h offset + (128d × i), where i=0d to 120d

**CCM\_MISC\_ROOTn\_SET field descriptions**

Field	Description
31–9 -	This field is reserved. Reserved
8 VIOLATE	This sticky bit reflects access violation in normal interface of this clock. This bit has internal 4 bits, one for each domain. Violation from other domain is not visible or clearable. This file is cleared to 0 while write 1.
7–5 -	This field is reserved. Reserved
4 TIMEOUT	This sticky bit reflects time out happened during accessing this clock. This bit has internal 4 bits, one for each domain. Timeout from other domain is not visible or clearable. This file is cleared to 0 while write 1.
3–1 -	This field is reserved. Reserved
0 AUTHEN_FAIL	This sticky bit reflects access restricted by access control of this clock. This bit has internal 4 bits, one for each domain. Authentic fail from other domain is not visible or clearable. This file is cleared to 0 while write 1

## 5.2.8.16 Miscellaneous Register (CCM\_MISC\_ROOTn\_CLR)

### MISC

Address: 3038\_0000h base + 8018h offset + (128d × i), where i=0d to 120d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
R	Reserved																	
W																		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	Reserved								VIOLATE	Reserved				TIMEOUT	Reserved			AUTHEN_FAIL
W																		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### CCM\_MISC\_ROOTn\_CLR field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
8 VIOLATE	This sticky bit reflects access violation in normal interface of this clock. This bit has internal 4 bits, one for each domain. Violation from other domain is not visible or clearable. This file is cleared to 0 while write 1.
7–5 -	This field is reserved. Reserved
4 TIMEOUT	This sticky bit reflects time out happened during accessing this clock. This bit has internal 4 bits, one for each domain. Timeout from other domain is not visible or clearable. This file is cleared to 0 while write 1.
3–1 -	This field is reserved. Reserved
0 AUTHEN_FAIL	This sticky bit reflects access restricted by access control of this clock. This bit has internal 4 bits, one for each domain. Authentic fail from other domain is not visible or clearable. This file is cleared to 0 while write 1

### 5.2.8.17 Miscellaneous Register (CCM\_MISC\_ROOTn\_TOG)

#### MISC

Address: 3038\_0000h base + 801Ch offset + (128d × i), where i=0d to 120d

#### CCM\_MISC\_ROOTn\_TOG field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
8 VIOLATE	This sticky bit reflects access violation in normal interface of this clock. This bit has internal 4 bits, one for each domain. Violation from other domain is not visible or clearable. This file is cleared to 0 while write 1.
7–5 -	This field is reserved. Reserved
4 TIMEOUT	This sticky bit reflects time out happened during accessing this clock. This bit has internal 4 bits, one for each domain. Timeout from other domain is not visible or clearable. This file is cleared to 0 while write 1.
3–1 -	This field is reserved. Reserved
0 AUTHEN_FAIL	This sticky bit reflects access restricted by access control of this clock. This bit has internal 4 bits, one for each domain. Authentic fail from other domain is not visible or clearable. This file is cleared to 0 while write 1

### 5.2.8.18 Post Divider Register (CCM\_POSTn)

#### Post Register

Address: 3038\_0000h base + 8020h offset + (128d × i), where i=0d to 120d

## CCM Memory Map/Register Definition

### CCM\_POSTn field descriptions

Field	Description
31 BUSY2	Safe multiplexer is applying new setting
30–29 -	This field is reserved. Reserved
28 SELECT	Selection of pre clock branches This field is not applied in IP 0 select branch A 1 select branch B
27–8 -	This field is reserved. Reserved
7 BUSY1	Post divider is applying new set value
6 -	This field is reserved. Reserved
POST_PODF	Post divider divide the number Divider value is $n + 1$

Table continues on the next page...

**CCM\_POST $n$  field descriptions (continued)**

Field	Description
	<p>For CORE, DRAM, this field is 3 bit long.</p> <p>This field does not apply to DRAM_PHYM</p> <p>000000 Divide by 1</p> <p>000001 Divide by 2</p> <p>000010 Divide by 3</p> <p>000011 Divide by 4</p> <p>000100 Divide by 5</p> <p>000101 Divide by 6</p> <p>:</p> <p>111111 Divide by 64</p>

### 5.2.8.19 Post Divider Register (CCM\_POST\_ROOTn\_SET)

#### Post Divider Register

Address: 3038\_0000h base + 8024h offset + (128d × i), where i=0d to 120d

**CCM\_POST\_ROOTn\_SET field descriptions**

Field	Description
31 BUSY2	Safe multiplexer is applying new setting
30–29 -	This field is reserved. Reserved
28 SELECT	Selection of pre clock branches This field is not applied in IP  0 select branch A 1 select branch B
27–8 -	This field is reserved. Reserved
7 BUSY1	Post divider is applying new set value
6 -	This field is reserved. Reserved
POST_PODF	Post divider divide number Divider value is n + 1

Table continues on the next page...

**CCM\_POST\_ROOT $n$ \_SET field descriptions (continued)**

Field	Description
	<p>For CORE, DRAM, this field is 3 bit long.</p> <p>This field does not apply to DRAM_PHYM</p> <p>000000 Divide by 1</p> <p>000001 Divide by 2</p> <p>000010 Divide by 3</p> <p>000011 Divide by 4</p> <p>000100 Divide by 5</p> <p>000101 Divide by 6</p> <p>:</p> <p>111111 Divide by 64</p>

### 5.2.8.20 Post Divider Register (CCM\_POST\_ROOTn\_CLR)

#### Post Root Register

Address: 3038\_0000h base + 8028h offset + (128d × i), where i=0d to 120d

## CCM Memory Map/Register Definition

**CCM\_POST\_ROOTn\_CLR field descriptions**

Field	Description
31 BUSY2	Safe multiplexer is applying new setting
30–29 -	This field is reserved. Reserved
28 SELECT	Selection of pre clock branches This field is not applied in IP  0 select branch A 1 select branch B
27–8 -	This field is reserved. Reserved
7 BUSY1	Post divider is applying new set value
6 -	This field is reserved. Reserved
POST_PODF	Post divider divide the number Divider value is n + 1

*Table continues on the next page...*

**CCM\_POST\_ROOT<sub>n</sub>\_CLR field descriptions (continued)**

Field	Description
	<p>For CORE, DRAM, this field is 3 bit long.</p> <p>This field does not apply to DRAM_PHYM</p> <p>000000 Divide by 1</p> <p>000001 Divide by 2</p> <p>000010 Divide by 3</p> <p>000011 Divide by 4</p> <p>000100 Divide by 5</p> <p>000101 Divide by 6</p> <p>:</p> <p>111111 Divide by 64</p>

### 5.2.8.21 Post Divider Register (CCM\_POST\_ROOTn\_TOG)

#### Post Root Register

Address: 3038\_0000h base + 802Ch offset + (128d × i), where i=0d to 120d

**CCM\_POST\_ROOTn\_TOG field descriptions**

Field	Description
31 BUSY2	Safe multiplexer is applying new setting
30–29 -	This field is reserved. Reserved
28 SELECT	Selection of pre clock branches This field is not applied in IP  0 select branch A 1 select branch B
27–8 -	This field is reserved. Reserved
7 BUSY1	Post divider is applying new set value
6 -	This field is reserved. Reserved
POST_PODF	Post divider divide number Divider value is n + 1

Table continues on the next page...

CCM\_POST\_ROOT $n$ \_TOG field descriptions (continued)

Field	Description
	For CORE, DRAM, this field is 3 bit long. This field does not apply to DRAM_PHYM
000000	Divide by 1
000001	Divide by 2
000010	Divide by 3
000011	Divide by 4
000100	Divide by 5
000101	Divide by 6
:	
111111	Divide by 64

### 5.2.8.22 Pre Divider Register (CCM\_PREn)

#### Pre Register

Address: 3038\_0000h base + 8030h offset + (128d × i), where i=0d to 120d

## CCM Memory Map/Register Definition

### CCM\_PREN field descriptions

Field	Description
31 BUSY4	EN_A field is applied to field This field applies to DRAM and DRAM_PHYM
30–29 -	This field is reserved. Reserved
28 EN_A	Branch A clock gate control This field applies to DRAM and DRAM_PHYM 0 Clock shutdown 1 clock ON
27 -	This field is reserved. Reserved
26–24 MUX_A	Selection control of multiplexer of branch A This field applies to DRAM and DRAM_PHYM
23–20 -	This field is reserved. Reserved
19 BUSY3	Pre divider value for branch A is applied This field applies to DRAM and DRAM_PHYM

Table continues on the next page...

**CCM\_PREn field descriptions (continued)**

<b>Field</b>	<b>Description</b>
18–16 PRE_PODF_A	Pre divider divide number for branch A Divider value is $n + 1$ . This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8
15 BUSY1	EN_B is applied to field This field does not apply for CORE, IP, DRAM, DRAM_PHYM
14–13 -	This field is reserved. Reserved
12 EN_B	Branch B clock gate control This field does not apply for CORE, IP, DRAM, DRAM_PHYM  0 Clock shutdown 1 Clock ON
11 -	This field is reserved. Reserved
10–8 MUX_B	Selection control of multiplexer of branch B This field does not apply for CORE, IP, DRAM, DRAM_PHYM
7–4 -	This field is reserved. Reserved
3 BUSY0	Pre divider value for branch a is applying field does not apply for CORE, IP, DRAM, DRAM_PHYM
PRE_PODF_B	Pre divider divide number for branch B Divider value is $n + 1$ . This field does not apply for CORE, IP, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8

### 5.2.8.23 Pre Divider Register (CCM\_PRE\_ROOTn\_SET)

#### Pre Divider Register

Address: 3038\_0000h base + 8034h offset + (128d × i), where i=0d to 120d

**CCM\_PRE\_ROOTn\_SET field descriptions**

Field	Description
31 BUSY4	EN_A field is applied to field This field applies to DRAM and DRAM_PHYM
30–29 -	This field is reserved. Reserved
28 EN_A	Branch A clock gate control This field applies to DRAM and DRAM_PHYM 0 Clock shutdown 1 clock ON
27 -	This field is reserved. Reserved
26–24 MUX_A	Selection control of multiplexer of branch A This field applies to DRAM and DRAM_PHYM
23–20 -	This field is reserved. Reserved
19 BUSY3	Pre divider value for branch A is applied This field applies to DRAM and DRAM_PHYM

Table continues on the next page...

## CCM\_PRE\_ROOTn\_SET field descriptions (continued)

Field	Description
18–16 PRE_PODF_A	Pre divider divide number for branch A Divider value is $n + 1$ . This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8
15 BUSY1	EN_B is applied to field This field does not apply for CORE, IP, DRAM, DRAM_PHYM
14–13 -	This field is reserved. Reserved
12 EN_B	Branch B clock gate control This field does not apply for CORE, IP, DRAM, DRAM_PHYM  0 Clock shutdown 1 Clock ON
11 -	This field is reserved. Reserved
10–8 MUX_B	Selection control of multiplexer of branch B This field does not apply for CORE, IP, DRAM, DRAM_PHYM
7–4 -	This field is reserved. Reserved
3 BUSY0	Pre divider value for branch A is applying field does not apply for CORE, IP, DRAM, DRAM_PHYM
PRE_PODF_B	Pre divider divide number for branch B Divider value is $n + 1$ . This field does not apply for CORE, IP, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8

## 5.2.8.24 Pre Divider Register (CCM\_PRE\_ROOT $n$ \_CLR)

### Pre Root Register

Address: 3038\_0000h base + 8038h offset + (128d × i), where i=0d to 120d

## CCM Memory Map/Register Definition

**CCM\_PRE\_ROOTn\_CLR field descriptions**

Field	Description
31 BUSY4	EN_A field is applied to field This field applies to DRAM and DRAM_PHYM
30–29 -	This field is reserved. Reserved
28 EN_A	Branch A clock gate control This field applies to DRAM and DRAM_PHYM 0 Clock shutdown 1 clock ON
27 -	This field is reserved. Reserved
26–24 MUX_A	Selection control of multiplexer of branch A This field applies to DRAM and DRAM_PHYM
23–20 -	This field is reserved. Reserved
19 BUSY3	Pre divider value for branch A is applied This field applies to DRAM and DRAM_PHYM

Table continues on the next page...

## CCM\_PRE\_ROOTn\_CLR field descriptions (continued)

Field	Description
18–16 PRE_PODF_A	Pre divider divide number for branch A Divider value is $n + 1$ . This field does not apply for CORE, DRAM, DRAM_PHYM  000 Divide by 1 001 Divide by 2 010 Divide by 3 011 Divide by 4 100 Divide by 5 101 Divide by 6 110 Divide by 7 111 Divide by 8

## 5.2.8.26 Access Control Register (CCM\_ACCESS\_CTRLn)

### Access Control Register

Address: 3038\_0000h base + 8070h offset + (128d × i), where i=0d to 120d

### CCM\_ACCESS\_CTRLn field descriptions

Field	Description
31 LOCK	Lock this clock root to use access control This bit can be set to 1 by software, and can be cleared only by system reset.  0 Access control inactive 1 Access control active
30–29 -	This field is reserved. Reserved
28 SEMA_EN	Enable internal semaphore This field cannot be changed when lock bit is 1

Table continues on the next page...

## CCM\_ACCESS\_CTRLn field descriptions (continued)

Field	Description
	0 Disable 1 Enable
27 DOMAIN3_ WHITELIST	White list of domains that can change setting of this clock root. Each domain has a corresponding bit.  0 Domain cannot change the setting 1 Domain can change the setting
26 DOMAIN2_ WHITELIST	White list of domains that can change setting of this clock root. Each domain has a corresponding bit.  0 Domain cannot change the setting 1 Domain can change the setting
25 DOMAIN1_ WHITELIST	White list of domains that can change setting of this clock root. Each domain has a corresponding bit.  0 Domain cannot change the setting 1 Domain can change the setting
24 DOMAIN0_ WHITELIST	White list of domains that can change setting of this clock root. Each domain has a corresponding bit.  0 Domain cannot change the setting 1 Domain can change the setting
23–21 -	This field is reserved. Reserved
20 MUTEX	Semaphore to control access  0 Semaphore is free to take 1 Semaphore is taken Write 0 Release semaphore Write 1 Acquire semaphore
19–18 -	This field is reserved. Reserved
17–16 OWNER_ID	Current domain that owns semaphore This field is meaningless when MUTEX is 0  0 domain0 1 domain1 2 domain2 3 domain3
15–12 DOMAIN3_INFO	Information from domain 3 to pass to others This field can only be changed by domain 3
11–8 DOMAIN2_INFO	Information from domain 2 to pass to others This field can only be changed by domain 2
7–4 DOMAIN1_INFO	Information from domain 1 to pass to others This field can only be changed by domain 1

*Table continues on the next page...*

## CCM\_ACCESS\_CTRLn field descriptions (continued)

Field	Description
DOMAIN0_INFO	Information from domain 0 to pass to others This field can only be changed by domain 0

### 5.2.8.27 Access Control Register (CCM\_ACCESS\_CTRL\_ROOTn\_SET)

#### Access Control Register

Address: 3038\_0000h base + 8074h offset + (128d × i), where i=0d to 120d

#### CCM\_ACCESS\_CTRL\_ROOTn\_SET field descriptions

Field	Description
31 LOCK	Lock this clock root to use access control This bit can be set to 1 by software, and can be cleared only by system reset.

Table continues on the next page...

## CCM\_ACCESS\_CTRL\_ROOTn\_SET field descriptions (continued)

Field	Description
	0 Access control inactive 1 Access control active
30–29 -	This field is reserved. Reserved
28 SEMA_EN	Enable internal semaphore This field cannot be changed when lock bit is 1  0 Disable 1 Enable

3036_0150	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)	32	R/W	05F5_E100h	<a href="#">5.2.9.16/784</a>
3036_0160	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)	32	R/W	10A2_4447h	<a href="#">5.2.9.17/784</a>
3036_0170	Miscellaneous0 Analog Clock Control and Status Register (CCM_ANALOG_CLK_MISC0)	32	R/W	0000_0000h	<a href="#">5.2.9.18/785</a>
3036_0174	Miscellaneous0 Analog Clock Control and Status Register (CCM_ANALOG_CLK_MISC0_SET)	32	R/W	0000_0000h	<a href="#">5.2.9.18/785</a>
3036_0178	Miscellaneous0 Analog Clock Control and Status Register (CCM_ANALOG_CLK_MISC0_CLR)	32	R/W	0000_0000h	<a href="#">5.2.9.18/785</a>
3036_017C	Miscellaneous0 Analog Clock Control and Status Register (CCM_ANALOG_CLK_MISC0_TOG)	32	R/W	0000_0000h	<a href="#">5.2.9.18/785</a>

### 5.2.9.1 Anadig ARM PLL control Register (CCM\_ANALOG\_PLL\_ARMn)

The control register provides control for the system PLL.

Address: 3036\_0000h base + 60h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_ARMn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.

Table continues on the next page...

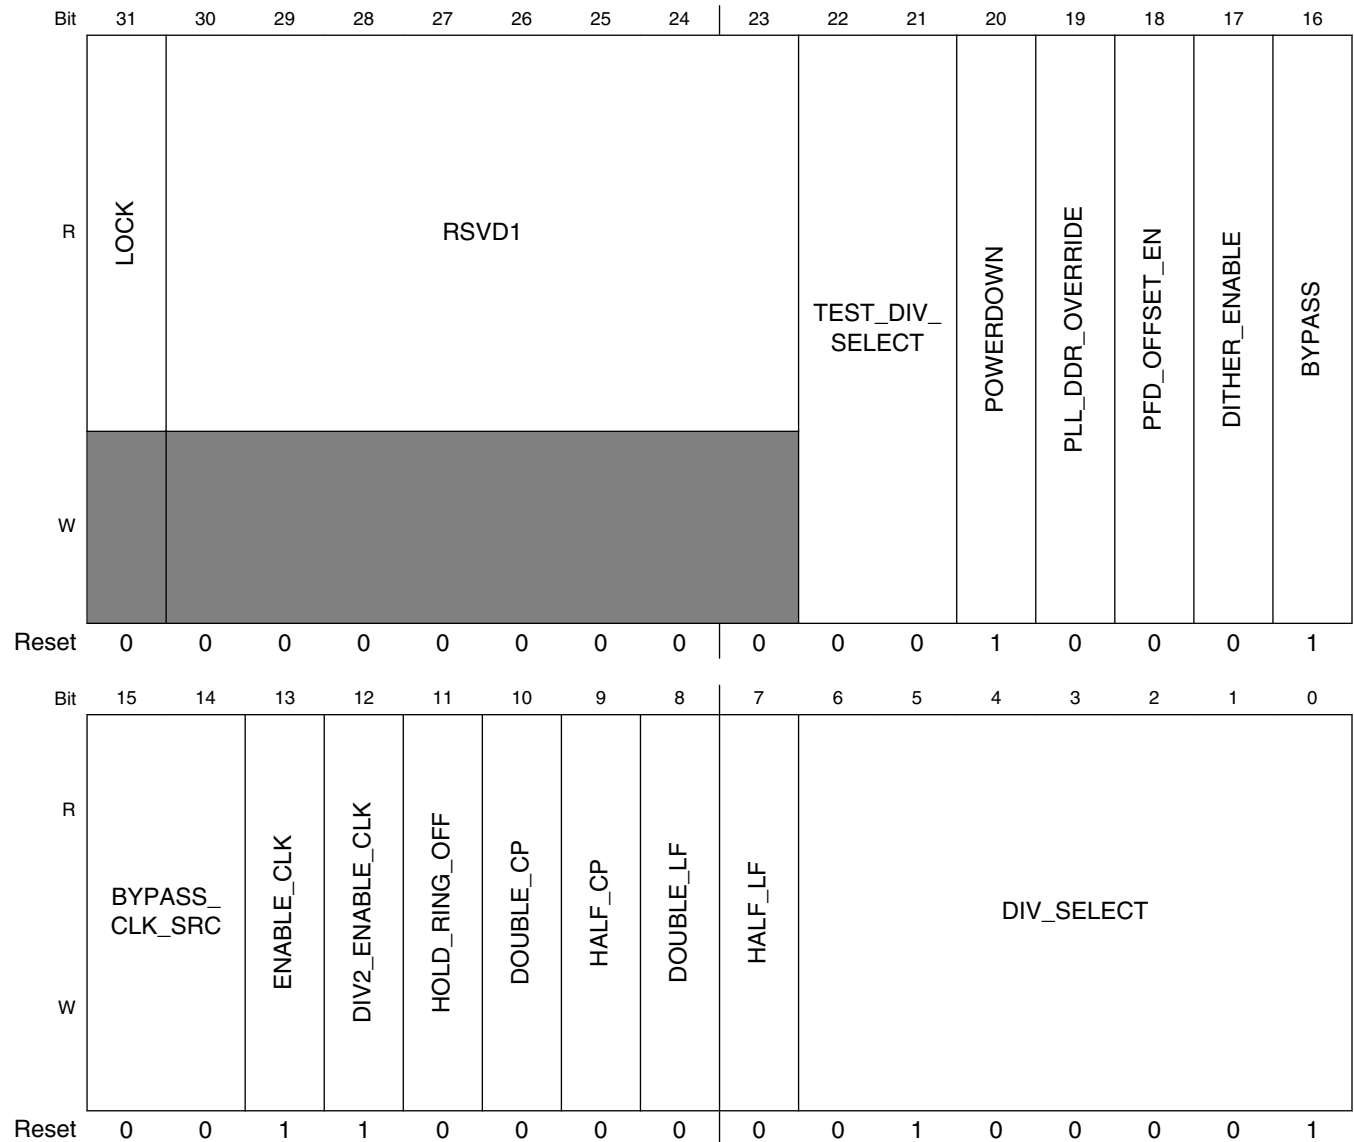

## CCM\_ANALOG\_PLL\_ARMn field descriptions (continued)

Field	Description
30–21 RSVD0	Always set to zero (0).
20 PLL_ARM_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
19 PLL_SEL	
18 LVDS_24MHZ_ SEL	
17 LVDS_SEL	
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_ SRC	Determines the bypass source.
13 ENABLE_CLK	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11 HOLD_RING_ OFF	Analog debug bit.
10 DOUBLE_CP	Increases the charge pump gain 2x.
9 HALF_CP	Reduces the charge pump gain 2x.
8 DOUBLE_LF	Increases the frequency of the loop filter 2x.
7 HALF_LF	Reduces the frequency of the loop filter 2x.
DIV_SELECT	This field controls the pll loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * \text{div\_select}/2.0$ .

### 5.2.9.2 Anadig DDR PLL Control Register (CCM\_ANALOG\_PLL\_DDRn)

The control register provides control for the 480MHz PLL.

Address: 3036\_0000h base + 70h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_DDRn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.

Table continues on the next page...

## CCM\_ANALOG\_PLL\_DDRn field descriptions (continued)

Field	Description
30–23 RSVD1	Always set to zero (0).
22–21 TEST_DIV_SELECT	Control bits for the post divider for the PLL clk and lvds outputs: 0x0=div-by-4(default), 0x1=div-by-2, 0x2=div-by-1, 0x3=div-by-1
20 POWERDOWN	Powers down the PLL.
19 PLL_DDR_OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 DITHER_ENABLE	Enables dither in the fractional modulator calculation.
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source.
13 ENABLE_CLK	
12 DIV2_ENABLE_CLK	
11 HOLD_RING_OFF	Status of ana_irq2 input from analog block.
10 DOUBLE_CP	Increases the charge pump gain 2x.
9 HALF_CP	Reduces the charge pump gain 2x.
8 DOUBLE_LF	Increases the frequency of the loop filter 2x.
7 HALF_LF	Reduces the frequency of the loop filter 2x.
DIV_SELECT	This field controls the pll loop divider. Valid values for divider: 33 to 44.

### 5.2.9.3 DDR PLL Spread Spectrum Register. (CCM\_ANALOG\_PLL\_DDR\_SS)

This register contains the DDR PLL spread spectrum controls.

Address: 3036\_0000h base + 80h offset = 3036\_0080h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	STOP																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	ENABLE	STEP															
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

#### CCM\_ANALOG\_PLL\_DDR\_SS field descriptions

Field	Description
31–16 STOP	Frequency change = $\text{step}/B \times 24\text{MHz}$ .
15 ENABLE	This bit enables the spread spectrum modulation.
STEP	The max frequency change = $\text{stop}/B \times 24\text{MHz}$ .

### 5.2.9.4 Numerator of DDR PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_DDR\_NUM)

This register contains the numerator of DDR PLL fractional loop divider.

Address: 3036\_0000h base + 90h offset = 3036\_0090h

**CCM\_ANALOG\_PLL\_DDR\_NUM field descriptions**

Field	Description
31–30 RSVD0	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

### 5.2.9.5 Denominator of DDR PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_DDR\_DENOM)

This register contains the Denominator of DDR PLL fractional loop divider.

Address: 3036\_0000h base + A0h offset = 3036\_00A0h

**CCM\_ANALOG\_PLL\_DDR\_DENOM field descriptions**

<b>Field</b>	<b>Description</b>
31–30 RSVD0	Always set to zero (0).
B	30 bit Denominator (B) of fractional loop divider (signed integer).

### 5.2.9.6 Anadig 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_480n)

The control register provides control for the 480MHz PLL.

Address: 3036\_0000h base + B0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## CCM\_ANALOG\_PLL\_480n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–29 RSVD1	Always set to zero (0).
28 PFD2_DIV2_ CLKGATE	If set to 1, pll_sys_pfd2_135m_clk is off (power savings). 0: pll_sys_pfd2_135m_clk is enabled.
27 PFD1_DIV2_ CLKGATE	If set to 1, pll_sys_pfd1_166m_clk is off (power savings). 0: pll_sys_pfd1_166m_clk is enabled.
26 PFD0_DIV2_ CLKGATE	If set to 1, pll_sys_pfd0_196m_clk is off (power savings). 0: pll_sys_pfd0_196m_clk is enabled.
25 PFD7_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
24 PFD6_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
23 PFD5_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
22 PFD4_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
21 PFD3_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
20 PFD2_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
19 PFD1_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
18 PFD0_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
17 PLL_480_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_ SRC	Determines the bypass source.
13 ENABLE_CLK	Enable the clock output.

*Table continues on the next page...*

## CCM\_ANALOG\_PLL\_480n field descriptions (continued)

Field	Description
12 POWERDOWN	Powers down the PLL.
11 HOLD_RING_ OFF	Analog debug bit.
10 DOUBLE_CP	Increases the charge pump gain 2x.
9 HALF_CP	Reduces the charge pump gain 2x.
8 DOUBLE_LF	Increases the frequency of the loop filter 2x.
7 HALF_LF	Reduces the frequency of the loop filter 2x.
6 MAIN_DIV4_ CLKGATE	If set to 1, pll_sys_main_120m_clk is off (power savings). 0: pll_sys_main_120m_clk is enabled.
5 MAIN_DIV2_ CLKGATE	If set to 1, pll_sys_main_240m_clk is off (power savings). 0: pll_sys_main_240m_clk is enabled.
4 MAIN_DIV1_ CLKGATE	If set to 1, pll_sys_main_480m_clk is off (power savings). 0: pll_sys_main_480m_clk is enabled.
3-1 RSVD0	Always set to zero (0).
0 DIV_SELECT	This field controls the pll loop divider. 0 - Fout=480MHz; 1 - Fout=528MHz.

### 5.2.9.7 480MHz Clock Phase Fractional Divider Control Register A (CCM\_ANALOG\_PFD\_480An)

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 3036\_0000h base + C0h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PFD\_480An field descriptions

Field	Description
31 PFD3_DIV1_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_DIV1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_DIV1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

**CCM\_ANALOG\_PFD\_480An field descriptions (continued)**

<b>Field</b>	<b>Description</b>
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_DIV1_ CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

### 5.2.9.8 480MHz Clock Phase Fractional Divider Control Register B (CCM\_ANALOG\_PFD\_480Bn)

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 3036\_0000h base + D0h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PFD\_480Bn field descriptions**

Field	Description
31 PFD7_DIV1_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd7) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
30 PFD7_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD7_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD7\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD6_DIV1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
22 PFD6_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD6_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD6\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD5_DIV1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
14 PFD5_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

**CCM\_ANALOG\_PFD\_480Bn field descriptions (continued)**

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD5_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD5\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD4_DIV1_ CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. If the corresponding override bit is set in the 480MHz PLL control register, this field has no effect.
6 PFD4_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD4_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD4\_FRAC}$ where PFD0_FRAC is in the range 12-35.

### 5.2.9.9 Anadig ENET PLL Control Register (CCM\_ANALOG\_PLL\_ENETn)

The control register provides control for the ENET PLL.

Address: 3036\_0000h base + E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
R	LOCK	RSVD1													PFD_OFFSET_EN	DITHER_ENABLE	BYPASS	
W	[Shaded]															[Shaded]	[Shaded]	[Shaded]
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1		
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	BYPASS_CLK_SRC		PLL_ENET_OVERRIDE	ENABLE_CLK_500MHZ	ENABLE_CLK_250MHZ	ENABLE_CLK_125MHZ	ENABLE_CLK_100MHZ	ENABLE_CLK_50MHZ	ENABLE_CLK_40MHZ	ENABLE_CLK_25MHZ	POWERDOWN	HOLD_RING_OFF	DOUBLE_CP	HALF_CP	DOUBLE_LF	HALF_LF		
W	[Shaded]		[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]		
Reset	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0		

CCM\_ANALOG\_PLL\_ENET $n$  field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 RSVD1	Always set to zero (0).
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 DITHER_ENABLE	Enables dither in the fractional modulator calculation.
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_SRC	Determines the bypass source.
13 PLL_ENET_OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
12 ENABLE_CLK_500MHZ	Enables the ethernet 500MHz clock output.
11 ENABLE_CLK_250MHZ	Enables the ethernet 250MHz clock output.
10 ENABLE_CLK_125MHZ	Enables the ethernet 125MHz clock output.
9 ENABLE_CLK_100MHZ	Enables the ethernet 100MHz clock output.
8 ENABLE_CLK_50MHZ	Enables the ethernet 50MHz clock output.
7 ENABLE_CLK_40MHZ	Enables the ethernet 40MHz clock output.
6 ENABLE_CLK_25MHZ	Enables the ethernet 25MHz clock output.
5 POWERDOWN	Powers down the PLL.
4 HOLD_RING_OFF	Status of ana_irq2 input from analog block.
3 DOUBLE_CP	Increases the charge pump gain 2x.
2 HALF_CP	Reduces the charge pump gain 2x.

*Table continues on the next page...*

**CCM\_ANALOG\_PLL\_ENET $n$  field descriptions (continued)**

Field	Description
1 DOUBLE_LF	Increases the frequency of the loop filter 2x.
0 HALF_LF	Reduces the frequency of the loop filter 2x.

### 5.2.9.10 Anadig Audio PLL control Register (CCM\_ANALOG\_PLL\_AUDION)

The control register provides control for the Audio PLL.

Address: 3036\_0000h base + F0h offset + (4d × i), where i=0d to 3d

## CCM\_ANALOG\_PLL\_AUDION field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–25 RSVD1	Always set to zero (0).
24 PLL_AUDIO_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
23–22 POST_DIV_SEL	Post-divider for audio PLL: 0x0=div-by-1 (default), 0x1=div-by-2, 0x2=div-by-1, 0x3=div-by-4. The output clock of the audio PLL should be gated prior to changing this divider to prevent glitches.
21 RSVD0	Always set to zero (0).
20–19 TEST_DIV_ SELECT	Control bits for the divider for the PLL clk and lvds outputs: 0x0=div-by-4 (default), 0x1=div-by-2, 0x2=div-by-1, 0x3=div-by-1. This divider is placed before the post divider.
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 DITHER_ ENABLE	Enables dither in the fractional modulator calculation.
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_ SRC	Determines the bypass source.
13 ENABLE_CLK	
12 POWERDOWN	Powers down the PLL.
11 HOLD_RING_ OFF	Status of ana_irq2 input from analog block.
10 DOUBLE_CP	Increases the charge pump gain 2x.
9 HALF_CP	Reduces the charge pump gain 2x.
8 DOUBLE_LF	Increases the frequency of the loop filter 2x.
7 HALF_LF	Reduces the frequency of the loop filter 2x.
DIV_SELECT	This field controls the pll loop divider. Valid range for DIV_SELECT divider value: 27-54 decimal.

### 5.2.9.11 Audio PLL Spread Spectrum Register. (CCM\_ANALOG\_PLL\_AUDIO\_SS)

This register contains the Audio PLL spread spectrum controls.

Address: 3036\_0000h base + 100h offset = 3036\_0100h

#### CCM\_ANALOG\_PLL\_AUDIO\_SS field descriptions

Field	Description
31-16 STOP	Frequency change = step/B*24MHz.
15 ENABLE	This bit enables the spread spectrum modulation.
STEP	The max frequency change = stop/B*24MHz.

### 5.2.9.12 Numerator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider.

Address: 3036\_0000h base + 110h offset = 3036\_0110h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	RSVD0			A													
W	[Shaded]			[Shaded]													
Reset	0	0	0	0	0	1	0	1		1	1	1	1	0	1	0	1
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	A																
W	[Shaded]																
Reset	1	1	1	0	0	0	0	1		0	0	0	0	0	0	0	0

#### CCM\_ANALOG\_PLL\_AUDIO\_NUM field descriptions

Field	Description
31–30 RSVD0	Always set to zero (0).
A	30 bit numerator of fractional loop divider.

### 5.2.9.13 Denominator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider.

Address: 3036\_0000h base + 120h offset = 3036\_0120h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	RSVD0			B													
W	[Shaded]			[Shaded]													
Reset	0	0	1	0	1	0	0	1		0	1	1	0	0	1	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	B																
W	[Shaded]																
Reset	0	1	1	0	0	0	0	1		1	0	0	1	1	1	0	0

**CCM\_ANALOG\_PLL\_AUDIO\_DENOM field descriptions**

Field	Description
31–30 RSVD0	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

### 5.2.9.14 Anadig Video PLL control Register (CCM\_ANALOG\_PLL\_VIDEOn)

The control register provides control for the Video PLL.

Address: 3036\_0000h base + 130h offset + (4d × i), where i=0d to 3d

CCM\_ANALOG\_PLL\_VIDEO<sub>n</sub> field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–25 RSVD1	Always set to zero (0).
24 PLL_VIDEO_ OVERRIDE	The OVERRIDE bit allows the clock control module to automatically override portions of the register.
23–22 POST_DIV_SEL	Post-divider for video PLL: 0x0=div-by-1(default), 0x1=div-by-2, 0x2=div-by-1, 0x3=div-by-4. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches.
21 RSVD0	Always set to zero (0).
20–19 TEST_DIV_ SELECT	Control bits for the divider for the PLL clk and lvds outputs: 0x0=div-by-4(default), 0x1=div-by-2, 0x2=div-by-1, 0x3=div-by-1. This divider is placed before the post divider.
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 DITHER_ ENABLE	Enables dither in the fractional modulator calculation.
16 BYPASS	Bypass the pll.
15–14 BYPASS_CLK_ SRC	Determines the bypass source.
13 ENABLE_CLK	
12 POWERDOWN	Powers down the PLL.
11 HOLD_RING_ OFF	Status of ana_irq2 input from analog block.
10 DOUBLE_CP	Increases the charge pump gain 2x.
9 HALF_CP	Reduces the charge pump gain 2x.
8 DOUBLE_LF	Increases the frequency of the loop filter 2x.
7 HALF_LF	Reduces the frequency of the loop filter 2x.
DIV_SELECT	This field controls the pll loop divider. Valid range for DIV_SELECT divider value: 27-54 decimal.

### 5.2.9.15 Video PLL Spread Spectrum Register. (CCM\_ANALOG\_PLL\_VIDEO\_SS)

This register contains the Video PLL spread spectrum controls.

Address: 3036\_0000h base + 140h offset = 3036\_0140h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	STOP																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	ENABLE	STEP															
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

#### CCM\_ANALOG\_PLL\_VIDEO\_SS field descriptions

Field	Description
31–16 STOP	Frequency change = $\text{step}/B \times 24\text{MHz}$ .
15 ENABLE	This bit enables the spread spectrum modulation.
STEP	The max frequency change = $\text{stop}/B \times 24\text{MHz}$ .

### 5.2.9.16 Numerator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_NUM)

This register contains the numerator (A) of Video PLL fractional loop divider.

Address: 3036\_0000h base + 150h offset = 3036\_0150h

**CCM\_ANALOG\_PLL\_VIDEO\_NUM field descriptions**

Field	Description
31–30 RSVD0	Always set to zero (0).
A	30 bit numerator of fractional loop divider.

### 5.2.9.17 Denominator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider.

Address: 3036\_0000h base + 160h offset = 3036\_0160h

## CCM\_ANALOG\_PLL\_VIDEO\_DENOM field descriptions

Field	Description
31–30 RSVD0	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

### 5.2.9.18 Miscellaneous0 Analog Clock Control and Status Register (CCM\_ANALOG\_CLK\_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks. The lvds1 and lvds2 controls control the behavior of the anack1/1b and anack2/2b lvds IO's.

Address: 3036\_0000h base + 170h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_CLK\_MISC0n field descriptions**

Field	Description
31–8 RSVD0	Always set to zero (0).
7 ACLK2_PREDIV	Predivider ACLK2 source/reference clock of the PLL's. 0 - divide by 1; 1 - divide by 2. Please see PLL programming registers to select this source as the reference clock to the desired PLL
6 LVDSCLK1_ IBEN	This enables the lvds input buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
5 LVDSCLK1_ OBEN	This enables the lvds output buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
LVDS1_CLK_ SEL	This field selects the clock to be routed to anaclk1/1b 0x00 - Arm PLL; 0x01 - 480 PLL; 0x02 - pfd0; 0x03 - pfd1; 0x04 - pfd2; 0x05 - pfd3; 0x06 - pfd4; 0x07 - pfd5; 0x08 - pfd6; 0x09 - pfd7; 0x0A - Audio PLL; 0x0B - Video PLL; 0x0C - pll_enet_div2 (500MHz); 0x0D - pll_enet_div4 (250MHz); 0x0E - pll_enet_div8 (125MHz); 0x0F - pll_enet_div10 (100MHz); 0x10 - pll_enet_div20 (50MHz); 0x11 - pll_enet_div25 (40MHz); 0x12 - pll_enet_div40 (25MHz); 0x13 - pll_ddr; 0x14 - RC_OSC24; 0x15 - clk24mhz; 0x16 - anatest ring oscillators; 0x17 - aclk2_loopback; 0x18-0x1F - Reserved.

## 5.3 Crystal Oscillator (XTALOSC)

### 5.3.1 Overview

Crystal oscillators are constituted of oscillator I/O (POSC1 and POSCP) together with external board components.

**Figure 5-21. Crystal oscillator block diagram**

### 5.3.2 Functional Description

**Figure 5-22. Using the crystal oscillator cell**

Crystal oscillator provides selection control switches to either select crystal clock or external clock through PADI pin. PADI pin accepts external clock at 1.8V pre-driver supply voltage domain. Any voltage higher than 1.8V supply voltage applied at PADI can damage the oscillator I/O.

Crystal oscillator is required to be placed in a certain order in the I/O ring.

### 5.3.3 XTALOSC Memory Map/Register Definition

#### NOTE

The register content is mixed with analog functions not related to the oscillator function. These bits are noted.

#### XTALOSC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
3036_0000	Anadig 24M Oscillator Control Register (XTALOSC_CTRL_24M)	32	R/W	0000_222Ah	5.3.3.1/ 791

### 5.3.3.1 Anadig 24M Oscillator Control Register (XTALOSC\_CTRL\_24Mn)

The enable bit is useful kill the output clocks while keeping the oscillator working. Naturally, it is good practice to disable the oscillator before powering down.

Address: 3036\_0000h base + 0h offset + (4d × i), where i=0d to 3d

## XTALOSC Memory Map/Register Definition

### XTALOSC\_CTRL\_24Mn field descriptions

Field	Description
31 -	This field is reserved. Always set to zero (0).
30–15 XTAL_MISC	Misc control bits for 24m xtal osc
14 -	This field is reserved. Always set to zero (0).
13 RC_OSC_EN	RC osc. enable control. 0- turn off the RC osc. 24MHz clock; 1- turn on the RC osc. clock.
12 OSC_SEL	Select the source for the 24MHz clock. 0 - xtal osc.; 1 - RC osc.
11 XTALOSC_PWRUP_STAT	Status of the 24MHz xtal oscillator. 0 - not stable; 1 - Stable and ready to use.
10–9 XTALOSC_PWRUP_DELAY	Specifies the time delay between when the 24MHz xtal is powered up until it is stable and ready to use. 0 - 0.25ms; 1 - 0.5ms; 2 - 1ms; 3 - 2ms.

Table continues on the next page...

**XTALOSC\_CTRL\_24Mn field descriptions (continued)**

Field	Description
8 RCOSC_CG_OVERRIDE	For debug purposes only. This bit effects clock gating of certain digital logic clocked by the 24MHz clk.
7-5 CLKGATE_DELAY	This field specifies the delay between powering up the xtal 24MHz clock and release the clock to the digital logic inside the analog block. 0x0 - 0.5 ms; 0x1 - 1 ms; 0x2 - 2 ms; 0x3 - 3 ms; 0x4 - 4 ms; 0x5 - 5 ms; 0x6 - 6 ms; 0x7 - 7 ms. Note: Do not change this field during a low power event. This is not a field that the user would normally need to modify.
4 CLKGATE_CTRL	This bit allows disabling the clock gate (always un-gated) for the xtal 24MHz clock that clocks the digital logic in the analog block. 0x0 - Allow the logic to automatically gate the clock when the xtal is powered down. 0x1 - Prevent the logic from ever gating off the clock. Under normal operating conditions, if the RCOsc is sourcing the 24MHz clk, this setting is ignored and the clock gate will not be gated. Note: Do not change this field during a low power event. This control is not a bit that the user would normally need to modify.
3 OSC_XTALOK_EN	Enable the xtalog detection circuitry.
2 OSC_XTALOK	Status bit which signals that the output of the 24MHz crystal oscillator is stable.
1 XTAL_24M_EN	This field controls the clock gate at the output of the oscillator. 1 = enabled
0 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true.

### 5.3.3.2 Anadig 24MHz RC Osc. config0 Register (XTALOSC\_RCOSC\_CONFIG0n)

This register is used to configure the 24MHz RC oscillator.

Address: 3036\_0000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RC_OSC_PROG_CUR								Reserved				HYST_MINUS			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	HYST_PLUS				RC_OSC_PROG				TUNE_INVERT		TUNE_BYPASS		TUNE_ENABLE		TUNE_START	
W																
Reset	0	0	1	0	1	0	0	1	0	0	1	1	0	0	0	0

**XTALOSC\_RCOSC\_CONFIG0n field descriptions**

Field	Description
31–24 RC_OSC_ PROG_CUR	The current tuning value in use.
23–20 -	This field is reserved. Always set to zero (0).
19–16 HYST_MINUS	Negative hysteresis value. Subtracted from target value before comparison. This, along with HYST_PLUS creates a range.
15–12 HYST_PLUS	Positive hysteresis value. Added to target value before comparison. This, along with HYST_MINUS creates a range.
11–4 RC_OSC_PROG	RC osc. tuning values.
3 TUNE_INVERT	Invert the stepping of the calculated RC tuning value.
2 TUNE_BYPASS	Bypasses any calculated RC tuning value and uses the programmed register value.
1 TUNE_ENABLE	Enables the tuning logic to calculate new RC tuning values. Disabling essentially freezes the state of the calculation.
0 TUNE_START	Start/stop bit for the RC tuning calculation logic. If stopped the tuning logic is reset.

**5.3.3.3 Anadig 24MHz RC Osc. config1 Register (XTALOSC\_RCOSC\_CONFIG1n)**

This register is used to configure the 24MHz RC oscillator.

Address: 3036\_0000h base + 20h offset + (4d × i), where i=0d to 3d

**XTALOSC\_RCOSC\_CONFIG1n field descriptions**

Field	Description
31–20 COUNT_RC_ CUR	The current tuning value in use.
19–12 -	This field is reserved. Always set to zero (0).
COUNT_RC_ TRG	The target count used to tune the RC OSC frequency. Essentially the number of desired RC Osc clock cycles within 1 32KHz clock cycle.

### 5.3.3.4 Anadig 24MHz RC Osc. config2 Register (XTALOSC\_RCOSC\_CONFIG2n)

This register is used to configure the 24MHz RC oscillator.

Address: 3036\_0000h base + 30h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	CLK_1M_ERR_FL	Reserved													MUX_1M	ENABLE_1M
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				COUNT_1M_TRG											
W	Reserved				COUNT_1M_TRG											
Reset	0	0	0	0	0	0	1	0	1	1	1	0	1	1	1	0

#### XTALOSC\_RCOSC\_CONFIG2n field descriptions

Field	Description
31 CLK_1M_ERR_FL	Flag indicates that the count_1m count wasn't reached within 1 32KHz period. This is intended as feedback to software that the OSC_CONFIG2_COUNT_1M_TRG value is too high for the RC Osc frequency. Write 1 to this field to clear.
30–18 -	This field is reserved. Always set to zero (0).
17 MUX_1M	Mux the corrected or uncorrected 1MHz clock to the output. 0 - .
16 ENABLE_1M	Enable the 1MHz clock output. 0 - disabled; 1 - enabled.
15–12 -	This field is reserved. Always set to zero (0).
COUNT_1M_TRG	The target count used to tune the RC OSC frequency. Essentially the number of desired RC Osc clock cycles within 1 32KHz clock cycles

### 5.3.3.5 32K Oscillator Control Register (XTALOSC\_OSC\_32Kn)

The 32K low precision oscillator is only enabled when the frequency on the RTC xtal oscillator is determined to be out of range. This detection is done automatically.

Address: 3036\_0000h base + 50h offset + (4d × i), where i=0d to 3d

**XTALOSC\_OSC\_32Kn field descriptions**

Field	Description
31-1 -	This field is reserved. Always set to zero (0).
0 RTC_XTAL_SOURCE	This field indicates which chip source is being used for the rtc clock. 0 - internal ring oscillator, 1 - rtc_xtal.

## 5.4 Power Management Unit (PMU)

### 5.4.1 Overview

The power management unit (PMU) is designed to simplify the external power interface. The power system can be split into the input power sources and their characteristics, the integrated power transforming and controlling elements, and the final load interconnection and requirements.

A typical power system utilizing the PMU is depicted below.

## Power Management Unit (PMU)

**Figure 5-23. Power system overview**

Utilizing seven LDO regulators, the number of external supplies is greatly reduced. Not counting the backup coin and USB inputs, the number of external supplies is reduced to two. Missing from this external supply total is the number of necessary external supplies

to power the desired memory interface; that number varies depending on the type of external memory selected. Other supplies may also be necessary to supply the voltage to the different I/O power segments if their I/O voltages have to be different from what is provided above.

## 5.4.2 LDO Regulators

The PMU has seven LDO regulators, which have two basic modes.

- **Power Gate**—The regulation FET is switched off fully, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage falls to a level at which the residual leakage of the power FET balances with the leakage of the load. (TARG = 0x00)
- **Analog regulation mode**—The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25-mV steps.

### 5.4.2.1 LDO\_1P0A

The LDO\_1P0A regulator implements a programmable linear regulator function from the VDDA\_1P8\_IN supply. Nominal output voltage with default settings is 1.0V. This regulator supplies internal analog functions such as clock generation, ADCs, etc. A programmable brown out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current limiting can be enabled to allow for in rush current requirements during start-up, if needed. Active pull down can also be enabled for systems requiring this feature. See the Register [PMU\\_REG\\_1P0A](#) for the LDO control.

### 5.4.2.2 LDO\_1P0D

The LDO\_1P0D regulator implements a programmable linear regulator function from the VDDA\_1P8\_IN supply. This regulator is disabled out of reset, however, nominal output voltage with default settings is 1.0V once enabled. This regulator is designed to supply the digital portion of the MIPI and PCIe modules. A programmable brown out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current limiting can be enabled to allow for in rush current requirements during start-up, if needed. Active pull down can also be enabled for systems requiring this feature. See [Register PMU\\_REG\\_1P0D](#) for the LDO control.

### 5.4.2.3 LDO\_1P2

The LDO\_1P2 regulator implements a programmable linear regulator function from the VDDA\_1P8\_IN supply. This regulator is disabled out of reset, however, nominal output voltage with default settings is 1.0 V once enabled. This regulator is designed to supply the analog portion of USB HSIC module. A programmable brown out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current limiting can be enabled to allow for in rush current requirements during start-up, if needed. Active pull down can also be enabled for systems requiring this feature. See the [Register PMU\\_REG\\_HSIC\\_1P2](#) for the LDO control.

### 5.4.2.4 LDO\_LPSR\_1P0

The LDO\_LPSR\_1P0 regulator implements a fixed low-power regulator function from the VDDA\_LPSR\_IN supply. This regulator is always on whenever VDD\_SNVS\_IN and VDDA\_LPSR\_IN are present and its nominal output voltage is 1.0V. This regulator is designed to provide power to the LPSR logic domain. See the [Register PMU\\_REG\\_LPSR\\_1P0](#) for the LDO control.

### 5.4.3 LDO\_USB1\_1P0/LDO\_USB2\_1P0

The LDO\_USB1\_1P0/LDO\_USB2\_1P0 derives a 1V logic supply from the 3V USB input supply. It is utilized by the logic of the USB PHY. There are two instances of this regulator on the die, one for each USB. LDO\_USB1\_1P0 and LDO\_USB2\_1P0 are dedicated hardware. No software program interface is available for them.

### 5.4.4 LDO\_SNVS\_1P8

The LDO\_SNVS\_1P8 regulator takes the VDD\_SNVS\_IN supply and generates a nominal 1.8 V VDD\_SNVS\_CAP supply, which powers the real time clock and SNVS blocks.

## 5.4.5 PMU Memory Map/Register Definition

The register definitions that affect the behavior of the digital LDO regulators follow.

### NOTE

Some of the registers are collections of bits that affect multiple components on the chip. Those that are not pertinent to this chapter have comments in the related register bitfields.

If a full description is desired, please consult the full register programming reference in the related block.

### 5.4.5.1 Anadig 1.0V A Regulator Control Register (PMU\_REG\_1P0An)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 3036\_0000h base + 200h offset + (4d × i), where i=0d to 3d

**PMU\_REG\_1P0An field descriptions**

Field	Description
31–24 RSVD1	Always set to zero (0).
23–20 REG_TEST	Test bits to monitor different analog signals through anamux.

*Table continues on the next page...*

## PMU\_REG\_1P0An field descriptions (continued)

Field	Description
19 SELREF_ WEAK_LINREG	Selects the source for the reference voltage of the weak 1p1 regulator: 0x0=weak-linreg output tracks low-power-bandgap voltage, 0x1=weak-linreg output tracks VDD_SOC_CAP voltage.
18 ENABLE_ WEAK_LINREG	Enables the weak 1p1 regulator. This regulator can be used when the main 1p1 regulator is disabled, under low-power conditions.
17 OK	Status bit that signals when the regulator output is ok.
16 BO	Interrupt/status bit that signals when a brown-out is detected on the regulator output. Sticky bit, write 1 to this field to clear.
15–13 RSVD0	Always set to zero (0).
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage in 25mV steps. 0x18 - 1.2V; 0x10 - 1.0V; 0x08 - 0.8V. Note that the programmable output of the regulator exceeds the maximum and minimum supply limits for the chip.
7 ENABLE_ PWRUPLOAD	Always set to zero (0).
6–4 BO_OFFSET	Control bits to adjust the regulator brown-out offset voltage in 25mV steps. The brown-out level is relative to the programmed target voltage. The reset brown-out offset is 175mV below the programmed target level.
3 ENABLE_ PULLDOWN	Control bit to enable the pull-down circuitry in the regulator
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brown-out circuitry in the regulator.
0 ENABLE_ LINREG	Control bit to enable the regulator output.

### 5.4.5.2 Anadig 1.0V D Regulator Control Register (PMU\_REG\_1P0Dn)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 3036\_0000h base + 210h offset + (4d × i), where i=0d to 3d

**PMU\_REG\_1P0Dn field descriptions**

Field	Description
31 OVERRIDE	The OVERRIDE bit allows the GPC module to automatically override portions of the register.
30–24 RSVD1	Always set to zero (0).

Table continues on the next page...

## PMU\_REG\_1P0Dn field descriptions (continued)

Field	Description
23–20 REG_TEST	Test bits to monitor different analog signals through anamux.
19 SELREF_ WEAK_LINREG	Selects the source for the reference voltage of the weak 1p1 regulator: 0x0=weak-linreg output tracks low-power-bandgap voltage, 0x1=weak-linreg output tracks VDD_SOC_CAP voltage.
18 ENABLE_ WEAK_LINREG	Enables the weak 1p1 regulator. This regulator can be used when the main 1p1 regulator is disabled, under low-power conditions.
17 OK	Status bit that signals when the regulator output is ok.
16 BO	Interrupt/status bit that signals when a brown-out is detected on the regulator output. Sticky bit, write 1 to this field to clear.
15–13 RSVD0	Always set to zero (0).
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage in 25mV steps. 0x18 - 1.2V; 0x10 - 1.0V; 0x08 - 0.8V. Note that the programmable output of the regulator exceeds the maximum and minimum supply limits for the chip.
7 ENABLE_ PWRUPLOAD	Always set to zero (0).
6–4 BO_OFFSET	Control bits to adjust the regulator brown-out offset voltage in 25mV steps. The brown-out level is relative to the programmed target voltage. The reset brown-out offset is 175mV below the programmed target code.
3 ENABLE_ PULLDOWN	Control bit to enable the pull-down circuitry in the regulator
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brown-out circuitry in the regulator.
0 ENABLE_ LINREG	Control bit to enable the regulator output.

### 5.4.5.3 Anadig 1.2V HSIC Regulator Control Register (PMU\_REG\_HSIC\_1P2n)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 3036\_0000h base + 220h offset + (4d × i), where i=0d to 3d

PMU\_REG\_HSIC\_1P2n field descriptions

Field	Description
31 OVERRIDE	The OVERRIDE bit allows the GPC module to automatically override portions of the register.
30–24 RSVD1	Always set to zero (0).

Table continues on the next page...

## PMU\_REG\_HSIC\_1P2n field descriptions (continued)

Field	Description
23–20 REG_TEST	Test bits to monitor different analog signals through anamux.
19 SELREF_ WEAK_LINREG	Selects the source for the reference voltage of the weak 1p1 regulator: 0x0=weak-linreg output tracks low-power-bandgap voltage, 0x1=weak-linreg output tracks VDD_SOC_CAP voltage.
18 ENABLE_ WEAK_LINREG	Enables the weak 1p1 regulator. This regulator can be used when the main 1p1 regulator is disabled, under low-power conditions.
17 OK	Status bit that signals when the regulator output is ok.
16 BO	Interrupt/status bit that signals when a brown-out is detected on the regulator output. Sticky bit, write 1 to this field to clear.
15–13 RSVD0	Always set to zero (0).
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage in 25mV steps. 0x1c - 1.3V; 0x18 - 1.2V; 0x14 - 1.1V. Note that the programmable output of the regulator exceeds the maximum and minimum supply limits for the chip.
7 ENABLE_ PWRUPLOAD	Always set to zero (0).
6–4 BO_OFFSET	Control bits to adjust the regulator brown-out offset voltage in 25mV steps. The brown-out level is relative to the programmed target voltage. The reset brown-out offset is 175mV below the programmed target code.
3 ENABLE_ PULLDOWN	Control bit to enable the pull-down circuitry in the regulator
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brown-out circuitry in the regulator.
0 ENABLE_ LINREG	Control bit to enable the regulator output.

### 5.4.5.4 Anadig 1.0V Low Power State Retention Regulator Control Register (PMU\_REG\_LPSR\_1P0n)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 3036\_0000h base + 230h offset + (4d × i), where i=0d to 3d

PMU\_REG\_LPSR\_1P0n field descriptions

Field	Description
31–24 RSVD1	Always set to zero (0).
23–20 REG_TEST	Not used

Table continues on the next page...

## PMU\_REG\_LPSR\_1P0n field descriptions (continued)

Field	Description
19 SELREF_ WEAK_LINREG	Not used
18 ENABLE_ WEAK_LINREG	Not used, always on.
17 OK	Always 1 after reset
16 BO	Not used
15–13 RSVD0	Always set to zero (0).
12–8 OUTPUT_TRG	Not used.
7 ENABLE_ PWRUPLOAD	Enables a ~100kohm load to ground. Typically software would clear this if not necessary.
6–4 BO_OFFSET	Not used
3 ENABLE_ PULLDOWN	Enables a ~50kohm load to ground. Typically software would clear this if not necessary.
2 ENABLE_ILIMIT	Not used
1 ENABLE_BO	Not used
0 ENABLE_ LINREG	Always enabled, field not used

### 5.4.5.5 Anadig Reference Analog Control and Status Register (PMU\_REFn)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 3036\_0000h base + 270h offset + (4d × i), where i=0d to 3d

## PMU\_REFn field descriptions

Field	Description
31–14 RSVD1	Always set to zero (0).
13 REFTOP_ LINREGREF_EN	Enables buffer from the main bandgap for use with the linear regulators. This bit is useful to save power when the regulators are configured to use the low power bandgap voltage.
12 REFTOP_IBIAS_ OFF	Low power reftop ibias disable. This bit switches the bias current source from this reference to the low power bandgap.
11 LPBG_TEST	Low power bandgap test bit.. Freescale debug/test purposes only.
10 LPBG_SEL	Bandgap select. 0 - normal power bandgap; 1 - low power bandgap.
9–8 REFTOP_BIAS_ TST	Freescale debug/test bits 0x0 - nom, 0x1 - 90% I <sub>bias</sub> , 0x2 - 80% I <sub>bias</sub> , 0x3 110% I <sub>bias</sub>
7 REFTOP_ VBGUP	Status bit which signals that the analog bandgap voltage is up and stable.
6–4 REFTOP_ VBGADJ	Freescale debug/test bits
3 REFTOP_ SELFBIAOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.
2 REFTOP_ LOWPOWER	Freescale debug/test only. Control bit to enable the low-power mode in the analog bandgap.
1 REFTOP_ PWDVBGUP	Control bit to power-down the VBG-up detection circuitry in the analog bandgap.
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry.

### 5.4.5.6 Anadig Low Power Control Register (PMU\_LOWPWR\_CTRLn)

This register defines fields for low power capabilities of the analog.

Address: 3036\_0000h base + 330h offset + (4d × i), where i=0d to 3d

**PMU\_LOWPWR\_CTRLn field descriptions**

Field	Description
31–24 CONTROL1	Reserved control bits.
23–14 CONTROL0	Reserved control bits.
13 GPU_PWRGATE	GPU power gate control. Used as software mask. Set to zero to force ungated.
12 MIX_PWRGATE	Display power gate control. Used as software mask. Set to zero to force ungated.

Table continues on the next page...

**PMU\_LOWPWR\_CTRLn field descriptions (continued)**

Field	Description
11 DISPLAY_ PWRGATE	Display power gate control. Used as software mask. Set to zero to force ungated.
10 CPU_PWRGATE	GPU power gate control. Used as software mask. Set to zero to force ungated.
9 L2_PWRGATE	L2 power gate control. Used as software mask. Set to zero to force ungated.
8 L1_PWRGATE	L1 power gate control. Used as software mask. Set to zero to force ungated.
7–2 RSVD0	Always set to zero (0).
STOP_MODE_ CONFIG	Configure the analog behavior in stop mode.  0 All analog except RTC powered down on stop mode assertion. <ul style="list-style-type: none"> <li>• XtalOsc = on</li> <li>• RCOsc = off</li> </ul> 1 Certain analog functions, such as certain regulators left up. <ul style="list-style-type: none"> <li>• XtalOsc = on</li> <li>• RCOsc = off</li> </ul> 2 <ul style="list-style-type: none"> <li>• XtalOsc = off</li> <li>• RCOsc = on</li> <li>• Old BG = on</li> <li>• New BG = off</li> </ul> 3 <ul style="list-style-type: none"> <li>• XtalOsc = off</li> <li>• RCOsc = on</li> <li>• Old BG = off</li> <li>• New BG = on</li> </ul>

## 5.5 General Power Controller (GPC)

### 5.5.1 Overview

The General Power Controller (GPC) module controls the following functions:

- Provide low power mode control for A7 and M4 platform
- Provide Power domain management all ARM and SOC power domain
- Provide domain control mechanism based on A7 and M4 CPU domain
- Provide handshake with CCM for clock management in low power mode
- Provide handshake with SRC for power down and power up sequence
- Provide handshake with Analog for Deep Sleep Mode control

## 5.5.2 Features

The General Power Controller (GPC) module controls the following functions:

- Support programmable feature for WAIT/STOP/DSM low power mode
- Support time slot based power domain control
- Support flexible sleep and wakeup condition
- Support domain control for multi CPU platforms system
- All register accessed by IP bus
- Interface for the following IPs:
  - CCM – clock controller module
  - SRC – system reset controller
  - ANALOG – miscellaneous analog control

### 5.5.3 Block Diagram

**Figure 5-24. GPC Block Diagram**

The GPC module contains two sub-modules: System Mode Controller (SMC) and Power Gating Time Slot Control (PGTSC):

- GPC Top: the top level GPC. It also includes the top memory map and registers, domain control information, and memory low power control.
- System Mode Controller (SMC):
  - The SMC supports two low power modes (LPM), WAIT and STOP. Each LPM corresponds to one mode for A7 platform and one mode for M4 platform.

- SMC controls the power sequence in Deep Sleep Mode (DSM)
- SMC support the power up and power down of A7 core0/core1 by IRQ/WFI signals without LPM triggered
- SMC can translate the LPM request for A7 and M4 platform to power up and power down request to PGTSC.
- Power Gating Time Slot Control (PGTSC):
  - The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems. For subsystems to be completely powered down in low power modes, a specific sequence of power control signals must be followed. The sequence timing is programmable using the PGC control registers.
  - There are 9 PGCs in the chip, all of them can be power down/up with a software trigger and all of them can be mapped to 10 timing slots and power-up and power down by request from SMC.

## 5.5.4 Functional Description

### 5.5.4.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode.

### 5.5.4.2 Low power mode

There are two CPU platforms (each of them represents a CPU domain): Dual core Cortex A7 platform and Cortex M4 platform. Each platform supports two low power modes: WAIT mode and STOP mode.

#### 5.5.4.2.1 WAIT mode

In this low power mode:

- LPCG can be defined to be shut off or not in wait mode for each CPU domain
- PLL can be defined to be shut off or not in wait mode for each CPU domain

#### NOTE

The PLLs will only be closed in non-fast wake-up mode, relevant bit are

GPC\_SLPCR[EN\_A7\_FASTWUP\_WAIT\_MODE] and  
GPC\_SLPCR[EN\_M4\_FASTWUP\_WAIT\_MODE]

- CPU clock can be defined been shut off or not in wait for each CPU platform.  
(GPC\_LPCR\_A7\_BSC[CPU\_CLK\_ON\_LPM] and  
GPC\_LPCR\_M4[CPU\_CLK\_ON\_LPM])
- Power of different power domain can be defined be shut off or not in wait mode for each platform domain
- Some peripherals may go to wait mode along with A7 or M4 platform.

#### 5.5.4.2.2 STOP mode

In this low power mode:

- LPCG can be defined been shut off or not in stop mode for each CPU domain
- PLL can be defined been shut off or not in stop mode for each CPU domain

#### NOTE

The PLLs will only been closed in non-fast wake-up mode,  
relevant bit are

GPC\_SLPCR[EN\_A7\_FASTWUP\_STOP\_MODE] and  
GPC\_SLPCR[EN\_M4\_FASTWUP\_STOP\_MODE]

- CPU clock can be defined been shut off or not in stop for each CPU  
(GPC\_LPCR\_A7\_BSC[CPU\_CLK\_ON\_LPM] and  
GPC\_LPCR\_M4[CPU\_CLK\_ON\_LPM])
- Power of different power domain can be defined be shut off or not in stop mode for each platform domain
- Some peripherals may go to stop mode along with A7 or M4 platform.

#### 5.5.4.3 Deep Sleep Mode

The Deep Sleep Mode (DSM) is a system low power mode.

In this mode:

- On-chip OSC can be defined to be shut off or not in DSM (GPC\_SLPCR[SBYOS])
- PMIC can be defined to be stand-by mode or not in DSM (GPC\_SLPCR[VSTBY])
- Regulator can be defined to be BYPASS mode or not in DSM  
(GPC\_SLPCR[RBC\_EN])
- Memory can be defined to go to retention mode or not in  
DSM(GPC\_MLPCR[MEMLP\_CTL\_DIS])
- A7 platform power (VDD\_ARM) can be defined to be shut off or not in DSM.

**NOTE**

CCM configuration must make sure close all PLLs before system goes to DSM

**NOTE**

For the SoC to correctly power up after entering DSM, CCM\_PLL\_CTRLx must not be set to 0x0 or 0x3 for any domain in use.

**5.5.4.4 LPM Sleep Process**

CPU platform will go to WAIT/STOP under the following conditions:

- LPM registers (GPC\_LPCR\_A7\_BSC[LPM0], GPC\_LPCR\_A7\_BSC[LPM1], GPC\_LPCR\_M4[LPM]) are set to WAIT or STOP.

**NOTE**

Since A7 platform has two cores, the so each core has its own LPM register: GPC\_LPCR\_A7\_BSC[LPM0] and GPC\_LPCR\_A7\_BSC[LPM1]. The unified LPM of A7 will be generated with the lower LPM of the two Cores.

- Asserting the WFI signal will trigger CPU sleep process. There are three WFIs that come from A7 platform: WFI\_core0, WFI\_core1 and WFI\_scu. The A7 platform will go to LPM when all three WFIs are asserted. If the GPC\_LPCR\_A7\_AD[EN\_C0\_WFI\_PDN] or GPC\_LPCR\_A7\_AD[EN\_C1\_WFI\_PDN] bit is set, the LPM trigger condition will be a little different, please refer to [Power control for A7 Platform](#) for more information. Only one WFI comes from M4 platform. The M4 platform will go to LPM when WFI\_m4 asserted.

**NOTE**

WFI condition can be masked by register bits GPC\_LPCR\_A7\_BSC[MASK\_n\_WFI] and GPC\_LPCR\_M4[MASK\_M4\_WFI]

Figure 5-25. LPM transition inside CPU platform

System will go to DSM under the following conditions:

- Both A7 and M4 are STOP mode.
- Both GPC\_SLPCR[EN\_A7\_FASTWUP\_STOP\_MODE] and GPC\_SLPCR[EN\_M4\_FASTWUP\_STOP\_MODE] are not set.
- GPC\_SLPCR[EN\_DSM] is set.

**NOTE**

If GPC\_LPCR\_M4[MASK\_DSM\_TRIGGER] is set, the system will go to DSM when A7 goes STOP mode and GPC\_SLPCR[EN\_A7\_FASTWUP\_STOP\_MODE] is not set. If GPC\_LPCR\_A7\_BSC[MASK\_DSM\_TRIGGER] is set, the system will go to DSM when M4 goes to STOP mode and GPC\_SLPCR[EN\_M4\_FASTWUP\_STOP\_MODE] not set. GPC\_LPCR\_M4[MASK\_DSM\_TRIGGER] and GPC\_LPCR\_A7\_BSC[MASK\_DSM\_TRIGGER] cannot be set at the same time.

**5.5.4.5 LPM Wake Up Process**

DSM, STOP, WAIT mode will be woken up by interrupts:

- The two CPU platforms share the same IRQ sources in this chip. Software can use GPC\_IMRn\_CORE0\_A7, GPC\_IMRn\_CORE1\_A7, and GPC\_IMRn\_M4 to separate the 128 bits IRQ sources to A7 core0, A7 core1, and M4 platform.
- The A7 core0 and core1 IRQ can also be from GIC source (defined by GPC\_LPCR\_A7\_BSC[IRQ\_SRC\_C1] and GPC\_LPCR\_A7\_BSC[IRQ\_SRC\_C0]) and if it is chosen from GIC source the GPC\_IMRn\_x\_A7 will lose its function (please refer to [Power control for A7 Platform](#) for more information).
- Interrupts for both A7 and M4 will cause the system wake up from DSM, A7 interrupt will wake up A7 from LPM, M4 interrupt will wake up M4 from LPM.

### 5.5.5 Power Gating Controller (PGC) Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems. For subsystems to be completely powered down in low power modes, a specific sequence of power control signals must be followed. The sequence timing is programmable using the PGC control registers.

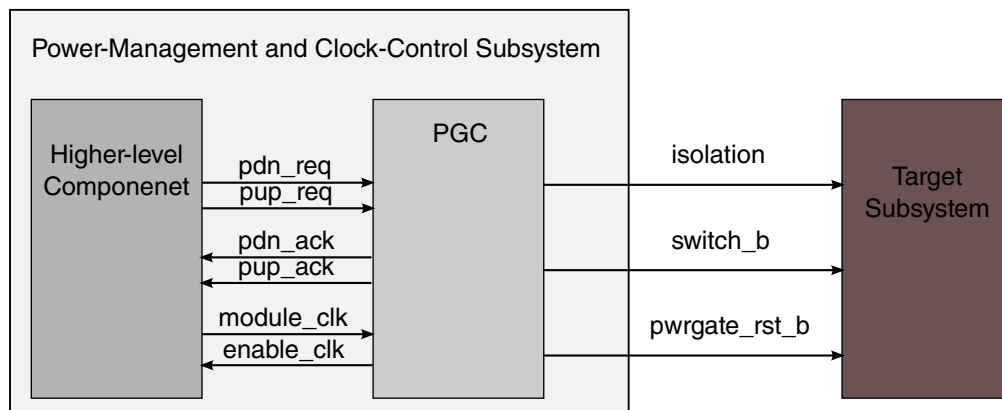

Figure 5-26. Power Gating Controller (PGC)

#### 5.5.5.1 PGC power domains

The following table lists the PGCs in the chip and the corresponding power domain.

PGC type	Power domain
PGC_C0	Core 0 of A7 platform
PGC_C1	Core1 of A7 platform
PGC_SCU	SCU/L2 cache RAM of A7 platform

Table continues on the next page...

## General Power Controller (GPC)

PGC type	Power domain
PGC_MF	Fastmix and Megamix (see table below)
PGC_OTG1	USB OTG1 PHY
PGC_OTG2	USB OTG2 PHY
PGC_PCIE	PCIE PHY
PGC_MIPI	MIPI PHY
PGC_HSIC	USB HSIC PHY

### NOTE

M4 is inside fastmix and doesn't have its own PGC.

**Table 5-20. PGC\_MF Power Domain**

Megamix	Fastmix
QSPI	DDRC
EIM	OCRAM
SIMv2	PCIe/PCIe PHY
ENET x2	TZASC
USB2 (2xOTG, HSIC)	CSI
uSDHC x3 (1-3)	CM4
NAND (GPMI, BCH)	PXP
APBHDMA	LCDIF
MQS	EPDC
SAI x3 (1-3)	MIPI CSI2
eCSPI x3 (1-3)	MIPI DSI
UART x3 (1-3)	
SDMA	
SPBA	

### 5.5.5.2 Trigger to PGC: Hardware and Software Requests

All PGCs(except fastmix/megamix PGC) can be power up/down by hardware or software request. Fastmix/megamix PGC can only be power up/down by hardware request.

The LPM controller for each platform can generate hardware power down or power up request. All hardware requests will be mapped to “timeslot controller” before they goes to relevant PGC (see “Time slot control for PGCs” for more information).

The CPU can also generate software power up or power down request to relevant PGCs. The software trigger will not be mapped to timeslot control. If there are PGCs in software PDN/PUP sequence the request from LPM will be masked. The software trigger will also be failed if the timeslot control is in “busy” state.

All power up/down request to PGCs will be mapped to domain control module (see “Domain control for PGCs”).

PGC\_C0 and PGC\_C1 can be triggered by its own “WFI/IRQ” without LPM trigger and time slot. (see “Power control for A7 platform” for more information)

### 5.5.5.3 Time slot control mechanism for PGCs

GPC uses a time slot controller to control the PGC sub-systems, such as the PGC in CPU0, CPU1, MIX, PCIE PHY, etc. We use it for below reasons when system wakes from low power mode.

1. Support flexible power down/up sequence for different sub-system
2. Sub-system can be power up in different slot to avoid large ramping up current in case they start ramping up at the same time

There are a total of 10 time slots used in the chip, one or more PGCs are used for power up or power down in each of these slots. The time slot controller will sample power up/down requests at slot0. If there are power up/down requests from SMC, it will scan from slot0 to slot9. When the scan process comes to one slot which has a defined power up or power down for one or more PGCs (defined by “SLTn\_CFG”), the power up/down sequence of relevant PGCs will happen in that slot. Otherwise, the relevant slot will be skipped.

The next slot will not begin until the all PGCs finish their power up or power down process in current time slot. When all the 10 slots are finished, slot controller will jump to IDLE state and monitor new request from SMC.

**Figure 5-27. Slot controller processing flow**

**NOTE**

PGC\_SCU should be “always-on” to PGC\_C0 and PGC\_C1. This means PGC\_SCU should be power up earlier than PGC\_C0/PGC\_C1 and should be power down later than PGC\_C0/PGC\_C1 (See example code 1 and 2). If we arrange A7 Cx/A7 SCU power down/up in same slot, special setting is required (See example code 2).

**NOTE**

When the system enters/exists ALL\_OFF or L2\_RETENTION mode, PGC\_MF should be power up earlier than PGC\_C0/

PGC\_C1/PGC\_SCU. We can arrange MIX PGC power up in earlier slot than A7 Cx/SCU power up slot (See example code 1 and 2).

#### 5.5.5.4 Handshake between LPM controller and time slot controller

The figure below shows an example of A7 “into” LPM sequence. We want to power up fastmix/megamix, A7 SCU and A7 core0 in time slot0 /slot1/slot2 respectively. Request from low power mode controller will be mapped to relevant PGCs according to the rules listed above. We choose acknowledge from PGC\_core0 as the acknowledge for A7 LPM power down request (relevant register bits are defined in “PGC\_ACK\_SEL\_A7”). The A7 LPM will regard the three PGCs as a virtual big PGC and it will cancel all power up request when it receive the acknowledge signals from PGC\_core0.

**Figure 5-28. A7 into LPM sequence**

#### NOTE

If a PGC is mapped to two CPU domain (refer to “Domain control for PGCs” for more information), it cannot be selected as the power down acknowledge for both of the CPU platform. “PGC\_ACK\_SEL\_A7” and “PGC\_ACK\_SEL\_M4” should be chosen for the last PGC in power up or power down sequence in the time slot. If there is no PGC to power up/power down with LPM sequence, the “dummy” acknowledge should be selected. Only one PGC should be selected for power down or power up acknowledge for one CPU platform.

## 5.5.6 Power control for A7 Platform

### 5.5.6.1 A7 Platform power domains and power modes

There are four power domains inside SEC dual core Cortex A7 platform: Core0, core1, SCU and L2 RAM. There are six power states in A7 platform:

Power state	Core0	Core1	SCU	L2 RAM
ALL_ON	ON	ON	ON	ON
CPU0_OFF	ON	OFF	ON	ON
CPU1_OFF	ON	ON	OFF	ON
CPU01_OFF	ON	OFF	OFF	ON
L2_RETENTION	OFF	OFF	OFF	ON
ALL_OFF	OFF	OFF	OFF	OFF

In all six power states, “ALL\_ON”, “CPU0\_OFF”, “CPU1\_OFF” and “CPU01\_OFF” can exist in all RUN, WAIT or STOP mode of A7 platform. “L2\_RETENTION” and “ALL\_OFF” can only exist in WAIT or STOP mode of A7 platform.

### 5.5.6.2 Power down process for the A7 Platform

#### 5.5.6.2.1 Power down of Core0 and Core1 in the A7 Platform

The power of core0 and core1 can be shut off along with the LPM process , as show in the figure below:

**Figure 5-29. Power down of Core0 and Core1**

WFIs from A7 platform will trigger the A7 platform LPM and the power of core0 or core1 will be shut off when “lpcr\_a7\_ad.en\_c0\_pdn” or “lpcr\_a7\_ad.en\_c1\_pdn” enabled in this process. This mode should be used when core0 is used as the leading core of A7 platform.

The power of core0 and core1 can also be shut off in RUN mode: in this mode “LPCR\_A7\_AD.en\_c0\_wfi\_pdn” and “LPCR\_A7\_AD.en\_c1\_wfi\_pdn” should be set and the condition to trigger A7 LPM will be some different:

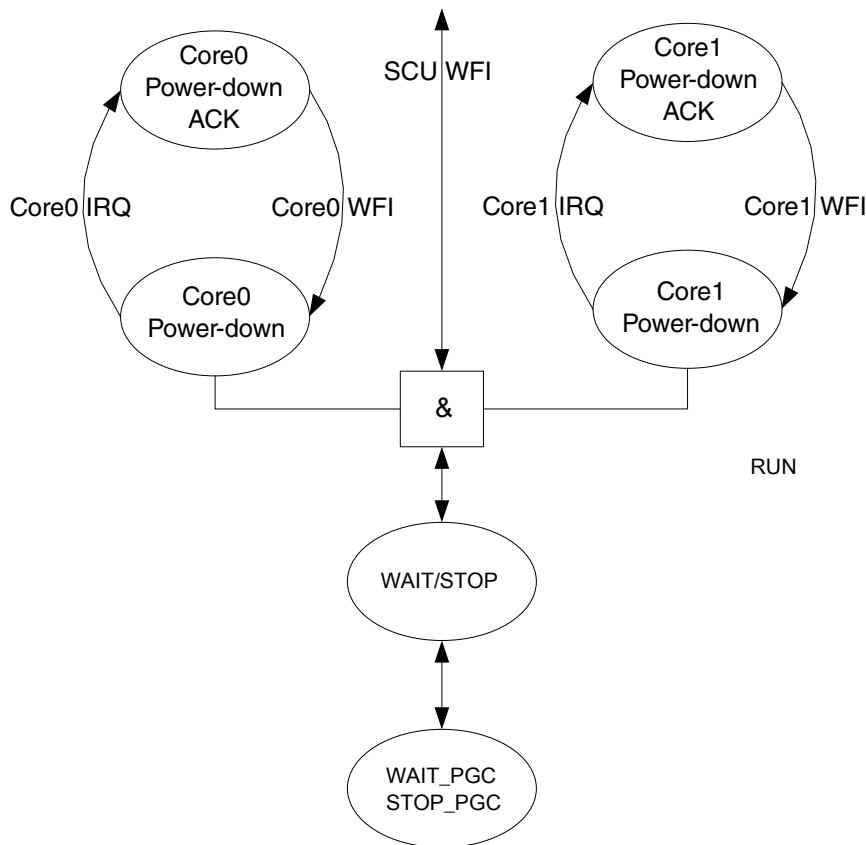

Figure 5-30. Power down of Core0 and Core1 in RUN mode

In this mode, core0/core1 power down process should not be disturbed by IRQs.

### 5.5.6.2 Power down of SCU and L2 Cache RAM

Power domain SCU and L2 cache RAM is controlled by one PGC – “PGC\_PLAT” and they can only be power down in LPM process (when “LPCR\_A7\_AD.en\_plat\_pdn” is set). There is another bit “LPCR\_A7\_AD.l2pge” which will decide if L2 cache RAM need to be in retention mode when SCU domain is power down.

### 5.5.6.3 Power up process for the A7 Platform

- The core0 and core1 can be powered up with the exit of A7 LPM. The relevant bits are “LPCR\_A7\_AD.en\_c0\_pup” and “LPCR\_A7\_AD.en\_c1\_pup”.
- The core0 and core1 can also be powered up by interrupt signal in RUN mode.
- The relevant bit are “LPCR\_A7\_AD.en\_c0\_irq\_pup” , “LPCR\_A7\_AD.en\_c1\_irq\_pup” .

- The interrupt signal can be chosen from GIC or directly from IRQ with mask in GPCv2.
- The relevant select bits are “LPCR\_A7\_BSC.irq\_src\_c0”, “LPCR\_A7\_BSC.irq\_src\_c1” and “LPCR\_A7\_BSC.irq\_src\_a7\_wup”. (LPCR\_A7\_BSC[30:28]).

LPCR_A7_BSC[30:28]	Usage	Restriction
3'b000	Use IRQ trigger A7 LPM and use IRQ to power up core0/core1	None
3'b011	Use GIC trigger A7 LPM and GIC to power up core0/core1	SCU cannot power down in LPM, CPU clock cannot stop in LPM
3'b111	Use IRQ trigger A7 LPM and GIC to power up core0/core1	SCU cannot power down in LPM

As show in the table above, core0/core1 can only be power up by its own interrupt in RUN mode of A7 platform.

There are three combination of “LPCR\_A7\_BSC[30:28]”:

1. In the first case , “IMRn\_CORE0\_A7, IMRn\_CORE1\_A7 “ are used to separate the 128 bits interrupts for core0 and core1 of A7 platform and also used as the interrupt mask for A7 LPM.
2. In the 2nd case, “IMRn\_CORE0\_A7, IMRn\_CORE1\_A7” are not used, GIC setting are used to separate interrupts for core0 and core1 of A7 platform and also used as the interrupt mask for A7 LPM.
3. In the 3rd case, “IMRn\_CORE0\_A7” is used as the mask for interrupt for A7 LPM, GIC setting are used to separate interrupts for core0 and core1.

## 5.5.7 Power control for the M4 Platform

M4 LPM is same as A7 LPM. M4 platform doesn't have its own power domain and exist as a part of Megamix. M4 LPM power down request cannot power down the fastmix/megamix directly. There is a virtual PGC reserved for M4, the virtual PGC will do nothing else except generating an acknowledge signal and this signal can be chosen as the acknowledge signal for M4 platform. Make sure virtual PGC power up/down slot same with fastmix/megamix PGC power up/down slot (See example code 3).

## 5.5.8 Domain control for PGCs

The following rules are used for PGC power up/down with domain mapping control:

1. For PGCs inside CPU platform (since M4 doesn't have its own power domain, only PGCs in A7 platform are referred): for hardware trigger (including both power up and power down) only the LPM request from its own platform will take effect; for software trigger (including both power up and power down) (the relevant register bit are "CPU\_PGC\_SW\_PUP\_REQ" and "CPU\_PGC\_SW\_PDN\_REQ"), only the software running in its own platform will take effect.
2. For PGCs outside CPU platform(MIX and PU PGCs), register bits "PGC\_CPU\_MAPPING" will map MIX and PU PGCs to A7 or M4 CPU domain:
  - One PGC can be mapped to one or both of A7 and M4 domain;
  - For hardware power up request, if a PGC is mapped to any CPU domain, the PGC will be powered up when the corresponding CPU platform sends out its power up request.
  - For software power up, if a PGC is mapped any CPU platform, the PGC can be powered up by software running in corresponding CPU.(the relevant register bits are "MIX\_PGC\_SW\_PUP\_REQ" and "PU\_PGC\_SW\_PUP\_REQ")
  - For hardware power down, if a power domain is mapped to only one CPU domain, the relevant PGC can be powered down when the corresponding CPU platform sends out its power down request; If a power domain is mapped to both two CPU domain, when one CPU platform sends out its hardware power down request, the relevant PGC will power down with any of the following condition satisfied: the other CPU already in LPM; the other CPU want to power down relevant PGC (the relevant register are "A7\_MIX\_PDN\_FLG, M4\_MIX\_PDN\_FLG, A7\_PU\_PDN\_FLG, M4\_PU\_PDN\_FLG")
  - For software power down, if a power domain is mapped to only one CPU domain, the PGC can be powered down by software running in corresponding CPU. (the relevant register bits are "MIX\_PGC\_SW\_PUP\_REQ" and "PU\_PGC\_SW\_PUP\_REQ"). If a power domain is mapped to both two CPU domain, when one CPU platform sends out its software power down request, the relevant PGC will power down with any of the following condition satisfied: the other CPU already in LPM; the other CPU want to power down relevant PGC (the relevant register are "A7\_MIX\_PDN\_FLG, M4\_MIX\_PDN\_FLG, A7\_PU\_PDN\_FLG, M4\_PU\_PDN\_FLG")
  - The access of "PGC\_CPU\_MAPPING" is controlled by domain information from RDC

### 5.5.9 Example Code

Below are code examples for entering specific power scenarios

### 5.5.9.1 Example Code 1

```

//ARM enters into ALL_OFF(STOP) mode and enable DSM :
//after "wfi", MIX/C0/C1 power down in SLOT0, SCU power down in SLOT1 when
//after "GPT1_INT" arrived, MIX power up in SLOT2, SCU power up in SLOT3, C0 power up in
SLOT4

//IMRx_CORE0_A7
reg32_write(GPC_IPS_BASE_ADDR + 0x30, 0xFFFFFFFF);
reg32_write(GPC_IPS_BASE_ADDR + 0x34, 0xFF7FFFFFFF); // [23] : GPT1 used as wakeup source
reg32_write(GPC_IPS_BASE_ADDR + 0x38, 0xFFFFFFFF);
reg32_write(GPC_IPS_BASE_ADDR + 0x3C, 0xFFFFFFFF);

//IMRx_CORE1_A7
reg32_write(GPC_IPS_BASE_ADDR + 0x40, 0xFFFFFFFF);
reg32_write(GPC_IPS_BASE_ADDR + 0x44, 0xFFFFFFFF);
reg32_write(GPC_IPS_BASE_ADDR + 0x48, 0xFFFFFFFF);
reg32_write(GPC_IPS_BASE_ADDR + 0x4C, 0xFFFFFFFF);

//LPCR_A7_BSC
reg32_write(GPC_IPS_BASE_ADDR, 0x0000000A);
// [30:28] : A7_C0/A7_C1/LPM wakeup from external INT
// [14] : CLOCK OFF during STOP mode
// [3:0] : STOP mode

//LPCR_A7_AD
reg32_write(GPC_IPS_BASE_ADDR + 0x4, 0x00010A1A);
// [16] : 1 (ALL_OFF mode); 0 (L2 retention mode)
// [11]/[9] : A7_C0/A7_C1 power up with A7 LPM PUP REQ

reg32_write(GPC_IPS_BASE_ADDR +0x880, reg32_read(GPC_IPS_BASE_ADDR +0x880) | 0x00000001) ;
    // enable A7_SCU PGC power down

reg32_write(GPC_IPS_BASE_ADDR +0x890, (0x59 && 10) | 0x5B | (0x51 && 20) ) ;
    // change nL2retn/mempwr/dftram to meet SCU power up timing

//fastmix/megamix PGC
reg32_write(GPC_IPS_BASE_ADDR +0xA00, reg32_read(GPC_IPS_BASE_ADDR +0xA00) | 0x00000001) ;
    // enable MIX PGC power down
```

### 5.5.9.4 Example Code 4

```
// software power up/down PCIE PHY
//power up PCIE PHY
reg32_write ( GPC_IPS_BASE_ADDR + 0xEC, reg32_read(GPC_IPS_BASE_ADDR + 0x0EC) | 0x8 ) ;
    //map PCIE PGC to A7
reg32_write ( 0x30360210, reg32_read(0x30360210) | 0x80000000 ) ;
    //allow GPC to control LDO_1P0D

reg32_write ( GPC_IPS_BASE_ADDR + 0xF8 , reg32_read(GPC_IPS_BASE_ADDR + 0xF8) | 0x2 ) ;
    //trigger sw Power up Request
while( read(GPC_IPS_BASE_ADDR + 0xF8) & 0x2 ) ;
    //wait software power up request self clear

//power down PCIE PHY
reg32_write ( GPC_IPS_BASE_ADDR + 0xEC, reg32_read(GPC_IPS_BASE_ADDR + 0x0EC) | 0x8 ) ;
    //map PCIE PGC to A7
reg32_write ( 0x30360210, reg32_read(0x30360210) | 0x80000000 ) ;
    // allow GPC to control LDO_1P0D
reg32_write ( GPC_IPS_BASE_ADDR + 0xC40, reg32_read(GPC_IPS_BASE_ADDR + 0xC40) | 0x1 ) ;
    // enable PCIE PGC power down

reg32_write ( GPC_IPS_BASE_ADDR + 0x104 , reg32_read(GPC_IPS_BASE_ADDR + 0x104) | 0x2 ) ;
    //trigger sw Power Down Request
while( read(GPC_IPS_BASE_ADDR + 0x104) & 0x2 ) ;
```

```
//wait software power down request self clear
```

## 5.5.10 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

The total GPC memory map is 4KB

**Table 5-21. Memory Regions**

Address Range(offset)	Region
0x000 - 0x3FF	GPC configuration register
0x400 - 0x7FF	Reserved
0x800 - 0x9FF	CPU and SCU type PGC register base address
0xA00 - 0xBFF	MIX type PGC register base address
0xC00 - 0xDFF	PU type PGC register base address
0xE00 - 0xFFF	Reserved

Each PGC (CPU type, MIX type, PU type) will occupy 64 Bytes address space, the specific base address of each PGC are listed as below.

- 0x800 ~ 0x83F : PGC for A7 core0
- 0x840 ~ 0x87F: PGC for A7 core1
- 0x880 ~ 0x8BF: PGC for A7 SCU
- 0xA00 ~ 0xA3F: PGC for fastmix/megamix
- 0xC00 ~ 0xC3F: PGC for MIPI PHY
- 0xC40 ~ 0xC7F: PGC for PCIE\_PHY
- 0xC80 ~ 0xCBF: Reserved
- 0xCC0 ~ 0xCFF: Reserved
- 0xD00 ~ 0xD3F: PGC for USB HSIC PHY

For more specific information about PGC register definition, please see the register definition for each PGC.

#### GPC\_SLPCR field descriptions

Field	Description
31 EN_DSM	DSM enable 0 DSM disabled 1 DSM enabled
30 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, REG_BYPASS signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested REG_BYPASS won't be asserted, even if counter is enabled. 0 REG_BYPASS_COUNTER disabled 1 REG_BYPASS_COUNTER enabled
29–24 REG_BYPASS_COUNT	Counter for REG_BYPASS signal assertion after standby voltage request by PMIC_STBY_REQ. 000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock period delay

Table continues on the next page...

## GPC\_SLPCR field descriptions (continued)

Field	Description
23 DISABLE_A7_ IS_DSM	0 Enable a7 isolation signal in DSM 1 Disable a7 isolation signal in DSM
22-20 -	This field is reserved. Reserved
19 EN_M4_ FASTWUP_ STOP_MODE	Enable M4 fast wake up stop mode, relevant PLLs will not be closed in this mode.
18 EN_M4_ FASTWUP_ WAIT_MODE	Enable M4 fast wake up wait mode, relevant PLLs will not be closed in this mode.
17 EN_A7_ FASTWUP_ STOP_MODE	Enable A7 fast wake up stop mode, relevant PLLs will not be closed in this mode.
16 EN_A7_ FASTWUP_ WAIT_MODE	Enable A7 fast wake up wait mode, relevant PLLs will not be closed in this mode.
15-8 OSCCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in sequence out of DSM and if sbyos bit was defined. GPC will wait the "OSCCNT" number of cycles before it notify CCM to open the relevant PLLs.  00000000 count 1 ckil 11111111 count 256 ckils
7 COSC_EN	On-chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on-chip oscillator enabled to supply source for the PLL's. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then GPC will enable the on-chip oscillator and after counting oscnt ckil clock cycles before it notify CCM to open the relevant PLLs . The cosc_en bit should be changed only when on-chip oscillator is not chosen as the clock source.  0 Disable on-chip oscillator 1 Enable on-chip oscillator
6 COSC_ PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on-chip oscillator will be bypassed.  The manual closing of on-chip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation.  0 On-chip oscillator will not be powered down, i.e. cosc_pwrdown = 0 1 On-chip oscillator will be powered down, i.e. cosc_pwrdown = 1
5-3 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set), the amount of time GPC will wait between PMIC_STBY_REQ negation and the check of assertion of PMIC_READY.  000 GPC will wait 4 ckil clock cycles 001 GPC will wait 8 ckil clock cycles

Table continues on the next page...

## GPC\_SLPCR field descriptions (continued)

Field	Description
	010 GPC will wait 16 ckil clock cycles 011 GPC will wait 32 ckil clock cycles 100 GPC will wait 64 ckil clock cycles 101 GPC will wait 128 ckil clock cycles 110 GPC will wait 256 ckil clock cycles 111 GPC will wait 512 ckil clock cycles
2 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in stop mode.  0 Voltage will not be changed to standby voltage after next entrance to stop mode. (PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be changed to standby voltage after next entrance to stop mode.
1 SBYOS	Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in DSM.  0 On chip oscillator will not be powered down, after next entrance to DSM. 1 On chip oscillator will be powered down, after next entrance to DSM. When returning from DSM, external oscillator will be enabled again, on chip oscillator will return to oscillator mode , and after oscnt count GPC will continue with the exit from DSM process.
0 BYPASS_PMIC_READY	By asserting this bit GPC will bypass waiting for PMIC_READY signal when coming out of DSM. This should be used for PMIC's that don't support the PMIC_READY signal.  0 Don't bypass the PMIC_READY signal - GPC will wait for its assertion during exit of low power mode if standby voltage was enabled 1 Bypass the PMIC_READY signal - GPC will wait for its assertion during exit of low power mode if standby voltage was enabled

## 5.5.10.5 Memory low power control register (GPC\_MLPCR)

Address: 303A\_0000h base + 20h offset = 303A\_0020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**GPC\_PGC\_ACK\_SEL\_A7 field descriptions**

Field	Description
31 A7_PGC_PUP_ACK	Select power up acknowledge signal of A7 (dummy) PGC as the power up acknowledge for A7 LPM.
30-25 -	This field is reserved. Reserved
24 USB_HSIC_PGC_PUP_ACK	Select power up acknowledge signal of USB_HSIC PGC as the power up acknowledge for A7 LPM.
23 USB_OTG2_PGC_PUP_ACK	Select power up acknowledge signal of USB_OTG2 PGC as the power up acknowledge for A7 LPM.
22 USB_OTG1_PGC_PUP_ACK	Select power up acknowledge signal of USB_OTG1 PGC as the power up acknowledge for A7 LPM.
21 PCIE_PGC_PUP_ACK	Select power up acknowledge signal of PCIE PGC as the power up acknowledge for A7 LPM.
20 MIPI_PGC_PUP_ACK	Select power up acknowledge signal of MIPI PGC as the power up acknowledge for A7 LPM.
19 MF_PGC_PUP_ACK	Select power up acknowledge signal of MF PGC as the power up acknowledge for A7 LPM.
18 A7_PLAT_PGC_PUP_ACK	Select power up acknowledge signal of A7 PLATFORM PGC as the power up acknowledge for A7 LPM.

Table continues on the next page...

**GPC\_PGC\_ACK\_SEL\_A7 field descriptions (continued)**

Field	Description
17 A7_C1_PGC_PUP_ACK	Select power up acknowledge signal of A7 CORE1 PGC as the power up acknowledge for A7 LPM.
16 A7_C0_PGC_PUP_ACK	Select power up acknowledge signal of A7 CORE0 PGC as the power up acknowledge for A7 LPM.
15 A7_PGC_PDN_ACK	Select power down acknowledge signal of A7 (dummy) PGC as the power down acknowledge for A7 LPM.
14–9 -	This field is reserved. Reserved
8 USB_HSIC_PGC_PDN_ACK	Select power down acknowledge signal of USB_HSIC PGC as the power down acknowledge for A7 LPM.
7 USB_OTG2_PGC_PDN_ACK	Select power down acknowledge signal of USB_OTG2 PGC as the power down acknowledge for A7 LPM.
6 USB_OTG1_PGC_PDN_ACK	Select power down acknowledge signal of USB_OTG1 PGC as the power down acknowledge for A7 LPM.
5 PCIE_PGC_PDN_ACK	Select power down acknowledge signal of PCIE PGC as the power down acknowledge for A7 LPM.
4 MIPI_PGC_PDN_ACK	Select power down acknowledge signal of MIPI PGC as the power down acknowledge for A7 LPM.
3 MF_PGC_PDN_ACK	Select power down acknowledge signal of MIX PGC as the power down acknowledge for A7 LPM.
2 A7_PLAT_PGC_PDN_ACK	Select power down acknowledge signal of A7 PLATFORM PGC as the power down acknowledge for A7 LPM.
1 A7_C1_PGC_PDN_ACK	Select power down acknowledge signal of A7 CORE1 PGC as the power down acknowledge for A7 LPM.
0 A7_C0_PGC_PDN_ACK	Select power down acknowledge signal of A7 CORE0 PGC as the power down acknowledge for A7 LPM.

### 5.5.10.7 PGC acknowledge signal selection of M4 platform (GPC\_PGC\_ACK\_SEL\_M4)

This register can only be accessed by the M4 platform.

#### NOTE

“dummy” PGC cannot be mapped to time slot control. “virtual” PGC can be mapped to time slot control. When virtual PGC is used, below setting is required -  
 GPC\_MISC[M4\_PDN\_REQ\_MASK] should be set to 1'b1 and arrange virtual GPC in same slot with MIX. power/up slot (See example code 3). MIX PGC may possibly power down later than A7 platform power down when virtual PGC is used.

Address: 303A\_0000h base + 28h offset = 303A\_0028h

### GPC\_ISR4\_M4 field descriptions

Field	Description
ISR4_M4	M4 IRQ[127:96] status

### 5.5.10.29 Slot configure register (GPC\_SLTn\_CFG)

There are 10 slots in each SLTn\_CFG(n = 0~9) will define the power up or power down behavior of one or more PGC in that each slot.

In each “SLTn\_cfg”, 2 bits (slt\_cfg[1:0])are reserved for each PGC:

- 2'b01 (slot controller will power down relevant PGC in corresponding slot if hardware power down request asserted)
- 2'b10 (slot controller will power up relevant PGC in corresponding slot if hardware power up request asserted)
- 2'b00 or 2'b11 (not power down or power up behavior in relevant slot)

The specific bits assignment for each PGC is shown in the table below.

	PGCx	PGCx-1	..	PGC2	PGC1	PGC0
SLT0_CFG	slt_cfg[1:0]	slt_cfg[1:0]	slt_cfg[1:0]	slt_cfg[1:0]	slt_cfg[1:0]	slt_cfg[1:0]

**5.5.10.44 A7 PU PDN FLG (GPC\_A7\_PU\_PDN\_FLG)**

The register field is show in the table below. The 1'b1 represents A7 CPU platform wants to power down certain PU PGC. The register is a read only register. The register bits will be set when corresponding A7 software power down trigger happens and will be clear when corresponding A7 software power up trigger happens.

Address: 303A\_0000h base + 1B4h offset = 303A\_01B4h

**5.5.11 GPC PGC Memory Map/Register Definition**

There are 9 PGC inside GPCv2 with 4 different type : CPU/SCU/MIX/PU. PCIE/MIPI/USB OTGx/USB HSIC PGC belongs to PU type PGC. Each type PGC has 4 different control words PGC\_CTRL,PGC\_PUPSCR,PGC\_PDNSCR and PGC\_SR. Different types PGC may have different field definition in these four registers. There is another extra control word PGC\_AUXSW which has different field definition for PCIE/MIPI PGC and SCU type PGC.

**NOTE**

PGCs at offset 0xC80 - 0xCFF are Reserved. Don't use them to power up/down.

The total GPC memory map is 4KB

**Table 5-22. Memory Regions**

Address Range(offset)	Region
0x000 - 0x3FF	GPC configuration register
0x400 - 0x7FF	Reserved
0x800 - 0x9FF	CPU and SCU type PGC register base address
0xA00 - 0xBFF	MIX type PGC register base address
0xC00 - 0xDFF	PU type PGC register base address
0xE00 - 0xFFFF	Reserved

Each PGC (CPU type, MIX type, PU type) will occupy 64 Bytes address space, the specific base address of each PGC are listed as below.

- 0x800 ~ 0x83F : PGC for A7 core0
- 0x840 ~ 0x87F: PGC for A7 core1
- 0x880 ~ 0x8BF: PGC for A7 SCU
- 0xA00 ~ 0xA3F: PGC for fastmix/megamix
- 0xC00 ~ 0xC3F: PGC for MIPI PHY
- 0xC40 ~ 0xC7F: PGC for PCIE\_PHY
- 0xC80 ~ 0xCBF: Reserved
- 0xCC0 ~ 0xCFF: Reserved
- 0xD00 ~ 0xD3F: PGC for USB HSIC PHY

### 5.5.11.1 GPC PGC Control Register (GPC\_PGC\_nCTRL)

#### GPC PGC Control Register

Address: 303A\_0000h base + 800h offset + (64d × i), where i=0d to 5d

#### GPC\_PGC\_nCTRL field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29–24 MEMPWR_TCD1_TDR_TRM	After scu pdn_req, count this value to assert A7 mempwr to 1'b1 <b>NOTE:</b> Can't be programmed to zero (This register control only for SCU Type PGC)
23–22 -	This field is reserved. Reserved
21–16 L2RETN_TCD1_TDR	After scu pdn_req, count this value to assert A7 l2retn to 1'b0 <b>NOTE:</b> Can't be programmed to zero (This register control only for SCU Type PGC)
15–14 -	This field is reserved. Reserved
13–8 DFTRAM_TCD1	After scu pdn_req, count this value to assert A7 dftram to 1'b1

Table continues on the next page...

## GPC\_PGC\_nCTRL field descriptions (continued)

Field	Description
	<b>NOTE:</b> Can't be programmed to zero (This register control only for SCU Type PGC)
7 -	This field is reserved. Reserved
6-1 L2RSTDIS	After scu pdn_req, count this value to assert A7 l2rstdis to 1'b1, it will be clear automatically once any of A7 core0/core1 is wakeup  <b>NOTE:</b> Can't be programmed to zero (This register control only for SCU Type PGC)
0 PCR	Power Control  <b>NOTE:</b> PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up.  0 Do not switch off power even if pdn_req is asserted. 1 Switch off power when pdn_req is asserted.

### 5.5.11.2 GPC PGC Up Sequence Control Register (GPC\_PGC\_nPUPSCR)

#### GPC PGC Up Sequence Control Register

Address: 303A\_0000h base + 804h offset + (64d × i), where i=0d to 5d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	PUP_SCALL_SCALLOUT_CNT								SW2ISO							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SW2ISO							PUP_WAIT_SCALLOUT		SW						
W																
Reset	1	0	0	1	0	1	1	1	1	1	0	0	0	0	0	1

**GPC\_PGC\_nPUPSCR field descriptions**

Field	Description
31-23 PUP_SCALL_SCALLOUT_CNT	After SCALL asserting to 1'b0, count this value to complete switch power up <b>NOTE:</b> Only valid when pup_wait_scall_out is set to 1'b0. Can't be programmed to zero (This register control only for MIX Type PGC)
22-7 SW2ISO	After asserting switch_b, the PGC waits a number of clocks equal to the value of SW2ISO before negating isolation.
6 PUP_WAIT_SCALL_OUT	After SCALL asserting to 1'b0, wait handshake signal SCALL_OUT to return to 1'b0 (This register control only for MIX Type PGC)
SW	After a power-up request (pup_req assertion), the PGC waits a number of clocks equal to the value of SW before asserting switch_b <b>NOTE:</b> SW must not be programmed to zero.

**5.5.11.3 GPC PGC Down Sequence Control Register (GPC\_PGC\_nPDNSCR)**

GPC PGC Down Sequence Control Register

Address: 303A\_0000h base + 808h offset + (64d × i), where i=0d to 5d

## GPC\_PGC\_nPDNSCR field descriptions

Field	Description
31–24 PUP_SCPRE_ SCALL_CNT	After SCPRE asserting to 1'b0, count this value to assert SCALL to 1'b0 (This register control only for MIX Type PGC)
23–16 PDN_SCALL_ SCALLOUT_CNT	Default 8'h0. After SCALL asserting to 1'b1, count this value to complete switch power down. <b>NOTE:</b> This control is only valid when pdn_wait_scall_out is set to 1'b0. It can be programmed to zero. (This register control only for MIX Type PGC)
15–14 -	This field is reserved. Reserved
13–8 ISO2SW	After asserting isolation(by pdn_req assertion), the PGC waits a number of clocks equal to the value of ISO2SW before negating switch_b <b>NOTE:</b> ISO2SW must not be programmed to zero.
7 PDN_WAIT_ SCALL_OUT	Default 1'b0 If set to 1'b1, after SCALL asserting to 1'b1, wait handshake signal SCALL_OUT to change to 1'b1. <b>NOTE:</b> This register control is only for MIX Type PGC.
6 -	This field is reserved. Reserved
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of clocks equal to the value of ISO before asserting isolation <b>NOTE:</b> ISO must not be programmed to zero.

### 5.5.11.4 GPC PGC Status Register (GPC\_PGC\_nSR)

#### GPC PGC Status Register

Address: 303A\_0000h base + 80Ch offset + (64d × i), where i=0d to 5d

GPC\_PGC\_nSR field descriptions

Field	Description
31-18 -	This field is reserved. Reserved
17-8 L2RSTDIS_ DEASSERT_ CNT	Count this value to de-assert L2RSTDISABLE to LOW after CPU0 or CPU1 power up <b>NOTE:</b> This value can't be programmed to zero (This register control only for SCU Type PGC)
7 -	This field is reserved. Reserved
6-3 PUP_CLK_DIV_ SEL	Clock divider select for the clock of power up counter(count_clk is 32KHz for CPU/SCU type PGC, ipg_clk(66MHz) for MIX/PU Type PGC)  0000 1 0001 1/2 count_clk 0010 1/4 count_clk 0011 1/8 count_clk 0100 1/16 count_clk 0101 1/32 count_clk 0110 1/64 count_clk 0111 1/128 count_clk

Table continues on the next page...

**GPC\_PGC\_nSR field descriptions (continued)**

Field	Description
	1000 1/256 count_clk 1001 1/512 count_clk 1010 1/1024 count_clk 1011 1/2056 count_clk 1100 1/4096 count_clk 1101 1/8192 count_clk 1110 1/16384 count_clk 1111 1/32768 count_clk
2 ALLOFF_FLAG	All-off flag.  <b>NOTE:</b> Software should write “1” to clear this flag after A7 is wakeup from ALL_OFF mode, otherwise, it will always keep to 1 (This register control only for SCU Type PGC)  0 A7 is not wakeup from ALL_OFF mode. 1 A7 is wakeup from ALL_OFF mode.
1 L2RETN_FLAG	L2 Retention Flag  <b>NOTE:</b> Software should write “1” to clear this flag after A7 is wakeup from L2 retention mode, otherwise it will always keep to 1 (This register control only for SCU Type PGC)  0 A7 is not wakeup from L2 retention mode. 1 A7 is wakeup from L2 retention mode.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down.  0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

### 5.5.11.5 GPC PGC Auxiliary Power Switch SCU Control Register (GPC\_PGC\_SCU\_AUXSW)

GPC PGC Auxiliary Power Switch Control Register. The register has different field definition for PCIE/MIPI PGC and SCU Type PGC.

#### NOTE

The value of mempwr\_tRC1\_tMC/ l2retn\_tRC1\_tMC\_tMR/ dftram\_tRC1\_tMC\_tMR\_tCD2 should be programmed to 0x51/0x59/0x5B. That's required for A7 SCU power up timing.

Address: 303A\_0000h base + 890h offset = 303A\_0890h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved		MEMPWR_TRC1_TMC										L2RETN_TRC1_TMC_TMR

31-18 -	This field is reserved. Reserved
17-8 L2RSTDIS_ DEASSERT_ CNT	Count this value to de-assert L2RSTDISABLE to LOW after CPU0 or CPU1 power up <b>NOTE:</b> This value can't be programmed to zero (This register control only for SCU Type PGC)
7 -	This field is reserved. Reserved
6-3 PUP_CLK_DIV_ SEL	Clock divider select for the clock of power up counter(count_clk is 32KHz for CPU/SCU type PGC, ipg_clk(66MHz) for MIX/PU Type PGC)  0000 1 0001 1/2 count_clk 0010 1/4 count_clk 0011 1/8 count_clk 0100 1/16 count_clk 0101 1/32 count_clk 0110 1/64 count_clk 0111 1/128 count_clk

Table continues on the next page...

**GPC\_PGC\_HSIC\_SR field descriptions (continued)**

Field	Description
	1000 1/256 count_clk 1001 1/512 count_clk 1010 1/1024 count_clk 1011 1/2056 count_clk 1100 1/4096 count_clk 1101 1/8192 count_clk 1110 1/16384 count_clk 1111 1/32768 count_clk
2 ALLOFF_FLAG	All-off flag.  <b>NOTE:</b> Software should write “1” to clear this flag after A7 is wakeup from ALL_OFF mode, otherwise, it will always keep to 1 (This register control only for SCU Type PGC)  0 A7 is not wakeup from ALL_OFF mode. 1 A7 is wakeup from ALL_OFF mode.
1 L2RETN_FLAG	L2 Retention Flag  <b>NOTE:</b> Software should write “1” to clear this flag after A7 is wakeup from L2 retention mode, otherwise it will always keep to 1 (This register control only for SCU Type PGC)  0 A7 is not wakeup from L2 retention mode. 1 A7 is wakeup from L2 retention mode.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down.  0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

# Chapter 6

## SNVS, Reset, Fuse and Boot

### 6.1 Secure Non-Volatile Storage (SNVS)

#### 6.1.1 SNVS overview

The low-power (battery-backed) section incorporates a secure real time counter, a monotonic counter, and a general purpose register. This portion of the block is powered by a battery that maintains the state of the SNVS\_LP registers when the chip is powered off.

**Figure 6-1. Example SNVS Connectivity**

##### 6.1.1.1 SNVS features

The following table summarizes the features:

**Table 6-1. SNVS feature summary**

Feature	What it does
Non-secure Real time counter (HPRTC)	<ul style="list-style-type: none"><li>• The counter is driven by a dedicated clock, which is off when the system power is down</li><li>• Programmable time alarm interrupt</li><li>• Periodic interrupt can be generated with different frequencies</li></ul>
Monotonic counter	<ul style="list-style-type: none"><li>• The monotonic counter state is nonvolatile.</li><li>• The counter can only increment.</li><li>• The counter is a non-rollover counter</li><li>• The counter value is invalidated in case of security violation.</li></ul>
General-purpose register	<ul style="list-style-type: none"><li>• The general-purpose register state is nonvolatile.</li></ul>
Register access protection	<ul style="list-style-type: none"><li>• Privileged software access policy</li><li>• Registers can be programmed only when the system security monitor is in functional state.</li><li>• Some registers/values can only be programmable once per boot cycle.</li></ul>

### 6.1.1.2 Modes of operation

The SNVS operates in either the system power-down or system power-up mode of operation.

During system power-down, SNVS\_HP is powered-down. SNVS\_LP is powered from the backup power supply and is electrically isolated from the rest of the chip. In this mode, SNVS\_LP retains the state of its registers .

During system power-up, SNVS\_HP and SNVS\_LP are both powered-up and all SNVS functions are operational.

### 6.1.2 SNVS structure

The SNVS block is divided into two major submodules based on power supply: the high power domain (SNVS\_HP) and the low power domain (SNVS\_LP). They are powered as follows:

- SNVS\_LP - dedicated always-powered-on domain
- SNVS\_HP - system (chip) power domain

The following figure illustrates the low power and chip power domains of SNVS.

**Figure 6-2. SNVS Power Domains**

The SNVS\_HP section implements all features that enable system communication and provisioning of the SNVS\_LP section.

The SNVS\_LP section provides hardware that enables secure storage and protection of sensitive data.

### 6.1.2.1 SNVS\_HP (high power domain)

SNVS\_HP is partitioned into the following functional units:

- IP bus interface
- SNVS\_LP interface
- Real time counter with alarm
- Control and status registers

SNVS\_HP is in the chip's power supply domain and thus receives power along with the rest of the chip. SNVS\_HP provides an interface between SNVS\_LP and the rest of the system; there is no way to access the SNVS\_LP registers except through the SNVS\_HP. For access to the SNVS\_LP registers, SNVS\_HP must be powered up. It uses a register access permission policy to determine whether access to particular registers is permitted.

### 6.1.2.2 Non-secure real time counter

SNVS\_HP has an autonomous non-secure real time counter. The counter is not active and is reset when the system is powered down. The HP RTC can be used by any application; it has no privileged software access restrictions. The counter can be synchronized with the SNVS\_LP SRTC by writing to a specific bit in the SNVS\_HP Control Register.

#### 6.1.2.2.1 Calibrating the time counter

The RTC accuracy may suffer from a drift in the clock, which is used to increment the RTC register. To compensate for this drift, a clock calibration mechanism can adjust the RTC value. It is up to the system processor to decide whether calibration is required or not. If RTC correction is required, enable the mechanism and set the calibration value in the control register. The calibration value is a 5 bit value including the sign bit, which is implemented in 2's complement.

If the calibration mechanism is enabled, the calibration value is added or subtracted from the RTC on a periodic basis, once per 32768 cycles of the RTC clock.

The following table shows the available correction range.

**Table 6-2. Time counter calibration settings**

Calibration value setting	Correction in counts per 32768 cycles of the counter clock
01111	+15
:	:
00010	+2
00001	+1
00000	0
11111	-1
11110	-2
:	:
10001	-15
10000	-16

### 6.1.2.2.2 Time counter alarm

The SNVS\_HP non-secure RTC has its own time alarm register. Any application can update this register. The SNVS\_HP time alarm can generate interrupts to alert the host processor and can wake up the host processor from one of its low-power modes. Note that this alarm cannot wake up the entire system if it is powered off because this alarm would also be powered off.

### 6.1.2.2.3 Periodic interrupt

The SNVS\_HP non-secure RTC incorporates a periodic interrupt. The periodic interrupt is generated when a zero-to-one or one-to-zero transition occurs on the selected bit of the RTC. The periodic interrupt source is chosen from 16 bits of the HP RTC according to the PI\_FREQ field setting in the HP Control Register. This bit selection also defines the frequency of the periodic interrupt.

The following figure shows the SNVS\_HP RTC and its interrupts.

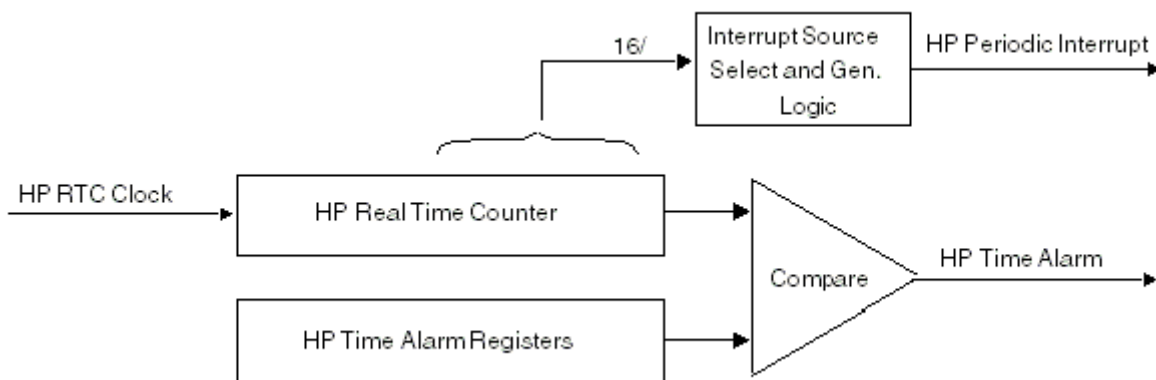

Figure 6-3. SNVS\_HP RTC, alarm, and interrupts

## 6.1.3 SNVS\_LP (low power domain)

SNVS\_LP has the following functional units:

- Non-rollover monotonic counter
- General purpose register
- Control and status registers

The SNVS\_LP is a data storage subsystem. Its purpose is to store and protect system data, regardless of the main system power state.

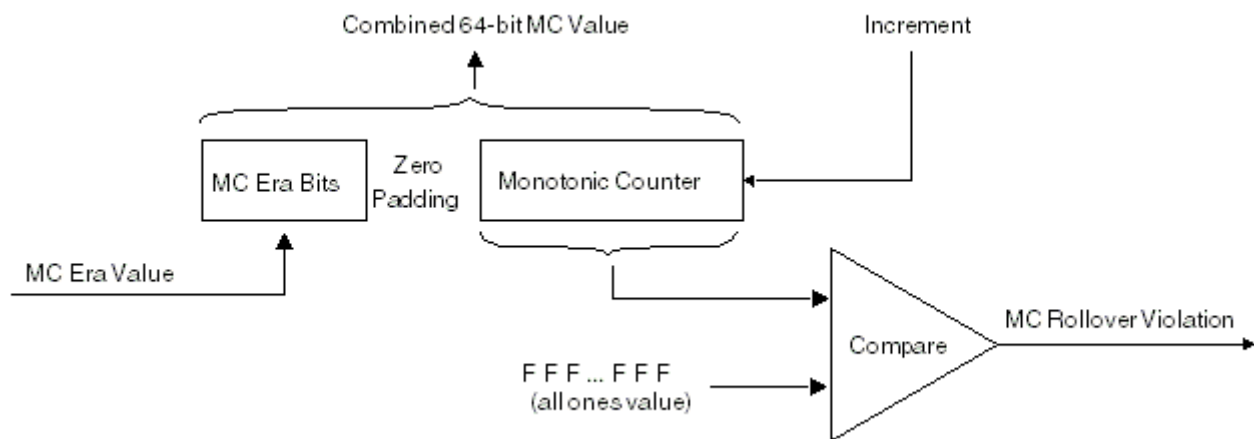

SNVS\_LP is in the always-powered-up domain, which is a separate power domain with its own power supply.

### 6.1.3.1 Behavior during system power down

When the chip power supply domain loses power, SNVS\_LP continues to operate normally, and it ignores all inputs from SNVS\_HP.

### 6.1.3.2 Monotonic counter (MC)

The following figure shows the MC and its rollover security violation.

**Figure 6-4. SNVS\_LP monotonic counter**

Some security applications require a monotonic counter (MC) that cannot be exhausted or returned to any previous value during the product's lifetime. Because the MC can never repeat a number, it cannot be reset or cycled back to its starting count. If it reaches its maximum value, it does not rollover. Instead, a monotonic counter rollover indication is generated to the SNVS\_LP tamper monitor. This generates an interrupt to the host processor.

The SNVS uses an ERA value derived from the OTP elements as a mechanism for recovery from an MC failure (for example, due to a failure of LP power) where the MC value was compromised or cleared. The ERA value is prepended to the MC to form its most significant bits. Once any of the ERA value bits are set, the MC can count up from any value, including zero. This guarantees that any future value of the combined monotonic counter will be greater than any of its past values.

## 6.1.4 SNVS reset and system power up

This table describes reset actions for SNVS.

**Table 6-3. Reset summary**

Reset	Source	Characteristics	Internally resets
HP Hard	ipg_hard_async_reset_b	active-low, asynchronous	All SNVS_HPSNVS_LP registers and flops.
LP Power On Reset (POR)	lp_por_b	active-low, asynchronous	All SNVS_LP registers and flops
LP software Reset	software	active-high, synchronous, 1 cycle	All SNVS_LP registers and flops. LP software Reset can be asserted if not disabled.

### 6.1.4.1 PMIC Interface

The On/Off logic inside of SNVS\_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a PMIC "ON" Request and a "Power Off" Interrupt. PMIC logic also supports the SNVS\_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

#### Dumb PMIC Mode:

The Dumb PMIC Mode uses PMIC "ON" Request to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- **Debounce:** The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the set\_pwr\_off\_irq interrupt. While in the ON state and the button is pressed longer than the debounce time the set\_pwr\_off\_irq is generated.

- Off to On Time: The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. Once the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- Max Timeout: The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The dumb PMIC mode uses a 2 state state machine, as shown below. The output of the pmic\_en\_b is generated by the state of the state machine.

### Smart PMIC Mode:

The smart PMIC mode is meant to connect to another PMIC. The PMIC "ON" Request signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the "Power Off" Interrupt.

## 6.1.5 SNVS interrupts and alarms

SNVS provides the following interrupt and alarm lines:

- Functional interrupt (active low)

- Real-time clock period interrupt
- Power off (button) interrupt

The following table summarizes all SNVS interrupts and alarm sources.

**Table 6-4. Interrupts and alarms summary**

Interrupt	Source	Default configuration <sup>1</sup>	Configuration options
SNVS functional interrupt	RTC time alarm	Disable	Enable/Disable
	RTC periodic interrupt	Disable	Enable/Disable
SNVS power off (button) interrupt	BTN input signal	50msec debounce	Debounce time

1. Default behavior refers to the setting after LP/HP reset.

## 6.1.6 Programming Guidelines

This section provides initialization and application information for the SNVS module.

### 6.1.6.1 RTC control bits setting

All SNVS registers are programmed from the register bus. Therefore, any changes are synchronized with the IP clock. Several registers can also change synchronously with the RTC clock after they are programmed. To avoid IP clock and RTC clock synchronization issues, these values can only be programmed when the corresponding function is disabled. The following table presents the list of these values with the control bit setting required for programming.

**Table 6-5. RTC synchronized values list**

Function	Value/register	Control bit setting
HP section		
HP Real Time Counter	HPRTCMR and HPRTCLR Registers	RTC_EN = 0 - HPRTCMR/HPRTCLR can be programmed RTC_EN = 1 - HPRTCMR/HPRTCLR cannot be programmed
HP Time Alarm	HPTAMR and HPTALR Registers	HPTA_EN = 0 - HPTAMR/HPTALR can be programmed HPTA_EN = 1 - HPTAMR/HPTALR cannot be programmed
HP Time Calibration Value	HPCALB_VAL Value	HPCALB_EN = 0 - HPCALB_VAL can be programmed HPCALB_EN = 1 - HPCALB_VAL cannot be programmed

Use the following step to program synchronized values:

1. Check the enable bit value. If set, clear it.

2. Verify that the enable bit is cleared.

There are two reasons to verify the enable bit's setting:

- Enable bit clearing does not happen immediately; it takes three IPclock cycles and two RTC clock cycles to change the enable bit's value.
  - If the enable bit is locked for programming, it cannot be cleared.
3. Program the desired value.
  4. Set the enable bit; it takes three IP clock cycles and two RTC clock cycles for the bit to set.

### NOTE

Incrementing the value programmed into RTC registers by two compensates for the two RTC clock cycle delay that is required to enable the counter.

#### 6.1.6.2 RTC value read

There are two scenarios when software can read corrupted values from the RTC (HPRTCMR and HPRTCLR) registers:

- The RTC counters are incremented by the slow 32 kHz clock, which is asynchronous to the system clock. The counter value is synchronized to the system clock before software reads that. The synchronization register may capture the counter value in the middle of the counter update. In this case, it is not guaranteed that all bits are properly sampled by the synchronization register; the value read by software can be wrong.
- The RTC value is longer than the single bus read transaction of 32-bits. Therefore, software reads two registers, each holding a portion of the counter value. After reading one of these registers but before reading the second register, both registers may update their values. In this case, the value combined by software will be incorrect.

To avoid these issues, it is strongly recommended that software perform two consecutive reads of the RTC value:

- If two consecutive reads are similar, the value is correct.
- If two consecutive reads are different, perform two more reads.

The worst case scenario may require three sessions of two consecutive reads.

### 6.1.6.3 General initialization guidelines

Complete the following steps in order to properly initialize the module:

1. Enable interrupts in SNVScntrol and configuration registers.
2. Program SNVS general functions/configurations.
3. User Specific: Set lock bits.

### 6.1.7 SNVS Register Descriptions

This section contains detailed register descriptions for the SNVS registers. Each description includes a standard register diagram and register table. The register table provides detailed descriptions of the register bit and field functions, in bit order.

SNVS registers consist of two types:

- Privileged read/write accessible
- Non-privileged read/write accessible

Privileged read/write accessible registers can only be accessed for read/write by privileged software. Unauthorized write accesses are ignored, and unauthorized read accesses return zero. Non-privileged software can access privileged access registers when the non-privileged software access enable bit is set in the SNVS\_HP Command Register.

In addition, all privileged access registers (except HPSVSR and LPSR) can be written to only if the system security monitor is in one of the three functional states:

- Non-Secure
- Trusted
- Secure

Certain fields in the SNVS\_HP Command Register can be written in non-functional system security monitor states (init, check, soft fail, and hard fail) as follows:

- SW\_LPSV, SSM\_ST, SW\_SV, and SW\_FSV can be written in check or soft fail state.
- The HAC\_STOP bit can only be set in soft fail state but can be cleared in either soft fail or a functional state.
- HAC\_LOAD, HAC\_CLEAR bits and HPSVSR, LPSR Registers can be accessed in soft fail or a functional state.

The system security monitor state does not restrict read access to SNVS registers.

Non-privileged read/write accessible registers are read/write accessible by any software.

The LP register values are set only on LP POR and are unaffected by System (HP) POR. The HP registers are set only on System POR and are unaffected by LP POR.

The following table shows the SNVS main memory map.

### 6.1.7.1 SNVS Memory Map

## 6.1.7.2 SNVS\_HP Lock (HPLR)

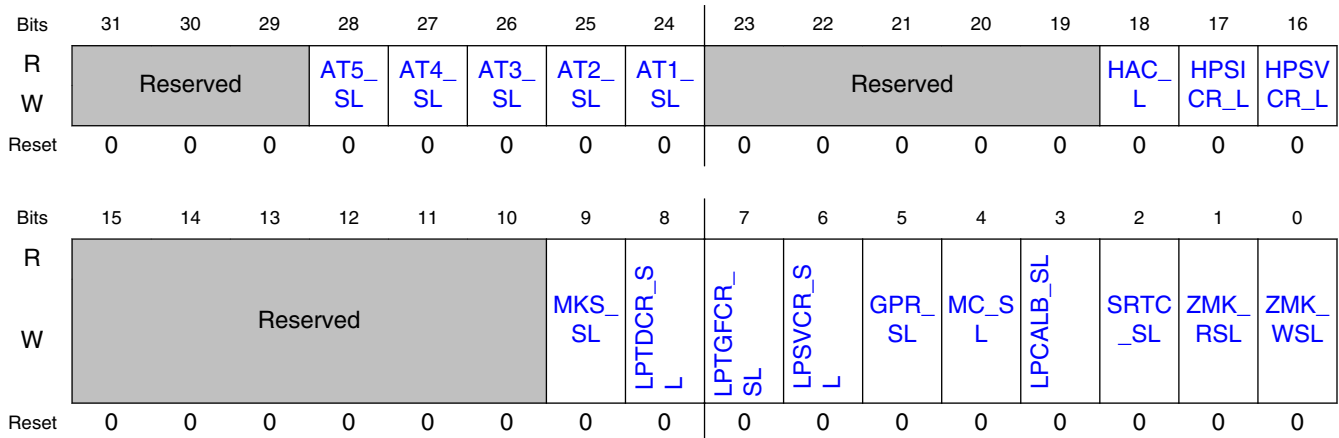

### 6.1.7.2.1 Address

Register	Offset
HPLR	0h

### 6.1.7.2.2 Function

The SNVS\_HP Lock Register contains lock bits for the SNVS registers. This is a privileged write register.

### 6.1.7.2.3 Diagram

### 6.1.7.2.4 Fields

Field	Function
31-29 —	
28 AT5_SL	Active Tamper 5 Soft Lock When set, prevents any writes to the Active Tamper 5 registers. Once set, this bit can only be reset by the system reset 0b - 1b -
27 AT4_SL	Active Tamper 4 Soft Lock When set, prevents any writes to the Active Tamper 4 registers. Once set, this bit can only be reset by the system reset. 0b - 1b -
26 AT3_SL	Active Tamper 3 Soft Lock When set, prevents any writes to the Active Tamper 3 registers. Once set, this bit can only be reset by the system reset. 0b - 1b -
25 AT2_SL	Active Tamper 2 Soft Lock When set, prevents any writes to the Active Tamper 2 registers. Once set, this bit can only be reset by the system reset. 0b - 1b -
24 AT1_SL	Active Tamper 1 Soft Lock

Table continues on the next page...

Field	Function
	When set, prevents any writes to the Active Tamper 1 registers. Once set, this bit can only be reset by the system reset. 0b - 1b -
23-19 —	
18 HAC_L	High Assurance Configuration Lock When set, prevents any writes to HPHACIVR, HPHACR, and HAC_EN bit of HPCOMR. Once set, this bit can only be reset by the system reset. 0b - 1b -
17 HPSICR_L	HP Security Interrupt Control Register Lock When set, prevents any writes to the HPSICR. Once set, this bit can only be reset by the system reset. 0b - 1b -
16 HPSVCR_L	HP Security Violation Control Register Lock When set, prevents any writes to the HPSVCR. Once set, this bit can only be reset by the system reset. 0b - 1b -
15-10 —	
9 MKS_SL	Master Key Select Soft Lock When set, prevents any writes to the MASTER_KEY_SEL field of the LPMKCR. Once set, this bit can only be reset by the system reset. 0b - 1b -
8 LPTDCR_SL	LP Tamper Detectors Configuration Register Soft Lock When set, prevents any writes to the LPTDCR. Once set, this bit can only be reset by the system reset. 0b - 1b -
7 LPTGFCR_SL	LP Tamper Glitch Filter Configuration Register Soft Lock When set, prevents any writes to the LPTGFCR. Once set, this bit can only be reset by the system reset. 0b - 1b -
6 LPSVCR_SL	LP Security Violation Control Register Soft Lock When set, prevents any writes to the LPSVCR. Once set, this bit can only be reset by the system reset. 0b - 1b -
5 GPR_SL	General Purpose Register Soft Lock When set, prevents any writes to the GPR. Once set, this bit can only be reset by the system reset.

*Table continues on the next page...*

## Secure Non-Volatile Storage (SNVS)

Field	Function
	0b - 1b -
4 MC_SL	Monotonic Counter Soft Lock When set, prevents any writes (increments) to the MC Registers and MC_ENV bit. Once set, this bit can only be reset by the system reset.  0b - 1b -
3 LPCALB_SL	LP Calibration Soft Lock When set, prevents any writes to the LP Calibration Value (LPCALB_VAL) and LP Calibration Enable (LPCALB_EN). Once set, this bit can only be reset by the system reset.  0b - 1b -
2 SRTC_SL	Secure Real Time Counter Soft Lock When set, prevents any writes to the SRTC Registers, SRTC_ENV, and SRTC_INV_EN bits. Once set, this bit can only be reset by the system reset.  0b - 1b -
1 ZMK_RSL	Zeroizable Master Key Read Soft Lock When set, prevents any software reads to the ZMK Registers and ZMK_ECC_VALUE field of the LPMKCR. In ZMK hardware programming mode (ZMK_HWP is set), the ZMK and ZMK_ECC_VALUE cannot be read by software. Regardless of the bit setting, hardware can use the ZMK value when ZMK is selected. Once set, this bit can only be reset by the system reset.  0b - 1b -
0 ZMK_WSL	Zeroizable Master Key Write Soft Lock When set, prevents any writes (software and hardware) to the ZMK registers and MASTER_KEY_SEL, ZMK_HWP, ZMK_VAL, and ZMK_ECC_EN fields of the LPMKCR. Once set, this bit can only be cleared by system reset.  0b - 1b -

### 6.1.7.3 SNVS\_HP Command (HPCOMR)

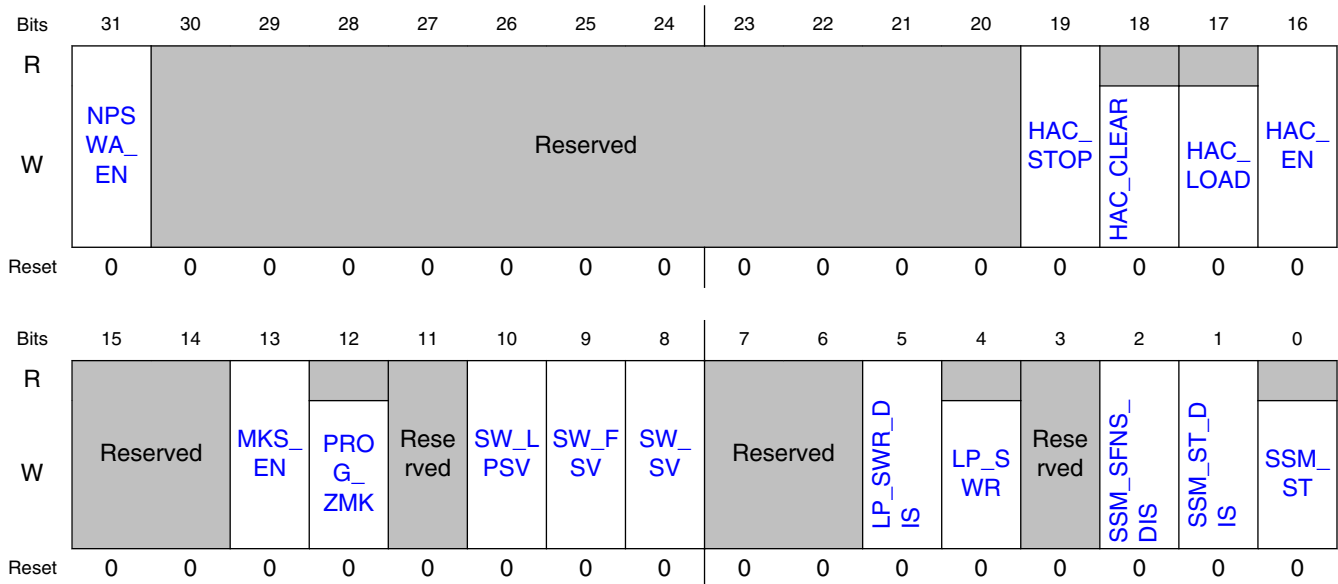

#### 6.1.7.3.1 Address

Register	Offset
HPCOMR	4h

### 6.1.7.3.2 Function

The SNVS\_HP Command Register contains the command, configuration, and control bits for the SNVS block. Some fields of this register can be written to in check and soft fail states in addition to the standard write access in functional states. This is a privileged write register.

### 6.1.7.3.3 Diagram

### 6.1.7.3.4 Fields

Field	Function
31 NPSWA_EN	<p>Non-Privileged Software Access Enable</p> <p>When set, allows non-privileged software to access all SNVS registers, including those that are privileged software read/write access only.</p> <p>0 Only privileged software can access privileged registers 1 Any software can access privileged registers</p>
30-20 —	
19 HAC_STOP	<p>High Assurance Counter Stop</p> <p>This bit can be set only when SSM is in soft fail state. When set, it stops the high assurance counter and prevents transition to the hard fail state. This bit can be cleared in a functional or soft fail state. If the bit is cleared in the soft fail state, the high assurance counter counts down from the place where it was stopped.</p> <p>0 HAC counter can count down</p>

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
	1 HAC counter is stopped
18 HAC_CLEAR	<p>High Assurance Counter Clear</p> <p>When set, it clears the High Assurance Counter Register. It can be cleared in a functional or soft fail state. If the HAC counter is cleared in the soft fail state, the SSM transitions to the hard fail state if high assurance configuration is enabled (HAC_EN is set). This self-clearing bit is always read as zero.</p> <p>0b - 1b -</p>
17 HAC_LOAD	<p>High Assurance Counter Load</p> <p>When set, it loads the High Assurance Counter Register with the value of the High Assurance Counter Load Register. It can be done in a functional or soft fail state. This self-clearing bit is always read as zero.</p> <p>0b - 1b -</p>
16 HAC_EN	<p>High Assurance Configuration Enable</p> <p>This bit controls the SSM transition from the soft fail to the hard fail state. When this bit is set and software fails to stop the HAC before it expires, the SSM transitions to the hard fail state. This bit cannot be changed once HAC_L bit is set.</p> <p>0b - 1b -</p>
15-14 —	
13 MKS_EN	<p>Master Key Select Enable</p> <p>When not set, the one time programmable (OTP) master key is selected by default. When set, the master key is selected according to the setting of the master key select field (MASTER_KEY_SEL) of LPMKCR. Once set, this bit can only be reset by the system reset.</p> <p>0b - OTP master key is selected as an SNVS master key 1b - SNVS master key is selected according to the setting of the MASTER_KEY_SEL field of LPMKCR</p>
12 PROG_ZMK	<p>Program Zeroizable Master Key</p> <p>This bit activates ZMK hardware programming mechanism. This mechanism is activated only if the ZMK is configured to the hardware programming mode and ZMK in not locked for writes. This self-clearing bit is always read as zero.</p> <p>0b - 1b -</p>
11 —	
10 SW_LPSV	<p>LP Software Security Violation</p> <p>When set, SNVS_LP treats this bit as a security violation. The LP secure data is zeroized or invalidated according to the configuration. This security violation may result in a system security monitor transition if the LP Security Violation is enabled in the SNVS_HP Security Violation Control Register.</p>
9 SW_FSV	<p>Software Fatal Security Violation</p> <p>When set, the system security monitor treats this bit as a fatal security violation. This security violation has no effect on the LP section. This command results only in the following transitions of the SSM: Check State -&gt; Soft Fail</p>

*Table continues on the next page...*

Field	Function
	Non-Secure State -> Soft Fail Trusted State -> Soft Fail Secure State -> Soft Fail
8 SW_SV	Software Security Violation When set, the system security monitor treats this bit as a non-fatal security violation. This security violation has no effect on the LP section. This command results only in the following transitions of the SSM: Check -> Non-Secure Trusted -> Soft Fail Secure -> Soft Fail
7-6 —	
5 LP_SWR_DIS	LP Software Reset Disable When set, disables the LP software reset. Once set, this bit can only be reset by the system reset. 0b - 1b -
4 LP_SWR	LP Software Reset When set, it resets the SNVS_LP section. This bit cannot be set when the LP_SWR_DIS bit is set. This self-clearing bit is always read as zero. 0b - 1b -
3 —	
2 SSM_SFNS_DIS	SSM Soft Fail to Non-Secure State Transition Disable When set, it disables the SSM transition from soft fail to non-secure state. Once set after the reset this bit cannot be changed 0b - 1b -
1 SSM_ST_DIS	SSM Secure to Trusted State Transition Disable When set, disables the SSM transition from secure to trusted state. Once set after the reset, this bit cannot be changed. 0b - 1b -
0 SSM_ST	SSM State Transition Transition state of the system security monitor. This self-clearing bit is always read as zero. This command results only in the following transitions of the SSM: Check State -> Non-Secure (when Non-Secure Boot and not in Fab Configuration ) Check State -> Trusted (when Secure Boot or in Fab Configuration ) Trusted State -> Secure Secure State -> Trusted (if not disabled by SSM_ST_DIS bit)

## Secure Non-Volatile Storage (SNVS)

Field	Function
	Soft Fail -> Non-Secure (if not disabled by SSM_SFNS_DIS bit)

### 6.1.7.4 SNVS\_HP Control (HPCR)

#### 6.1.7.4.1 Address

Register	Offset
HPCR	8h

#### 6.1.7.4.2 Function

The SNVS\_HP Control Register contains various control bits of the HP section of SNVS.

#### 6.1.7.4.3 Diagram

#### 6.1.7.4.4 Fields

Field	Function
31-28 —	
27 BTN_MASK	Button interrupt mask. This bit is used to mask the ipi_snvs_btn_int_b (button) interrupt request.

*Table continues on the next page...*

Field	Function
	0: Interrupt disabled 1: Interrupt enabled
26-24 BTN_CONFIG	Button Configuration. This field is used to configure which feature of the button (BTN) input signal constitutes "active". 000: Button signal is active low 001: Button signal is active high 010: Button signal is active on the rising edge 011: Button signal is active on the falling edge 100: Button signal is active on any edge All other patterns are reserved.
23-17 —	
16 HP_TS	HP Time Synchronize When set, this updates the HP Real Time Counter with the LP Real Time Counter value. This self-clearing bit is always read as zero.  0b - 1b -
15 —	
14-10 HPCALB_VAL	HP Calibration Value Defines signed calibration value for the HP Real Time Counter. This field can be programmed only when RTC Calibration is disabled (HPCALB_EN is not set). This is a 5-bit 2's complement value, hence the allowable calibration values are in the range from -16 to +15 counts per 32768 ticks of the counter.  00000b - 00001b - 00010b - 01111b - 10000b - 10001b - 11110b - 11111b -
9 —	
8 HPCALB_EN	HP Real Time Counter Calibration Enabled Indicates that the time calibration mechanism is enabled.  0b - 1b -
7-4 PI_FREQ	Periodic Interrupt Frequency Defines frequency of the periodic interrupt. The interrupt is generated when a zero-to-one or one-to-zero transition occurs on the selected bit of the HP Real Time Counter and Real Time Counter and Periodic Interrupt are both enabled (RTC_EN and PI_EN are set). It is recommended to program this field when Periodic Interrupt is disabled (PI_EN is not set). The possible frequencies are:

*Table continues on the next page...*

## Secure Non-Volatile Storage (SNVS)

Field	Function
	0000b - 0001b - 0010b - 0011b - 0100b - 0101b - 0110b - 0111b - 1000b - 1001b - 1010b - 1011b - 1100b - 1101b - 1110b - 1111b -
3 PI_EN	HP Periodic Interrupt Enable The periodic interrupt can be generated only if the HP Real Time Counter is enabled. 0b - 1b -
2 —	
1 HPTA_EN	HP Time Alarm Enable When set, the time alarm interrupt is generated if the value in the HP Time Alarm Registers is equal to the value of the HP Real Time Counter. 0b - 1b -
0 RTC_EN	HP Real Time Counter Enable 0b - 1b -

### 6.1.7.5 SNVS\_HP Security Interrupt Control (HPSICR)

#### 6.1.7.5.1 Address

Register	Offset
HPSICR	Ch

#### 6.1.7.5.2 Function

The HP Security Interrupt Control Register defines the SNVS security interrupt generation policy. This is a privileged write register.

### 6.1.7.5.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 6.1.7.5.4 Fields

Field	Function
31 LPSVI_EN	<p>LP Security Violation Interrupt Enable</p> <p>This bit enables generating of the security interrupt to the host processor upon security violation signal from the LP section.</p> <p>0b - 1b -</p>
30-6 —	Reserved
5 SVI_EN5	<p>Security Violation Interrupt 5 Enable</p> <p>This bit enables generation of the security interrupt to the host processor upon security violation detection on input port 5.</p> <p>0b - 1b -</p>
4 SVI_EN4	<p>Security Violation Interrupt 4 Enable</p> <p>This bit enables generation of the security interrupt to the host processor upon security violation detection on input port 4.</p> <p>0b - 1b -</p>
3 SVI_EN3	<p>Security Violation Interrupt 3 Enable</p> <p>This bit enables generation of the security interrupt to the host processor upon security violation detection on input port 3.</p> <p>0b - 1b -</p>
2 SVI_EN2	<p>Security Violation Interrupt 2 Enable</p> <p>This bit enables generation of the security interrupt to the host processor upon security violation detection on input port 2.</p>

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
	0b - 1b -
1 SVI_EN1	Security Violation Interrupt 1 Enable This bit enables generation of the security interrupt to the host processor upon security violation detection on input port 1. 0b - 1b -
0 SVI_EN0	Security Violation Interrupt 0 Enable This bit enables generation of the security interrupt to the host processor upon security violation detection on input port 0. 0b - 1b -

### 6.1.7.6 SNVS\_HP Security Violation Control (HPSVCR)

#### 6.1.7.6.1 Address

Register	Offset
HPSVCR	10h

#### 6.1.7.6.2 Function

The HP Security Violation Control Register defines types for each security violation input. This is a privileged write register.

#### 6.1.7.6.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 6.1.7.6.4 Fields

Field	Function
31-30 LPSV_CFG	<p>LP Security Violation Configuration</p> <p>This field configures the LP security violation source.</p> <p>00b - 01b - 1xb -</p>
29-7 —	
6-5 SV_CFG5	<p>Security Violation Input 5 Configuration</p> <p>This field configures the Security Violation Input 5. This setting instructs the SSM how to respond when a security violation on port 5 is detected.</p> <p>00b - 01b - 1xb -</p>
4 SV_CFG4	<p>Security Violation Input 4 Configuration</p> <p>This field configures the security violation Input 4. This setting instructs the SSM how to respond when a security violation on port 4 is detected.</p> <p>0b - 1b -</p>
3 SV_CFG3	<p>Security Violation Input 3 Configuration</p> <p>This field configures the security violation input 3. This setting instructs the SSM how to respond when a security violation on port 3 is detected.</p> <p>0b - 1b -</p>
2 SV_CFG2	<p>Security Violation Input 2 Configuration</p> <p>This field configures the security violation input 2. This setting instructs the SSM how to respond when a security violation on port 2 is detected.</p> <p>0b - 1b -</p>
1 SV_CFG1	<p>Security Violation Input 1 Configuration</p> <p>This field configures the Security Violation Input 1. This setting instructs the SSM how to respond when a security violation on port 1 is detected.</p> <p>0b - 1b -</p>
0 SV_CFG0	<p>Security Violation Input 0 Configuration</p> <p>This field configures the security violation input 0. This setting instructs the SSM how to respond when a security violation on port 0 is detected.</p> <p>0b - 1b -</p>

### 6.1.7.7 SNVS\_HP Status (HPSR)

#### 6.1.7.7.1 Address

Register	Offset
HPSR	14h

#### 6.1.7.7.2 Function

The HP Status Register reflects the internal state of the SNVS.

#### 6.1.7.7.3 Diagram

#### 6.1.7.7.4 Fields

Field	Function
31 ZMK_ZERO	Zeroizable Master Key is Equal to Zero. When set, this bit triggers "bad key" violation if the ZMK is selected for use. 0b -

Table continues on the next page...

Field	Function
	1b -
30-28 —	
27 OTPMK_ZERO	One Time Programmable Master Key is Equal to Zero. When set, this bit always triggers "bad key" violation.  0b - 1b -
26-25 —	
24-16 OTPMK_SYNDROME	One Time Programmable Master Key Syndrome  In the case of a single-bit error, the eight lower bits of this value indicate the bit number of error location. For example, syndrome word 10010110 indicates that key bit 150 (lsb=0) has an error.  The ninth bit of the syndrome word checks parity of the whole key value. This bit is 1 when an odd number of errors has occurred and it is 0 when the number of errors is even. For example, if one of the eight bits indicates a failure and the ninth bit is zero then the number of errors in the one time programmable master key is at least 2 and it cannot be corrected. When one of the syndrome bits is set, the bad key violation is always generated.
15 SYS_SECURE_BOOT	System Secure Boot  This bit reflects the value of the sys_secure_boot input signal to SNVS. If this bit is 1, the chip boots from internal ROM.
14-12 SYS_SECURITY_CFG	System Security Configuration  This field reflects the value of the sys_security_cfg input signal, which is defined as follows:  000b - 001b - 01xb - 1xxb -
11-8 SSM_STATE	System Security Monitor State  This field contains the encoded state of the SSM's state machine. The encoding of the possible states are:  0000b - 0001b - 0011b - 1000b - 1001b - 1011b - 1101b - 1111b -
7 BI	Button Interrupt  Signal ipi_snvs_btn_int_b was asserted.
6 BTN	Button  Value of the BTN input. This is the external button used for PMIC control.  0: BTN not pressed 1: BTN pressed

*Table continues on the next page...*

## Secure Non-Volatile Storage (SNVS)

Field	Function
5 —	
4-2 —	
1 PI	Periodic Interrupt Indicates that periodic interrupt has occurred since this bit was last cleared. 0b - 1b -
0 HPTA	HP Time Alarm Indicates that the HP Time Alarm has occurred since this bit was last cleared. 0b - 1b -

### 6.1.7.8 SNVS\_HP Security Violation Status (HPSVSR)

#### 6.1.7.8.1 Address

Register	Offset
HPSVSR	18h

#### 6.1.7.8.2 Function

The HP Security Violation Status Register reflects the HP domain security violation records. Write a 1 to SEC\_VIO5-0 to clear the corresponding security violation detection flag. Note that this does not automatically clear the security violation signal that is connected to the input, so the security violation may immediately be detected again

### 6.1.7.8.3 Diagram

### 6.1.7.8.4 Fields

Field	Function
31 LP_SEC_VIO	LP Security Violation A security violation was detected in the SNVS low power section.
30-28 —	
27 ZMK_ECC_FAIL	Zeroizable Master Key Error Correcting Code Check Failure When set, this bit triggers a bad key violation to the SSM and a security violation to the SNVS_LP section, which clears security sensitive data. Writing a one to this bit clears the record of this failure and also clears this register's ZMK_SYNDROME field.  0b - 1b -
26-25 —	
24-16 ZMK_SYNDROME	Zeroizable Master Key Syndrome The ZMK syndrome indicates the single-bit error location and parity for the ZMK register. It operates similar to the OTPMK syndrome. This value is set and locked when a ZMK ECC failure is detected. It is cleared by writing one into ZMK_ECC_FAIL bit.
15 SW_LPSV	LP Software Security Violation This bit is a read-only copy of the SW_LPSV bit in the HP Command Register.
14 SW_FSV	Software Fatal Security Violation This bit is a read-only copy of the SW_FSV bit in the HP Command Register.

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
13 SW_SV	Software Security Violation This bit is a read-only copy of the SW_SV bit in the HP Command Register.
12-6 —	
5 SEC_VIO5	Security violation on input 5 was detected. 0b - 1b -
4 SEC_VIO4	Security violation on input 4 was detected. 0b - 1b -
3 SEC_VIO3	Security violation on input 3 was detected. 0b - 1b -
2 SEC_VIO2	Security violation on input 2 was detected. 0b - 1b -
1 SEC_VIO1	Security violation on input 1 was detected. 0b - 1b -
0 SEC_VIO0	Security violation on input 0 was detected. 0b - 1b -

### 6.1.7.9 SNVS\_HP High Assurance Counter IV (HPHACIVR)

#### 6.1.7.9.1 Address

Register	Offset
HPHACIVR	1Ch

#### 6.1.7.9.2 Function

The SNVS\_HP High Assurance Counter IV Register contains the initial value for the high assurance counter.

### 6.1.7.9.3 Diagram

### 6.1.7.9.4 Fields

Field	Function
31-0 HAC_COUNTER_IV	High Assurance Counter Initial Value This register is used to set the starting count value to the high assurance counter. This register cannot be programmed when HAC_L bit is set.

## 6.1.7.10 SNVS\_HP High Assurance Counter (HPHACR)

### 6.1.7.10.1 Address

Register	Offset
HPHACR	20h

### 6.1.7.10.2 Function

The SNVS\_HP High Assurance Counter Register contains the value of the high assurance counter. The high assurance counter is a delay introduced before the system security monitor transitions from soft fail to hard fail state if this transition is enabled.

### 6.1.7.10.3 Diagram

### 6.1.7.10.4 Fields

Field	Function
31-0 HAC_COUNTER	<p>High Assurance Counter</p> <p>When the HAC_EN bit is set and the SSM is in the soft fail state, this counter starts to count down with the system clock. When the counter reaches zero, the SSM transitions to the Hard Fail State.</p> <ul style="list-style-type: none"> <li>• When HAC_STOP bit is set, the HAC Counter is stopped.</li> <li>• When HAC_CLEAR bit is set, the HAC Counter is cleared.</li> <li>• When HAC_LOAD bit is set, the HAC Counter is loaded with the value of the HPHACIVR.</li> </ul>

## 6.1.7.11 SNVS\_HP Real Time Counter MSB (HPRTC MR)

### 6.1.7.11.1 Address

Register	Offset
HPRTC MR	24h

### 6.1.7.11.2 Function

The SNVS\_HP Real Time Counter MSB register contains the 15 most-significant bits of the HP Real Time Counter.

### 6.1.7.11.3 Diagram

### 6.1.7.11.4 Fields

Field	Function
31-15 —	Reserved
14-0 RTC	HP Real Time Counter The most-significant 15 bits of the RTC. This register can be programmed only when RTC is not active (RTC_EN bit is not set).

## 6.1.7.12 SNVS\_HP Real Time Counter LSB (HPRTCLR)

### 6.1.7.12.1 Address

Register	Offset
HPRTCLR	28h

### 6.1.7.12.2 Function

The SNVS\_HP Real Time Counter LSB register contains the 32 least-significant bits of the HP real time counter.

### 6.1.7.12.3 Diagram

### 6.1.7.12.4 Fields

Field	Function
31-0 RTC	HP Real Time Counter least-significant 32 bits. This register can be programmed only when RTC is not active (RTC_EN bit is not set).

### 6.1.7.13 SNVS\_HP Time Alarm MSB (HPTAMR)

#### 6.1.7.13.1 Address

Register	Offset
HPTAMR	2Ch

#### 6.1.7.13.2 Function

The SNVS\_HP Time Alarm MSB register contains the most-significant bits of the SNVS\_HP Time Alarm value.

### 6.1.7.13.3 Diagram

### 6.1.7.13.4 Fields

Field	Function
31-15 —	
14-0 HPTA_MS	HP Time Alarm, most-significant 15 bits. This register can be programmed only when HP time alarm is disabled (HPTA_EN bit is not set).

## 6.1.7.14 SNVS\_HP Time Alarm LSB (HPTALR)

### 6.1.7.14.1 Address

Register	Offset
HPTALR	30h

### 6.1.7.14.2 Function

The SNVS\_HP Time Alarm LSB register contains the 32 least-significant bits of the SNVS\_HP Time Alarm value.

### 6.1.7.14.3 Diagram

### 6.1.7.14.4 Fields

Field	Function
31-0 HPTA_LS	HP Time Alarm, 32 least-significant bits. This register can be programmed only when HP time alarm is disabled (HPTA_EN bit is not set).

## 6.1.7.15 SNVS\_LP Lock (LPLR)

### 6.1.7.15.1 Address

Register	Offset
LPLR	34h

### 6.1.7.15.2 Function

The SNVS\_LP Lock Register contains lock bits for the SNVS\_LP registers.

### 6.1.7.15.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	Reserved							MKS_HL	LPTDCR_HL	LPTGFCR_HL	LPSVCR_HL	GPR_HL	MC_HL	LPCALB_HL	SRTC_HL	ZMK_RHL	ZMK_WHL
W	Reserved							MKS_HL	LPTDCR_HL	LPTGFCR_HL	LPSVCR_HL	GPR_HL	MC_HL	LPCALB_HL	SRTC_HL	ZMK_RHL	ZMK_WHL
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### 6.1.7.15.4 Fields

Field	Function
31-29 —	
28 AT5_HL	Active Tamper 5 Hard Lock When set, prevents any writes to the Active Tamper 5 registers. Once set, this bit can only be reset by the LP POR. 0b - 1b -
27 AT4_HL	Active Tamper 4 Hard Lock When set, prevents any writes to the Active Tamper 4 registers. Once set, this bit can only be reset by the LP POR. 0b - 1b -
26 AT3_HL	Active Tamper 3 Hard Lock When set, prevents any writes to the Active Tamper 3 registers. Once set, this bit can only be reset by the LP POR. 0b - 1b -
25 AT2_HL	Active Tamper 2 Hard Lock When set, prevents any writes to the Active Tamper 2 registers. Once set, this bit can only be reset by the LP POR. 0b - 1b -
24 AT1_HL	Active Tamper 1 Hard Lock

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
	When set, prevents any writes to the Active Tamper 1 registers. Once set, this bit can only be reset by the LP POR. 0b - 1b -
23-10 —	
9 MKS_HL	Master Key Select Hard Lock When set, prevents any writes to the MASTER_KEY_SEL field of the LP Master Key Control Register. Once set, this bit can only be reset by the LP POR. 0b - 1b -
8 LPTDCR_HL	LP Tamper Detectors Configuration Register Hard Lock When set, prevents any writes to the LPTDCR. Once set, this bit can only be reset by the LP POR. 0b - 1b -
7 LPTGFCR_HL	LP Tamper Glitch Filter Configuration Register Hard Lock When set, prevents any writes to the LPTGFCR. Once set, this bit can only be reset by the LP POR. 0b - 1b -
6 LPSVCR_HL	LP Security Violation Control Register Hard Lock When set, prevents any writes to the LPSVCR. Once set, this bit can only be reset by the LP POR. 0b - 1b -
5 GPR_HL	General Purpose Register Hard Lock When set, prevents any writes to the GPR. Once set, this bit can only be reset by the LP POR. 0b - 1b -
4 MC_HL	Monotonic Counter Hard Lock When set, prevents any writes (increments) to the MC Registers and MC_ENV bit. Once set, this bit can only be reset by the LP POR. 0b - 1b -
3 LPCALB_HL	LP Calibration Hard Lock When set, prevents any writes to the LP Calibration Value (LPCALB_VAL) and LP Calibration Enable (LPCALB_EN). Once set, this bit can only be reset by the LP POR. 0b - 1b -
2 SRTC_HL	Secure Real Time Counter Hard Lock When set, prevents any writes to the SRTC registers, SRTC_ENV, and SRTC_INV_EN bits. Once set, this bit can only be reset by the LP POR. 0b -

*Table continues on the next page...*

Field	Function
	1b -
1 ZMK_RHL	<p>Zeroizable Master Key Read Hard Lock</p> <p>When set, prevents any software reads to the ZMK registers and ZMK_ECC_VALUE field of the LPMKCR. In ZMK hardware programming mode (ZMK_HWP is set), software cannot read the ZMK or ZMK_ECC_VALUE. Regardless of the setting of this bit, hardware can use the ZMK value when ZMK is selected. Once set, this bit can only be reset by the LP POR.</p> <p>0b - 1b -</p>
0 ZMK_WHL	<p>Zeroizable Master Key Write Hard Lock</p> <p>When set, prevents any writes (software and hardware) to the ZMK registers and ZMK_HWP, ZMK_VAL, and ZMK_ECC_EN fields of the LPMKCR. Once set, this bit can only be reset by the LP POR.</p> <p>0b - 1b -</p>

## 6.1.7.16 SNVS\_LP Control (LPCR)

### 6.1.7.16.1 Address

Register	Offset
LPCR	38h

### 6.1.7.16.2 Function

The SNVS\_LP Control Register contains various control bits of the LP section of SNVS.

### 6.1.7.16.3 Diagram

### 6.1.7.16.4 Fields

Field	Function
31-25 —	
24 GPR_Z_DIS	General Purpose Registers Zeroization Disable. 1 = Disable zeroization of the GPR registers when a tamper event occurs. 0 = Zeroize the GPR registers when a tamper event occurs. (Default)
23 PK_OVERRIDE	PMIC On Request Override The value written to PK_OVERRIDE will be asserted on output signal snvs_lp_pk_override. That signal is used to override the IOMUX control for the PMIC I/O pad.
22 PK_EN	PMIC On Request Enable The value written to PK_EN will be asserted on output signal snvs_lp_pk_en. That signal is used to turn off the pullup/pulldown circuitry in the PMIC I/O pad.
21-20 ON_TIME	The ON_TIME field is used to configure the period of time after BTN is asserted before pmic_en_b is asserted to turn on the SoC power. 00: 500msec off->on transition time 01: 50msec off->on transition time 10: 100msec off->on transition time 11: 0msec off->on transition time
19-18	This field configures the amount of debounce time for the BTN input signal.

Table continues on the next page...

Field	Function
DEBOUNCE	00: 50msec debounce 01: 100msec debounce 10: 500msec debounce 11: 0msec debounce
17-16 BTN_PRESS_TIME	This field configures the button press time out values for the PMIC Logic. 00 : 5 secs 01 : 10 secs 10 : 15 secs 11 : long press disabled (pmic_en_b will not be asserted regardless of how long BTN is asserted)
15 —	
14-10 LPCALB_VAL	LP Calibration Value Defines signed calibration value for SRTC. This field can be programmed only when SRTC calibration is disabled and not locked, i.e. when LPCALB_EN, LPCALB_SL, and LPCALB_HL bits are not set. This is a 5-bit 2's complement value. Hence, the allowable calibration values are in the range from -16 to +15 counts per 32768 ticks of the counter clock  00000b - 00001b - 00010b - 01111b - 10000b - 10001b - 11110b - 11111b -
9 —	
8 LPCALB_EN	LP Calibration Enable When set, enables the SRTC calibration mechanism. This bit cannot be changed once LPCALB_SL or LPCALB_HL bit is set.  0b - 1b -
7 PWR_GLITCH_EN	Power Glitch Enable By default the detection of a power glitch does not cause the pmic_en_b signal to be asserted. Setting the Power Glitch Enable bit to 1 enables the power glitch event for the PMIC.  0 - disabled 1 - enabled
6 TOP	Turn off System Power Asserting this bit causes a signal to be sent to the Power Management IC to turn off the system power. This bit will clear once power is off. This bit is only valid when the Dumb PMIC is enabled.  0b - 1b -
5	Dumb PMIC Enabled

*Table continues on the next page...*

## Secure Non-Volatile Storage (SNVS)

Field	Function
DP_EN	When set, software can control the system power. When cleared, the system requires a Smart PMIC to automatically turn power off.  0b - 1b -
4 SRTC_INV_EN	If this bit is 1, in the case of a security violation the SRTC stops counting and the SRTC is invalidated (SRTC_ENV bit is cleared). This is intended to allow software to read the time at which the security violation occurred. This field cannot be changed once SRTC_SL or SRTC_HL bit is set.  0b - 1b -
3 LPWUI_EN	LP Wake-Up Interrupt Enable  This interrupt line should be connected to the external pin and is intended to inform the external chip about an SNVS_LP event (tamper event, MC rollover, SRTC rollover, or time alarm ). This wake-up signal can be asserted only when the chip (HP section) is powered down, and the LP section is isolated.  0 LP wake-up interrupt is disabled. 1 LP wake-up interrupt is enabled.
2 MC_ENV	Monotonic Counter Enabled and Valid  When set, the MC can be incremented (by write transaction to the LPSMCMR or LPSMCLR). This bit cannot be changed once MC_SL or MC_HL bit is set.  0b - 1b -
1 LPTA_EN	LP Time Alarm Enable  When set, the SNVS functional interrupt is asserted if the LP Time Alarm Register is equal to the 32 MSBs of the secure real time counter.  0b - 1b -
0 SRTC_ENV	Secure Real Time Counter Enabled and Valid  When set, the SRTC becomes operational. This bit cannot be changed once SRTC_SL or SRTC_HL bit is set.  0b - 1b -

### 6.1.7.17 SNVS\_LP Master Key Control (LPMKCR)

#### 6.1.7.17.1 Address

Register	Offset
LPMKCR	3Ch

### 6.1.7.17.2 Function

The SNVS\_LP Master Key Control Register contains the master keys configuration.

### 6.1.7.17.3 Diagram

### 6.1.7.17.4 Fields

Field	Function
31-16 —	
15-7 ZMK_ECC_VALUE	<p>Zeroizable Master Key Error Correcting Code Value</p> <p>This field is automatically calculated and set when one is written into ZMK_ECC_EN bit of this register. This field cannot be programmed by software. It keeps the ECC value of the zeroizable master key, which allows checking that ZMK has not been corrupted/alterd with time.</p> <p>Note that this ZMK ECC code is equivalent to the ECC bits encoded into the OTPMK value but for the ZMK, the ECC value is kept separate from the ZMK value. See <a href="#">Error code for the ZMK</a> for details. Read restrictions similar to the ZMK Registers are applied to this field (see ).</p>
6-5 —	
4 ZMK_ECC_EN	<p>Zeroizable Master Key Error Correcting Code Check Enable</p> <p>Writing one to this field automatically calculates and sets the ZMK ECC value in the ZMK_ECC_VALUE field of this register. When both ZMK value is valid (ZMK_VAL is set) and ZMK ECC check is enabled (ZMK_ECC_EN is set), the ZMK value is continuously checked for the valid ECC word. If the ZMK ECC word calculated every clock cycle does not match the one recorded in this register, the ZMK ECC Check Fail Violation is generated. This bit cannot be programmed when ZMK_WSL or ZMK_WHL bit is set.</p> <p>0b - 1b -</p>
3	Zeroizable Master Key Valid

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
ZMK_VAL	When set, the ZMK value can be selected by the master key control block for use by cryptographic modules. In hardware programming mode, hardware sets this bit when the ZMK provisioning is complete. In software programming mode, software should set this bit. This bit cannot be programmed when ZMK_WSL or ZMK_WHL bit is set.  0b - 1b -
2 ZMK_HWP	Zeroizable Master Key hardware Programming mode  When set, only the hardware key programming mechanism can set the ZMK and software cannot read it. When not set, the ZMK can be programmed only by software. See for details. This bit cannot be programmed when ZMK_WSL or ZMK_WHL bit is set.  0b - 1b -
1-0 MASTER_KEY_SEL	Master Key Select  These bits select the SNVS Master Key output when Master Key Select bits are enabled by MKS_EN bit in the HPCOMR . When MKS_EN bit is not set, the one time programmable master key is selected by default. This field cannot be programmed when MKS_SL(or the hard lock) bit is set.  0xb - 10b - Select zeroizable master key when MKS_EN bit is set . 11b - Select combined master key when MKS_EN bit is set .

### 6.1.7.18 SNVS\_LP Security Violation Control (LPSVCR)

#### 6.1.7.18.1 Address

Register	Offset
LPSVCR	40h

#### 6.1.7.18.2 Function

The LP Security Violation Control Register configures security violation inputs. This register cannot be programmed when the LPSVCR Lock bit is set. Note that configurations of the security violation inputs in the HP section (HPSVCR) and LP section (LPSVCR Register) are independent and have different functionality.

### 6.1.7.18.3 Diagram

### 6.1.7.18.4 Fields

Field	Function
31-6 —	
5 SV_EN5	<p>Security Violation 5 Enable</p> <p>This bit enables security violation input 5. When set, a security violation 5 causes an LP security violation, which clears LP sensitive data.</p> <p>0b - 1b -</p>
4 SV_EN4	<p>Security Violation 4 Enable</p> <p>This bit enables security violation input 4. When set, a security violation 4 causes an LP security violation, which clears LP sensitive data.</p> <p>0b - 1b -</p>
3 SV_EN3	<p>Security Violation 3 Enable</p> <p>This bit enables security violation input 3. When set, a security violation 3 causes an LP security violation, which clears LP sensitive data.</p> <p>0b - 1b -</p>
2 SV_EN2	<p>Security Violation 2 Enable</p> <p>This bit enables security violation input 2. When set, a security violation 2 causes an LP security violation, which clears LP sensitive data.</p> <p>0b - 1b -</p>
1 SV_EN1	<p>Security Violation 1 Enable</p> <p>This bit enables security violation input 1. When set, a security violation 1 causes an LP security violation, which clears LP sensitive data.</p> <p>0b - 1b -</p>

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
0 SV_EN0	<p>Security Violation 0 Enable</p> <p>This bit enables security violation input 0. When set, a security violation 0 causes an LP security violation, which clears LP sensitive data.</p> <p>0b - 1b -</p>

### 6.1.7.19 SNVS\_LP Tamper Glitch Filters Configuration (LPTGFCR)

#### 6.1.7.19.1 Address

Register	Offset
LPTGFCR	44h

#### 6.1.7.19.2 Function

The SNVS\_LP Tamper Glitch Filters Configuration Register is used to configure the glitch filters for the SNVS\_LP tamper inputs. This register cannot be programmed when the LPTGFCR\_SL or LPTGFCR\_HL bit is set.

#### 6.1.7.19.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	ETGF2								ETGF1							
W	ETGF2_EN								ETGF1_EN

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								WMTGF_EN	Reserved		WMTGF				
W									WMTGF_EN							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### 6.1.7.19.4 Fields

Field	Function
31	External Tamper Glitch Filter 2 Enable

*Table continues on the next page...*

Field	Function
ETGF2_EN	When set, enables the external tamper glitch filter 2. 0b - 1b -
30-24 ETGF2	External Tamper Glitch Filter 2 Configures the length of the digital glitch filter for the external tamper 2 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 2 that is equal to or less than the value of the digital glitch filter is ignored. The length of the glitches filtered out is: $128 + (\text{ETGF2} \times 256)$ , where $\text{ETGF2} = 0, \dots, 127$
23 ETGF1_EN	External Tamper Glitch Filter 1 Enable When set, enables the external tamper glitch filter 1. 0b - 1b -
22-16 ETGF1	External Tamper Glitch Filter 1 Configures the length of the digital glitch filter for the external tamper 1 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 1 that is equal to or less than the value of the digital glitch filter is ignored. The length of the glitches filtered out is: $128 + (\text{ETGF1} \times 256)$ , where $\text{ETGF1} = 0, \dots, 127$
15-8 —	
7 WMTGF_EN	Wire-Mesh Tamper Glitch Filter Enable When set, enables the wire-mesh tamper glitch filter. Note that two wire-mesh tamper inputs (1 and 2) share this glitch filter. 0b - 1b -
6-5 —	
4-0 WMTGF	Wire-Mesh Tamper Glitch Filter Configures the length of the digital glitch filter for the wire-mesh tamper 1 and 2 pins between 1 and 63 SRTC clock cycles. Two wire-mesh tamper inputs share this glitch filter. Any assertion on wire-mesh tamper 1 or 2 that is equal to or less than the value of the digital glitch filter is ignored. The length of the glitches filtered out is: $1 + (\text{WMTGF} \times 2)$ , where $\text{WMTGF} = 0, \dots, 31$

### 6.1.7.20 SNVS\_LP Tamper Detectors Configuration (LPTDCR)

### 6.1.7.20.1 Address

Register	Offset
LPTDCR	48h

### 6.1.7.20.2 Function

The SNVS\_LP Tamper Detectors Configuration Register is used to configure analog and digital tamper detector sources. This register cannot be programmed when LPTDCR is locked for write.

### 6.1.7.20.3 Diagram

### 6.1.7.20.4 Fields

Field	Function
31-29 —	
28 OSCB	Oscillator Bypass When OSCB=1 the osc_bypass signal is asserted. That signal asks SoC logic external to SNVS to bypass the SoC's normal SRTC clock source and drive the SRTC clock from an alternate source. 0b - 1b -
27 —	
26-24 VRC	Voltage Reference Configuration These configuration bits are wired as an output of the module.

Table continues on the next page...

Field	Function
23 —	
22-20 HTDC	High Temperature Detect Configuration These configuration bits are wired as an output of the module.
19 —	
18-16 LTDC	Low Temp Detect Configuration These configuration bits are wired as an output of the module.
15 POR_OBSERV	Power On Reset (POR) Observability Flop The asynchronous reset input of this flop is connected directly to the output of the POR analog circuitry (external to the SNVS. This flop can be used to detect brown-out voltage of the POR circuitry.
14 PFD_OBSERV	System Power Fail Detector (PFD) Observability Flop The asynchronous reset input of this flop is connected directly to the inverted output of the PFD analog circuitry (external to the SNVS block). This flop can be used to detect brown-out voltage of the PFD circuitry.
13 —	
12 ET2P	External Tampering 2 Polarity This bit is used to determine the polarity of external tamper 2.  0b - 1b -
11 ET1P	External Tampering 1 Polarity This bit is used to determine the polarity of external tamper 1.  0b - 1b -
10 ET2_EN	External Tampering 2 Enable When set, external tampering 2 detection generates an LP security violation.  0b - 1b -
9 ET1_EN	External Tampering 1 Enable When set, external tampering 1 detection generates an LP security violation.  0b - 1b -
8 WMT2_EN	Wire-Mesh Tampering 2 Enable When set, wire-mesh tampering 2 detection generates an LP security violation.  0b - 1b -
7 WMT1_EN	Wire-Mesh Tampering 1 Enable

*Table continues on the next page...*

## Secure Non-Volatile Storage (SNVS)

Field	Function
	When set, wire-mesh tampering 1 detection generates an LP security violation. 0b - 1b -
6 VT_EN	Voltage Tamper Enable <b>NOTE:</b> Voltage Tamper Enable should be enabled 500 us after setting SCSC_SOSC_CTR [VOLT_TEMP_TAMPER_EN]. After enabling voltage tamper enable, clear SNVSLPSR [VTD] if set. When set, a voltage monitor tamper generates an LP security violation. 0b - 1b -
5 TT_EN	Temperature Tamper Enable When set, a temperature monitor tamper generates an LP security violation. <b>NOTE:</b> Temperature Tamper Enable should be enabled 500 us after setting SCSC_SOSC_CTR [VOLT_TEMP_TAMPER_EN]. After enabling temperature tamper enable, clear SNVS_LPSR [TTD] if set. 0b - 1b -
4 CT_EN	Clock Tamper Enable When set, a clock monitor tamper generates an LP security violation. 0b - 1b -
3 —	Reserved
2 MCR_EN	MC Rollover Enable When set, an MC Rollover event generates an LP security violation. 0b - 1b -
1 SRTCR_EN	SRTC Rollover Enable When set, an SRTC rollover event generates an LP security violation. 0b - 1b -
0 —	

### 6.1.7.21 SNVS\_LP Status (LPSR)

### 6.1.7.21.1 Address

Register	Offset
LPSR	4Ch

### 6.1.7.21.2 Function

The SNVS\_LP Status Register reflects the internal state and behavior of the SNVS\_LP.

### 6.1.7.21.3 Diagram

### 6.1.7.21.4 Fields

Field	Function
31 LPS	<p>LP Section is Secured</p> <p>Indicates that the LP section is provisioned/programmed in the secure or trusted state. The first write to the LP registers in secure or trusted state sets this bit. This bit can never be set together with the LPNS bit. When set the SNVS_LP section cannot be programmed and ZMK cannot be read in the non-secure state of the SSM.</p> <p>0b - 1b -</p>
30 LPNS	<p>LP Section is Non-Secured</p> <p>Indicates that LP section was provisioned/programmed in the non-secure state. The first successful write to the LP Registers in non-secure state sets this bit. This bit can never be set together with the LPS bit. When set, the entire SNVS_LP section (all LP registers) are cleared upon an SSM transition from check to trusted state.</p> <p>0b - 1b -</p>
29-21 —	

Table continues on the next page...

## Secure Non-Volatile Storage (SNVS)

Field	Function
20 SED	Scan Exit Detected 0b - 1b -
19 —	
18 SPO	Set Power Off The SPO bit is set when the set_pwr_off_irq interrupt is triggered, which happens when software writes a 1 to the TOP bit in the LPCR or when the power button is pressed longer than the configured debounce time. Writing to the SPO bit will clear the set_pwr_off_irq interrupt. 0b - 1b -
17 EO	Emergency Off This bit is set when a power off is requested. 0b - 1b -
16 ESVD	External Security Violation Detected Indicates that a security violation is detected on one of the HP security violation ports. The record of the port on which the violation has occurred can be found in the HP Security Violation Status Register. 0b - 1b -
15-11 —	
10 ET2D	0b - 1b -
9 ET1D	External Tampering 1 Detected 0b - 1b -
8 WMT2D	Wire-Mesh Tampering 2 Detected 0b - 1b -
7 WMT1D	Wire-Mesh Tampering 1 Detected 0b - 1b -
6 VTD	Voltage Tampering Detected 0b - 1b -
5 TTD	Temperature Tamper Detected 0b - 1b -
4 CTD	Clock Tampering Detected 0b - 1b -

*Table continues on the next page...*

Field	Function
3 PGD	Power Supply Glitch Detected 0 No power supply glitch. 1 Power supply glitch is detected.
2 MCR	Monotonic Counter Rollover 0b - 1b -
1 SRTC	Secure Real Time Counter Rollover 0b - 1b -
0 LPTA	LP Time Alarm 0b - 1b -

## 6.1.7.22 SNVS\_LP Secure Real Time Counter MSB (LPSRTC MR)

### 6.1.7.22.1 Address

Register	Offset
LPSRTC MR	50h

### 6.1.7.22.2 Function

The SNVS\_LP Secure Real Time Counter MSB register contains the 15 most-significant bits of the LP Secure Real Time Counter.

### 6.1.7.22.3 Diagram

### 6.1.7.22.4 Fields

Field	Function
31-15 —	
14-0 SRTC	LP Secure Real Time Counter The most-significant 15 bits of the SRTC. This register can be programmed only when SRTC is not active and not locked, meaning the SRTC_ENV, SRTC_SL, and SRTC_HL bits are not set.

### 6.1.7.23 SNVS\_LP Secure Real Time Counter LSB (LPSRTCLR)

#### 6.1.7.23.1 Address

Register	Offset
LPSRTCLR	54h

#### 6.1.7.23.2 Function

The SNVS\_LP Secure Real Time Counter LSB register contains the 32 least-significant bits of the secure real time counter.

#### 6.1.7.23.3 Diagram

### 6.1.7.23.4 Fields

Field	Function
31-0 SRTC	LP Secure Real Time Counter least-significant 32 bits This register can be programmed only when SRTC is not active and not locked, meaning the SRTC_ENV, SRTC_SL, and SRTC_HL bits are not set.

### 6.1.7.24 SNVS\_LP Time Alarm (LPTAR)

#### 6.1.7.24.1 Address

Register	Offset
LPTAR	58h

#### 6.1.7.24.2 Function

The SNVS\_LP Time Alarm register contains the 32-bit LP Time Alarm value.

#### 6.1.7.24.3 Diagram

#### 6.1.7.24.4 Fields

Field	Function
31-0 LPTA	LP Time Alarm This register can be programmed only when the LP time alarm is disabled (LPTA_EN bit is not set).

### 6.1.7.25 SNVS\_LP Secure Monotonic Counter MSB (LPSMCMR)

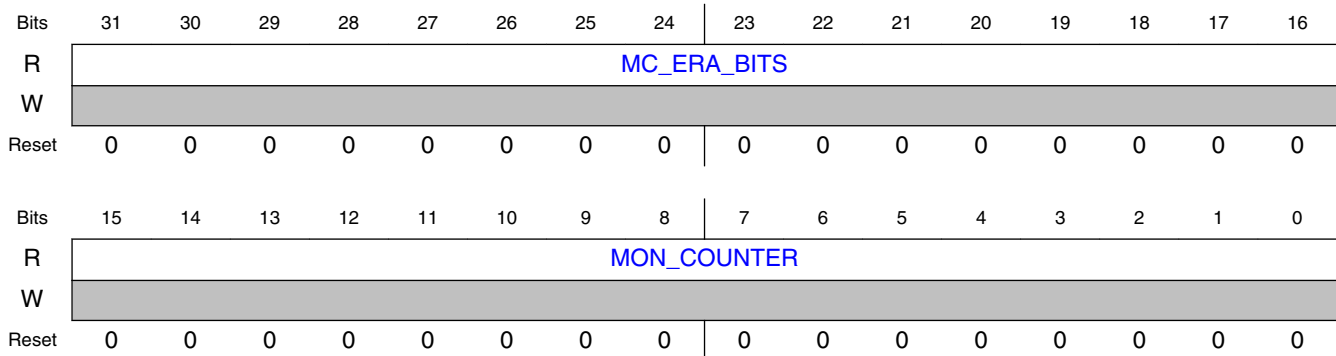

#### 6.1.7.25.1 Address

Register	Offset
LPSMCMR	5Ch

#### 6.1.7.25.2 Function

The SNVS\_LP Secure Monotonic Counter MSB Register contains the monotonic counter era bits and the most-significant 16 bits of the monotonic counter. The monotonic counter is incremented by one if there is a write command to the LPSMCMR or LPSMCLR register.

#### 6.1.7.25.3 Diagram

#### 6.1.7.25.4 Fields

Field	Function
31-16 MC_ERA_BITS	Monotonic Counter Era Bits These bits are inputs to the module and typically connect to fuses.
15-0 MON_COUNTER	Monotonic Counter most-significant 16 Bits The MC is incremented by one when: <ul style="list-style-type: none"> <li>• A write transaction to the LPSMCMR or LPSMCLR register is detected.</li> <li>• The MC_ENV bit is set.</li> <li>• MC_SL and MC_HL bits are not set.</li> </ul>

## 6.1.7.26 SNVS\_LP Secure Monotonic Counter LSB (LPSMCLR)

### 6.1.7.26.1 Address

Register	Offset
LPSMCLR	60h

### 6.1.7.26.2 Function

The SNVS\_LP Secure Monotonic Counter LSB Register contains the 32 least-significant bits of the monotonic counter. The MC is incremented by one if there is a write command to the LPSMCMR or LPSMCLR register.

### 6.1.7.26.3 Diagram

### 6.1.7.26.4 Fields

Field	Function
31-0 MON_COUNTER	Monotonic Counter bits The MC is incremented by one when: <ul style="list-style-type: none"> <li>• A write transaction to the LPSMCMR or LPSMCLR Register is detected.</li> <li>• The MC_ENV bit is set.</li> <li>• MC_SL and MC_HL bits are not set.</li> </ul>

## 6.1.7.27 SNVS\_LP Power Glitch Detector (LPPGDR)

### 6.1.7.27.1 Address

Register	Offset
LPPGDR	64h

### 6.1.7.27.2 Function

The SNVS\_LP Power Glitch Detector Register is a 32-bit read/write register that is used for storing the power glitch detector value, as described in .

### 6.1.7.27.3 Diagram

### 6.1.7.27.4 Fields

Field	Function
31-0	Power Glitch Detector Value
PGD	

## 6.1.7.28 SNVS\_LP General Purpose 0 (alias) (LPGPR0\_alias)

### 6.1.7.28.1 Address

Register	Offset
LPGPR0_alias	68h

### 6.1.7.28.2 Function

The SNVS\_LP General Purpose Register is a 128-bit read/write register located in the low power domain, which can be used by any application for retaining data during an SoC power-down mode. The register is accessed as four 32-bit registers located in successive word addresses starting at offset 90h. For backward compatibility with earlier versions of SNVS LPGPR0 is aliased at its original offset of 68h. The GPR will be automatically zeroized when a tamper event occurs, unless GPR zeroization is disabled via the GPR\_Z\_DIS bit in the LP Control Register.

### 6.1.7.28.3 Diagram

### 6.1.7.28.4 Fields

Field	Function
31-0 GPR	General Purpose Register When GPR_SL or GPR_HL bit is set, the register cannot be programmed.

## 6.1.7.29 SNVS\_LP Zeroizable Master Key (LPZMKRa)

### 6.1.7.29.1 Address

For a = 0 to 31:

Register	Offset
LPZMKRa	6Ch + (a × 1h)

### 6.1.7.29.2 Function

The SNVS\_LP Zeroizable Master Key Registers contain the 256-bit zeroizable master key value. These registers are programmable as follows:

- When ZMK write lock bit is set, they cannot be programmed.
- When ZMK\_HWP is not set, they are in software programming mode and can be programmed only by software.
- When ZMK\_HWP is set, they are in hardware programming mode and can be programmed only by hardware.

These registers cannot be read by software when the ZMK\_HWP or ZMK read lock bit is set.

### 6.1.7.29.3 Diagram

### 6.1.7.29.4 Fields

Field	Function
7-0 ZMK	Zeroizable Master Key Each of these registers contains part of the 256-bit ZMK value. When accessed via the register bus this should be treated as a byte array with the first byte in offset 6Ch (although the register must be accessed as eight 32-bit words).

## 6.1.7.30 SNVS\_LP General Purposes 0 .. 3 (LPGPR0\_3a)

### 6.1.7.30.1 Address

Register	Offset
LPGPR0_30	90h
LPGPR0_31	94h
LPGPR0_32	98h
LPGPR0_33	9Ch

### 6.1.7.30.2 Function

The SNVS\_LP General Purpose Register is a 128-bit read/write register located in the low power domain, which can be used by any application for retaining data during an SoC power-down mode. The register is accessed as four 32-bit registers located in successive word addresses starting at offset 90h. For backward compatibility with earlier versions of SNVS LPGPR0 is aliased at its original offset of 68h. The GPR will be automatically zeroized when a tamper event occurs, unless GPR zeroization is disabled via the GPR\_Z\_DIS bit in the LP Control Register.

### 6.1.7.30.3 Diagram

### 6.1.7.30.4 Fields

Field	Function
31-0 GPR	General Purpose Register When GPR_SL or GPR_HL bit is set, the register cannot be programmed.

## 6.1.7.31 SNVS\_LP Tamper Detectors Config 2 (LPTDC2R)

### 6.1.7.31.1 Address

Register	Offset
LPTDC2R	A0h

### 6.1.7.31.2 Function

The SNVS\_LP Tamper Detectors Configuration 2 Register is used to configure digital external tamper sources. This register cannot be programmed when LPTDCR is locked for write.

### 6.1.7.31.3 Diagram

### 6.1.7.33.4 Fields

Field	Function
31 ETGF6_EN	External Tamper Glitch Filter 6 Enable When set, enables the external tamper glitch filter 6.  0b - 1b -
30-24 ETGF6	External Tamper Glitch Filter 6 Configures the length of the digital glitch filter for the external tamper 6 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 6 that is equal to or less than the value of the digital glitch filter is ignored.  The length of the glitches filtered out is: $128 + (\text{ETGF6} \times 256)$ , where $\text{ETGF6} = 0, \dots, 127$
23 ETGF5_EN	External Tamper Glitch Filter 5 Enable When set, enables the external tamper glitch filter 5.  0b - 1b -
22-16 ETGF5	External Tamper Glitch Filter 5 Configures the length of the digital glitch filter for the external tamper 5 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 5 that is equal to or less than the value of the digital glitch filter is ignored.  The length of the glitches filtered out is: $128 + (\text{ETGF5} \times 256)$ , where $\text{ETGF5} = 0, \dots, 127$

Table continues on the next page...

Field	Function
15 ETGF4_EN	External Tamper Glitch Filter 4 Enable When set, enables the external tamper glitch filter 4.  0b - 1b -
14-8 ETGF4	External Tamper Glitch Filter 4 Configures the length of the digital glitch filter for the external tamper 4 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 4 that is equal to or less than the value of the digital glitch filter is ignored.  The length of the glitches filtered out is: 128 + (ETGF4 x 256), where ETGF4 = 0, ... , 127
7 ETGF3_EN	External Tamper Glitch Filter 3 Enable When set, enables the external tamper glitch filter 3.  0b - 1b -
6-0 ETGF3	External Tamper Glitch Filter 3 Configures the length of the digital glitch filter for the external tamper 3 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 3 that is equal to or less than the value of the digital glitch filter is ignored.  The length of the glitches filtered out is: 128 + (ETGF3 x 256), where ETGF3 = 0, ... , 127

### 6.1.7.34 SNVS\_LP Tamper Glitch Filter 2 Configuration (LPTGF2CR)

#### 6.1.7.34.1 Address

Register	Offset
LPTGF2CR	ACh

#### 6.1.7.34.2 Function

The SNVS\_LP Tamper Glitch Filters Configuration Register is used to configure the glitch filters for the SNVS\_LP> external tamper inputs 7-10. This register cannot be programmed when the LPTGFCR\_SL or LPTGFCR\_HL bit is set.

### 6.1.7.34.3 Diagram

### 6.1.7.34.4 Fields

Field	Function
31 ETGF10_EN	External Tamper Glitch Filter 10 Enable When set, enables the external tamper glitch filter 10.  0b - 1b -
30-24 ETGF10	External Tamper Glitch Filter 10 Configures the length of the digital glitch filter for the external tamper 10 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 6 that is equal to or less than the value of the digital glitch filter is ignored.  The length of the glitches filtered out is: 128 + (ETGF10 x 256), where ETGF10 = 0, ... , 127
23 ETGF9_EN	External Tamper Glitch Filter 9 Enable When set, enables the external tamper glitch filter 9.  0b - 1b -
22-16 ETGF9	External Tamper Glitch Filter 9 Configures the length of the digital glitch filter for the external tamper 9 pin between 128 and 32640 SRTC clock cycles. Any assertion on external tamper 5 that is equal to or less than the value of the digital glitch filter is ignored.  The length of the glitches filtered out is: 128 + (ETGF9 x 256), where ETGF9 = 0, ... , 127
15 ETGF8_EN	External Tamper Glitch Filter 8 Enable When set, enables the external tamper glitch filter 8.  0b - 1b -

## 6.2 System Reset Controller (SRC)

### 6.2.1 SRC Overview

The System Reset Controller (SRC) controls the reset and boot operation of the SoC.

It is responsible for the generation of all reset signals and boot decoding.

The reset controller determines the source and the type of reset, such as POR, COLD, and performs the necessary reset qualification and stretching sequences. Based on the type of reset, the reset logic generates the reset sequence for the entire IC. Whenever the chip is powered on, the reset is issued through SRC\_ONOFF signal and the entire chip is reset.

### 6.2.1.1 Features

The SRC includes the following features.

- Receives and handles the resets from all the reset sources
- Resets the appropriate domains based upon the resets sources and the nature of the reset
- Latches the SRC\_BOOT\_MODE pins and common configuration signals from the internal fuse

### 6.2.2 External Signals

The following table describes the external signals of SRC.

**Table 6-6. SRC External Signals**

Signal	Description	Pad	Mode	Direction
SRC_BOOT_CFG00	Boot configuration signal	LCD1_DATA00	ALT6	I
SRC_BOOT_CFG01	Boot configuration signal	LCD1_DATA01	ALT6	I
SRC_BOOT_CFG02	Boot configuration signal	LCD1_DATA02	ALT6	I
SRC_BOOT_CFG03	Boot configuration signal	LCD1_DATA03	ALT6	I
SRC_BOOT_CFG04	Boot configuration signal	LCD1_DATA04	ALT6	I
SRC_BOOT_CFG05	Boot configuration signal	LCD1_DATA05	ALT6	I

Normal ON to OFF, by button	<ol style="list-style-type: none"> <li>1. Button is pressed for a short duration on the external PMIC.</li> <li>2. Interrupt request (irq) is sent to SoC from external PMIC.</li> <li>3. SoC is programming PMIC for power off when standby is asserted.</li> </ol>	<ol style="list-style-type: none"> <li>1. SoC button is pressed for a short duration.</li> <li>2. Interrupt request (irq) is sent to SoC from FSM.</li> <li>3. Alarm timer is set up by software routine and started.</li> <li>4. Upon alarm_in assertion to '1', PMIC_ON_REQ goes '0'.</li> </ol>

Table continues on the next page...

**Table 6-8. Power mode transitions (continued)**

Power mode	Configuration with external PMIC	Configuration with internal PMIC
	4. In CCM STOP mode, Standby is asserted, PMIC gates SoC supplies.	5. External regulator goes OFF.
Emergency ON to OFF, by button	<ol style="list-style-type: none"> <li>1. Button is pressed for an extended time on the external PMIC.</li> <li>2. PMIC is powering off.</li> </ol>	<ol style="list-style-type: none"> <li>1. Button is pressed for longer than 5 seconds on the SoC.</li> <li>2. FSM validates button pressed for 5 seconds.</li> <li>3. Emergency power off is logged, PMIC_ON_REQ goes '0', alarm_mask goes '1'.</li> <li>4. External regulator goes OFF.</li> </ol>
OFF to ON, by button	<ol style="list-style-type: none"> <li>1. Button is pressed on the external PMIC.</li> <li>2. PMIC powers ON.</li> </ol>	<ol style="list-style-type: none"> <li>1. Button is pressed on the SoC.</li> <li>2. PMIC_ON_REQ goes '1', alarm_mask goes '0'.</li> <li>3. External regulator powers ON.</li> </ol>
OFF to ON, by timer alarm	<ol style="list-style-type: none"> <li>1. Timer alarm in SNVS is programmed by software before SoC goes OFF.</li> <li>2. SoC enters OFF mode.</li> <li>3. Upon timer limit, wake up alarm goes '0'. PMIC_ON_REQ goes '1'.</li> <li>4. PMIC receives assertion of PMIC_ON_REQ and wakes up.</li> </ol>	<ol style="list-style-type: none"> <li>1. Timer alarm in SNVS is programmed by software before SoC goes OFF.</li> <li>2. SoC enters OFF mode.</li> <li>3. Upon timer limit, wake up alarm goes '0'. PMIC_ON_REQ goes '1'.</li> <li>4. External regulator is enabled by PMIC_ON_REQ = 1.</li> </ol>

## 6.2.5 Power-On Reset and power sequencing

This module generates an internal POR\_B signal that is logically AND'ed with any externally applied SRC\_POR\_B signal. The internal POR\_B signal will be held low until all of the following conditions are met:

- 4ms after the external power supply VDDHIGH\_IN is valid
- 1ms after the VDD\_SOC\_CAP supply is valid

The 4ms and 1ms delays are derived from counting the 32 kHz RTC clock cycles; the accuracy depends on the accuracy of the RTC. When the RTC crystal is either absent or in the process of powering up, an internal ring oscillator will be the source of RTC, which is not as accurate as the crystal.

### 6.2.5.1 External POR using SRC\_POR\_B

If the external SRC\_POR\_B signal is used to control the processor POR, SRC\_POR\_B must remain low (asserted) until the VDD\_ARM\_CAP and VDD\_SOC\_CAP supplies are stable.

## 6.2.5.2 Internal POR

If the external SRC\_POR\_B signal is not used (always held high or left unconnected), the processor defaults to the internal POR function (PMU controls generation of the POR based on the power supplies).

If the internal POR function is used, the following power supply requirements must be met:

- VDD\_ARM\_IN and VDD\_SOC\_IN may be supplied from the same source, or
- VDD\_SOC\_IN can be supplied before VDD\_ARM\_IN with a maximum delay of 1 ms.

## 6.2.6 Functional Description

### 6.2.6.1 Reset Control

This section details the reset control of this device.

#### 6.2.6.1.1 Reset inputs and outputs

The reset control logic receives reset requests from all potential reset sources. All the immediate sources of reset are directly passed to the reset stretching block, whereas the resets requiring qualification are passed on to the reset qualification logic before they are sent to the reset stretching block.

All reset inputs and outputs are described in the following figure:

**Figure 6-9. SRC inputs and outputs**

The reset types and modules they affect are shown in [Table 6-9](#). As there is no chip POR, the POR\_B is used to reset the entire chip including test logic and JTAG modules.

### NOTE

All resets are expected to be active low except `jtag_sw_rst`.

**Table 6-9. SRC reset functionality**

SoC Modules	POR	COLD
System modules (PLLs, fuses, etc)	yes	yes
Functional modules	yes	yes
ARM	yes	yes
ARM SoC	yes	yes
M4 Core	yes	yes
M4 Platform	yes	yes
ARM POR	yes	no
ARM debug	yes	no
SJC	yes	no
SRTC	yes	no

The reset priorities are POR (strongest) and COLD. If a stronger reset is asserted during the sequence of a weaker reset, then the weaker sequence will be overridden, and the stronger reset sequence will commence. There is no priority within a reset type (POR, etc). If a reset is asserted during the reset sequence of the same type, the reset sequence will be interrupted and restarted.

The following lists the functionality of each of these reset outputs:

- `system_early_rst_b` - Resets the system modules that need to start first as CCM, OCOTP\_CTRL, FUSEBOX, etc.
- `system_rst_b` - Resets functional modules
- `arm_rst_b` - Resets ARM module (on regular system reset)
- `arm_por_rst_b` - Resets ARM por input
- `arm_soc_rst_b` - Reset for ARM SOC
- `m4c_rst_b` - Reset for M4 core
- `m4p_rst_b` - Reset for M4 platform
- `arm_dbg_rst_b` - Reset debug logic of ARM
- `test_logic_rst_b` - Reset test logic (IOMUXC, DAP)
- `sjc_por_rst_b` - Reset to SJC
- `src_rst_b` - Resets SRTC

### NOTE

It is assumed that each reset source will deassert after its assertion, either due to reset generated to the system from SRC, or by negation of the reset source (if it came from an external source to the chip). In the latter case, the reset source is assumed to be held for at least 2 XTALI clocks so it can be sampled by SRC.

## 6.2.6.1.2 Reset Handling

### 6.2.6.1.2.1 Reset Sequence and De-Assertion

The SRC\_ONOFF will assert immediately after any reset source is recognized. After all of the reset sources are released, the SRC will start the following set of events depending on the type of reset that occurred.

### 6.2.6.1.2.2 POR (SRC\_POR\_B)

SRC\_POR\_B is an external reset signal. When the chip is powered up, the reset signal is passed through the POR\_B pin indicating power-up sequence. The SRC resets the entire chip including the JTAG (SJC) module. All SRC registers will be reset during the POR sequence.

As soon as SRC\_POR\_B occurs, all resets are asserted and the entire chip is reset by SRC. The SRC\_POR\_B is stretched for 2 XTALI cycles and the stretching sequence takes place after 2 XTALI clocks of POR\_B pin deassertion.

The sjc\_por\_rst\_b and srctc\_rst\_b signals are deasserted together with SRC\_POR\_B signal. Those outputs are also deasserted after the stretching of SRC\_POR\_B has deasserted.

Once the above resets deassert, system\_early\_rst\_b reset is deasserted after 2 XTALI clocks. The system\_early\_rst\_b is used for the CCM and PLL-IPs to start generating PLL clock outputs and the system root clocks.

When the system root clocks are ready, the CCM will assert system\_clk\_ready signal. This signal is generated during the start sequence in the CCM and it involves the preparation of the PLLs to generate clock roots for functional operation.

SRC then enables OCOTP\_CTRL and fusebox clocks, so that fuses can be loaded to OCOTP\_CTRL.

- SRC will prepare the boot information
- After 8 ipg cycles, resets to all modules will be de-asserted
- After 8 ipg cycles, system clocks will be enabled (en\_system\_clk).

### 6.2.6.1.2.3 COLD RESET

The sequence is similar to SRC\_POR\_B except the memory repair operation is not performed.

Once the reset source deasserts, system\_early\_rst\_b reset is deasserted after at least 2 XTALI clocks. The system\_early\_rst\_b is used for the CCM and PLL-IPs to start generating PLL clock outputs and the system root clocks.

Once the system root clocks are ready, the CCM will assert system\_clk\_ready signal. This signal is generated during the start sequence in the CCM and it involves the preparation of the PLLs to generate clock roots for functional operation. See CCM for more information.

Once `system_clk_ready` arrives at the SRC, it will enable `OCOTP_CTRL` and fusebox clocks, so that fuses can be loaded to `OCOTP_CTRL`. `OCOTP_CTRL` will notify with `iim_ready_flag` once the fusebox loading finishes.

- SRC will prepare the boot information
- After 8 ipg cycles resets to all modules will be deasserted
- After 8 ipg cycles, system clocks will be enabled (`en_system_clk`).

### 6.2.6.2 Parallel Reset Requests

SRC will follow the following rules in the case of parallel reset requests:

1. The order of strength of resets is POR - strongest, COLD - medium
2. If a stronger reset is asserted during weaker reset sequence, then the stronger reset will take over and the stronger reset process will commence. The following cases fall into this category:
  - POR reset request in the middle of cold reset process - the cold will be stopped and the POR sequence will start.
3. If a weaker reset is asserted during stronger reset sequence, then the stronger reset sequence will continue without interference. If at the end of the stronger reset process the weaker request is still asserted then the weaker sequence will commence. The following cases fall into this category:
  - COLD reset requests in the middle of POR reset process - the POR process will continue without interference.
4. If a similar reset request is asserted during the process of reset handling, then the process of reset handling will start over (with the same process). The following cases fall into this category:
  - POR reset request in the middle of POR reset process - the POR process will start over.
  - COLD reset request in the middle of COLD reset process - the COLD process will start over.

### 6.2.6.3 Boot Mode Control

#### 6.2.6.3.1 BOOT\_MODE Pin Latching

The exact boot sequence is controlled by the values of the `BOOT_MODE` pins on this device.

The value of the BOOT\_MODE pins will be latched after the OCOTP\_CTRL asserts the fuse read completion flag. After latching, the values of the BOOT\_MODE pins are used to determine the booting options of the core as described in the SRC\_SBMRx registers.

The boot mode general purpose bits can be provided to the SRC from either e-fuses or GPIO signals. The gpio\_bt\_sel e-fuse defines the source to be used to derive the boot information. When gpio\_bt\_sel is set, e-fuses are used. When cleared, GPIO signals are used.

The boot information is provided in SRC\_SBMR1 register. The figure below shows the selection of boot mode information.

### NOTE

BOOT\_MODE[1:0] inputs of SRC are connected to BOOT\_MODE[1:0] pins.

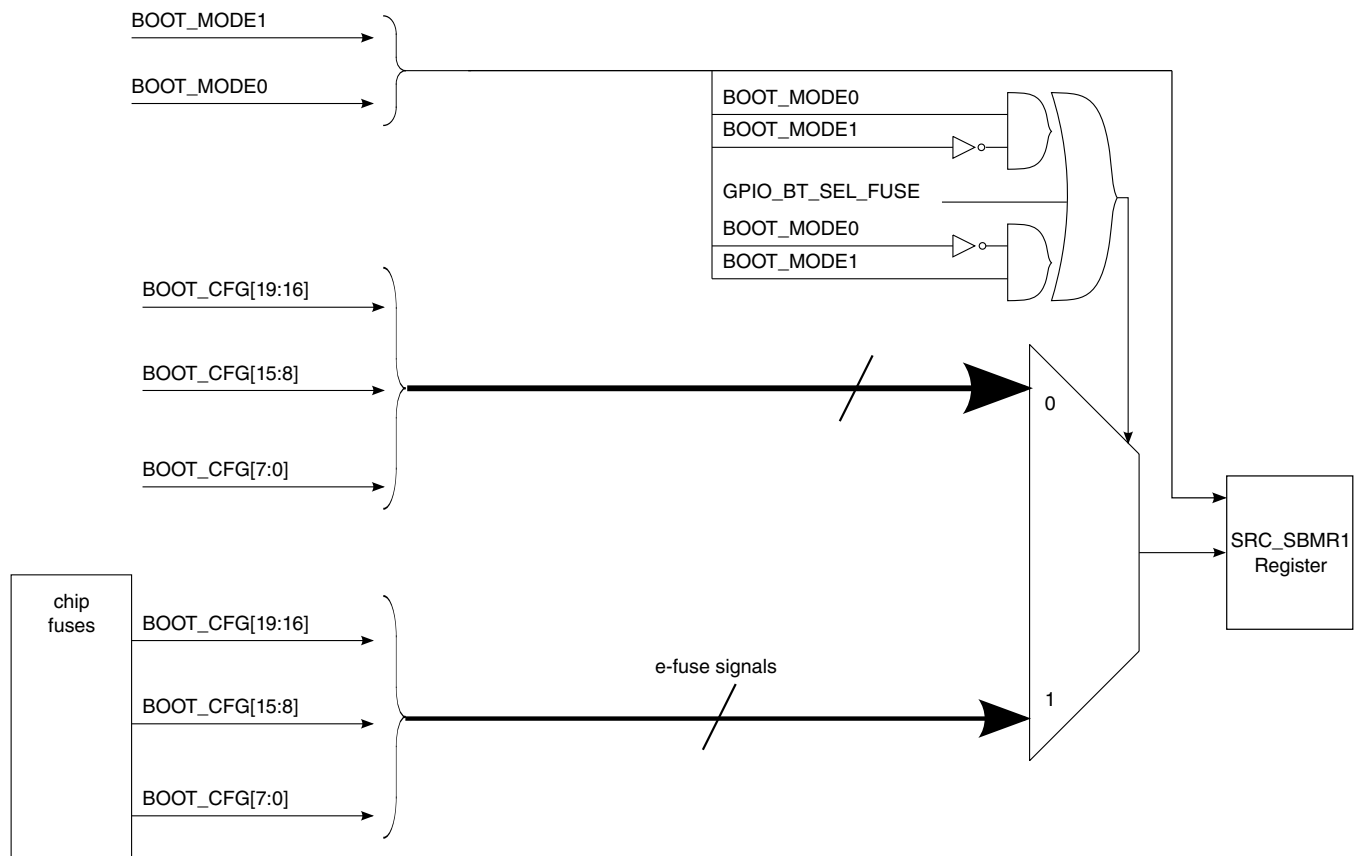

Figure 6-10. Boot mode information

## 6.2.7 SRC Memory Map/Register Definition

## SRC\_SCR field descriptions

Field	Description
31 DOM_EN	<p>Domain Control enable for this register.</p> <p><b>NOTE:</b> [31:30] and [27:24] areas are not controlled by this bit. [31:30] and [27:24] area can be modified by any masters from any domains when Lock bit is not set.</p> <p>0 Disables domain control. All of this register's bits except [31:30] and [27:24] can be modified by any masters</p> <p>1 Enables domain control. All of this register's bits except [31:30] and [27:24] can only be modified by the masters from the domains specified in [27:24] area.</p>
30 LOCK	Domain control bits lock

Table continues on the next page...

## SRC\_SCR field descriptions (continued)

Field	Description
	<p><b>NOTE:</b> Lock bit is a write-once register, once it is set to 1, it can't be write to 0</p> <p>0 [31] and [27:24] bits can be modified  1 [31] and [27:24] bits cannot be modified</p>
29–28 -	This field is reserved. Reserved
27 DOMAIN3	Domain3 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain3. The master from domain3 cannot write to this register. 1 This register is assigned to domain3. The master from domain3 can write to this register
26 DOMAIN2	Domain2 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain2. The master from domain3 cannot write to this register. 1 This register is assigned to domain2. The master from domain3 can write to this register
25 DOMAIN1	Domain1 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain1. The master from domain3 cannot write to this register. 1 This register is assigned to domain1. The master from domain3 can write to this register
24 DOMAIN0	Domain0 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain0. The master from domain3 cannot write to this register. 1 This register is assigned to domain0. The master from domain3 can write to this register
23–8 -	This field is reserved. Reserved
7–4 MASK_ TEMPSENSE_ RESET	Mask tempsense_reset source. If these 4 bits are coded from A to 5 then, the tempsense_reset input to SRC will be masked and the tempsense_reset will not create a reset to the chip. 0101 tempsense_reset is masked 1010 tempsense_reset is not masked
-	This field is reserved. Reserved

### 6.2.7.2 A7 Reset Control Register (SRC\_A7RCR0)

The A7 Reset Control Register (A7RCR), contains bits that control the A7 reset generation.

Address: 3039\_0000h base + 4h offset = 3039\_0004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29–28 -	<p>This field is reserved.</p> <p>Reserved</p>
27 DOMAIN3	<p>Domain3 assignment control. Effective when dom_en is set to 1.</p>

Table continues on the next page...

## SRC\_A7RCR0 field descriptions (continued)

Field	Description
	0 This register is not assigned to domain3. The master from domain3 cannot write to this register. 1 This register is assigned to domain3. The master from domain3 can write to this register
26 DOMAIN2	Domain2 assignment control. Effective when dom_en is set to 1.  0 This register is not assigned to domain2. The master from domain3 cannot write to this register. 1 This register is assigned to domain2. The master from domain3 can write to this register
25 DOMAIN1	Domain1 assignment control. Effective when dom_en is set to 1.  0 This register is not assigned to domain1. The master from domain3 cannot write to this register. 1 This register is assigned to domain1. The master from domain3 can write to this register
24 DOMAIN0	Domain0 assignment control. Effective when dom_en is set to 1.  0 This register is not assigned to domain0. The master from domain3 cannot write to this register. 1 This register is assigned to domain0. The master from domain3 can write to this register
23–22 -	This field is reserved. Reserved
21 A7_L2RESET	Software reset for A7 Snoop Control Unit (SCU).  <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert SCU reset 1 assert SCU reset
20 A7_SOC_DBG_RESET	Software reset for system level debug reset. It initializes the shared Debug APB, the CTI, and the CTM. It also causes: <ul style="list-style-type: none"> <li>A7_dbgreset[1:0] and A7_etmreset[1:0] to be asserted</li> <li>debug logic in the processor power domain and in the debug power domain to be reset</li> </ul> <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert system level debug reset 1 assert system level debug reset
19–16 MASK_WDOG1_RST	Mask wdog1_rst_b source. If these 4 bits are coded from A to 5 then, the wdog1_rst_b input to SRC will be masked and the wdog1_rst_b will not create a reset to the chip.  <b>NOTE:</b> During the time the WDOG event is masked using SRC logic, it is likely that the WDOG Reset Status Register (WRSR) bit 1 (which indicates a WDOG timeout event) will get asserted. software / OS developer must prepare for this case. Re-enabling the WDOG is possible, by unmasking it in SRC, though it must be preceded by servicing the WDOG. However, for the case that the event has been asserted, the status bit (WRSR bit-1) will remain asserted, regardless of servicing the WDOG module.  (Hardware reset is the only way to cause the de-assertion of that bit). Any other code will be coded to 1010 i.e. wdog1_rst_b is not masked  0101 wdog1_rst_b is masked 1010 wdog1_rst_b is not masked
15–14 -	This field is reserved. Reserved

Table continues on the next page...

## SRC\_A7RCR0 field descriptions (continued)

Field	Description
13 A7_ETM_ RESET1	Software reset for core1 ETM only. <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert core1 ETM reset 1 assert core1 ETM reset
12 A7_ETM_ RESET0	Software reset for core0 ETM only. <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert core0 ETM reset 1 assert core0 ETM reset
11–10 -	This field is reserved. Reserved
9 A7_DBG_ RESET1	Software reset for core1 debug only. It initialize the debug, and breakpoint and watchpoint logic in the core1 processor power domain. It also reset the debug logic for core1 processor, which is in the debug power domain. <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert core1 debug reset 1 assert core1 debug reset
8 A7_DBG_ RESET0	Software reset for core0 debug only. It initialize the debug, and breakpoint and watchpoint logic in the core1 processor power domain. It also reset the debug logic for core1 processor, which is in the debug power domain. <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert core0 debug reset 1 assert core0 debug reset
7–6 -	This field is reserved. Reserved
5 A7_CORE_ RESET1	Software reset for core1 only. It initializes the processor logic in the core1 processor power domains, not including the debug, breakpoint and watchpoint logic. <b>NOTE:</b> This is a self clearing bit. Once it is set to 1, the reset process will begin, and once it finishes, this bit will be self cleared.  0 do not assert core1 reset 1 assert core1 reset
4 A7_CORE_ RESET0	Software reset for core0 only. It initializes the processor logic in the core0 processor power domains, not including the debug, breakpoint and watchpoint logic.

**SRC\_SBMR1 field descriptions**

Field	Description
31–24 BOOT_ CFG4[7:0]	Refer to fusemap.
23–16 BOOT_ CFG3[7:0]	Refer to fusemap.
15–8 BOOT_ CFG2[7:0]	Refer to fusemap.
BOOT_ CFG1[7:0]	Refer to fusemap.

### 6.2.7.12 SRC Reset Status Register (SRC\_SRSR)

The SRSR is a write to one clear register which records the source of the reset events for the chip. The SRC reset status register will capture all the reset sources that have occurred. This register is reset on ipp\_reset\_b. This is a read-write register.

For bit[9-0] - writing zero does not have any effect. Writing one will clear the corresponding bit. The individual bits can be cleared by writing one to that bit. When the system comes out of reset, this register will have bits set corresponding to all the reset sources that occurred during system reset. Software has to take care to clear this register by writing one after every reset that occurs so that the register will contain the information of recently occurred reset.

Address: 3039\_0000h base + 5Ch offset = 3039\_005Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## SRC\_SRSR field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9 tempense_rst_b	Temper Sensor software reset. Indicates whether the reset was the result of software reset from on-chip Temperature Sensor.  0 Reset is not a result of software reset from Temperature Sensor. 1 Reset is a result of software reset from Temperature Sensor.
8 wdog4_rst_b	IC Watchdog4 Time-out reset. Indicates whether the reset was the result of the watchdog4 time-out event.  0 Reset is not a result of the watchdog4 time-out event. 1 Reset is a result of the watchdog4 time-out event.
7 wdog3_rst_b	IC Watchdog3 Time-out reset. Indicates whether the reset was the result of the watchdog3 time-out event.  0 Reset is not a result of the watchdog3 time-out event. 1 Reset is a result of the watchdog3 time-out event.
6 jtag_sw_rst	JTAG software reset. Indicates whether the reset was the result of software reset from JTAG.  0 Reset is not a result of software reset from JTAG. 1 Reset is a result of software reset from JTAG.
5 jtag_rst_b	HIGH - Z JTAG reset. Indicates whether the reset was the result of HIGH-Z reset from JTAG.  0 Reset is not a result of HIGH-Z reset from JTAG. 1 Reset is a result of HIGH-Z reset from JTAG.
4 wdog1_rst_b	IC Watchdog1 Time-out reset. Indicates whether the reset was the result of the watchdog time-out event.  0 Reset is not a result of the watchdog1 time-out event. 1 Reset is a result of the watchdog1 time-out event.
3 ipp_user_reset_b	Indicates whether the reset was the result of the ipp_user_reset_b qualified reset.  0 Reset is not a result of the ipp_user_reset_b qualified as COLD reset event. 1 Reset is a result of the ipp_user_reset_b qualified as COLD reset event.
2 csu_reset_b	Indicates whether the reset was the result of the csu_reset_b input.  <b>NOTE:</b> If case the csu_reset_b occurred during a WARM reset process, during the phase that ipg_clk is not available yet, then the occurrence of CSU reset will not be reflected in this bit.  0 Reset is not a result of the csu_reset_b event. 1 Reset is a result of the csu_reset_b event.
1 Reserved	This read-only field is reserved and always has the value 0.
0 ipp_reset_b	Indicates whether reset was the result of ipp_reset_b pin (Power-up sequence)  0 Reset is not a result of ipp_reset_b pin. 1 Reset is a result of ipp_reset_b pin.

### 6.2.7.13 SRC Interrupt Status Register (SRC\_SISR)

Address: 3039\_0000h base + 68h offset = 3039\_0068h

R	0										BT_FUSE_SEL	DIR_BT_DIS	0	SEC_CONFIG[1:0]		
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**SRC\_SBMR2 field descriptions**

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.

*Table continues on the next page...*

## SRC\_SBMR2 field descriptions (continued)

Field	Description
25–24 BMOD[1:0]	BMOD[1:0] shows the latched state of the BOOT_MODE1 and BOOT_MODE0 signals on the rising edge of POR_B. See the Boot mode pin settings section of System Boot.
23–5 Reserved	This read-only field is reserved and always has the value 0.
4 BT_FUSE_SEL	BT_FUSE_SEL (connected to gpio bt_fuse_sel) shows the state of the BT_FUSE_SEL fuse. See Fusemap for additional information on this fuse.
3 DIR_BT_DIS	DIR_BT_DIS shows the state of the DIR_BT_DIS fuse. See Chapter 5, Fusemap for additional information on this fuse.
2 Reserved	This read-only field is reserved and always has the value 0.
SEC_ CONFIG[1:0]	SECONFIG[1] shows the state of the SECONFIG[1] fuse. See Fusemap for additional information on this fuse. SECONFIG[0] shows the state of the SECONFIG[0] fuse. This fuse is shown as reserved in Fusemap (address 0x440[1]) because it does not have a user-relevant function.

## 6.2.7.16 SRC General Purpose Register 1 (SRC\_GPR1)

Address: 3039\_0000h base + 74h offset = 3039\_0074h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## SRC\_GPR1 field descriptions

Field	Description
PERSISTENT_ENTRY0	Holds entry function for core0 for waking-up from low power mode. The SRC ensures that the register value will persist across system resets.

## 6.2.7.17 SRC General Purpose Register 2 (SRC\_GPR2)

Address: 3039\_0000h base + 78h offset = 3039\_0078h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## SRC\_GPR2 field descriptions

Field	Description
PERSISTENT_ARG0	Holds argument of entry function for core0 for waking-up from low power mode. The SRC ensures that the register value will persist across system resets.

### 6.2.7.18 SRC General Purpose Register 3 (SRC\_GPR3)

Address: 3039\_0000h base + 7Ch offset = 3039\_007Ch

#### SRC\_GPR3 field descriptions

Field	Description
PERSISTENT_ENTRY1	Holds entry function for core1. The SRC ensures that the register value will persist across system resets.

### 6.2.7.19 SRC General Purpose Register 4 (SRC\_GPR4)

Address: 3039\_0000h base + 80h offset = 3039\_0080h

#### SRC\_GPR4 field descriptions

Field	Description
PERSISTENT_ARG1	Holds argument of entry function for core1. The SRC ensures that the register value will persist across system resets.

### 6.2.7.20 SRC General Purpose Register 5 (SRC\_GPR5)

Address: 3039\_0000h base + 84h offset = 3039\_0084h

#### SRC\_GPR5 field descriptions

Field	Description
-	Read/write general purpose bits used to store an arbitrary value.

### 6.2.7.21 SRC General Purpose Register 6 (SRC\_GPR6)

Address: 3039\_0000h base + 88h offset = 3039\_0088h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### SRC\_GPR8 field descriptions

Field	Description
-	Read/write general purpose bits used to store an arbitrary value.

### 6.2.7.24 SRC General Purpose Register 9 (SRC\_GPR9)

Reserved for Internal Use.

Address: 3039\_0000h base + 94h offset = 3039\_0094h

#### SRC\_GPR9 field descriptions

Field	Description
-	This field is reserved. Reserved.

### 6.2.7.25 SRC General Purpose Register 10 (SRC\_GPR10)

Address: 3039\_0000h base + 98h offset = 3039\_0098h

## SRC\_GPR10 field descriptions

Field	Description
31–26 -	Read/write bits, for general purpose <b>NOTE:</b> Reset only by POR
25 -	This field is reserved. Reserved.
-	Read/write bits, for general purpose <b>NOTE:</b> Reset only by POR

### 6.2.7.26 SRC DDR Controller Reset Control Register (SRC\_DDRC\_RCR)

#### DDR Controller Reset Control Register

Address: 3039\_0000h base + 1000h offset = 3039\_1000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DOM_EN	LOCK	Reserved				DOMAIN3	DOMAIN2	DOMAIN1	DOMAIN0	Reserved

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved														DDRC_CORE_RST	DDRC_PRST
W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

#### SRC\_DDRC\_RCR field descriptions

Field	Description
31 DOM_EN	<p>Domain Control enable for this register.</p> <p><b>NOTE:</b> [31:30] and [27:24] areas are not controlled by this bit. [31:30] and [27:24] area can be modified by any masters from any domains when Lock bit is not set.</p> <p>0 Disables domain control. All of this register's bits except [31:30] and [27:24] can be modified by any masters</p> <p>1 Enables domain control. All of this register's bits except [31:30] and [27:24] can only be modified by the masters from the domains specified in [27:24] area.</p>

Table continues on the next page...

## SRC\_DDRC\_RCR field descriptions (continued)

Field	Description
30 LOCK	Domain control bits lock <b>NOTE:</b> Lock bit is a write-once register, once it is set to 1, it can't be write to 0 0 [31] and [27:24] bits can be modified 1 [31] and [27:24] bits cannot be modified
29–28 -	This field is reserved. Reserved
27 DOMAIN3	Domain3 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain3. The master from domain3 cannot write to this register. 1 This register is assigned to domain3. The master from domain3 can write to this register
26 DOMAIN2	Domain2 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain2. The master from domain3 cannot write to this register. 1 This register is assigned to domain2. The master from domain3 can write to this register
25 DOMAIN1	Domain1 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain1. The master from domain3 cannot write to this register. 1 This register is assigned to domain1. The master from domain3 can write to this register
24 DOMAIN0	Domain0 assignment control. Effective when dom_en is set to 1. 0 This register is not assigned to domain0. The master from domain3 cannot write to this register. 1 This register is assigned to domain0. The master from domain3 can write to this register
23–2 -	This field is reserved. Reserved
1 DDRC_CORE_ RST	DDR Controller core_ddrc_rstn and aresetn. This bit is set to 1 automatically when fastmix is powered off. 0 De-assert DDR controller aresetn and core_ddrc_rstn 1 Assert DDR Controller preset and DDR PHY reset
0 DDRC_PRST	DDR Controller preset and DDR PHY reset. This bit is set to 1 automatically when fastmix is powered off. <b>NOTE:</b> This reset can only be released when DDR Controller clock inputs are active and stable for 30 cycles 0 De-assert DDR Controller preset and DDR PHY reset 1 Assert DDR Controller preset and DDR PHY reset

## 6.3 Fusemap

### 6.3.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by BOOT\_CFG[15:12] fuses listed in [Table 6-10](#).

**Table 6-10. Boot Device Select**

Boot Device	BOOT_CFG[15]	BOOT_CFG[14]	BOOT_CFG[13]	BOOT_CFG[12]	BOOT_CFG[11]
SD/eSD	0	0	0	1	x
MMC/eMMC	0	0	1	0	x
NAND	0	0	1	1	x
QSPI	0	1	0	0	x
EIM	0	1	0	1	Memory Type: 0 - NOR Flash 1 - OneNAND
SPI/NOR	0	1	1	0	x

### NOTE

Fuses marked as “Reserved” are reserved for Freescale internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either 0 or 1.

**Table 6-11. SD/eSD Boot Fusemap**

Addr	7	6	5	4	3	2	1	0
0x470[7:0]	Fast Boot: 0 - Regular 1 - Fast Boot	Reserved		Bus Width: 0 - 1-bit 1 - 4-bit	Speed 000 - Normal/SDR12 001 - High/SDR25 010 - SDR50 011 - SDR104 101 - Reserved for DDR50 Others - Reserved			Reserved

## 6.3.3 Fusemap Descriptions Table

**Table 6-19. Fusemap Descriptions**

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
0x400[1:0]	TESTER_LOCK	2			OCOTP
0x400[3:2]	BOOT_CFG_LOCK	2	Perform lock on BOOT related fuses.	0 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded IIM register) 1 - Lock (The controlled field can be read or sensed only)	OCOTP
0x400[10]	SJC_RESP_LOCK	1			OCOTP
0x400[15:14]	MAC_ADDR_LOCK	2	Lock MAC_ADDR fuses.		OCOTP
0x400[21:20]	GP1_LOCK	2	Lock for General Purpose fuse register #1 (GP1)		OCOTP

Table continues on the next page...

**Table 6-19. Fusemap Descriptions (continued)**

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
0x400[23:22]	GP2_LOCK	2	Lock for General Purpose fuse register #2 (GP2)		OCOTP
0x400[9]	SRK_LOCK	1	Locking SRK_HASH[255:0]		OCOTP
0x410[31:0]	[31:0] in LOT_NO_ENC[42:0](SJC_CHALL/UNIQUE_ID[42:0])	32	FSL-wide unique, encoded LOT ID STD II/SJC CHALLENGE/ Unique ID		SJC, SW
0x420[10:0]	[42:32] in LOT_NO_ENC[42:0](SJC_CHALL/UNIQUE_ID[42:0])	11	FSL-wide unique, encoded LOT ID STD II/SJC CHALLENGE/ Unique ID		SJC, SW
0x420[15:11]	WAFER_NO[4:0] ( SJC_CHALL[47:43] / UNIQUE_ID[47:43] )	5	The wafer number of the wafer on which the device was fabricated/SJC CHALLENGE/ Unique ID		SJC, SW
0x420[23:16]	DIE-Y-CORDINATE[7:0] ( SJC_CHALL[55:48] / UNIQUE_ID[55:48] )	8	The Y-coordinate of the die location on the wafer/SJC CHALLENGE/ Unique ID		SJC, SW
0x420[31:24]	DIE-X-CORDINATE[7:0] ( SJC_CHALL[63:56] / UNIQUE_ID[63:56] )	8	The X-coordinate of the die location on the wafer/SJC CHALLENGE/ Unique ID		SJC, SW
0x440[3:0]	SI_REV[3:0]	4	Silicon Revision number. Can be used in conjunction with HW value set in GPR registers. (gpr4[15:8])		SW
0x440[9:8]	SPEED_GRADING[1:0]	2	Burned by tester program, for indicating IC core speed. (Hot burn may not be used).	FCA[5:4] FHA[3:2] FRAL[1:0] MHz P/N Code xx xx 00 800 08 xx xx 01 500 05 xx xx 10 1000 10 xx xx 11 1200 12	PROD / SW
0x450[0]	NUM_A7_CORES	1	Indicates the type of device : 1x cores or 2x cores.	'0' - 2x A7 Cores '1' - 1x A7 Cores	SRC, SJC, SW
0x450[8]	M4_DISABLE	1	Disable M4 Core.	0 - enabled 1 - disabled	M4
0x450[9]	M4_MPU_DISABLE	1	Disable M4 MPU IP.	0 - enabled 1 - disabled	M4
0x450[10]	M4_FPU_DISABLE	1	Disable M4 FPU IP.	0 - enabled 1 - disabled	M4
0x450[21]	FLEXCAN_DISABLE	1	Disable FlexCAN IP.	0 - enabled 1 - disabled	FLEXCAN
0x450[22]	ADC_DISABLE	1	Disable ADC IP.	0 - enabled 1 - disabled	ADC
0x450[23]	PCIE_DISABLE	1	Disable PCIe IP.	0 - enabled 1 - disabled	PCIE

Table continues on the next page...

Table 6-19. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
0x450[24]	LCDIF_DISABLE	1	Disable LCDIF IP.	0 - enabled 1 - disabled	LCDIF
0x450[25]	CSI_DISABLE	1	Disable CSI IP.	0 - enabled 1 - disabled	CSI
0x450[26]	PXP_DISABLE	1	Disable PXP IP	0 - enabled 1 - disabled	PXP
0x450[27]	PXP_WFE_DISABLE	1	Disable WFE Module in PXP IP	0 - enabled 1 - disabled	PXP
0x450[28]	EPDC_DISABLE	1	Disable EPDC IP.	0 - enabled 1 - disabled	EPDC
0x450[29]	ENET1_DISABLE	1	Disable ENET IP 1st instance.	0 - enabled 1 - disabled	ENET 1
0x450[30]	ENET2_DISABLE	1	Disable ENET IP 2nd instance.	0 - enabled 1 - disabled	ENET 2
0x450[31]	MIPI_DISABLE	1	Disable MIPI IP.	0 - enabled 1 - disabled	MIPI
0x470[19:0]	BOOT_CFG	20	BOOT configuration register, Usage varies, depending on selected boot device.	See "Boot" sheet	SRC SW(ROM)
0x470[25]	SEC_CONFIG[1]	1	Security Configuration (with SEC_CONFIG[0])	00 - FAB (Open) 01 - Open - allows any code to be flashed and executed, even if it has no valid signature. 1x - Closed (Security On)	SW (ROM), SRC, SNVS, TPSMP
0x470[27]	DIR_BT_DIS	1	Direct External Memory Boot Disable	0 - Direct boot from external memory is allowed 1 - Direct boot from external memory is not allowed	SRC SW(ROM)
0x470[28]	BT_FUSE_SEL	1	Determines, whether using fuses for boot configuration, or GPIO /Serial loader.	If boot_mode="00" (Development) 0=Boot mode configuration is taken from GPIOs. 1=Boot mode configuration is taken from fuses. If boot_mode="10" (Production) 0 - Boot using Serila Loader (USB) 1- Boot mode configuration is taken from fuses.	SRC SW(ROM)
0x470[29]	FORCE_COLD_BOOT(SBMR)	1	Force cold boot when A7 core come out of reset. Reflected in SBMR reg of SRC	Fuse Function: 0 – Default behavior equivalent to the rest of the i.MX6 family allowing a fast recovery from low power modes. That is, the ROM is allowed to jump to the address previously programmed in the SRC persistent register. 1 – Fast recovery path in the ROM is not allowed and a cold boot is always performed. Customers wanting a higher level of security should burn this fuse.	SRC SW(ROM)

## 6.4 On-Chip OTP Controller (OCOTP\_CTRL)

### 6.4.1 Overview

This section contains information describing the requirements for the on-chip eFuse OTP controller along with details about the block functionality and implementation.

In this document, the words "eFuse" and "OTP" are interchangeable. OCOTP refers to the hardware block itself.

### 6.4.1.1 Features

The OCOTP provides the following features :

- 16 128-bit fuse bank.
- Bank based, restricted program, and read to 4 kbit of eFuse OTP.
- Loading and housing of fuse content into shadow registers.
- Memory-mapped (restricted) access to 4 kbit of shadow registers.
- Generation of HWV\_FUSE (hardware visible fuse bus) and the HWV\_REG bus which is made of up of volatile PIO register based "fuses". The HWV\_REG bits come from the SCS (Software Controllable Signals) register.
- Generation of STICKY\_REG which is consist of sticky register bits.
- Provide program-protect and read-protect eFuse.
- Provide override and read protection of shadow register.
- CRC32 test for read-lock fuse content.

### 6.4.2 Clocks

The table found here describes the clock sources for OCOTP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 6-20. OCOTP Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock

### 6.4.3 Top-Level Symbol and Functional Overview

The figure found here shows the OCOTP system level diagram.

Figure 6-11. OCOTP System Level Diagram

#### 6.4.3.1 Operation

The IP bus interface of the OCOTP provides two functions.

- Configure control registers for programming and reading fuse bank.
- Override and read shadow registers.

4-kbit fuses are physically divided into 16 128-bit fuse banks. Each fuse bank contains four words. OCOTP configuration for program and read are performed on fuse bank. For write, the four program words HW\_OCOTP\_DATA<sub>x</sub> (x = 0, 1, 2, 3) reflects the "write-mask". Bit fields with 0 are not programmed and bit fields with 1 are programmed. OCOTP programs bit field with 1 in the fuse words bit by bit. For reads, OCOTP read 4 fuse words in same fuse bank and put 4 read fuse words into HW\_OCOTP\_READ\_FUSE\_DATA<sub>x</sub> (x = 0, 1, 2, 3).

### 6.4.3.1.1 Shadow Register Reload

All fuse words in fuse bank are shadowed. Therefore, fuse information is available through memory mapped shadow registers. If fuses are subsequently programmed, the shadow registers should be reloaded to keep them coherent with the fuse bank arrays.

The "reload shadows" feature allows the user to force a reload of the shadow registers (including HW\_OCOTP\_LOCK) without having to reset the device. To force a reload, complete the following steps:

1. Check that HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read or reload must be completed before a new access can be requested.
2. Set the HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] bit. OCOTP will read all the fuse banks one by one and put it into corresponding shadow register.
3. Wait for HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] to be cleared by the controller.

The controller will automatically clear the HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] bit after the successful completion of the operation.

### 6.4.3.1.2 Fuse and Shadow register read

All shadow registers are always readable through the APB bus except some secret keys regions. When their corresponding fuse lock bits are set, the shadow registers also become read locked. After read locking, reading from these registers will return 0xBADABADA.

In addition HW\_OCOTP\_CTRL[ERROR] will be set. It must be cleared by software before any new write, read or reload access can be issued. Subsequent reads to unlocked shadow locations will still work successfully however.

To read fuse words directly from fuse bank correctly complete the following steps:

1. Check that HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read or reload must be completed before a read access can be requested.
2. Write the requested fuse bank number (0 -15) to HW\_OCOTP\_CTRL[ADDR].
3. Set HW\_OCOTP\_READ\_CTRL[READ\_FUSE] to 1. OCOTP read whole 128 bits fuse content in the fuse bank which is assigned by HW\_OCOTP\_CTRL[ADDR]. Then put read value into HW\_OCOTP\_READ\_FUSE\_DATAx (x = 0, 1, 2, 3) registers.
4. If all the 4 fuse words in the fuse bank are read protected or locked, a read request will result in no OTP access and no setting in HW\_OCOTP\_CTRL[BUSY]. In addition HW\_OCOTP\_CTRL[ERROR] is set. It must be cleared by software before

any new access issued. If only some fuse words in the fuse bank are read protected or locked, controller read unprotected fuse words and assert HW\_OCOTP\_CTRL[BUSY]. Once completed, the controller clears HW\_OCOTP\_CTRL[BUSY].

5. Read HW\_OCOTP\_READ\_FUSE\_DATA<sub>x</sub> (x = 0, 1, 2, 3 ) registers to acquire the fuse word value. HW\_OCOTP\_READ\_FUSE\_DATA<sub>x</sub> (x = 0, 1, 2, 3) is 0xBADABADA if read fuse lock bit is programmed.

### 6.4.3.1.3 Fuse and Shadow Register Writes

Shadow register bits can be overridden by software until the corresponding fuse lock bit for the region is set. When the lock shadow bit is set, the shadow registers for that lock region become write locked. The LOCK shadow register also has no shadow or fuse lock bits but it is always read only.

In order to avoid "rogue" code performing erroneous writes to OTP, a special unlocking sequence is required for writes to the fuse banks. To program fuse bank correctly complete the following steps:

1. Program HW\_OCOTP\_TIMING[STROBE\_PROG] and HW\_OCOTP\_TIMING[FSOURCE] fields with timing values to match the current frequency of the ipg\_clk. OTP writes will work at maximum bus frequencies as long as the HW\_OCOTP\_TIMING parameters are set correctly.
2. Check that HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write or reload must be completed before a write access can be requested.
3. Write the requested fuse bank number to HW\_OCOTP\_CTRL[ADDR] and program the unlock code into HW\_OCOTP\_CTRL[WR\_UNLOCK]. This must be programmed for each write access. The lock code is documented in the register description. Both the unlock code and address can be written in the same operation.
4. Write the program data to the HW\_OCOTP\_DATA<sub>x</sub> (x = 0, 1, 2, 3) register. The HW\_OCOTP\_DATA<sub>0</sub> must be written at last. After HW\_OCOTP\_DATA<sub>0</sub> is written, OCOTP automatically set HW\_OCOTP\_CTRL[BUSY] and clears HW\_OCOTP\_CTRL[WR\_UNLOCK]. Bit fields with 1's will result in that OTP bit being programmed. Bit fields with 0's will be ignored. At the same time that the write is accepted, the controller makes an internal copy of HW\_OCOTP\_CTRL[ADDR] which cannot be updated until the next write sequence is initiated. This copy guarantees that erroneous writes to HW\_OCOTP\_CTRL[ADDR] will not affect an active write operation.
5. If all the 4 fuse words in the fuse bank are program protected or locked, the write request will result in no OTP access and no setting of HW\_OCOTP\_CTRL[BUSY]. In addition HW\_OCOTP\_CTRL[ERROR] will be set. It must be cleared by software

before any new write access issued. If only part of fuse words in the fuse bank are program protected or locked, there are two kinds of cases.

- a. The program data for unprotected fuse words are all 0.

In this case, the write request will result in no OTP access and no setting of HW\_OCOTP\_CTRL[BUSY]. In addition HW\_OCOTP\_CTRL[ERROR] will be set. It must be cleared by software before any new write access issued. It is for protecting OTP and reducing unnecessary program operation for OTP.

- b. The program data for unprotected fuse words are not 0.

OCOTP will only program unprotected fuse words and assert HW\_OCOTP\_CTRL[BUSY]. Once completed, the controller clears HW\_OCOTP\_CTRL[BUSY].

It should be noted that write latencies to OTP are numbers of 10 micro-seconds. Write latencies is based on amount of bit filed which is 1. For example : program half fuse bits in one word need 10 us x 16.

#### **NOTE**

The program times for one fuse bank are limited. It is better to program all the 4 fuse words in one fuse bank at one program operation.

For further details of OTP read/write operations see [eFUSE].

HW\_OCOTP\_CTRL[ERROR] will be set under the following conditions:

- A write is performed to a shadow register during a shadow reload (essentially, while HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] is set. In addition, the contents of the shadow register shall not be updated.
- A write is performed to a shadow register which has been locked.
- A read is performed to from a shadow register which has been read locked.
- A program is performed to a fuse bank which all the fuse words has been program locked or all the program data for program unlocked region are all 0.
- A read is performed to from a fuse bank which all the fuse words has been read locked.

#### **6.4.3.1.4 Write Postamble**

Due to internal electrical characteristics of the OTP during writes, all OTP operations following a write must be separated by 2 us after the clearing of HW\_OCOTP\_CTRL\_BUSY following the write. This guarantees programming voltages on-chip to reach a steady state when exiting a write sequence. This includes reads, shadow reloads, or other writes.

A recommended software sequence to meet the postamble requirements is as follows:

- Issue the write and poll for BUSY (as per [Fuse Shadow Memory Footprint](#)).
- Once BUSY is clear, use `HW_DIGCTL_MICROSECONDS` to wait 2 us.
- Perform the next OTP operation.

### 6.4.3.2 Fuse Shadow Memory Footprint

The OTP memory footprint shows in the following figure. The registers are grouped by lock region. Their names correspond to the PIO register and fusemap names.

i.MX 7Dual Applications Processor Reference Manual, Rev. 0.1, 08/2016

### 6.4.3.3 OTP Read/Write Timing Parameters

There are two timing fields contained in the HW\_OCOTP\_TIMING register that specify counter limit values, which are used to specify the FSOURCE and PROG signal timing.

Both two timing parameters are specified in ipg\_clk cycles. Since the ipg\_clk frequency can be set to a range of values, these parameters must be adjusted with the clock to yield the appropriate delay.

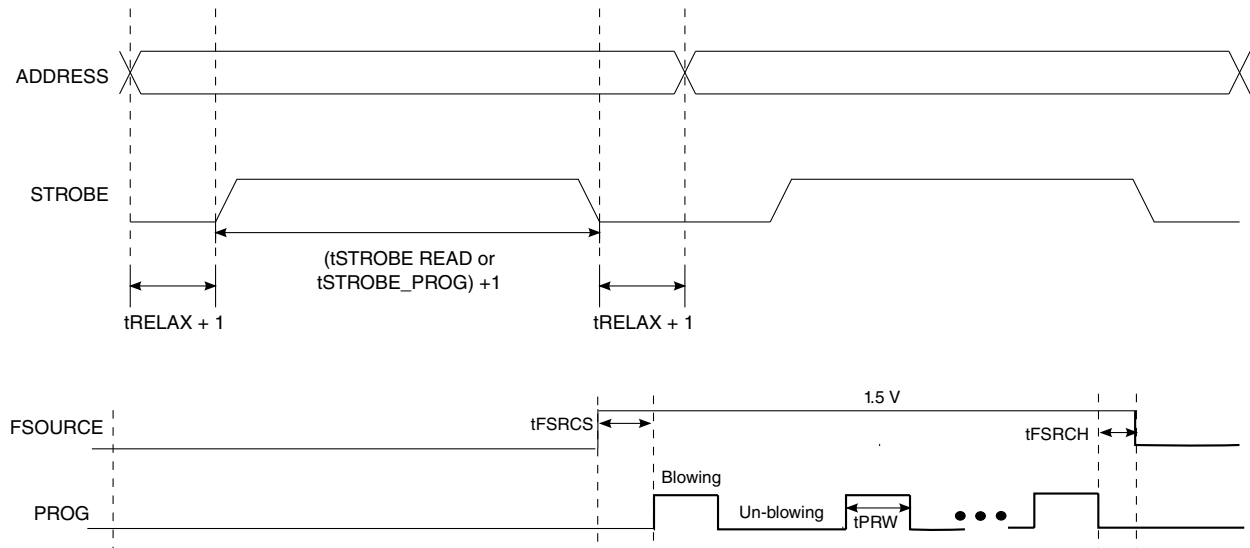

The HW\_OCOTP\_TIMING[PROG] field specifies the period of the RPOG signal for fuse writes and given in units of ipg\_clk cycles. This value is specified, so that the requirement for the time when the PROG signal is asserted high is met:  $9900 \text{ ns} < t_{PRW} < 10100 \text{ ns}$ . Even though a range is given for  $t_{PRM}$ , it is recommended that to program [eFUSE] for a value of 10000 ns. Therefore, this field can be set according to the following equation:

$$t_{PGM} = (\text{HW\_OCOTP\_TIMING}[\text{PROG}] - 1) / \text{ipg\_frequency} = 10000 \text{ ns}$$

The HW\_OCOTP\_TIMING[FSOURCE] field specifies the setup and hold time between FSOURCE signal and PROG signal for fuse writes and given in units of ipg\_clk cycles. This field can be set according to the following equation:

$$t_{FSRCS} = t_{FSRCH} = (\text{HW\_OCOTP\_TIMING}[\text{FSOURCE}] - 1) / \text{ipg\_frequency} > 1000 \text{ ns} .$$

The following figure illustrates the relationship between the PROG and FSOURCE signal in programming mode, as well as the timing PIO register fields that affect it.

**Figure 6-13. FSOURCE and PROG Signal Timing**

#### 6.4.3.4 Hardware Visible Fuses

The `hwv_fuse` bus emanates from the OCOTP block and goes to various other blocks inside the chip. This bus is made up of all the shadow register bits for all the 16 fuse banks.

Only a subset of these fuse bits are currently used by the hardware. The fuse bits are initially copied from the fuse banks after reset is deasserted. When all fuse bits are loaded into their shadow registers, the OCOTP asserts the `fuse_latched` output signal.

The `hwv_reg` bus also comes from the OCOTP. Its source is the `HW_OCOTP_SCS` register. This register has 1 defined bit, the `HAB_JDE` bit, that is connected to the SJC block. The SCS bits are intended to be used as volatile fuse bits under software control. Additional bits will be defined as needed in future implementations.

The system-wide reset sequence must be coordinated by the system reset controller, so that the `hwv_fuse` and `hwv_reg` buses are stable and reflect the values of the fuses before they are used by the rest of the system.

### 6.4.3.5 Behavior During Reset

The OCOTP is always active. The shadow registers automatically load the appropriate OTP contents after reset is deasserted. During this load-time HW\_OCOTP\_CTRL\_BUSY is set. The load time is similar to that of a "reload shadow" operation.

### 6.4.3.6 Secure JTAG control

The JTAG control fuses are used to allow or disallow JTAG access to secured resources. Three JTAG security levels are envisioned, as shown in the table below.

**Table 6-21. JTAG Security Level Control Bits**

Security Mode	JTAG_SMODE	Description
No Debug	2'b11	The highest security level.
Secure JTAG	2'b01	Limit the JTAG access by using key based authentication mechanism.
JTAG Enable	2'b00	Low Security, all JTAG features are enabled.

## 6.4.4 Fuse Map

See the Fusemap chapter of this reference manual for more information.

## 6.4.5 OCOTP Memory Map/Register Definition

OCOTP Hardware Register Format Summary

**OCOTP memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 6.4.5.1 OTP Controller Control Register (OCOTP\_CTRLn)

The OCOTP Control and Status Register specifies the copy state, as well as the control required for random access of the OTP memory

OCOTP\_CTRL: 0x000

OCOTP\_CTRL\_SET: 0x004

OCOTP\_CTRL\_CLR: 0x008

OCOTP\_CTRL\_TOG: 0x00C

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR\_UNLOCK, ADDR, and BUSY / ERROR may be used in conjunction with the HW\_OCOTP\_DATAn (n = 0, 1, 2, 3) register to perform write operations. Read operations to the On-Chip OTP are involving ADDR, BUSY / ERROR bit field and HW\_OCOTP\_READ\_CTRL register. Read value is saved in HW\_OCOTP\_READ\_FUSE\_DATAn (n = 0, 1, 2, 3) register.

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 0h offset + (4d × i), where i=0d to 3d

**OCOTP\_CTRLn field descriptions**

Field	Description
31–16 WR_UNLOCK	Write 0x3E77 to enable OTP write accesses.  <b>NOTE:</b> This register must be unlocked on a write-by-write basis (a write is initiated when HW_OCOTP_DATA is written), so the UNLOCK bit must contain the correct key value during all writes to HW_OCOTP_DATA, otherwise a write is not initiated. This field is automatically cleared after a successful write completion (clearing of BUSY).  0x3E77 <b>KEY</b> — Key needed to unlock HW_OCOTP_DATA register.
15–13 RSVD1	This field is reserved.  This read-only field is reserved and always has the value 0.
12 CRC_FAIL	Set by controller when calculated CRC value is not equal to appointed CRC fuse word.

Table continues on the next page...

**OCOTP\_CTRLn field descriptions (continued)**

Field	Description
11 CRC_TEST	Set to calculate CRC32 according to start address and end address in CRC_ADDR register. Then compare with CRC fuse word according CRC address in CRC_ADDR register to generate CRC_FAIL flag. This operation automatically set Busy. Once CRC test is finished, BUSY and CRC_TEST are automatically cleared by the controller.
10 RELOAD_SHADOWS	Set to force re-loading all the shadow registers (HW / SW capability and LOCK). This operation automatically set BUSY. Once the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.
9 ERROR	Set by the controller when an access to a locked region (OTP or shadow register) is requested. Must be cleared before any further access performed. This bit can only be set by the controller. This bit is also set if the Pin interface is active and software requests an access to the OTP. For instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a 1 to the SCT clear address space and not by a general write.
8 BUSY	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.
7-4 RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
ADDR	OTP write and read access address register. Specifies one of 16 128 bits OTP locations (bank 0x0 ~ 0xF). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

**6.4.5.2 OTP Controller Timing Register (OCOTP\_TIMING)**

This register specifies timing parameters of programming and reading the OCOTP fuse array.

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 10h offset = 3035\_0010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSRVD0												FSOURCE				PROG															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	1	0	1	0	0	0	1	1	0	0	0	0	1	0	0	1	0	1	0	0	1	1	0	0	1

**OCOTP\_TIMING field descriptions**

Field	Description
31-20 RSRVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
19-12 FSOURCE	This count value specifies FSOURCE to PROG setup / hold time. $tFSRCS = tFSRCH = (FSOURCE + 1) / IPG\_CLK\_FREQ$ . It is given in number of IPG_CLK periods.

Table continues on the next page...

**OCOTP\_TIMING field descriptions (continued)**

Field	Description
PROG	This count value specifies the strobe period in one time write OTP. $t_{PRW} = (PROG - 1) / IPG\_CLK\_FREQ$ . It is given in number of IPG_CLK periods.

**6.4.5.3 OTP Controller Write Data Register (OCOTP\_DATA0)**

This register associates with HW\_OCOTP\_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 20h offset = 3035\_0020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**OCOTP\_DATA0 field descriptions**

Field	Description
DATA0	The program data for first fuse word in one 128 bits OTP. It is used to initiate a write to OTP. Please see the "Software Write Sequence" section for operating details.

**6.4.5.4 OTP Controller Write Data Register (OCOTP\_DATA1)**

This register associates with HW\_OCOTP\_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 30h offset = 3035\_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**OCOTP\_DATA1 field descriptions**

Field	Description
DATA1	The program data for second fuse word in one 128 bits OTP.

### 6.4.5.5 OTP Controller Write Data Register (OCOTP\_DATA2)

This register associates with HW\_OCOTP\_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 40h offset = 3035\_0040h

#### OCOTP\_DATA2 field descriptions

Field	Description
DATA2	The program data for third fuse word in one 128 bits OTP.

### 6.4.5.6 OTP Controller Write Data Register (OCOTP\_DATA3)

This register associates with HW\_OCOTP\_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 50h offset = 3035\_0050h

#### OCOTP\_DATA3 field descriptions

Field	Description
DATA3	The program data for the last fuse word in one 128 bits OTP.

### 6.4.5.7 OTP Controller Write Data Register (OCOTP\_READ\_CTRL)

This register associates with HW\_OCOTP\_CTRL to perform one time read to the OTP. Please see the "Software read Sequence" section for operating details.

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 60h offset = 3035\_0060h

**OCOTP\_READ\_CTRL field descriptions**

Field	Description
31–1 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.
0 READ_FUSE	Used to initiate a read to OTP. Please see the "Software read Sequence" section for operating details.

**6.4.5.8 OTP Controller Read Data Register (OCOTP\_READ\_FUSE\_DATA0)**

**EXAMPLE**

Empty Example.

## On-Chip OTP Controller (OCOTP\_CTRL)

Address: 3035\_0000h base + 70h offset = 3035\_0070h

### OCOTP\_READ\_FUSE\_DATA0 field descriptions

Field	Description
DATA0	The first fuse word data read from one OTP.

## 6.4.5.9 OTP Controller Read Data Register (OCOTP\_READ\_FUSE\_DATA1)

### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 80h offset = 3035\_0080h

### OCOTP\_READ\_FUSE\_DATA1 field descriptions

Field	Description
DATA1	The second fuse word data read from one OTP.

## 6.4.5.10 OTP Controller Read Data Register (OCOTP\_READ\_FUSE\_DATA2)

### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 90h offset = 3035\_0090h

### OCOTP\_READ\_FUSE\_DATA2 field descriptions

Field	Description
DATA2	The third fuse word data read from one OTP.

### 6.4.5.11 OTP Controller Read Data Register (OCOTP\_READ\_FUSE\_DATA3)

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + A0h offset = 3035\_00A0h

#### OCOTP\_READ\_FUSE\_DATA3 field descriptions

Field	Description
DATA3	The last fuse word data read from one OTP.

### 6.4.5.12 Sticky bit Register (OCOTP\_SW\_STICKY)

Some sticky bits are used by software to lock some fuse area, shadow registers, and other features.

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + B0h offset = 3035\_00B0h

## On-Chip OTP Controller (OCOTP\_CTRL)

### OCOTP\_SW\_STICKY field descriptions

Field	Description
31–3 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
2 FIELD_RETURN_LOCK	Shadow register write and OTP write lock for FIELD_RETURN region. When set, the writing of this region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
1 SRK_REVOKE_LOCK	Shadow register write and OTP write lock for SRK_REVOKE region. When set, the writing of this region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
0 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.

### 6.4.5.13 Software Controllable Signals Register (OCOTP\_SCSn)

OCOTP\_SCS: 0x0C0

OCOTP\_SCS\_SET: 0x0C4

OCOTP\_SCS\_CLR: 0x0C8

OCOTP\_SCS\_TOG: 0x0CC

This register holds volatile configuration values that can be set and locked by verified software. All values are back to their default values after POR.

### EXAMPLE

Empty Example.

Address: 3035\_0000h base + C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SPARE															HAB_JDE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### OCOTP\_SCSn field descriptions

Field	Description
31 LOCK	When set, all of the bits in this register are locked and cannot be changed during SW programming. This bit is only reset after a POR is issued.
30–1 SPARE	Unallocated read / write bits of implementation for specific software use.
0 HAB_JDE	<p>HAB JTAG Debug Enable.</p> <p>This bit is used by the HAB to enable JTAG debugging, assuming that a properly signed command to do it, so it can be found and validated by the HAB.</p> <p>The HAB must lock the register before passing control to the OS depend on whether JTAG debugging has been enabled.</p> <p>Once JTAG is enabled by this bit, it cannot be disabled unless the system is reset by POR.</p> <p>0 JTAG debugging is not enabled by the HAB (it can be enabled by other mechanisms).</p> <p>1 JTAG debugging is enabled by the HAB (though this signal may be gated off).</p>

#### 6.4.5.14 OTP Controller CRC test address (OCOTP\_CRC\_ADDR)

The OCOTP Data Register is used for OTP Read

### EXAMPLE

Empty Example.

## On-Chip OTP Controller (OCOTP\_CTRL)

Address: 3035\_0000h base + D0h offset = 3035\_00D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD0														CRC_ADDR	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DATA_END_ADDR								DATA_START_ADDR							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### OCOTP\_CRC\_ADDR field descriptions

Field	Description
31–18 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.
17–16 CRC_ADDR	Address of 32-bit CRC result is for comparing.
15–8 DATA_END_ADDR	End address of fuse word location is for CRC calculation.
DATA_START_ADDR	Start address of fuse word location is for CRC calculation.

## 6.4.5.15 OTP Controller CRC Value Register (OCOTP\_CRC\_VALUE)

The CRC32 value is based on CRC\_ADDR.

### EXAMPLE

Empty Example.

Address: 3035\_0000h base + E0h offset = 3035\_00E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R	DATA																																															
W																																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### OCOTP\_CRC\_VALUE field descriptions

Field	Description
DATA	The CRC32 value is based on CRC_ADDR.

### 6.4.5.16 OTP Controller Version Register (OCOTP\_VERSION)

This register always returns a known read value for debug purposes. It indicates the version of the block.

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + F0h offset = 3035\_00F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W	[Shaded]																															
Reset	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### OCOTP\_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only values reflect the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only values reflect the MINOR field of the RTL version.
STEP	Fixed read-only values reflect the stepping of the RTL version.

### 6.4.5.17 Value of OTP Bank0 Word0 (Lock controls) (OCOTP\_LOCK)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS]

#### EXAMPLE

Empty Example.

## On-Chip OTP Controller (OCOTP\_CTRL)

Address: 3035\_0000h base + 400h offset = 3035\_0400h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	CRC_GP2		CRC_GP1		RSVD2				GP2		GP1		RSVD1		ROM_PATCH	MAU_KEY
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAC_ADDR		USB_ID		RSVD0	SJC_RESP	SRK	OTPMK	ANALOG		MEM_TRIM		BOOT_CFG		TESTER	
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### OCOTP\_LOCK field descriptions

Field	Description
31–30 CRC_GP2	Status of shadow register write and read, OTP write and read lock for CRC_GP2 region. When bit 1 is set, the reading and writing of this region's OTP fuse and reading of shadow register are blocked. When bit 0 is set, the writing of this region's shadow register and OTP fuse are blocked.
29–28 CRC_GP1	Status of shadow register write and read, OTP write and read lock for CRC_GP1 region. When bit 1 is set, the reading and writing of this region's OTP fuse and reading of shadow register are blocked. When bit 0 is set, the writing of this region's shadow register and OTP fuse are blocked.
27–24 RSVD2	This field is reserved.  This read-only field is reserved and always has the value 0.
23–22 GP2	Status of shadow register and OTP write lock for GP2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

Table continues on the next page...

**OCOTP\_LOCK field descriptions (continued)**

Field	Description
21–20 GP1	Status of shadow register and OTP write lock for GP1 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
19–18 RSVD1	This field is reserved.  This read-only field is reserved and always has the value 0.
17 ROM_PATCH	Status of shadow register and OTP write lock for ROM_PATCH region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
16 MAU_KEY	Status of shadow register read and write, OTP read and write lock for MANUFACTURE_KEY region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
15–14 MAC_ADDR	Status of shadow register and OTP write lock for MAC_ADDR region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
13–12 USB_ID	Status of shadow register and OTP write lock for USB_ID region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
11 RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
10 SJC_RESP	Status of shadow register read and write, OTP read and write lock for SJC_RESP region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
9 SRK	Status of shadow register and OTP write lock for SRK region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
8 OTPMK	Status of shadow register read and write, OTP read and write lock for OTPMK region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
7–6 ANALOG	Status of shadow register and OTP write lock for analog region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
5–4 MEM_TRIM	Status of shadow register and OTP write lock for MEM_TRIM region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
3–2 BOOT_CFG	Status of shadow register and OTP write lock for BOOT_CFG region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
TESTER	Status of shadow register and OTP write lock for tester region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

**6.4.5.18 Value of OTP Bank0 Word1 (Tester Information) (OCOTP\_TESTER0)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting `HW_OCOTP_CTRL[RELOAD_SHADOWS]`.

**EXAMPLE**

## On-Chip OTP Controller (OCOTP\_CTRL)

Empty Example.

Address: 3035\_0000h base + 410h offset = 3035\_0410h

### OCOTP\_TESTER0 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 0, word 1. These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

### 6.4.5.19 Value of OTP Bank0 Word2 (Tester Information) (OCOTP\_TESTER1)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 420h offset = 3035\_0420h

### OCOTP\_TESTER1 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 0, word 2. These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

### 6.4.5.20 Value of OTP Bank0 Word3 (Tester Information) (OCOTP\_TESTER2)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 430h offset = 3035\_0430h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### OCOTP\_TESTER2 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 0, word 3. These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

### 6.4.5.21 Value of OTP Bank1 Word0 (Tester Information) (OCOTP\_TESTER3)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 440h offset = 3035\_0440h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### OCOTP\_TESTER3 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 1, word 0. These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

### 6.4.5.22 Value of OTP Bank1 Word1 (Tester Information) (OCOTP\_TESTER4)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

## On-Chip OTP Controller (OCOTP\_CTRL)

Address: 3035\_0000h base + 450h offset = 3035\_0450h

### OCOTP\_TESTER4 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 1, word 1. These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

### 6.4.5.23 Value of OTP Bank1 Word2 (Tester Information) (OCOTP\_TESTER5)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 460h offset = 3035\_0460h

### OCOTP\_TESTER5 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 1, word 2. These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

### 6.4.5.24 Value of OTP Bank1 Word3 (Boot Configuration Information) (OCOTP\_BOOT\_CFG0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS]

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 470h offset = 3035\_0470h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### OCOTP\_BOOT\_CFG0 field descriptions

Field	Description
BITS	It reflects value of OTP Bank 1, word 3. These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

#### 6.4.5.25 Value of OTP Bank2 Word0 (Boot Configuration Information) (OCOTP\_BOOT\_CFG1)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 480h offset = 3035\_0480h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### OCOTP\_BOOT\_CFG1 field descriptions

Field	Description
BITS	It reflects value of OTP bank 2, word 0. These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

#### 6.4.5.26 Value of OTP Bank2 Word1 (Boot Configuration Information) (OCOTP\_BOOT\_CFG2)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

## On-Chip OTP Controller (OCOTP\_CTRL)

Address: 3035\_0000h base + 490h offset = 3035\_0490h

### OCOTP\_BOOT\_CFG2 field descriptions

Field	Description
BITS	It reflects value of OTP bank 2, word 1. These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

## 6.4.5.27 Value of OTP Bank2 Word2 (Boot Configuration Information) (OCOTP\_BOOT\_CFG3)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 4A0h offset = 3035\_04A0h

### OCOTP\_BOOT\_CFG3 field descriptions

Field	Description
BITS	It reflects value of OTP bank 2, word 2. These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

## 6.4.5.28 Value of OTP Bank2 Word3 (BOOT Configuration Information) (OCOTP\_BOOT\_CFG4)

After reset, it copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 4B0h offset = 3035\_04B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### OCOTP\_BOOT\_CFG4 field descriptions

Field	Description
BITS	It reflects value of OTP bank 2, word 3. These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

#### 6.4.5.29 Value of OTP Bank3 Word0 (Memory Related Information) (OCOTP\_MEM\_TRIM0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 4C0h offset = 3035\_04C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### OCOTP\_MEM\_TRIM0 field descriptions

Field	Description
BITS	It reflects value of OTP bank 3, word 0. These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

#### 6.4.5.30 Value of OTP Bank3 Word1 (Memory Related Information) (OCOTP\_MEM\_TRIM1)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

## On-Chip OTP Controller (OCOTP\_CTRL)

Address: 3035\_0000h base + 4D0h offset = 3035\_04D0h

### OCOTP\_MEM\_TRIM1 field descriptions

Field	Description
BITS	It reflects value of OTP bank 3, word 1. These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

### 6.4.5.31 Value of OTP Bank3 Word2 (Analog Information) (OCOTP\_ANA0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 4E0h offset = 3035\_04E0h

### OCOTP\_ANA0 field descriptions

Field	Description
BITS	It reflects value of OTP bank 3, word 2. These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

### 6.4.5.32 Value of OTP Bank3 Word3 (Analog Info.) (OCOTP\_ANA1)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 4F0h offset = 3035\_04F0h

### OCOTP\_ANA1 field descriptions

Field	Description
BITS	It reflects value of OTP bank 3, word 3. These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

#### 6.4.5.33 Shadow Register for OTP Bank4 Word0 (OTPMK Key) (OCOTP\_OTPMK0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 500h offset = 3035\_0500h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### OCOTP\_OTPMK0 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word0 (Copy of OTP Bank 4, word 0). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

#### 6.4.5.34 Shadow Register for OTP Bank4 Word1 (OTPMK Key) (OCOTP\_OTPMK1)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 510h offset = 3035\_0510h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**OCOTP\_OTPMK1 field descriptions**

Field	Description
BITS	Shadow register for the OTPMK Key word1 (Copy of OTP Bank 4, word 1). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

**6.4.5.35 Shadow Register for OTP Bank4 Word2 (OTPMK Key) (OCOTP\_OTPMK2)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 520h offset = 3035\_0520h

**OCOTP\_OTPMK2 field descriptions**

Field	Description
BITS	Shadow register for the OTPMK Key word2 (Copy of OTP Bank 4, word 2). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

**6.4.5.36 Shadow Register for OTP Bank4 Word3 (OTPMK Key) (OCOTP\_OTPMK3)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 530h offset = 3035\_0530h

### OCOTP\_OTPMK3 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word3 (Copy of OTP Bank 4, word 3). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

#### 6.4.5.37 Shadow Register for OTP Bank5 Word0 (OTPMK Key) (OCOTP\_OTPMK4)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 540h offset = 3035\_0540h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**OCOTP\_OTPMK5 field descriptions**

Field	Description
BITS	Shadow register for the OTPMK Key word5 (Copy of OTP Bank 5, word 1). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

**6.4.5.39 Shadow Register for OTP Bank5 Word2 (OTPMK Key) (OCOTP\_OTPMK6)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 560h offset = 3035\_0560h

**OCOTP\_OTPMK6 field descriptions**

Field	Description
BITS	Shadow register for the OTPMK Key word6 (Copy of OTP Bank 5, word 2). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

**6.4.5.40 Shadow Register for OTP Bank5 Word3 (OTPMK Key) (OCOTP\_OTPMK7)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 570h offset = 3035\_0570h

### OCOTP\_OTPMK7 field descriptions

Field	Description
BITS	Shadow register for the OTPMK Key word7 (Copy of OTP Bank 5, word 3). These bits cannot be read and written after the HW_OCOTP_LOCK_OTPMK bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

#### 6.4.5.41 Shadow Register for OTP Bank6 Word0 (SRK Hash) (OCOTP\_SRK0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 580h offset = 3035\_0580h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**OCOTP\_SRK1 field descriptions**

Field	Description
BITS	Shadow register for the hash of the Super Root Key word1 (Copy of OTP Bank 6, word 1). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

**6.4.5.43 Shadow Register for OTP Bank6 Word2 (SRK Hash) (OCOTP\_SRK2)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 5A0h offset = 3035\_05A0h

**OCOTP\_SRK2 field descriptions**

Field	Description
BITS	Shadow register for the hash of the Super Root Key word2 (Copy of OTP Bank 6, word 2). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

**6.4.5.44 Shadow Register for OTP Bank6 Word3 (SRK Hash) (OCOTP\_SRK3)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 5B0h offset = 3035\_05B0h

## OCOTP\_SRK3 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word3 (Copy of OTP Bank 6, word 3). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

#### 6.4.5.45 Shadow Register for OTP Bank7 Word0 (SRK Hash) (OCOTP\_SRK4)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 5C0h offset = 3035\_05C0h

**OCOTP\_SRK5 field descriptions**

Field	Description
BITS	Shadow register for the hash of the Super Root Key word5 (Copy of OTP Bank 7, word 1). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

**6.4.5.47 Shadow Register for OTP Bank7 Word2 (SRK Hash) (OCOTP\_SRK6)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 5E0h offset = 3035\_05E0h

**OCOTP\_SRK6 field descriptions**

Field	Description
BITS	Shadow register for the hash of the Super Root Key word6 (Copy of OTP Bank 7, word 2). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

**6.4.5.48 Shadow Register for OTP Bank7 Word3 (SRK Hash) (OCOTP\_SRK7)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 5F0h offset = 3035\_05F0h

## OCOTP\_SRK7 field descriptions

Field	Description
BITS	Shadow register for the hash of the Super Root Key word7 (Copy of OTP Bank 7, word 3). These bits become read-only after the HW_OCOTP_LOCK_SRK bit is set.

#### 6.4.5.49 Value of OTP Bank8 Word0 (Secure JTAG Response Field) (OCOTP\_SJC\_RESP0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS]

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 600h offset = 3035\_0600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
BITS	Shadow register for the SJC_RESP Key word1 (Copy of OTP Bank 8, word 1). These bits cannot be read and written after the HW_OCOTP_LOCK_SJC_RESP bit is set. If read, returns 0xBADA_BADA and sets HW_OCOTP_CTRL[ERROR].

**6.4.5.51 Value of OTP Bank8 Word2 (USB ID info) (OCOTP\_USB\_ID)**

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 620h offset = 3035\_0620h

**OCOTP\_USB\_ID field descriptions**

Field	Description
BITS	It reflects the value of OTP Bank 8, word 2.

**6.4.5.52 Value of OTP Bank8 Word3 (Field Return) (OCOTP\_FIELD\_RETURN)**

After reset, it automatically copied from the OTP. It cannot be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

**EXAMPLE**

Empty Example.

Address: 3035\_0000h base + 630h offset = 3035\_0630h

**OCOTP\_FIELD\_RETURN field descriptions**

Field	Description
BITS	It reflects the value of OTP Bank 8, word 3.

### 6.4.5.53 Value of OTP Bank9 Word0 (MAC Address) (OCOTP\_MAC\_ADDR0)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS]

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 640h offset = 3035\_0640h

#### OCOTP\_MAC\_ADDR0 field descriptions

Field	Description
BITS	It reflects the value of OTP Bank 9, word 0.

### 6.4.5.54 Value of OTP Bank9 Word1 (MAC Address) (OCOTP\_MAC\_ADDR1)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 650h offset = 3035\_0650h

#### OCOTP\_MAC\_ADDR1 field descriptions

Field	Description
BITS	It reflects the value of OTP Bank 9, word 1.

### 6.4.5.55 Value of OTP Bank9 Word2 (MAC Address) (OCOTP\_MAC\_ADDR2)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 660h offset = 3035\_0660h

#### OCOTP\_MAC\_ADDR2 field descriptions

Field	Description
BITS	It reflects the value of OTP Bank 9, word 2.

### 6.4.5.56 Value of OTP Bank9 Word3 (SRK Revoke) (OCOTP\_SRK\_REVOKE)

After reset, it automatically copied from the OTP. It can be re-loaded by setting HW\_OCOTP\_CTRL[RELOAD\_SHADOWS].

#### EXAMPLE

Empty Example.

Address: 3035\_0000h base + 670h offset = 3035\_0670h

#### OCOTP\_SRK\_REVOKE field descriptions

## 6.5 Watchdog Timer (WDOG)

### 6.5.1 Overview

The Watchdog Timer (WDOG) protects against system failures by providing a method by which to escape from unexpected events or programming errors.

Once the WDOG is activated, it must be serviced by the software on a periodic basis. If servicing does not take place, the timer times out. Upon timeout, the WDOG asserts the internal system reset signal, WDOG\_RESET\_B\_DEB to the System Reset Controller (SRC).

There is also a provision for WDOG signal assertion by timeout counter expiration. There is an option of programmable interrupt generation before the counter actually times out. The time at which the interrupt needs to be generated prior to counter timeout is programmable. There is a power down counter which is enabled out of any reset (POR, Warm/Cold). This counter has a fixed timeout period of 16 seconds, upon which it asserts the WDOG signal.

Flow diagrams for the timeout counter, power down counter and interrupt operations are shown in [Flow Diagrams](#).

**Figure 6-14. WDOG Diagram**

### 6.5.1.1 Features

The WDOG features are listed below:

- Configurable timeout counter with timeout periods from 0.5 to 128 seconds which, after timeout expiration, result in the assertion of WDOG\_RESET\_B\_DEB reset signal .
- Time resolution of 0.5 seconds
- Configurable timeout counter that can be programmed to run or stop during low-power modes
- Configurable timeout counter that can be programmed to run or stop during DEBUG mode
- Programmable interrupt generation prior to timeout

## Watchdog Timer (WDOG)

- The duration between interrupt and timeout events can be programmed from 0 to 127.5 seconds in steps of 0.5 seconds.
- Power down counter with fixed timeout period of 16 seconds, which if not disabled after reset will assert WDOG\_B signal low
  - Power down counter will be enabled out of any reset (POR, Warm / Cold reset) by default.

## 6.5.2 External signals

Table 6-22. WDOG External Signals

Signal	Description	Pad	Mode	Direction
WDOG1_ANY	Global WDOG signal	ENET1_COL	ALT1	IO
		GPIO1_IO00	ALT2	
WDOG1_B	This signal will power down the chip.	GPIO1_IO00	ALT3	IO
		GPIO1_IO08	ALT2	
WDOG1_RESET_B_D EB	This signal is a reset source for the chip.	GPIO1_IO00	ALT4	O
WDOG2_B	This signal will power down the chip.	ENET1_RX_CLK	ALT1	IO
WDOG2_RESET_B_D EB	This signal is a reset source for the chip.	ENET1_CRS	ALT1	O
WDOG3_B	This signal will power down the chip.	GPIO1_IO14	ALT4	IO
		I2C2_SCL	ALT2	
WDOG3_RESET_B_D EB	This signal is a reset source for the chip.	I2C2_SDA	ALT2	O
WDOG4_B	This signal will power down the chip.	GPIO1_IO15	ALT4	IO
		I2C4_SCL	ALT2	
WDOG4_RESET_B_D EB	This signal is a reset source for the chip.	I2C4_SDA	ALT2	O

## 6.5.3 Clocks

This section describes clocks and special clocking requirements of the block.

The WDOG uses the low frequency reference clock for its counter and control operations. The peripheral bus clock is used for register read/write operations.

The following table describes the clock sources for WDOG. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 6-23. WDOG Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	IP Global functional clock. All functionality inside the WDOG module is synchronized to this clock.
ipg_clk_s	ipg_clk_root	IP slave bus clock. This clock is synchronized to ipg_clk and is only used for register read/write operations.
ipg_clk_32k	ckil_sync_clk_root	Low frequency (32.768 kHz) clock that continues to run in low-power mode. It is assumed that the Clock Controller will provide this clock signal synchronized to ipg_clk in the normal mode, and switch to a non-synchronized signal in low-power mode when the ipg_clk is off.

## 6.5.4 Functional description

This section provides a complete functional description of the block.

### 6.5.4.1 Timeout event

The WDOG provides timeout periods from 0.5 to 128 seconds with a time resolution of 0.5 seconds.

The user can determine the timeout period by writing to the WDOG timeout field (WT[7:0]) in the [Watchdog Control Register \(WDOG\\_WCR\)](#). The WDOG must be enabled by setting the WDE bit of [Watchdog Control Register \(WDOG\\_WCR\)](#) for the timeout counter to start running. After the WDOG is enabled, the counter is activated, loads the timeout value and begins to count down from this programmed value. The timer will time out when the counter reaches zero and the WDOG outputs a system reset signal, WDOG\_RESET\_B\_DEB and asserts WDOG\_B (WDT bit should be set in [Watchdog Control Register \(WDOG\\_WCR\)](#)).

However, the timeout condition can be prevented by reloading the counter with the new timeout value (WT[7:0] of WDOG\_WCR) if a service routine (see [Servicing WDOG to reload the counter](#)) is performed before the counter reaches zero. If any system errors occur which prevent the software from servicing the [Watchdog Service Register \(WDOG\\_WSR\)](#), the timeout condition occurs. By performing the service routine, the WDOG reloads its counter to the timeout value indicated by bits WT[7:0] of the [Watchdog Control Register \(WDOG\\_WCR\)](#) and it restarts the countdown.

A system reset will reset the counter and place it in the idle state at any time during the countdown. The counter flow diagram is shown in [Flow Diagrams](#).

## NOTE

The timeout value is reloaded to the counter either at the time WDOG is enabled or after the service routine has been performed.

### 6.5.4.1.1 Servicing WDOG to reload the counter

To reload a timeout value to the counter the proper service sequence begins by writing 0x\_5555 followed by 0x\_AAAA to the [Watchdog Service Register \(WDOG\\_WSR\)](#). Any number of instructions can be executed between the two writes. If the WDOG\_WSR is not loaded with 0x\_5555 prior to writing 0x\_AAAA to the WDOG\_WSR, the counter is not reloaded. If any value other than 0x\_AAAA is written to the WDOG\_WSR after 0x\_5555, the counter is not reloaded. This service sequence will reload the counter with the timeout value WT[7:0] of [Watchdog Control Register \(WDOG\\_WCR\)](#). The timeout value can be changed at any point; it is reloaded when WDOG is serviced by the core.

### 6.5.4.2 Interrupt event

Prior to timeout, the WDOG can generate an interrupt which can be considered a warning that timeout will occur shortly.

The duration between interrupt event and timeout event can be controlled by writing to the WICT field of [Watchdog Interrupt Control Register \(WDOG\\_WICR\)](#). It can vary between 0 and 127.5 seconds. If the WDOG is serviced ([Servicing WDOG to reload the counter](#)) before the interrupt generation, the counter will be reloaded with the timeout value WT[7:0] of [Watchdog Control Register \(WDOG\\_WCR\)](#) and the interrupt will not be triggered.

### 6.5.4.3 Power-down counter event

The power-down counter inside WDOG will be enabled out of reset. This counter has a fixed timeout value of 16 seconds, after which it will drive the WDOG\_B signal low.

To prevent this, the software must disable this counter by clearing the PDE bit of [Watchdog Miscellaneous Control Register \(WDOG\\_WMCR\)](#) within 16 seconds of reset deassertion. Once disabled, this counter can't be enabled again until the next system reset occurs. This feature is intended to prevent the hanging up of cores after reset, as WDOG is not enabled out of reset.

## 6.5.4.4 Low power modes

### 6.5.4.4.1 STOP and DOZE mode

If the WDOG timer disable bit for low power STOP and DOZE mode (WDZST) bit in the [Watchdog Control Register \(WDOG\\_WCR\)](#), is cleared, the WDOG timer continues to operate using the low frequency reference clock. If the low power enable (WDZST) bit is set, the WDOG timer operation will be suspended in low power STOP or DOZE mode. Upon exiting low power STOP or DOZE mode, the WDOG operation returns to what it was prior to entering the STOP or DOZE mode.

### 6.5.4.4.2 WAIT mode

If the WDOG timer disable bit for low power WAIT mode (WDW) bit in the [Watchdog Control Register \(WDOG\\_WCR\)](#), is cleared, the WDOG timer continues to operate using the low frequency reference clock. If the low power WAIT enable (WDW) bit is set, the WDOG timer operation will be suspended. Upon exiting low power WAIT mode, the WDOG operation returns to what it was prior to entering the WAIT mode.

#### NOTE

The WDOG timer won't be able to detect events that happen for periods shorter than one low frequency reference clock cycle. For example, in repeated WAIT mode entry or exit, if the RUN mode time is less than one low frequency reference clock cycle and if the WDW bit is set, the WDOG timer may never time out, even though the system is in RUN mode for a finite duration; WDOG may not see a low frequency reference clock edge during its wake time.

### 6.5.4.5 Debug mode

The WDOG timer can be configured for continual operation, or for suspension during debug mode. If the WDOG debug enable (WDBG) bit is set in the [Watchdog Control Register \(WDOG\\_WCR\)](#), the WDOG timer operation is suspended in debug mode. If the WDBG bit is set and the debug mode is entered, WDOG timer operation is suspended after two low frequency reference clocks. Similarly, WDOG timer operation continues after two low frequency reference clocks of debug mode exit. Register read and write accesses in debug mode continue to function normally. Also, while in debug mode, the WDE bit of [Watchdog Control Register \(WDOG\\_WCR\)](#) can be enabled/disabled directly. If the WDOG debug enable (WDBG) bit is cleared then WDOG timer operation is not suspended. The power-down counter is not affected by debug mode entry/exit.

**NOTE**

If the WDE bit of [Watchdog Control Register \(WDOG\\_WCR\)](#) is set/cleared while in debug mode, it remains set/cleared even after exiting debug mode.

**6.5.4.6 Operations****6.5.4.6.1 Watchdog reset generation**

The WDOG generated reset signal WDOG\_RESET\_B\_DEB is asserted by the following operations:

- A software write to the Software Reset Signal (SRS) bit of the [Watchdog Control Register \(WDOG\\_WCR\)](#).
- WDOG timeout. See [Timeout event](#).

The  $\overline{\text{wdog\_rst}}$  will be asserted for one clock cycle of low frequency reference clock for both a timeout condition and a software write occurrence. It remains asserted for 1 clock cycle of low frequency reference clock even if a system reset is asserted in between.

[Figure 6-16](#) shows the timing diagram of this signal due to a timeout condition.

**6.5.4.6.2 WDOG\_B generation**

The WDOG asserts WDOG\_B in the following scenarios:

- Software write to WDA bit of [Watchdog Control Register \(WDOG\\_WCR\)](#). WDOG\_B signal remains asserted as long as the WDA bit is "0".
- WDOG timeout condition, WDT bit of [Watchdog Control Register \(WDOG\\_WCR\)](#) must be set for this scenario. A description of the timeout condition can be found in the [Timeout event](#). WDOG\_B signal remains asserted until a power-on reset (POR) occurs. It gets cleared after the POR occurs (not due to any other system reset). [Figure 6-17](#) shows the timing diagram of WDOG\_B due to timeout condition.
- WDOG power-down counter timeout, PDE bit of [Watchdog Miscellaneous Control Register \(WDOG\\_WMCR\)](#) should not be cleared for this scenario. A description of this counter can be found in the [Power-down counter event](#). WDOG\_B signal remains asserted for one clock cycle of low frequency reference clock.

[Figure 6-15](#) shows the scenarios under which WDOG\_B gets asserted.

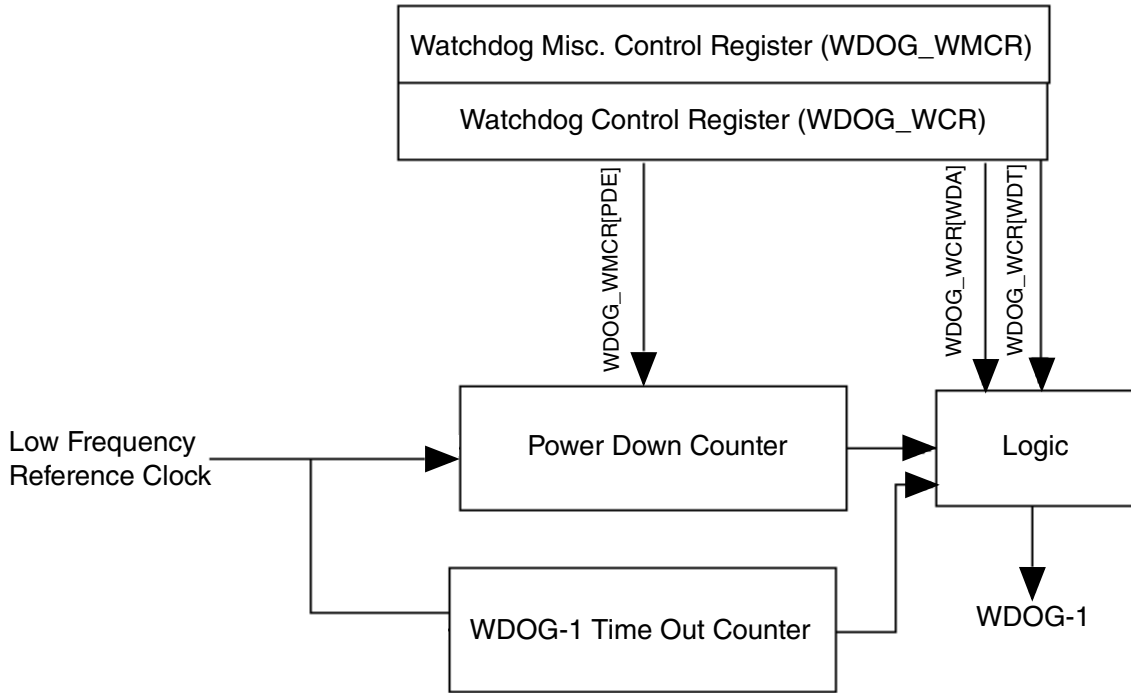

Figure 6-15. WDOG\_B generation

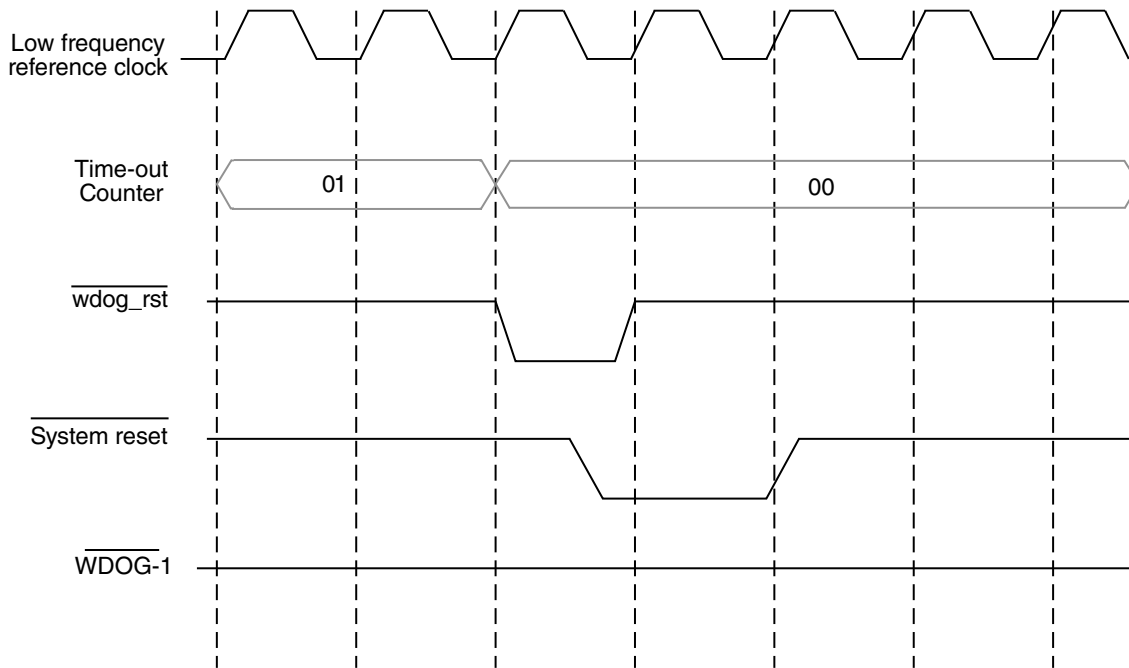

Figure 6-16. WDOG timeout condition/WDT bit is not set

Figure 6-17. WDOG timeout condition/WDT bit is set

### 6.5.4.7 Reset

The block is reset by a system reset and the WDOG counter will be disabled. The power-down counter is enabled and starts counting.

### 6.5.4.8 Interrupt

The WDOG has the feature of Interrupt generation before timeout.

The interrupt will be generated only if the WIE bit in [Watchdog Interrupt Control Register \(WDOG\\_WICR\)](#) is set. The exact time at which the interrupt should occur (prior to timeout) depends on the value of WICT field of [Watchdog Interrupt Control Register \(WDOG\\_WICR\)](#). For example, if the WICT field has a value 0x04, then the interrupt will be generated two seconds prior to timeout. Once the interrupt is triggered the WTIS bit in [Watchdog Interrupt Control Register \(WDOG\\_WICR\)](#) will be set. The software needs to clear this bit to deassert the interrupt. If the WDOG is serviced before the interrupt generation then the counter will be reloaded with the timeout value WT[7:0] of [Watchdog Control Register \(WDOG\\_WCR\)](#) and interrupt would not be triggered.

### 6.5.4.9 Flow Diagrams

A flow diagram of WDOG operation is shown below.

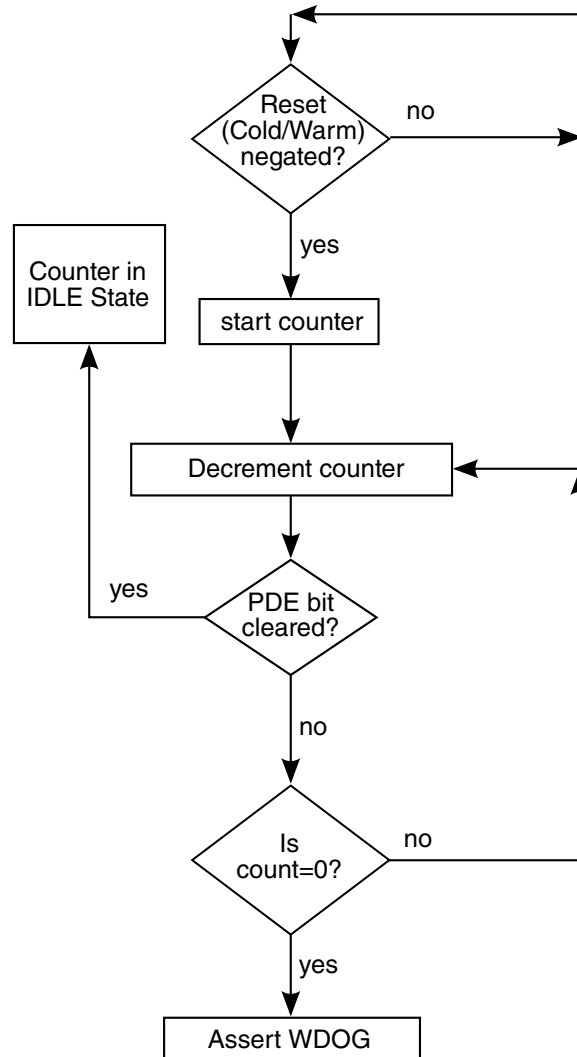

Figure 6-18. Power-Down Counter Flow Diagram

Figure 6-19. Interrupt Generation Flow Diagram

### 6.5.5 Initialization

The following sequence should be performed for WDOG initialization.

- PDE bit of [Watchdog Miscellaneous Control Register \(WDOG\\_WMCR\)](#) should be cleared to disable the power down counter.

- WT field of [Watchdog Control Register \(WDOG\\_WCR\)](#) should be programmed for sufficient timeout value.
- WDOG should be enabled by setting WDE bit of [Watchdog Control Register \(WDOG\\_WCR\)](#) so that the timeout counter loads the WT field value of [Watchdog Control Register \(WDOG\\_WCR\)](#) and starts counting.

## 6.5.6 WDOG Memory Map/Register Definition

The WDOG has user-accessible, 16-bit registers used to configure, operate, and monitor the state of the Watchdog Timer. Byte operations can be performed on these registers. If a 32-bit access is performed, the WDOG will not generate a peripheral bus error but will behave normally, like a 16-Bit access, making read/write possible. A 32-Bit access should be avoided, as the system may go to an unknown state.

**WDOG memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

**6.5.6.1 Watchdog Control Register (WDOGx\_WCR)**

The Watchdog Control Register (WDOG\_WCR) controls the WDOG operation.

- WZST, WDBG and WDW are write-once only bits. Once the software does a write access to these bits, they will be locked and cannot be reprogrammed until the next system reset assertion.
- WDE is a write one once only bit. Once software performs a write "1" operation to this bit it cannot be reset/cleared until the next system reset.
- WDT is also a write one once only bit. Once software performs a write "1" operation to this bit it cannot be reset/cleared until the next POR. This bit does not get reset/cleared due to any system reset.

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8
Read	WT							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	WDW	SRE	WDA	SRS	WDT	WDE	WDBG	WZST
Write								
Reset	0	0	1	1	0	0	0	0

## WDOGx\_WCR field descriptions

Field	Description
15–8 WT	<p>Watchdog Time-out Field. This 8-bit field contains the time-out value that is loaded into the Watchdog counter after the service routine has been performed or after the Watchdog is enabled. After reset, WT[7:0] must have a value written to it before enabling the Watchdog otherwise count value of zero which is 0.5 seconds is loaded into the counter.</p> <p><b>NOTE:</b> The time-out value can be written at any point of time but it is loaded to the counter at the time when WDOG is enabled or after the service routine has been performed. For more information see <a href="#">Timeout event</a> .</p> <p>0x00 - 0.5 Seconds (Default).  0x01 - 1.0 Seconds.  0x02 - 1.5 Seconds.  0x03 - 2.0 Seconds.  0xff - 128 Seconds.</p>
7 WDW	<p>Watchdog Disable for Wait. This bit determines the operation of WDOG during Low Power WAIT mode. This is a write once only bit.</p> <p>0 Continue WDOG timer operation (Default).  1 Suspend WDOG timer operation.</p>
6 SRE	<p>software reset extension, an option way to generate software reset</p> <p>adopt a new way to generate a more robust software reset. This bit can be set/clear with IP bus and will be reset with power-on reset .</p> <p>0 using original way to generate software reset (default)  1 using new way to generate software reset.</p>
5 WDA	<p>WDOG_B assertion. Controls the software assertion of the WDOG_B signal.</p> <p>0 Assert WDOG_B output.  1 No effect on system (Default).</p>
4 SRS	<p>Software Reset Signal. Controls the software assertion of the WDOG-generated reset signal WDOG_RESET_B_DEB . This bit automatically resets to "1" after it has been asserted to "0".</p> <p><b>NOTE:</b> This bit does not generate the software reset to the block.</p> <p>0 Assert system reset signal.  1 No effect on the system (Default).</p>
3 WDT	<p>WDOG_B Time-out assertion. Determines if the WDOG_B gets asserted upon a Watchdog Time-out Event. This is a write-one once only bit.</p> <p><b>NOTE:</b> There is no effect on WDOG_RESET_B_DEB (WDOG Reset) upon writing on this bit. WDOG_B gets asserted along with WDOG_RESET_B_DEB if this bit is set.</p> <p>0 No effect on WDOG_B (Default).  1 Assert WDOG_B upon a Watchdog Time-out event.</p>
2 WDE	<p>Watchdog Enable. Enables or disables the WDOG block. This is a write one once only bit. It is not possible to clear this bit by a software write, once the bit is set.</p> <p><b>NOTE:</b> This bit can be set/reset in debug mode (exception).</p> <p>0 Disable the Watchdog (Default).  1 Enable the Watchdog.</p>

Table continues on the next page...

**WDOGx\_WCR field descriptions (continued)**

Field	Description
1 WDBG	<p>Watchdog DEBUG Enable. Determines the operation of the WDOG during DEBUG mode. This bit is write once only.</p> <p>0 Continue WDOG timer operation (Default). 1 Suspend the watchdog timer.</p>
0 WDZST	<p>Watchdog Low Power. Determines the operation of the WDOG during low-power modes. This bit is write once-only.</p> <p><b>NOTE:</b> The WDOG can continue/suspend the timer operation in the low-power modes (STOP and DOZE mode).</p> <p>0 Continue timer operation (Default). 1 Suspend the watchdog timer.</p>

**6.5.6.2 Watchdog Service Register (WDOGx\_WSR)**

When enabled, the WDOG requires that a service sequence be written to the Watchdog Service Register (WSR) to prevent the timeout condition.

**NOTE**

Executing the service sequence will reload the WDOG timeout counter.

Address: Base address + 2h offset

**WDOGx\_WSR field descriptions**

Field	Description
WSR	<p>Watchdog Service Register. This 16-bit field contains the Watchdog service sequence. Both writes must occur in the order listed prior to the time-out, but any number of instructions can be executed between the two writes. The service sequence must be performed as follows:</p> <p>0x5555 Write to the Watchdog Service Register (WDOG_WSR). 0xAAAA Write to the Watchdog Service Register (WDOG_WSR).</p>

### 6.5.6.3 Watchdog Reset Status Register (WDOGx\_WRSR)

The WRSR is a read-only register that records the source of the output reset assertion. It is not cleared by a hard reset. Therefore, only one bit in the WRSR will always be asserted high. The register will always indicate the source of the last reset generated due to WDOG. Read access to this register is with one wait state. Any write performed on this register will generate a Peripheral Bus Error .

A reset can be generated by the following sources, as listed in priority from highest to lowest:

- Watchdog Time-out
- Software Reset

Address: Base address + 4h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	0		POR		0		TOUT	SFTW
Write								
Reset	0	0	0	0	0	0	0	0

**WDOGx\_WRSR field descriptions**

Field	Description
15–5 Reserved	This read-only field is reserved and always has the value 0.
4 POR	Power On Reset. Indicates whether the reset is the result of a power on reset. 0 Reset is not the result of a power on reset. 1 Reset is the result of a power on reset.
3–2 Reserved	This read-only field is reserved and always has the value 0.
1 TOUT	Timeout. Indicates whether the reset is the result of a WDOG timeout. 0 Reset is not the result of a WDOG timeout. 1 Reset is the result of a WDOG timeout.
0 SFTW	Software Reset. Indicates whether the reset is the result of a WDOG software reset by asserting SRS bit 0 Reset is not the result of a software reset. 1 Reset is the result of a software reset.

### 6.5.6.4 Watchdog Interrupt Control Register (WDOGx\_WICR)

The WDOG\_WICR controls the WDOG interrupt generation.

Address: Base address + 6h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Read	WIE		WTIS		0				WICT								
Write	w1c																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

#### WDOGx\_WICR field descriptions

Field	Description
15 WIE	<p>Watchdog Timer Interrupt enable bit. Reset value is 0.</p> <p><b>NOTE:</b> This bit is a write once only bit. Once the software does a write access to this bit, it will get locked and cannot be reprogrammed until the next system reset assertion</p> <p>0 Disable Interrupt (Default). 1 Enable Interrupt.</p>
14 WTIS	<p>Watchdog Timer Interrupt Status bit will reflect the timer interrupt status, whether interrupt has occurred or not. Once the interrupt has been triggered software must clear this bit by writing 1 to it.</p> <p>0 No interrupt has occurred (Default). 1 Interrupt has occurred</p>
13–8 Reserved	<p>This read-only field is reserved and always has the value 0.</p>
WICT	<p>Watchdog Interrupt Count Time-out (WICT) field determines, how long before the counter time-out must the interrupt occur. The reset value is 0x04 implies interrupt will occur 2 seconds before time-out. The maximum value that can be programmed to WICT field is 127.5 seconds with a resolution of 0.5 seconds.</p> <p><b>NOTE:</b> This field is write once only. Once the software does a write access to this field, it will get locked and cannot be reprogrammed until the next system reset assertion.</p> <p>0x00 WICT[7:0] = Time duration between interrupt and time-out is 0 seconds. 0x01 WICT[7:0] = Time duration between interrupt and time-out is 0.5 seconds. 0x04 WICT[7:0] = Time duration between interrupt and time-out is 2 seconds (Default). 0xff WICT[7:0] = Time duration between interrupt and time-out is 127.5 seconds.</p>

### 6.5.6.5 Watchdog Miscellaneous Control Register (WDOGx\_WMCR)

WDOG\_WMCR Controls the Power Down counter operation.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0															
Write	PDE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

#### WDOGx\_WMCR field descriptions

Field	Description
15–1 Reserved	This read-only field is reserved and always has the value 0.
0 PDE	<p>Power Down Enable bit. Reset value of this bit is 1, which means the power down counter inside the WDOG is enabled after reset. The software must write 0 to this bit to disable the counter within 16 seconds of reset de-assertion. Once disabled this counter cannot be enabled again. See <a href="#">Power-down counter event</a> for operation of this counter.</p> <p><b>NOTE:</b> This bit is write-one once only bit. Once software sets this bit it cannot be reset until the next system reset.</p> <p>0 Power Down Counter of WDOG is disabled. 1 Power Down Counter of WDOG is enabled (Default).</p>

## 6.6 System Boot

### 6.6.1 Overview

The boot process begins at Power On Reset (POR) where the hardware reset logic forces the ARM core to begin execution starting from the on-chip boot ROM.

Boot ROM code uses the state of the internal register BOOT\_MODE[1:0] as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG)
- Device configuration data (DCD) and plugin

- Digital signature and encryption based High Assurance Boot (HAB)
- Wake-up from low power modes

The boot ROM supports the following boot devices:

- NOR Flash
- NAND Flash
- OneNAND Flash
- SD/MMC
- Serial (I2C/SPI) NOR Flash
- QuadSPI (QSPI) Flash

The Boot ROM uses the state of `BOOT_MODE` and eFUSES to determine the boot device. For development purposes, eFUSES used to determine the boot device may be overridden by using GPIO pin inputs.

Boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provision a boot device with a new image. Typically the provisioning program is downloaded to internal RAM and allows the programming of boot devices, such as an SD/MMC Flash. The ROM Serial Downloader uses high speed USB in a non-stream mode connection.

Boot ROM allows waking up from low-power modes. On reset the ROM checks power gating status register. On waking from low power mode, the core will skip loading an image from the boot device and jump to the address saved in `PERSISTENT_ENTRY0`.

The device configuration data (DCD) feature allows boot ROM code to obtain SOC configuration data from an external Program Image residing on the boot device. As an example, DCD can be used to program the DDR controller for optimal settings improving the boot performance. DCD is restricted to memory areas and peripheral addresses that are considered essential for boot purposes (see [Write Data Command](#)).

A key feature of the boot ROM is the ability to perform a secure boot or High Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. HAB uses a combination of hardware and software together with a Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows a user's image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as part of the final Program Image. If configured to do so, the ROM verifies the signatures using the public keys included in the Program Image. In addition to supporting digital signature verification to authenticate Program Images, Encrypted boot is also supported. Encrypted boot can be used to prevent cloning of the Program Image directly off the boot device. A secure boot with HAB can be performed

on all boot devices supported on the chip in addition to the Serial Downloader. The HAB library in the boot ROM also provides API functions, allowing additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for SEC\_CONFIG is the Open configuration in which the ROM/HAB performs image authentication, but all authentication errors are ignored and the image is still allowed to execute.

## 6.6.2 Boot modes

During reset, the chip checks Power Gating Controller status register.

During boot, the core's behavior is defined by the Boot Mode pins settings as described in [Boot mode pin settings](#). On waking up from low power boot mode, the core skips clock settings. Boot ROM checks that PERSISTENT\_ENTRY0 (see [Persistent Bits](#)) is a pointer to valid address space (OCRAM, DDR, QSPI, or EIM). If PERSISTENT\_ENTRY0 is a pointer to valid range, it starts execution using entry point from PERSISTENT\_ENTRY0 register. If PERSISTENT\_ENTRY0 is a pointer to invalid range, the core performs system reset.

### 6.6.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for Freescale use). Boot mode is selected based on the binary value stored in the internal BOOT\_MODE register.

BOOT\_MODE is initialized by sampling the BOOT\_MODE0 and BOOT\_MODE1 inputs on the rising edge of POR\_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT\_MODE internal register. The state of the internal BOOT\_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC\_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See the table below for settings.

**Table 6-24. Boot MODE Pin Settings**

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

## 6.6.2.2 High level boot sequence

The figure found here shows the high-level boot ROM code flow.

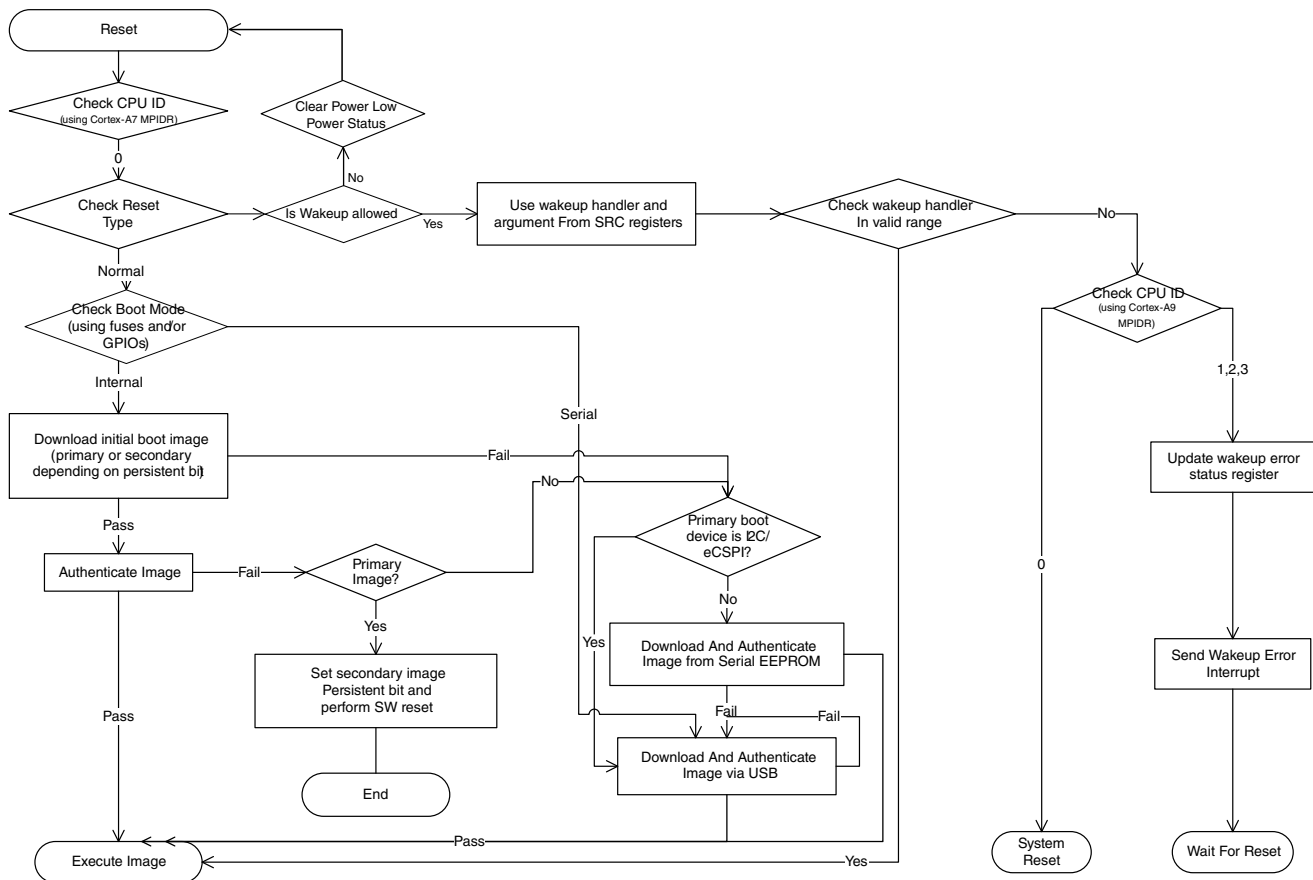

Figure 6-20. Boot Flow

### 6.6.2.3 Boot From Fuses Mode (BOOT\_MODE[1:0] = 00b)

A value of 00b in the BOOT\_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot Mode](#) (BOOT\_MODE[1:0] = 0b10) with one difference. In this mode the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT\_FUSE\_SEL eFUSE value. If BT\_FUSE\_SEL = 0, indicating that the boot device (for example, Flash, SD/MMC) has not yet been programmed, the boot flow jumps directly to the Serial Downloader. If BT\_FUSE\_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such a case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using Boot From Fuses mode addresses this problem.

Setting BT\_FUSE\_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a Program Image and blow the BT\_FUSE\_SEL and the other boot configuration eFUSES. After reset, the Boot ROM code determines that BT\_FUSE\_SEL is blown (BT\_FUSE\_SEL = 1) and the ROM code performs internal boot according to the new eFUSE settings. This allows a user to set BOOT\_MODE[1:0]=00b on a production device and burn fuses on the same device (by forcing entry to the Serial Downloader), without changing the value of BOOT\_MODE[1:0] or pullups/pulldowns on the BOOT\_MODE pins.

#### 6.6.2.4 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG1 for a time-out specified by fuse WDOG Time-out Select (See fusemap for details) if WDOG\_ENABLE eFuse is 1 and continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

#### NOTE

After being loaded, the downloaded image is responsible to manage the watchdog resets properly.

Figure 6-21 shows USB boot flow.

**Figure 6-21. Serial Download Boot Flow**

### 6.6.2.5 Internal Boot Mode (BOOT\_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT\_MODE[1:0] register selects the internal boot mode. In this mode, the processor continues to execute boot code from the internal boot ROM.

The boot code performs hardware initialization, loads the Program Image from the chosen boot device, performs image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the Program Image. If any error occurs during internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to internal boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT\_FUSE\_SEL) determines whether the ROM uses GPIO pins for a select number of configuration parameters or eFUSES in this mode.

- If BT\_FUSE\_SEL = 1, all boot options are controlled by the eFUSES described in [Table 6-25](#).
- If BT\_FUSE\_SEL = 0, specific boot configuration parameters may be set using GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 6-25](#). [Table 6-26](#) provides the details on the GPIO pins.

The use of GPIO overrides is intended for development since these pads are used for other purposes in deployed products. Freescale recommends controlling the boot configuration by eFUSES in deployed products and reserving the use of the GPIO mode for development and testing purposes only.

### 6.6.2.6 Boot security settings

Internal boot modes use one of three security configurations:

- **Closed:** This level is intended for use with shipping secure products. All HAB functions are executed and security hardware is initialized (the Security Controller, or SNVS, enters Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, and the boot flow aborted with control passing to the serial downloader. At this level, execution does not leave the internal ROM unless the target executable image has been authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. Security hardware is initialized (except the SNVS is left in Non-Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, but have no influence on the boot flow, which continues as if the errors did not occur. This configuration is useful for secure product development, since the Program Image will run even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of authentication failure.
- **Field Return:** This level is intended for parts returned from shipped products.

#### NOTE

If the DIR\_BT\_DIS eFuse is not blown, authentication may be bypassed. In this case the system is not secure.

## 6.6.3 Device Configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes boot device selection (SPI, EIM, NOR, SD, MMC, QSPI, etc.), boot device configuration (SD bus width, speed, etc), and so on. In general, the source for this configuration comes from eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from GPIO pins allowing further flexibility during the development process.

### 6.6.3.1 Boot eFUSE Descriptions

The table below is a comprehensive list of the configuration parameters that the ROM uses.

**Table 6-25. Boot eFUSE Descriptions**

Fuse	Configuration	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
DIR_BT_DIS	OEM	Disables Freescale reserved modes. Must be set for secure boot.	NA	0	0 Reserved Freescale modes enabled 1 Reserved Freescale modes disabled
BT_FUSE_SEL	OEM	In internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by GPIO pins or eFUSE settings in the On-Chip OTP Controller (OCOTP).  In Boot From Fuse mode BOOT_MODE[1:0] = 00, BT_FUSE_SEL fuse indicates whether bit configuration eFuses have been programmed.	NA	0	If BOOT_MODE[1:0] = 0b10 0 Bits of SBMR are overridden by GPIO pins. 1 Specific bits of SBMR are controlled by eFUSE settings.  If BOOT_MODE[1:0] = 0b00 0 BOOT configuration eFuses are not yet programmed. Boot flow jumps to serial downloader. 1 BOOT configuration eFuses have been programmed. Regular boot flow is performed.
SEC_CONFIG[1:0]	SEC_CONFIG[0] - Freescale	Security Configuration as defined in <a href="#">Boot security settings</a>	NA	01	00 Reserved 01 Open (allows any program image, even if authentication fails) 1x Closed (Program image executes only if authenticated)

*Table continues on the next page...*

**Table 6-25. Boot eFUSE Descriptions  
(continued)**

Fuse	Configuratio n	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
	SEC_C ONFIG[ 1] - OEM				
FIELD_RETURN	OEM	Enables Freescale reserved modes			0 - Freescale reserved modes are enabled/ disabled based on DIR_BT_DIS value 1 - Freescale reserved modes are enabled
SRK_HASH[255:0]	OEM	256-bit hash value of super root key (SRK_HASH)	NA	0	Settings vary - used by HAB
DIE-X- CORDINATE[7:0] DIE-Y- CORDINATE[7:0] WAFER_NO[4:0] LOT_NO_ENC[42:40] LOT_NO_ENC[39:32] LOT_NO_ENC[31:24] LOT_NO_ENC[23:16] LOT_NO_ENC[15:8] LOT_NO_ENC[7:0]	Freescale	Device Unique ID, 64-bit UID.	NA	Unique ID	Settings vary - used by HAB
BT_MMU_DISABLE (BOOT_CFG16)	OEM	MMU/L1 D Cache/PL310 disable bit used by boot ROM for fast HAB processing	No	0	0 - MMU/L1 D Cache/PL310 is enabled by ROM during the boot 1 - MMU/L1 D Cache/PL310 is disabled by ROM during the boot
BT_MMU_DISABLE (BOOT_CFG16)	OEM	SPI recovery boot enable	Yes	0	0 - Disabled 1 - Enabled
L1 I-Cache DISABLE	OEM	L1 I Cache disable bit used by boot during entire execution	No	0	0 - L1 I Cache is enabled by ROM during the boot 1 - L1 I Cache is disabled by ROM during the boot
BT_CFG[17]	OEM	SPI recovery boot enable	Yes	0	0 - Disabled 1 - Enabled
BT_FREQ (BOOT_CFG18)	OEM	Boot Frequency Selection	Yes	0	0 - ARM-792MHz, DDR-396MHz, AXI-396MHz 1 - ARM-396MHz, DDR-307MHz, AXI-307MHz ARM/DDR/AXI frequency may be lower if LP_BOOT is blown. See <a href="#">Table 6-65</a> for details.
BOOT_CFG[18:0]	OEM	Boot Configuration	Yes	0	Specific to selected boot mode

Table continues on the next page...

**Table 6-25. Boot eFUSE Descriptions  
(continued)**

Fuse	Configuratio n	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
BOOT_CFG[19]	OEM	Infinite Loop Enable at start of boot ROM. Used for debugging purposes. Ignored if DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0 - Disabled 1 - Enabled
LPB_BOOT	OEM	USB Low Power Boot	No	0	0x - LPB Disable 10 - Divide by 2 11 - Divide by 4
BT_LPB_POLARITY	OEM	USB Low Power Boot GPIO polarity	No	0	0 - low on GPIO pad indicates low power condition 1 - high on GPIO pad indicates low power condition
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0 - watchdog reset counter is disabled during serial downloader 1 - watchdog reset counter is enabled during serial downloader
MMC_DLL_DLY[6:0]	OEM	uSDHC Delay Line settings	No	0	uSDHC Delay Line settings
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask
DISABLE_SDMMC_MFG	OEM	Disable SDMMC manufacture mode	Yes	0	0: enable SD/MMC MFG mode 1: disable SD/MMC MFG mode
USDHC_PAD_SETTINGS NAND_PAD_SETTINGS	OEM	Override values for SD/MMC and NAND boot modes	No	0	Override the following IO PAD settings: [1:0] Driver Strength [2] Slew Rate [3] Hysteresis > [4] Pull/Keeper select [6:5] Pull up/down config .
OVERRIDE_HYS_SDMMC_PADS	OEM	Overrides HYS bit for SD pads	No	0	Override the IO PAD setting HYS to 1 for SD pads
eMMC_4.4_RESET_T O_PRE-IDLE_STATE	OEM	ROM reset the boot device in pre-idle state using eMMC 4.4 feature, CMD0 with argument value 0xf0f0f0	No	0	Applicable for booting from eMMC 4.4 spec or greater version devices. The fuse should not be blown for eMMC 4.3 or lesser spec version devices.

- Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.
- 0 = intact fuse and 1= blown fuse

### 6.6.3.2 GPIO Boot Overrides

The table below provides a list of GPIO boot overrides.

**Table 6-26. GPIO Override Contact Assignments**

Package Pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot Mode Selection
BOOT_MODE0	Input	
LCD1_DATA00	Input	BOOT_CFG[0]
LCD1_DATA01	Input	BOOT_CFG[1]
LCD1_DATA02	Input	BOOT_CFG[2]
LCD1_DATA03	Input	BOOT_CFG[3]
LCD1_DATA04	Input	BOOT_CFG[4]
LCD1_DATA05	Input	BOOT_CFG[5]
LCD1_DATA06	Input	BOOT_CFG[6]
LCD1_DATA07	Input	BOOT_CFG[7]
LCD1_DATA08	Input	BOOT_CFG[8]
LCD1_DATA09	Input	BOOT_CFG[9]
LCD1_DATA10	Input	BOOT_CFG[10]
LCD1_DATA11	Input	BOOT_CFG[11]
LCD1_DATA12	Input	BOOT_CFG[12]
LCD1_DATA13	Input	BOOT_CFG[13]
LCD1_DATA14	Input	BOOT_CFG[14]
LCD1_DATA15	Input	BOOT_CFG[15]
LCD1_DATA16	Input	BOOT_CFG[16]
LCD1_DATA17	Input	BOOT_CFG[17]
LCD1_DATA18	Input	BOOT_CFG[18]
LCD1_DATA19	Input	BOOT_CFG[19]

The input pins provided are sampled at boot, and can be used to override corresponding eFUSE values, depending on the setting of the BT\_FUSE\_SEL fuse.

### 6.6.3.3 Device Configuration Data (DCD)

DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on Device Configuration Data.

## 6.6.4 Device Initialization

This section describes the details on the ROM and provides initialization details.

This includes details on:

- The ROM Memory Map
- The RAM Memory Map
- On-chip blocks that the ROM should make use of or change POR register default values
- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

### 6.6.4.1 Internal ROM /RAM memory map

The following figure shows the iROM memory map.

Figure 6-22. Internal ROM and RAM memory map

**NOTE**

The entire OCRAM region can be used freely post boot. ROM takes OCRAM\_PXP(32KB) and OCRAM\_EPDC(128KB) as OCRAM Free Area.

**6.6.4.2 Boot Block Activation**

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and boot device selection:

- APBH - DMA engine to drive the GPMI module
- BCH - 62-bit error correction hardware engine with AXI bus master and private connection to GPMI
- CCM - Clock Control Module
- ECSPI - Enhanced Configurable Serial Peripheral Interface
- EIM - External Interface Module. Used for NOR and OneNAND devices
- GPMI - NAND controller pin interface
- OCOTP\_CTRL - On-Chip OTP Controller. The OCOTP contains the eFUSES.
- IOMUXC - I/O Multiplexer Control allows GPIO use to override eFUSE boot settings
- IOMUXC GPR - I/O Multiplexer Control General Purpose registers
- CAAM - Cryptographic Acceleration and Assurance Module
- QSPI - QuadSPI Flash
- SNVS - Secure Non-Volatile Storage
- SRC - System Reset Controller
- USB - Used for serial download of a boot device provisioning program
- USDHC - Ultra Secure Digital Host Controller
- WDOG-1 - Watchdog Timer

**6.6.4.3 Clocks at Boot Time**

The table below shows the various clocks and their sources used by ROM.

**Table 6-27. PLL Setting by ROM**

PLL Name	Frequency	Comment
ARM_PLL	792MHz	

*Table continues on the next page...*

**Table 6-27. PLL Setting by ROM (continued)**

PLL Name	Frequency	Comment
DDR_PLL	1066MHz	
SYS_PLL	480MHz	All PFDs enabled
ENET_PLL	1000MHz	Enabled when a) NAND boot with sync/toggle mode, and b) NAND working frequency is 50MHz/100MHz

**NOTE**

All other PLLs are in default status

**Table 6-28. Clock Root Setting by ROM**

Clock Name	Frequency(MHz)	Source	Enable	Comment
ARM_A7_CLK_ROOT	792	PLL_ARM	Yes	Frequency will be lower in Low Power Boot (LPB) mode. See "USB Low Power Boot" for detail.
ARM_M4_CLK_ROOT	240	PLL_SYS_MAIN_240M	Yes	
MAIN_AXI_CLK_ROOT	332	PLL_SYS_PFD1_332M	Yes	Frequency lower in LPB mode.
DISP_AXI_CLK_ROOT	332	PLL_SYS_PFD1_332M	No	
NAND_USDHC_BUS_CLK_ROOT	270	PLL_SYS_PFD2_270M	Yes	
AHB_CLK_ROOT	135	PLL_SYS_PFD2_270M	Yes	
DRAM_PHYM_CLK_ROOT	1066	PLL_DDR	Yes	
DRAM_CLK_ROOT	533	PLL_DDR	Yes	Frequency lower in LPB mode.
USB_HSIC_CLK_ROOT	480	PLL_SYS_MAIN_480M	No	
EIM_CLK_ROOT	120	PLL_SYS_MAIN_120M	Yes	
NAND_CLK_ROOT			Yes	See Table "NAND_CLK_ROOT setting"
QSPI_CLK_ROOT			Yes	See Table "QSPI_CLK_ROOT setting"
USDHC1_CLK_ROOT	196	PLL_SYS_PFD0_392M	Yes	
USDHC2_CLK_ROOT	196	PLL_SYS_PFD0_392M	Yes	
USDHC3_CLK_ROOT	196	PLL_SYS_PFD0_392M	Yes	
ECSPI1_CLK_ROOT	60	PLL_SYS_MAIN_240M	Yes	
ECSPI2_CLK_ROOT	60	PLL_SYS_MAIN_240M	Yes	

Table continues on the next page...

**Table 6-28. Clock Root Setting by ROM (continued)**

Clock Name	Frequency(MHz)	Source	Enable	Comment
ECSPI3_CLK_ROOT	60	PLL_SYS_MAIN_240M	Yes	
ECSPI4_CLK_ROOT	60	PLL_SYS_MAIN_240M	Yes	

**NOTE**

All other clock roots are in default status.

**Table 6-29. NAND\_CLK\_ROOT Setting**

NAND data rate	NAND_CLK_ROOT source	Frequency(MHz)
Async/Legacy NAND	PLL_SYS_MAIN_480M	24
Sync 40M	PLL_SYS_MAIN_480M	40
Toggle/Sync 66M	PLL_SYS_PFD0_392M	66
Toggle 80M	PLL_SYS_MAIN_480M	80
Sync 100M	PLL_ENET_MAIN_500M	100
Toggle/Sync 133M	PLL_SYS_PFD0_392M	133
Sync 160M	PLL_SYS_MAIN_480M	160
Toggle/Sync 200M	PLL_SYS_PFD0_392M	198

**NOTE**

NAND\_CLK\_ROOT source depends on NAND data rate.

**Table 6-30. QSPI\_CLK\_ROOT Setting**

QSPI Serial Clock Frequency	QSPI_CLK_ROOT	Frequency(MHz)
20MHz	PLL_SYS_PFD4	80
49MHz	PLL_SYS_PFD4 configured to 392MHz	196
55MHz	PLL_SYS_PFD4 configured to 432MHz	216
60MHz	PLL_SYS_PFD4	240
66MHz	PLL_SYS_PFD2_270M	270
76MHz	PLL_SYS_PFD4 configured to 320MHz	320
99MHz	PLL_SYS_PFD4 configured to 392MHz	392

**NOTE**

QSPI\_CLK\_ROOT source depends on QSPI data rate.

**NOTE**

QSPI\_CLK\_ROOT is 4x of the QSPI Serial Clock Frequency.

**NOTE**

"QSPI Serial Clock Frequency" in QSPI\_CLK\_ROOT mapping table is from QuadSPI Configuration Parameters; please refer to QuadSPI Configuration Parameters table for details. The real clock frequency may be different.

The ROM code will disable the clocks listed in the following table, except for the boot devices listed in the Enabled for Boot Device column below.

**Table 6-31. CCGR setting by ROM**

CCGR registers	LPCG Enable	Enabled for Boot Device
CCM_CCGR20	rawnand	RawNAND
CCM_CCGR21	qspi	QSPI NOR flash
CCM_CCGR22	eim	EIM NOR

CCM_CCGR158	wdog3	
CCM_CCGR159	wdog4	
CCM_CCGR170	kpp	

**NOTE**

All other CCGR registers are in default status

**6.6.4.4 Enabling MMU and Caches**

The boot ROM includes a feature of enabling the Memory Management Unit (MMU) and caches to improve boot speed.

L1 instruction cache is enabled at the start of image download. L1 data cache, L2 cache and MMU are enabled during image authentication. Once HAB authentication completes the ROM disables the L1 data cache, L2 cache and MMU.

L1 Instruction cache, L1 data cache, L2 cache and MMU is controlled by eFuse. By default these features are enabled.

Enabling the MMU when booting non-securely with SEC\_CONFIG=Open, and setting the CSF pointer in the Image Vector Table to NULL, has no impact on the boot performance. With this configuration it is recommended to blow BT\_MMU\_DISABLE fuse.

### 6.6.4.5 Exception Handling

The exception vectors located at the start of ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in ROM.

After boot the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate one in RAM.

#### Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR    PC, Reset_Addr
LDR    PC, Undefined_Addr
LDR    PC, SWI_Addr
LDR    PC, Prefetch_Addr
LDR    PC, Abort_Addr
NOP                                ; Reserved vector
LDR    PC, IRQ_Addr
LDR    PC, FIQ_Addr

;; Define exception vector table
Reset_Addr    DCD    start_address
Undefined_Addr DCD    iRAM_Undefined_Handler
SWI_Addr      DCD    iRAM_SWI_Handler
Prefetch_Addr DCD    iRAM_Prefetch_Handler
Abort_Addr    DCD    iRAM_Abort_Handler
              DCD    0 ; Reserved vector
IRQ_Addr      DCD    iRAM_IRQ_Handler
FIQ_Addr      DCD    iRAM_FIQ_Handler

start_address DCD start ;reset handler vector
```

### 6.6.4.6 Interrupt Handling During Boot

No special interrupt handling routines are required during the boot process. Interrupts are disabled during boot ROM execution and may be enabled in a later boot stage.

### 6.6.4.7 Persistent Bits

Some modes of boot ROM require registers that keep their values after warm reset. SRC General Purpose registers are used for this purpose.

See the table below for persistent bits list and description.

**Table 6-32. Persistent Bits**

Bit Name	Bit Location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used - primary and secondary. Used only for boot modes that support redundant boot.
PERSIST_BLOCK_REWRITE	SRC_GPR10[29]	This bit is used as warning. It identifies that there are errors in NAND blocks that hold the application image.  See <a href="#">NAND Flash</a> for more details.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds argument of entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ENTRY1[31:0]	SRC_GPR3[31:0]	Holds entry function for CPU1 for wake-up from low-power mode.
PERSISTENT_ARG1[31:0]	SRC_GPR4[31:0]	Holds argument of entry function for CPU1 for wake-up from low-power mode.

### 6.6.5 Boot Devices (Internal Boot)

The Chip supports the following boot Flash devices:

- NOR Flash with External Interface Module (EIM), located on CS0, 16-bit bus width
- OneNAND Flash with EIM interface, located on CS0, 16-bits bus width
- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface, located at CS0. Page sizes of 2 Kbyte, 4 Kbyte and 8 Kbyte. Bus widths of 8-bit with 2 through 62-bit BCH Hardware ECC (Error Correction) are supported.
- Quad SPI Flash
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards
- EEPROM boot via SPI (serial flash)

The selection of external boot device type is controlled by BOOT\_CFG[15:12] eFUSES. See the table below for more details.

**Table 6-33. Boot Device Selection**

BOOT_CFG[15:12]	Boot Device
0001	SD/eSD/SDXC
0010	MMC/eMMC
0011	Raw NAND
0100	QSPI
0101	NOR/OneNAND (EIM)
0110	Serial ROM (I2C/SPI)

### 6.6.5.1 NOR Flash/OneNAND using EIM Interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes based on fuse settings.

**Table 6-34. EIM Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG[15:12]	OEM	Boot Device Selection	Yes	0000	0101 - Boot from EIM Interface
BOOT_CFG[11]	OEM	NOR/OneNAND Selection	Yes	0	0 - NOR 1 - OneNAND
BOOT_CFG[10:9]	OEM	Muxing Scheme	Yes	00	00 - Muxed, 16-bit data (low half) interface 01 - Reserved 10 - Not muxed, 16-bit data (low half) interface 11 - Reserved
BOOT_CFG[7:6]	OEM	OneNAND Page Size	Yes	00	00 - 1K 01 - 2K 10 - 4K 11 - Reserved

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.

### 6.6.5.1.1 NOR Flash Boot Operation

Booting from the NOR Flash is supported via EIM interface. The ROM reads Image Vector Table and Boot Data structures to determine if the image can be executed directly from EIM address space or should be copied to other memory.

The start field of Boot Data Structure specifies the final location of the image (see [Image Vector Table and Boot Data](#)).

### 6.6.5.1.2 OneNAND Flash Boot Operation

At system power-up, the OneNAND device automatically copies an Initial Load Region of 1 Kbyte from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

#### NOTE

The OneNAND boot RAM memory containing the Initial 1K Load Region must contain the IVT, DCD and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the Program Image contents to the application destination pointer (located in the start entry of Boot Data (see [Image Vector Table and Boot Data](#)). The ROM determines the size of the Program Image by the length specified by size entry in Boot Data structure (see [Image Vector Table and Boot Data](#)). A failure loading data from the OneNAND device for any reason forces the Chip to enter the Serial Downloader, otherwise the booting from the OneNAND device continues.

The figure below illustrates the layout of the Program Image on a OneNAND boot device.

**Figure 6-23. Program Image Layout on a OneNAND Flash Device**

Prior to accessing the OneNAND device, the Chip waits approximately 500  $\mu$ s after Power On Reset. This delay is required for the OneNAND device to become ready. After this initial 500  $\mu$ s delay it can take an addition 70  $\mu$ s for the OneNAND device to load the

Initial Load Region of 1 Kbyte into its boot RAM. The Chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 Kbytes has been loaded to the OneNAND boot RAM before continuing with the boot flow.

### 6.6.5.1.3 IOMUX Configuration for EIM Devices

The EIM interface uses dedicated contacts on the IC.

The contacts assigned to the data signals used by EIM are shown in the table below.

**Table 6-35. EIM IOMUX Pin Configuration**

Signal	A/D16 (Muxed, 16-bit data interface)	A+D (Not muxed, 16-bit data interface)
DATA0	EPDC_D0.alt4	LCD_DAT0.alt4
DATA1	EPDC_D1.alt4	LCD_DAT1.alt4
DATA2	EPDC_D2.alt4	LCD_DAT2.alt4
DATA3	EPDC_D3.alt4	LCD_DAT3.alt4
DATA4	EPDC_D4.alt4	LCD_DAT4.alt4

## 6.6.5.2 NAND Flash

The boot ROM supports a number of MLC/SLC NAND Flash devices from different vendors and LBA NAND Flash devices. The Error Correction and Control (ECC) subblock (BCH) is used to detect the errors.

### 6.6.5.2.1 NAND eFUSE Configuration

The boot ROM determines the configuration of external NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins, during boot. See [Table 6-36](#) for parameters details.

#### NOTE

BOOT\_CFGx sampled on GPIO pins depends on BT\_FUSE\_SEL setting. See [Boot Fusemap](#) for details.

#### NOTE

ROM always boots from CS0\_B, while for multiple chip selects (such as some NAND chips), all other chip select pins of such NAND chip except CS0\_B, should be pull-up in boot progress

Table 6-36. NAND Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG[15:12]	OEM	Boot Device Selection	Yes	0	0011 - Boot from NAND Interface
BOOT_CFG[7]	OEM	BT_TOGGLEMODE	Yes	0	0 - raw NAND 1 - toggle mode NAND
BOOT_CFG[11:10]	OEM	Pages In Block	Yes	0	00 - 128 01 - 64 10 - 32 11 - 256
BOOT_CFG[9:8]	OEM	Row Address Cycles	Yes	00	00 - 3 01 - 2 10 - 4 11 - 5
BOOT_CFG[4:1]	OEM	Toggle Mode 33 MHz Preamble Delay, Read Latency	Yes	000	0000 - 16 GPMICLK cycles 0001 - 1 GPMICLK cycles 0010 - 2 GPMICLK cycles 0011 - 3 GPMICLK cycles 0100 - 4 GPMICLK cycles 0101 - 5 GPMICLK cycles 0110 - 6 GPMICLK cycles 0111 - 7 GPMICLK cycles 1000 - 8 GPMICLK cycles 1001 - 9 GPMICLK cycles 1010 - 10 GPMICLK cycles 1011 - 11 GPMICLK cycles 1100 - 12 GPMICLK cycles 1101 - 13 GPMICLK cycles 1110 - 14 GPMICLK cycles 1111 - 15 GPMICLK cycles

0x4B0[15:12]	OEM	READ_RETRY_SEQ_ID[3:0]	No	0000	0000 - Don't use ROM embedded read-retry sequence

**Table 6-36. NAND Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
					0001 - use Micron 20nm read-retry sequence 0010 - use Toshiba A19nm read-retry sequence 0011 - use Toshiba 19nm read-retry sequence 0100 - use SanDisk 19nm read-retry sequence 0101 - use SanDisk 19nm read-retry sequence 0110 to 1111 - Reserved

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

### 6.6.5.2.2 NAND Flash Boot Flow and Boot Control Blocks (BCB)

There are two BCB data structures:

- FCB
- DBBT

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

The hardware ECC level to use is embedded inside FCB block. The FCB data structure is also protected using ECC. Driver reads raw 2112 bytes of first sector and runs through software ECC engine that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

The FCB contains the page address of DBBT Search Area, and the page address for primary and secondary boot images. DBBT is searched in DBBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

Figure 6-24 shows the state diagram of FCB search.

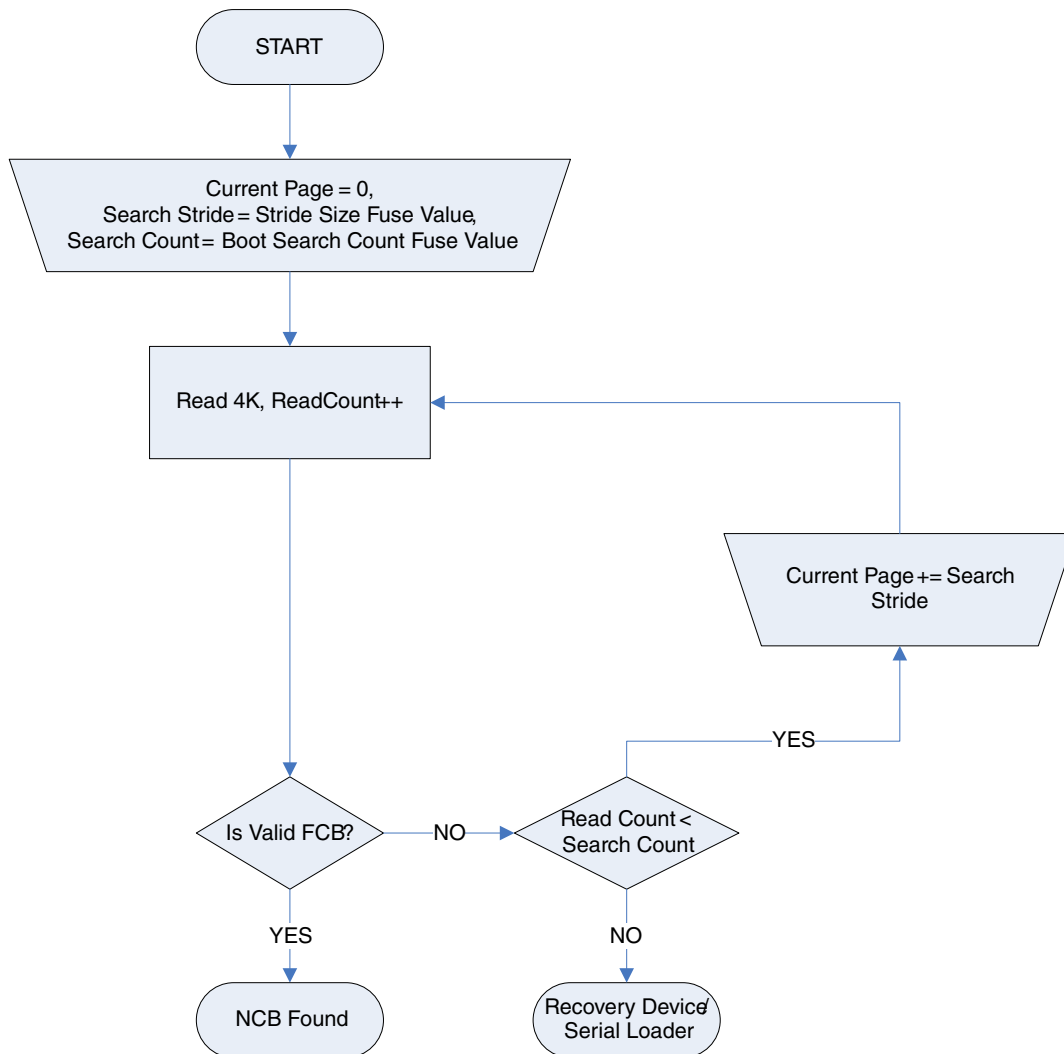

Figure 6-24. FCB Search Flow

Once FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBT Search Area is 0 in FCB, then ROM assumes that there are no bad blocks on NAND device boot area. See Figure 6-25 for the DBBT search flow.

**Figure 6-25. DBBT Search Flow**

The BCB search and load function also monitors the ECC correction threshold and sets the `PERSIST_BLOCK_REWRITE` persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on `PERSIST_SECONDARY_BOOT` bit and perform SW reset (After SW reset, secondary image is used).

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM goes to serial loader.

### 6.6.5.2.3 Firmware Configuration Block

The FCB is the first sector in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so in case the first NAND block becomes corrupted, the ROM will find its copy in the next NAND block. The search area should span over at least two NAND blocks. The location information for DBBT search area, FW1, and FW2 are all specified in the FCB. [Table 6-37](#) shows the Flash Control Block Structure.

**Table 6-37. Flash Control Block Structure**

Name	Start Byte	Size in Bytes	Description
Reserved	0	4	Reserved for Fingerprint #1(Checksum)
FingerPrint	4	4	32 bit word with a value of 0x46434220, in ascii "FCB"
Version	8	4	32-bit version number; this version of FCB is 0x00000001
m_NANDTiming	12	8	8 bytes of data for 8 NAND Timing Parameters from NAND datasheet. The 8 parameters are: m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH.  ROM only uses first 4 parameters but FCB provides space for other 4 parameters to be used by boot-loader or other applications.
PageDataSize	20	4	Number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size
TotalPageSize	24	4	Total number of bytes in page. Typically, 2112 for 2 KB page or 4224 or 4314 for 4 KB page or 8568 for 8 KB page.
SectorsPerBlock	28	4	Number of pages per block. Typically 64 or 128 or depending on NAND device type.
NumberOfNANDs	32	4	Not used by ROM

*Table continues on the next page...*

**Table 6-37. Flash Control Block Structure  
(continued)**

Name	Start Byte	Size in Bytes	Description
TotalInternalDie	36	4	Not used by ROM
CellType	40	4	Not used by ROM
EccBlockNEccType	44	4	Value from 0 to 31 used to set BCH Error Correction level 0, 2, 4, .. or 62 for Block BN of ECC page, used in configuring BCH62 page layout registers
EccBlock0Size	48	4	Size of block B0, used in configuring BCH62 page layout registers
EccBlockNSize	52	4	Size of block BN, used in configuring BCH62 page layout registers
EccBlock0EccType	56	4	Value from 0 to 31 used to set BCH Error Correction level 0, 2, 4, .. or 62 for Block BN of ECC page, used in configuring BCH62 page layout registers
MetadataBytes	60	4	Size of metadata bytes used in configuring BCH62 page layout registers
NumEccBlocksPerPage	64	4	Number of ECC blocks BN not including B0. This value is used in configuring BCH62 page layout registers
EccBlockNEccLevelSDK	68	4	Not used by ROM
EccBlock0SizeSDK	72	4	Not used by ROM
EccBlockNSizeSDK	76	4	Not used by ROM
EccBlock0EccLevelSDK	80	4	Not used by ROM
NumEccBlocksPerPageSDK	84	4	Not used by ROM
MetadataBytesSDK	88	4	Not used by ROM
EraseThreshold	92	4	Not used by ROM
Firmware1_startingPage	104	4	Page number address where first copy of bootable firmware is located
Firmware2_startingPage	108	4	Page number address where second copy of bootable firmware is located
PagesInFirmware1	112	4	Size of first copy of firmware in pages
PagesInFirmware2	116	4	Size of second copy of firmware in pages
DBBTSearchAreaStartAddress	120	4	Page address for bad block table search area
BadBlockMarkerByte	124	4	This is an input offset in BCH page for ROM to swap with first byte of metadata after reading a page using BCH62. ROM supports restoration of manufacturer marked bad block markers in the page and this offset is the bad block marker offset location
BadBlockMarkerStartBit	128	4	This is an input bit offset in BadBlockMarkerByte for ROM to use when swapping 8 bits with first byte of metadata.
BBMarkerPhysicalOffset	132	4	This is the offset where manufacturer leaves bad block marker on a page

Table continues on the next page...

**Table 6-37. Flash Control Block Structure  
(continued)**

Name	Start Byte	Size in Bytes	Description
BCHType	136	4	0 for BCH20 and 1 for BCH62. The Chip is backward compatible to BCH20 and this field tell ROM to use BCH20 or BCH62 block
TMTiming2_ReadLatency	140	4	Toggle mode NAND timing parameter read latency, ROM use this value to configure timing2 register of GPMI
TMTiming2_PreambleDelay	144	4	Toggle mode NAND timing parameter Preamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CEDelay	148	4	Toggle mode NAND timing parameter CE Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_PostambleDelay	152	4	Toggle mode NAND timing parameter Postamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CmdAddPause	156	4	Toggle mode NAND timing parameter Cmd Add Pause. ROM use this value to configure timing2 register of GPMI
TMTiming2_DataPause	160	4	Toggle mode NAND timing parameter Data Pause. ROM use this value to configure timing2 register of GPMI
TMSpeed	164	4	This is the toggle mode speed for ROM to configure gpmi clock. 0 for 33 MHz, 1 for 40 MHz and 2 for 66 MHz
TMTiming1_BusyTimeout	168	4	Toggle mode NAND timing parameter Busy Timeout. ROM use this value to configure timing1 register of GPMI
DISBBM	172	4	If 0 ROM will swap BadBlockMarkerByte with metadata[0] after reading a page using BCH62. If the value set is 1 then ROM will not do swapping
BBMark_spare_offset	176	4	The offset in mata data place which stores the data in Bad block marker place.
Onfi_sync_enable	180	4	Enable the Onfi nand sync mode support
Onfi_sync_speed	184	4	Speed for onfi nand sync mode: 0 - 24 MHZ, 1 - 33 MHZ, 2 - 40 MHZ, 3 - 50 MHZ, 4 - 66 MHZ, 5 - 80 MHZ, 6 - 100 MHZ, 7 - 133 MHZ, 8 - 160 MHZ, 9 - 200 MHZ
Onfi_syncNANDData	188	28	parameters for onfi nand sync mode timing. They are read_latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, busy_timeout
DISBB_Search	216	4	Disable the badblock search function when reading the firmware, only using DBBT.
Randomizer_Enable	220	4	Enable randomizer support with randomizer type 2. This is for DBBT and firmware.
Reserved	224	60	Reserved for future use

Table continues on the next page...

**Table 6-37. Flash Control Block Structure  
(continued)**

Name	Start Byte	Size in Bytes	Description
Read_Retry_Enable	284	4	Enable read retry for DBBT and firmware
Reserved	288	4	Reserved and must be kept as 0

The FCB data structure is protected using 62-bit ECC. The layout of FCB page is illustrated in the figure below.

**Figure 6-26. Layout of the FCB Page**

The detailed parameters of FCB pages are listed in the table below.

**Table 6-38. Parameters Setting for FCB Page**

Parameter	Value
TotalPageSize	2048+64=2112
MetadataBytes	32
EccBlock0Size	128
EccBlock0EccType	31
BCHType	0
EccBlockNSize	128
EccBlockNEccType	31
NumEccBlocksPerPage	7

In order to reduce the disturbances caused by a neighboring cell in the FCB page in the NAND chip, a randomizer is enabled when reading FCB page. The randomizer is used to reduce bit errors in FCB. Ensure the randomizer is enabled when burning FCB pages in NAND flash. To control randomizer for the pages except for FCB, a new field called `Randomizer_Enable` is added into FCB structure. If the `Randomizer_Enable` field is set as 0, randomizer will be disabled when reading the pages except FCB, being set as a non-zero value will enable randomizer. For detailed randomizer information, please see [Randomizer](#)

### 6.6.5.2.4 Discovered Bad Block Table (DBBT)

See the table below for DBBT format.

**Table 6-39. DBBT Structure**

Name	Start Byte	Size in Bytes	Description
reserved	0	4	-
FingerPrint	4	4	32-bit word with a value of 0x44424254, in ascii "DBBT"
Version	8	4	32-bit version number; this version of DBBT is 0x00000001
reserved	12	4	-
DBBT_NUM_OF_PAGES	16	4	Size of DBBT in pages
reserved	20	4*PageSize-20	-
reserved	4*PageSize	4	-
Number of Entries	4*PageSize + 4	4	Number of bad blocks
Bad Block Number	4*PageSize + 8	4	First bad block number
Bad Block Number	4*PageSize + 12	4	Second bad block number
...-	-	-	...next bad block number
...-	-	-	...-
Last bad block number	-	-	last bad block number

### 6.6.5.2.5 Bad Block Handling in the ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If Bad Block table start page is null, check the manufactory made Bad Block marker. The location of Bad Block maker is at the first 3 or last 3 pages in every block of the NAND flash. NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark a block is bad or not. 0xFF means good block, non FF means bad block.

In order to preserve the BI (bad block information), flash updater or gang programmer applications need to swap Bad Block Information (BI) data to byte 0 of metadata area for every page before programming NAND flash. ROM when loading firmware copies back the value at metadata[0] to BI offset in page data. The [Figure 6-27](#) shows how the factory bad block marker is preserved.

Bad block information at  
column address 2048

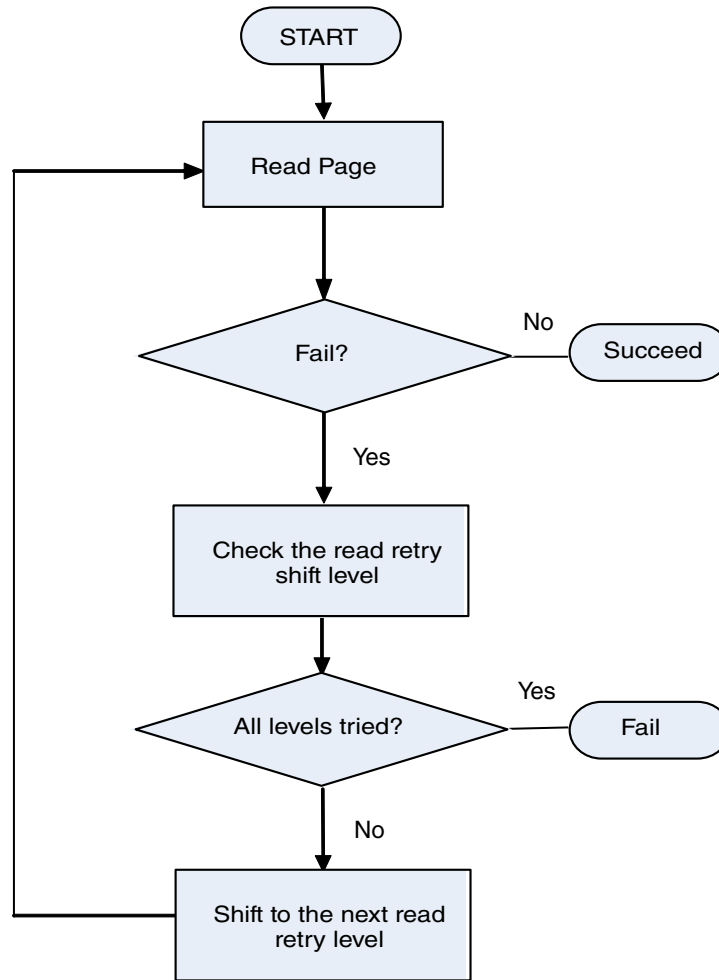

**Figure 6-27. Factory Bad Block Marker Preservation**

In the FCB structure, there are two elements `m_u32BadBlockMarkerByte` and `m_u32BadBlockMarkerStartBit` to indicate the byte and bit place in the page data, that manufacturer marked the bad block marker.

#### 6.6.5.2.6 Read Retry Handling in the ROM

Read retry is used to recover from NAND bit errors beyond the ECC correction threshold. If reading a page failed and the `read_retry_enable` field in FCB is set as 1, ROM will issue read retry command sequence to shift the read level before reading the page again. If the previous reading failed, ROM keep shifting the read level until reading succeeds or all levels had been tried. The state diagram of read retry is shown in the figure below.

**Figure 6-28. Read Retry Flow**

Different vendors and different process may have different read retry sequences. At present, ROM supports five (5) read retry sequences. Blowing the fuse `READ_RETRY_SEQ_ID[3:0]` can select to use which sequence.

The detailed read retry sequences are listed in the table below.

Vendor	Process	READ_RETRY_SEQ_ID[3:0]	Comment

### 6.6.5.2.7 Toggle Mode DDR NAND Boot

If `BT_TOGGLEMODE` efuse is blown then ROM does the following to boot from Samsung's toggle mode DDR NAND.

### 6.6.5.2.7.1 GPMI and BCH Clocks Configuration

ROM sets the clock source and the dividers in CCM registers.

If `BOOT_CFG[7]` is set (toggle mode), GPMI/BCH CLK source is PLL2PFD4, and running at 66 MHz, otherwise GPMI/ BCH CLK source is PLL3, running at 24 MHz. ROM sets default values to `timing0`, `timing1` and `timing2` gpmi registers for 24 MHz clock speed. It uses fuse `BOOT_CFG[4:1]` to configure GPMI `timing2` register parameters preamble delay and read latency, the default value for these parameters is 2 when fuses are not blown.

Default timing parameter values used by ROM for toggle-mode device:

- `Timing0.ADDRESS_SETUP` = 5
- `Timing0.DATA_SETUP` = 10
- `Timing0.DATA_HOLD` = 10
- `Timing1.DEVICE_BUSY_TIMEOUT` = 0 x 500
- `Timing2.READ_LATENCY` = `BOOT_CFG[4:1]` if blown, otherwise 2
- `Timing2.CE_DELAY` = 2
- `Timing2.PREAMBLE_DELAY` = `BOOT_CFG[4:1]` if blown, otherwise 2
- `Timing2.POSTAMBLE_DELAY` = 3
- `Timing2.CMDADD_PAUSE` = 4
- `Timing2.DATA_PAUSE` = 6

Default timing parameters can be overridden by `TMTiming2_ReadLatency`, `TMTiming2_PreambleDelay`, `TMTiming2_CEDelay`, `TMTiming2_PostambleDelay`, `TMTiming2_CmdAddPause`, `TMTiming2_DataPause` parameters of FCB.

### 6.6.5.2.7.2 Setup DMA for DDR Transfers

In DMA descriptors GPMI is configured to read page data at double data rate, the word length is set to 16 and transfer count to half of page size.

### 6.6.5.2.7.3 Reconfigure Timing and Speed Using Values in FCB

After reading FCB page with GPMI set to default timings and speed 33 MHz, ROM reconfigures CCM dividers to run gpmi/bch clks to desired speed specified in FCB for rest of boot process. The GPMI timing registers are also reconfigured to values specified in FCB.

The GPMI speed can be configured using FCB parameter `TMSpeed`:

- 0 - 24 MHz

- 1 - 33 MHZ
- 2 - 40 MHZ
- 3 - 50 MHz
- 4 - 66 MHz
- 5 - 80 MHz
- 6 - 100 MHz
- 7 - 133 MHz
- 8 - 160 MHz
- 9 - 200 MHz

The GPMI timing0 register fields data\_setup, data\_hold and address\_setup are set to values specified for data\_setup, data\_hold and address\_setup in FCB member m\_NANDTiming.

The GPMI timing1.DEVICE\_BUSY\_TIMEOUT is set to value specified in FCB member TMTiming1\_BusyTimeout.

The GPMI timing2 register values are set using FCB members TMTiming2.READ\_LATENCY, CE\_DELAY, PREAMBLE\_DELAY, POSTAMBLE\_DELAY, CMDADD\_PAUSE and DATA\_PAUSE.

### 6.6.5.2.8 Typical NAND Page Organization

#### 6.6.5.2.8.1 BCH ECC Page Organization

The first data block is called block 0 and the rest of the blocks are called block N. Separate ECC level scan be used for block 0 and block N.

The metadata bytes should be located at the beginning of a page, starting at byte 0, followed by data block 0, followed by ECC bytes for data block 0, followed by block 1 and its ECC bytes, and so on until N data blocks. The ECC level for block 0 can be different from the ECC level of rest of the blocks.

For NAND boot, with page size restrictions and data block size restricted to 512 bytes, only few combinations of ECC for block 0 and block N are possible.

The figure below shows the valid layout for 2112 byte sized page.

**Figure 6-29. Valid Layout for 2112 bytes Sized Page**

The example below is for 13 bits of parity(GF13). The number of ECC bits required for a data block is calculated using (ECC\_Correction\_Level \* 13) bits.

In the above layout the ECC size for EccB0 and EccBN should be selected to not exceed a total page size of 2112 bytes. EccB0 and EccBN can be one of 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 bits ECC correction level. The total bytes would then be:

$$[M + (\text{data\_block\_size} \times 4) + ([\text{EccB0} + (\text{EccBN} \times 3)] \times 13) / 8] \leq 2112;$$

M = metadata bytes and data\_block\_size is 512.

There are 4 data blocks of 512 bytes each in a page of 2k page sized NAND. The values of EccB0 and EccBN should be such that the above calculation would not result in a value greater than 2112 bytes.

M	Block0 512 bytes	EccB0	Block1 512 bytes	EccBN	Block2 512 bytes	EccBN	Block3 512 bytes	EccBN
	Block4 512 bytes	EccBN	Block5 512 bytes	EccBN	Block6 512 bytes	EccBN	Block7 512 bytes	EccBN

**Figure 6-30. Valid Layout for 4 Kbytes Sized Page**

Different NAND manufacturers have different sizes for a 4K page; 4314 bytes is typical.

$$[M + (\text{data\_block\_size} \times 8) + ([\text{EccB0} + (\text{EccBN} \times 7)] \times 13) / 8] \leq 4314;$$

M= metadata bytes and data\_block\_size is 512.

There are 8 data blocks of 512 bytes each in a page of a 4k page sized NAND. The values of EccB0 and EccBN should be such that above calculation should not result in a value greater than the size of a page in a 4k page NAND.

#### 6.6.5.2.8.2 Metadata

The number of bytes used for metadata is specified in FCB. Metadata for BCH encoded pages will be placed at the beginning of a page. ROM only cares about the first byte of metadata to swap it with bad block marker byte in page data after each page read; it is important to have at least one byte for the metadata bytes field in FCB data structure.

### 6.6.5.2.9 IOMUX Configuration for NAND

The table below shows the RawNAND IOMUX pin configuration.

**Table 6-40. NAND IOMUX Pin Configuration**

Signal	Pad Name
NAND_CLE	SD3_CLK.alt1
NAND_ALE	SD3_CMD.alt1
NAND_WP_B	SAI1_MCLK.alt1
NAND_RE_B	SD3_STROBE.alt1
NAND_WE_B	SD3_RESET_B.alt1
NAND_READY_B	SAI1_TXD.alt1
NAND_DQS	SAI1_TXFS.alt1
NAND_CE0_B	SAI1_TXC.alt1
NAND_DATA00	SD3_DATA0.alt1
NAND_DATA01	SD3_DATA1.alt1
NAND_DATA02	SD3_DATA2.alt2
NAND_DATA03	SD3_DATA3.alt3
NAND_DATA04	SD3_DATA4.alt4
NAND_DATA05	SD3_DATA5.alt5
NAND_DATA06	SD3_DATA6.alt6
NAND_DATA07	SD3_DATA7.alt7

### 6.6.5.3 Expansion Device

The ROM supports booting from MMC/eMMC and SD/eSD compliant devices.

#### 6.6.5.3.1 Expansion Device eFUSE Configuration

SD/MMC/eSD/eMMC/SDXC boot can be performed using either USDHC ports, based on setting of the BOOT\_CFG[11:10] (Port Select) fuse or it's associated GPIO input value at boot.

All USDHC ports support fast boot. See the table below for details.

**Table 6-41. USDHC Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG[7]	OEM	Fast Boot Support	Yes	000	0 - Normal Boot 1 - Fast Boot
BOOT_CFG[6:4]	OEM	Bus Width	Yes	000	0 - SD/eSD/SDXC

*Table continues on the next page...*

**Table 6-41. USDHC Boot eFUSE Descriptions  
(continued)**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
					1 - MMC/eMMC
BOOT_CFG[3:1]	OEM	SD/MMC Speed Mode/ USDHC1 IO Voltage Selection	Yes	000	MMC Speed Selection 00 - Normal 01 - High else - Reserved  SD Speed Selection Speed 000 - Normal/SDR12 001 - High/SDR25 010 - SDR50 011 - SDR104 else - Reserved  USDHC1 IO VOLTAGE SELECTION (Only for MMC/eMMC boot) 0 - 3.3V 1 - 1.8V

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.

Boot code supports following standards.

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less

- eSDv2.10 rev-0.9, with or without FAST\_BOOT.
- SDXCv3.0

MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4Kbyte of data from MMC/SD/eSD/eMMC device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

The maximum image size to load in SD/MMC boot is 32MB. This is due to the limited number of uSDHC ADMA Buffer Descriptors allocated by ROM.

### NOTE

The Initial 4Kbyte of Program Image must contain the IVT, DCD and the Boot Data structures.

**Table 6-42. SD/MMC Frequencies**

	SD	MMC	MMC (DDR Mode)
Identification (KHz)	347.22		
Normal Speed Mode (MHz)	25	20	25
High Speed Mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

### NOTE

The boot ROM code reads application image length and application destination pointer from image.

#### 6.6.5.3.2 MMC and eMMC Boot

The following table provides MMC and eMMC boot details.

**Table 6-43. MMC and eMMC Boot Details**

Normal Boot Mode	During initialization (normal boot mode) the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, voltage validation is performed and the ROM boot code checks high voltage settings and card capacity. The ROM boot code supports both high capacity and low capacity MMC/eMMC cards. After initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in Normal boot mode or 40 MHz in High Speed mode). eMMC is also interfaced via USDHC and follows the same flow as MMC.
------------------	--

*Table continues on the next page...*

**Table 6-43. MMC and eMMC Boot Details (continued)**

	<p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in BOOT_PARTITION_ENABLE field or the user partition has been mentioned, ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 Device Supporting Special Boot Mode	<p>If using an eMMC4.3 or eMMC4.4 device supporting special boot mode, it can be initiated by pulling the CMD line low. If BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via DATA lines and ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. eMMC4.3/eMMC4.4 device with "Boot mode" feature can only be supported via ESDHCV3-3 and with or without BOOT ACK. If BOOT ACK is enabled ROM waits 50 ms to get the BOOT ACK and if BOOT ACK is received by ROM. If BOOT ACK is disabled ROM waits 1 second for data. If BOOT ACK or data was received then eMMC4.3/eMMC4.4 is booted in "Boot mode", otherwise eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by BOOT_CFG[7] (Fast Boot) fuse. BOOT ACK is selected by 0x4A0[0].</p>
eMMC4.4 Device	<p>If using eMMC4.4 device, Double Data Rate (DDR) mode can be used. This mode can be selected by BOOT_CFG2[7:5] (Bus Width) fuse.</p>

**Figure 6-37. Expansion Device Boot Flow (6 of 6)**  
i.MX 7Dual Applications Processor Reference Manual, Rev. 0.1, 08/2016

### 6.6.5.3.3 SD, eSD and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, SD/eSD/SDXC card voltage validation is performed. During voltage validation, boot code first checks with high voltage settings; if that fails, it checks with low voltage settings.

The capacity of the card is also checked. Boot code supports high capacity and low capacity SD/eSD/SDXC cards after voltage validation card initialization is done.

During card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes the card is a normal SD card or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, boot code switches to a higher frequency (25 MHz in Normal Speed mode or 50 MHz in High Speed Mode). ROM also supports FAST\_BOOT mode booting from eSD card. This mode can be selected by BOOT\_CFG[4] (Fast Boot) fuse described in [Table 6-41](#).

For UHSI cards, clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2, USDHC3 and USDHC4 ports. This will enable the voltage switch process to set the signaling voltage to 1.8V during voltage validation. The bus width is fixed at 4 bits wide and a sampling point tuning process is needed to calibrate the number of delay cells. If SD Loopback Clock eFuse is set, the feedback clock will come directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by BOOT\_CFG[3:2], and the SD Loopback Clock is selected by BOOT\_CFG[0].

UHSI calibration start value (MMC\_DLL\_DLY[6:0]) and step value can be set to optimize the sample point tuning process.

If SD Power Cycle Enable eFuse is 1, ROM will set SD\_RST pad low, wait 5ms and then set SD\_RST pad high. If SD\_RST pad is connected to SD power supply enable logic on board, it enables power cycle of SD card. This may be crucial in case when SD logic is in 1.8V states and must be reset to 3.3V states.

SDR50 and SDR104 boot are not supported on the USDHC1 and USDHC2 ports because there are no reset signals for those ports when connected in the IOMUX.

### 6.6.5.3.4 IOMUX Configuration for SD/MMC

**Table 6-44. SD/MMC IOMUX Pin Configuration**

Signal	USDHC1	USDHC2	USDHC3
CLK	SD1_CLK.alt0	SD2_CLK.alt0	SD3_CLK.alt0

*Table continues on the next page...*

**Table 6-44. SD/MMC IOMUX Pin Configuration (continued)**

### 6.6.5.3.5 Redundant Boot Support for Expansion Device

ROM supports redundant boot for expansion device. Primary or Secondary image is selected depending on PERSIST\_SECONDARY\_BOOT setting (see [Table 6-32](#)).

If PERSIST\_SECONDARY\_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST\_SECONDARY\_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

**Table 6-45. Secondary Image Table Format**

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

**Figure 6-38. Expansion Device Structures Layout**

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST\_SECONDARY\_BOOT bit (see [Table 6-32](#)) and perform software reset. (After software reset, secondary image will be used.)

### 6.6.5.4 Serial ROM through SPI

The chip supports boot from serial memory devices, such as EEPROM and Serial Flash using the SPI.

The following ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4) interfaces.

#### 6.6.5.4.1 Serial ROM eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

See the table below for details:

**Table 6-46. Serial ROM Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG[15:12]	OEM	Boot Device Selection	Yes	0000	0110 - Boot from Serial ROM
BOOT_CFG[11:9]	OEM	ECSPI Port Selection	Yes	000	000 - eCSPI1 001 - eCSPI2 010 - eCSPI3 011 - eCSPI4
BOOT_CFG[8]	OEM	SPI Addressing	Yes	0	0 - 3-bytes (24-bit) 1 - 2-bytes (16-bit)
BOOT_CFG[17]	OEM	Recovery Boot Enable	Yes	0	0 – Disabled 1 – Enabled
BOOT_CFG[7:6]	OEM	CS selection (SPI only)	Yes	00	00 – CS#0 01 – CS#1 10 – CS#2 11 – CS#3
0x480[31:29]	OEM	Recovery Port Selection	No	000	000 - eCSPI1 001 - eCSPI2 010 - eCSPI3 011 - eCSPI4
0x480[28]	OEM	Recovery SPI Addressing	No	0	0 - 3-bytes (24-bit) 1 - 2-bytes (16-bit)
0x480[27:26]	OEM	Recovery CS selection (SPI only)	No	00	00 - CS#0 01 - CS#1 10 - CS#2 11 - CS#3

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as boot device using ECSPI interface for serial ROM boot. The SPI interface is configured to operate at 15 MHz for 3-byte addressing device and 3.75 MHz for 2-byte addressing devices.

The boot ROM will copy 4Kbyte of data from Serial ROM device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

### NOTE

The Initial 4K of Program Image must contain the IVT, DCD and the Boot Data structures.

#### 6.6.5.4.2 ECSPi Boot

The Enhanced Configurable SPI (ECSPi) interface is configured in master mode and the EEPROM device is connected to ECSPi interface as a slave.

The boot ROM code copies 4 KB data from EEPROM device to the internal RAM. If DCD verification is successful, the ROM code copies the initial 4 KB data, as well as the rest of the image extracted from application image, directly to the application destination. The ECSPi can read data from EEPROM using 2 or 3 byte addressing. Its burst length is 32 bytes.

### NOTE

The Serial ROM Chip Select Number is determined by BOOT\_CFG4[5:4] (Chip Select) fuse.

When using the SPI as boot device, the Chip supports booting from both Serial EEPROM and Serial Flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at boot (see [Table 6-46](#) for details).

Figure 6-39. CSPI Flow chart

### 6.6.5.4.2.1 ECSPI IOMUX Pin Configuration

The contacts assigned to the signals used by the CSPI blocks is shown in the table below.

Table 6-47. ECSPI IOMUX Pin Configuration

## 6.6.6 QuadSPI Serial Flash Memory Boot

### 6.6.6.1 QuadSPI eFUSE Configuration

**Table 6-48. QSPi Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO	Shipped Value	Settings
BOOT_CFG[15:12]	OEM	Boot Device Selection	Yes	0000	0100 - Boot from QuadSPI
BOOT_CFG[11]	OEM	QuadSPI Interface Selection	Yes	0	0 - QSPi1 1 - Reserved

### 6.6.6.2 QuadSPI Serial Flash BOOT Operation

The Boot ROM attempts to boot from QuadSPI flash if the BOOT\_CFG[15:12] fuses are programmed to 0100 as shown in the QuadSPI eFUSE Configuration table. The ROM will initialize the requested the QuadSPI Interface as selected in Fuse bit BOOT\_CFG[11] in the QuadSPI eFUSE Configuration. QuadSPI interface initialization is a two step process.

The ROM expects the QuadSPI configuration parameters as explained in the QuadSPI Configuration Parameters to be present in the Serial Flash memory from offset 0x400 of serial flash of length 512 bytes. The ROM reads these configuration parameters using the default read command configured in the LUT of the QuadSPI interface with SCLOCK operating at 20 MHz.

In the second step, ROM configures the selected QuadSPI interface with the configuration parameters read from the serial flash and starts the boot procedure. Refer to Table 19-12 for details regarding QuadSPI configuration parameters and to the QuadSPI boot flow chart for detailed boot flow chart of QuadSPI.

Both booting an XIP and non XIP image is supported from serial flash. For XIP boot, the image has to be built for QuadSPI address space and for non XIP the image can be built to execute from DDR or OCRAM.

For QUAD mode boot, the Boot ROM expects the Quad Enable bit inside the QSPI Flash to be already set before booting starts. Therefore, the QUAD enable bit must be set in the non-volatile register of the flash at the time of programming.

### NOTE

If the SPI flash device requires quad enable command, it can be sent via configuration structure fields: `device_quad_mode_en`, `device_cmd`, `write_cmd_ipcr`, `write_enable_ipcr`, `busy_bit_offset`, `read_status_ipcr`.

### 6.6.6.3 QuadSPI Configuration Parameters

The QuadSPI Configuration Parameters Table is built in boot image at fixed offset 0x400 from QSPI NOR A1 base address (368 bytes). Table below lists various QuadSPI Configuration Parameters.

**Table 6-49. QuadSPI Configuration Parameters**

Name	Offset	Size in Bytes	Description		
DQS Loopback	0	4	DQS LoopBack Mode to enable Dummy Pad, 0 - Disable, 1 - Enable		
Hold Delay	4	4	Hold Delay for QSPI[0,1] A/B		
			<b>Value</b>	<b>QSPI1 B</b>	<b>QSPI1 A</b>
			00	Disable	Disable
			01	Disable	Enable
			10	Enable	Disable
			11	Enable	Enable
Reserved	8	4	Reserved to 0		
Reserved	12	4	Reserved to 0		
<code>device_quad_mode_en</code>	16	4	Send Quad enable command to SPI device.		
<code>device_cmd</code>	20	4	Command to send to SPI device.		
<code>write_cmd_ipcr</code>	24	4	IPCR register value for write command		
<code>write_enable_ipcr</code>	28	4	IPCR register value for Enable		
Chip Select hold time	32	4	This is chip select hold time in terms of Serial clock (For Example 1 serial clock cycle 0-15).		
Chip Select setup time	36	4	Chip select setup time in terms of Serial clock (For example 1 serial clock).		

*Table continues on the next page...*

Table 6-49. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description																
Serial Flash A1 size	40	4	Serial Flash A1 size in units of bytes																
Serial Flash A2 size	44	4	Serial Flash A2 size in units of bytes																
Serial Flash B1 size	48	4	Serial Flash B1 size in units of bytes																
Serial Flash B2	52	4	Serial Flash B2 size in units of bytes																
Serial Clock Frequency	56	4	This is serial clock frequency select parameter. <table border="1"> <thead> <tr> <th>Value</th> <th>Clock</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>18 MHz</td> </tr> <tr> <td>01</td> <td>49 MHz</td> </tr> <tr> <td>02</td> <td>55 MHz</td> </tr> <tr> <td>03</td> <td>60 MHz</td> </tr> <tr> <td>04</td> <td>66 MHz</td> </tr> <tr> <td>05</td> <td>76 MHz</td> </tr> <tr> <td>06</td> <td>99 MHz (only SDR mode)</td> </tr> </tbody> </table>	Value	Clock	00	18 MHz	01	49 MHz	02	55 MHz	03	60 MHz	04	66 MHz	05	76 MHz	06	99 MHz (only SDR mode)

Serial Flash Port B Selection	68	4	Port A is always available. This field informs the device ROM the availability of Port B. 0 – Port B is not used 1 – Port B is used																
Dual Data Rate mode enable	72	4	This field enables the device ROM to enable DDR mode. 0 – DDR mode is disabled 1 – DDR mode is enabled																
Data Strobe Signal enable in Serial Flash	76	4	This field enables Data Strobe signal in Serial Flash which supports it. 0 – Disable DQS 1 – Enable DQS																
Parallel Mode enable	80	4	This field enables parallel mode. Data will be read from serial Flash in parallel mode. Refer to QSP chapter for detail. 0 – Disable Parallel mode in QSPI																

Table continues on the next page...

Table 6-49. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description
			1 – Enable Parallel Mode in QSPI
CS1 on Port A	84	4	This field enables CS1 on port A 0 – Disable CS1 on Port A 1 – Enable CS1 on Port A
CS1 on Port B	88	4	This field enables CS1 on port B 0 – Disable CS1 on Port B 1 – Enable CS1 on Port B
Full Speed Phase Selection	92	4	Select the edge of the sampling clock valid for full speed commands: 0: Select sampling at non-inverted clock 1: Select sampling at inverted clock This bit is also used to shift the dqs_enable when DQS mode is selected
Full Speed Delay Selection	96	4	Select the delay w.r.t. the reference edge for the sample point valid for full speed commands: 0: One clock cycle delay 1: Two clock cycles delay This bit is also used to shift the dqs_enable when DQS mode is selected
DDR Sampling Point	100	4	Select the sampling point for incoming data when serial flash is in DDR mode. <b>NOTE:</b> Valid Values are (b000-b111)
LUT program sequence	104	256	256 Bytes of Look up table program sequence. ROM programs the LUT of QuadSPI with this parameter supplied. It assumes that the optimize read command sequence which will be used to read data from Serial flash and fill the AHB buffer is programmed at index 0.
read_status_ipcr	360	4	IPCR value of Read Status Reg
enable_dqs_phase	364	4	Enable DQS Phase
Reserved	368	36	Not used
dqs_pad_setting_override	404	4	DQS pin pad setting override
sclk_pad_setting_override	408	4	SCLK pin pad setting override
data_pad_setting_override	412	4	DATA pins pad setting override
cs_pad_setting_override	416	4	CS pins pad setting override
dqs_loopback_internal	420	4	0: dqs loopback from pad 1: dqs loopback internally
dqs_phase_sel	424	4	dqs phase selection
dqs_fa_delay_chain_sel	428	4	dqs fa delay chain selection
dqs_fb_delay_chain_sel	432	4	dqs fb delay chain selection

Table continues on the next page...

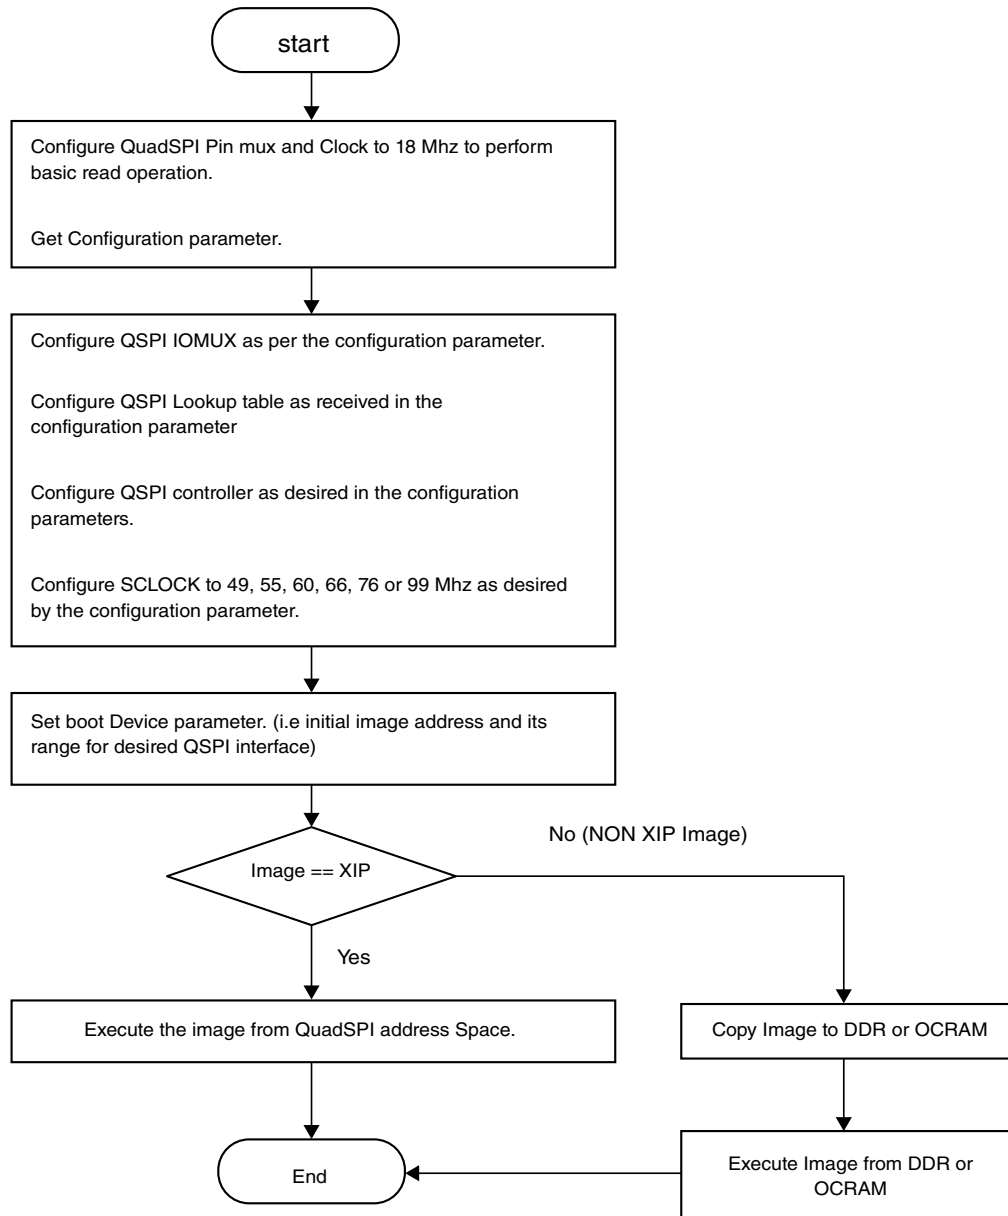

**Table 6-49. QuadSPI Configuration Parameters (continued)**

Name	Offset	Size in Bytes	Description
sclk_fa_delay_chain_sel	436	4	sclk fa delay chain selection
sclk_fb_delay_chain_sel	440	4	sclk fb delay chain selection
Reserved	448	60	Reserved
tag	508	4	End flag of QSPI parameters area

#### 6.6.6.4 IOMUX Configuration for QSPI Devices

The QSPI interface uses dedicated contacts on the IC. The contacts assigned to the data signals used by QSPI are shown in the table below.

#### 6.6.6.5 QuadSPI boot flow chart

**Figure 6-40. QuadSPI boot flow chart**

### NOTE

If flash is configured for "High performance mode (where command is generated only once)" in LUT program sequence. then external reset should be routed to flash reset to allow rebooting in case of any device reset other than Power On Reset. Also this high performance mode must be exited by application before any Low power mode entry where the device is supposed to reboot from QSPI flash on Low power mode exit. In general, any preserved configuration in external flash will not be understood by device after reset.

## 6.6.7 Program image

This section describes the data structures that are required to be included in a user's program image. A program image consists of:

- Image vector table—A list of pointers located at a fixed address that the ROM examines to determine where other components of the program image are located
- Boot data—A table indicating the program image location, program image size in bytes, and the plugin flag
- Device configuration data—IC configuration data
- User code and data

### 6.6.7.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

**Table 6-50. Image Vector Table Offset and Initial Load Region Size**

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	1 Kbyte = 0x400 bytes	Entire Image Size
NAND	1 Kbyte = 0x400 bytes	4 Kbyte
OneNAND	1 Kbyte = 0x400 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

Figure 6-41. Image Vector Table

### 6.6.7.1.1 Image Vector Table Structure

The IVT has the following format where each entry is a 32 bit word:

Table 6-51. IVT Format

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See <a href="#">Device Configuration Data (DCD)</a> for further details on DCD.
boot data: Absolute address of the Boot Data
self: Absolute address of the IVT. Used internally by the ROM
csf: Absolute address of Command Sequence File (CSF) used by the HAB library. See <a href="#">High Assurance Boot (HAB)</a> for details on secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

Figure 6-42 shows the IVT header format:

Tag	Length	Version
-----	--------	---------

**Figure 6-42. IVT Header Format**

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40 or 0x41

### 6.6.7.1.2 Boot Data Structure

The Boot Data must follow the format defined in the table found here, each entry is a 32-bit word.

**Table 6-52. Boot Data Format**

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see <a href="#">Plugin Image</a> )

### 6.6.7.2 Device Configuration Data (DCD)

Upon reset, the Chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various peripherals on the Chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately out of reset. This allows the Chip to interface with any NOR flash device, but has the cost of slow performance. Additionally, some components such as DDR require some sequence of register programming as part of configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big endian byte array of the allowable DCD commands. The maximum size of the DCD limited to 1768 bytes.

Header
[CMD]
[CMD]
...

**Figure 6-43. DCD Data Format**

The DCD header is 4 bytes with the following format:

Tag	Length	Version
-----	--------	---------

**Figure 6-44. DCD Header Format**

where:

Tag: A single byte field set to 0xD2

Length: a two byte field in big endian format containing the overall length of the DCD, in bytes, including the header

Version: A single byte field set to 0x41

### 6.6.7.2.1 Write Data Command

The Write Data Command is used to write a list of given 1-, 2- or 4-byte values or bitmasks to a corresponding list of target addresses.

The format of Write Data Command, again a big endian byte array, is shown in the table below.

**Table 6-53. Write Data Command Format**

Tag	Length	Parameter
	Address	
	Value/Mask	

*Table continues on the next page...*

**Table 6-53. Write Data Command Format (continued)**

[Address]
[Value/Mask]
...
[Address]
[Value/Mask]

where:

Tag: A single byte field set to 0xCC  
 Length: A two byte field in big endian format containing the length of the Write Data Command, in bytes, including the header  
 Address: target address to which data should be written  
 Value/Mask: data value or bitmask to be written to preceding address

The Parameter field is a single byte divided into bitfields as follows:

**Table 6-54. Write Data Command Parameter field**

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4  
 flags: control flags for command behavior.  
 Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)  
 Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes and flags parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

**Table 6-55. Interpretation of Write Data Command Flags**

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address  = val_msk	Set bitmask

**NOTE**

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values is larger or any of the bitmasks is wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within an allowed region, none of the values are written. The list of allowable blocks and target addresses for the Chip are given below.

**Table 6-56. Valid DCD Address Ranges**

Address range	Start address	Last Address
DDR controller register set	0x30790000	0x307AFFFF
IOMUXC register set	0x30330000	0x3033FFFF
IOMUXC GPR register set	0x30340000	0x3034FFFF
IOMUXC LPSR register set	0x302C0000	0x302CFFFF
IOMUXC LPSR GPR register set	0x30270000	0x3027FFFF
WEIM register set	0x30BC0000	0x30BCFFFF
CCM register set	0x30380000	0x3038FFFF
Anatop register set	0x30360000	0x3036FFFF
GPT2 register set	0x302E0000	0x302EFFFF
SRC registers for DDRC	0x30391000	0x30391FFF

**6.6.7.2.2 Check Data Command**

The Check Data Command is used to test for a given -1, 2- or 4-byte bitmasks from a source address.

The Check Data Command is a big endian byte array with format shown in the table below.

**Table 6-57. Check Data Command Format**

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

## System Boot

Tag: A single byte field set to 0xCF

Length: A two byte field in big endian format containing the length of the Check Data Command, in bytes, including the header

Address: source address to test

Mask: bit mask to test

Count: optional poll count. If count is not specified this command will poll indefinitely until the exit condition is met. If count = 0, this command behaves as for NOP.

The Parameter field is a single byte divided into bitfields as follows:

**Table 6-58. Check Data Command Parameter field**

7	6	5	4	3	2	1	0
flags				bytes			

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

**Table 6-59. Interpretation of Check Data Command Flags**

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask) != mask	Any bit clear
1	1	(*address & mask) != 0	Any bit set

### NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

### 6.6.7.2.3 NOP Command

This command has no effect.

The format of NOP Command is a big endian four byte array as shown in the table below.

**Table 6-60. NOP Command Format**

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: A single byte field set to 0xC0

Length: A two byte field in big endian containing the length of the NOP Command in bytes. Fixed to a value of 4.

Undefined: This byte is ignored and can be set to any value.

#### 6.6.7.2.4 Unlock Command

The Unlock Command is used to prevent specific engine features being locked when exiting ROM.

The format of Unlock Command, again a big endian byte array, is shown in the table below.

**Table 6-61. Unlock Command Format**

Tag	Length	Eng
	Value	
	Value	
	...	
	Value	

where:

Tag: A single byte field set to 0xB2

Eng: Engine to be left unlocked.

Values: [optional] unlock values required by engine.

#### **NOTE**

This command may not be used in DCD structure if the SEC\_CONFIG is configured as closed.

### 6.6.8 Plugin Image

The ROM supports a limited number of boot devices. For using other devices as boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) for firmware with the missing boot drivers. >Additionally

plugin can customize supported boot drivers. It is more flexible when doing device initialization, such as condition judging, delay assertion, applying custom settings to boot device and memory system.

>In addition to standard images, the chip also supports plugin images. Plugin images return execution to the ROM whereas a standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot Data Structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end the plugin function must return with the program image parameters. (See [High level boot sequence](#) for details about boot flow).

The boot ROM authenticates the plugin image prior to running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32 *ivt_offset);
```

ARGUMENTS PASSED:

- start - Image load address on exit.
- bytes - Image size on exit.
- ivt\_offset - Offset in bytes of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - on success
- 0 - on failure

### 6.6.9 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

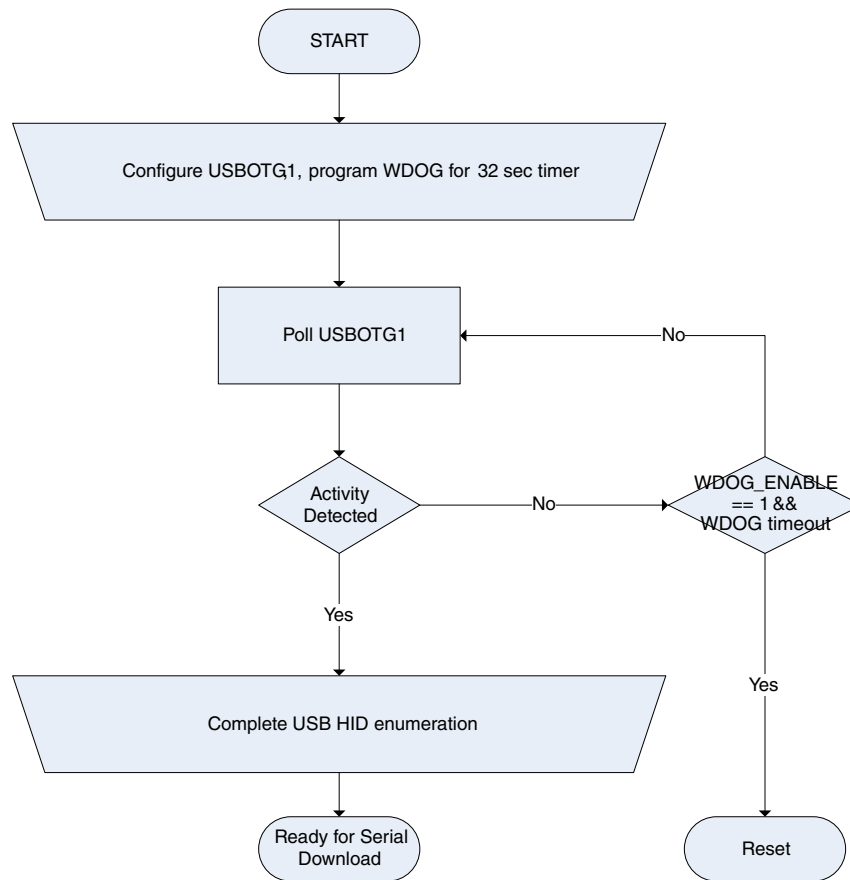

In this mode the ROM programs WDOG1 for a time-out specified by fuse WDOG Time-out Select (See fusemap for details) if WDOG\_ENABLE eFuse is 1 and continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

#### NOTE

After being loaded, the downloaded image is responsible to manage the watchdog resets properly.

Figure 6-21 shows USB boot flow.

**Figure 6-45. Serial Download Boot Flow**

### 6.6.9.1 USB

USB support is composed of the ( core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of 4 HID reports are used to implement SDP protocol for data transfers as described in [Table 6-62](#).

**Table 6-62. USB HID Reports**

Report ID (first byte)	Transfer Endpoint	Direction	Length	Description
1	control OUT	Host to device	17 bytes	SDP command from host to device
2	control OUT	Host to device	Up to 1025 bytes	Data associated with report 1 SDP command
3	interrupt	Device to host	5 bytes	HAB security configuration. Device sends 0x12343412 in closed mode and 0x56787856 in open mode.
4	interrupt	Device to host	Up to 65 bytes	Data in response to SDP command in report 1

### 6.6.9.1.1 USB Configuration Details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for USB device driver are listed in the table below.

**Table 6-63. VID/PID and Strings for USB Device Driver**

Descriptor	Value
VID	0x15A2 (Freescale vendor ID)
PID <sup>1</sup>	
String Descriptor1 (manufacturer)	Freescale Semiconductor, Inc.
String Descriptor2 (product)	S Blank SE Blank NS Blank
String Descriptor4	Freescale Flash
String Descriptor5	Freescale Flash

1. Allocation based on BPN (Before Part Number)

### 6.6.9.1.2 IOMUX Configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX except for the USB\_OTGn\_ID pins. The USB ID pin function is configured using USBNC\_n\_CTRL2[ID\_DIG\_SEL] and the IOMUXC\_USB\_OTGn\_ID\_SELECT\_INPUT register. The remaining pins of the UTMI PHY interface use dedicated contacts on the IC. See the chip data sheet for details.

### 6.6.9.2 Serial Download protocol

The 16 byte SDP command from host to device is sent using HID report 1.

The table below describes 16 byte SDP command data structure:

**Table 6-64. 16 Byte SDP Command Data Structure**

BYTE Offset	Size	Name	Description
0	2	COMMAND TYPE	The following commands are supported for ROM: <ul style="list-style-type: none"> <li>• 0x0101 READ_REGISTER</li> <li>• 0x0202 WRITE_REGISTER</li> <li>• 0x0404 WRITE_FILE</li> <li>• 0x0505 ERROR_STATUS</li> <li>• 0x0A0A DCD_WRITE</li> <li>• 0x0B0B JUMP_ADDRESS</li> <li>• 0x0C0C SKIP_DCD_HEADER</li> </ul>
2	4	ADDRESS	Only relevant for following commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS.  For READ_REGISTER and WRITE_REGISTER commands, this field is address to a register. For WRITE_FILE and JUMP_ADDRESS commands, this field is an address to internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for 8-bit access, 0x10 for 16-bit and 0x20 for 32-bit access. Only relevant for READ_REGISTER and WRITE_REGISTER commands.
7	4	DATA COUNT	Size of data to read or write. Only relevant for WRITE_FILE, READ_REGISTER, WRITE_REGISTER and DCD_WRITE commands. For WRITE_FILE and DCD_WRITE commands DATA COUNT is in byte units.
11	4	DATA	Value to write. Only relevant for WRITE_REGISTER command.
15	1	RESERVED	Reserved

### 6.6.9.2.1 SDP Command

SDP commands are described in the following sections.

#### 6.6.9.2.1.1 READ REGISTER

The transaction for command READ\_REGISTER consists of following reports: Report1 for command, Report3 for security configuration and Report4 for response or register value.

The register to read is specified in ADDRESS field of SDP command. First device sends Report3 with security configuration followed by Report4 with bytes read at given address. If count is greater than 64 then multiple reports with report id 4 are sent until entire data requested by host is sent. The STATUS is either 0x12343412 for closed parts and 0x56787856 for open or field return parts.

Report1, Command, Host to Device:

1	Valid values for READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register Value
---	----------------

ID 4 bytes of data containing register value. If number of bytes requested is less than 4 then remaining bytes should be ignored by host.

Multiple reports of report id 4 are sent until entire data requested is sent

Report4, Response, Device to Host: Last response report

4	Register Value
---	----------------

ID 64 bytes of data containing register value. If number of bytes requested is less than 64 then remaining bytes should be ignored by host.

### 6.6.9.2.1.2 WRITE REGISTER

The transaction for command WRITE\_REGISTER consists of the following reports: Report1 for command, Report3 for security configuration and Report4 for write status.

Host sends Report1 with WRITE\_REGISTER command. The register to write is specified in ADDRESS field of SDP command of Report1, with FORMAT field set to data type (number of bits to write 8, 16 or 32) and value to write in DATA field of SDP command. Device writes the DATA to register address and returns WRITE\_COMPLETE code using Report4 and security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

### 6.6.9.2.1.3 WRITE\_FILE

The transaction for command WRITE\_FILE consists of following reports: Report1 for command-phase, Report2 for data-phase, Report3 for hab mode and Report4 to indicate data received in full.

The size of each Report2 is limited to 1024 bytes (limitation of USB HID protocol) hence multiple Report2 packets will be sent by host in data phase until entire data is transferred to device. Once entire data (DATA\_COUNT bytes) is received then device sends report 3 with hab mode and report 4 with 0x88888888, indicating file download completed.

Report1, Host to Device:

**System Boot**

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

=====Optional Begin=====

Host sends ERROR\_STATUS command to query if HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with first 4 bytes to indicate file download has completed with code 0x88888888. On failure device will report HAB error status.

**6.6.9.2.1.4 ERROR\_STATUS**

The transaction for SDP command ERROR\_STATUS consists of three reports.

Report1 is used by host to send the command; device sends global error status in 4 bytes of Report4 after returning security configuration in Report3. When device receives ERROR\_STATUS command it will return global error status that is updated for each command. This command is useful to find out if last command resulted in device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	4 bytes Error status
---	----------------------

ID first 4 bytes status in 64 bytes report 4

#### 6.6.9.2.1.5 DCD WRITE

The SDP command DCD\_WRITE is used by host to send multiple register writes in one shot. This command is provided to speed up the process of programming register writes such as to configure external RAM device.

The command goes with Report1 from host with COMMAND TYPE set to DCD\_WRITE, ADDRESS which is used for temporary location of DCD data and DATA\_COUNT to number of bytes sent in data out phase. In data phase host sends data for number of registers using Report2. Device completes the transaction with Report3 indicating security configuration and report 4 with WRITE\_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

## System Boot

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

See [Device Configuration Data \(DCD\)](#) for DCD format description.

### 6.6.9.2.1.6 SKIP\_DCD\_HEADER

The SDP command SKIP\_DCD\_HEADER is used by host to inform device skip the DCD configuration within download image.

Normally, if the download image should be run on DDR, the DCD configuration data should be built-in the image. In case that host has issued DCD\_WRITE to push DCD configuration data to device for DDR initialization, the image with DCD information will cause ROM initializes DDR twice and may cause initialization processing hung.

The SKIP\_DCD\_HEADER command inform device to skip the DCD configuration with the download image, and avoid this issue.

This command should typically be sent after JUMP\_ADDRESS. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command. Device completes the transaction with Report3 indicating security configuration and report 4 with OK\_ACK code 0x900DD009.

Report1, Command, Host to Device:

1	SKIP_DCD_HEADER
---	-----------------

## ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

## ID 4 bytes status

Report4, Response, Device to Host:

4	OK_ACK (0x900DD009)
---	---------------------

**6.6.9.2.1.7 JUMP ADDRESS**

The SDP command JUMP\_ADDRESS will be the last command host can send to the device, after this command device will jump to the address specified in the ADDRESS field of SDP command and start executing.

This command should typically follow after WRITE\_FILE command. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command but device send status report3 to complete the transaction. And if HAB authentication fails then it will also send report 4 with HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

## ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

## ID 4 bytes status

This report is sent by device only in case of an error jumping to the given address, device reports error in Report4, Response, Device to Host:

4	4 bytes HAB error status
---	--------------------------

## ID 4 bytes status, 64 bytes report length

## 6.6.10 Recovery Devices

The Chip supports recovery devices. If primary boot device fails, boot ROM will try to boot from recovery device using one of ECSPi ports.

For enabling recovery device BOOT\_CFG4[6] fuse must be set. Additionally Serial EEPROM fuses must be set as described in [Serial ROM through SPI](#).

## 6.6.11 USB Low Power Boot

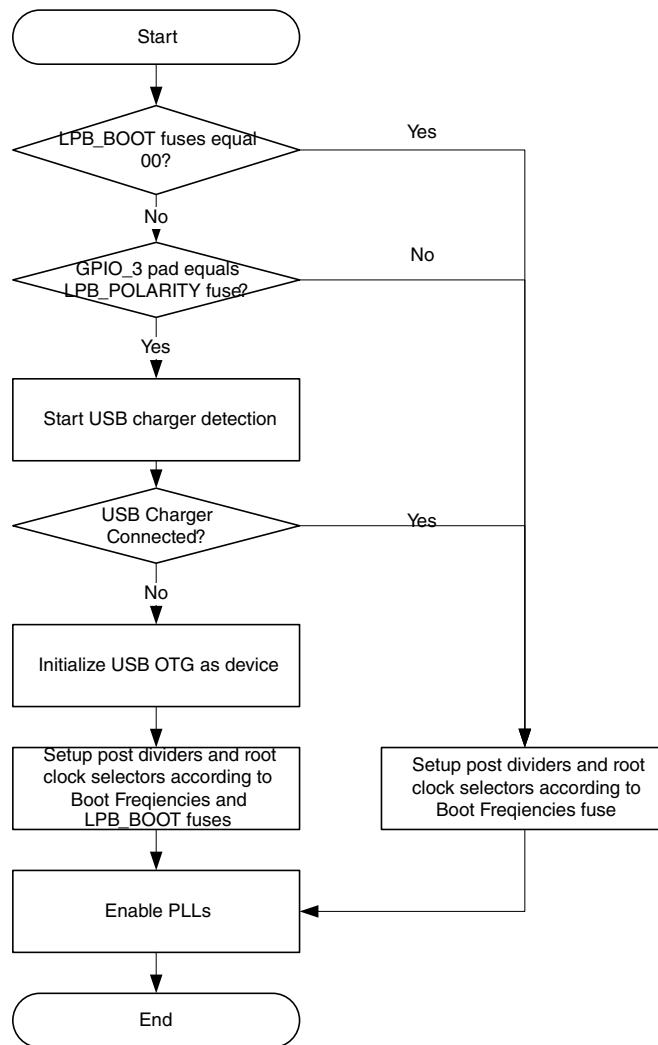

ROM supports USB Low Power Boot. This feature enables a device with dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter the upstream port is a USB charger or USB host/hub.

If a USB dedicated charger or host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (Max. 1.5A) can be supplied by charger. If USB host/hub are connected, the maximal 100mA current is supplied to the device, the device should be able to power up to boot the image with less than 100mA.

If LPB\_BOOT fuses are blown, the Chip will check if there is low power condition via GPIO\_3 pad. If there is low power boot condition USB charger detection will be activated. If there is no USB charger, ROM will initialize USB as device and apply division factors on ARM, DDR, AXI and AHB root clocks based on LPB\_BOOT fuses value (see the table below). Polarity of low power boot condition on GPIO\_3 pad is set by BT\_LPB\_POLARITY fuse (see the figure below).

**Table 6-65. USB Low Power Boot Frequencies**

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
00	ARM_CLK_ROOT=792MHz MMDC_CLK_ROOT=396MHz FABRIC_CLK_ROOT=396MHz AHB_CLK_ROOT=132MHz	ARM_CLK_ROOT=396MHz MMDC_CLK_ROOT=307MHz FABRIC_CLK_ROOT=307MHz AHB_CLK_ROOT=77MHz
01	ARM_CLK_ROOT=792MHz MMDC_CLK_ROOT=396MHz FABRIC_CLK_ROOT=396MHz AHB_CLK_ROOT=132MHz	ARM_CLK_ROOT=396MHz MMDC_CLK_ROOT=307MHz FABRIC_CLK_ROOT=307MHz AHB_CLK_ROOT=102MHz
10		
11	ARM_CLK_ROOT=198MHz MMDC_CLK_ROOT=99MHz FABRIC_CLK_ROOT=99MHz AHB_CLK_ROOT=49MHz	ARM_CLK_ROOT=99MHz MMDC_CLK_ROOT=76MHz FABRIC_CLK_ROOT=76MHz AHB_CLK_ROOT=38MHz

**Figure 6-46. USB Low Power Boot Flow**

### 6.6.12 SD/MMC Manufacture Mode

When internal boot and recover boot (if enabled) failed, SDMMC\_MFG\_DISABLE fuse bit isn't set, and EEPROM Recovery fuse bit is set, boot will go to SD/MMC manufacture mode before serial download mode. In manufacture mode, one bit bus width is used despite of the fuse setting.

In manufacture mode, SD or MMC card will be scanned on uSDHC1. If card is detected and valid boot image is found in card, then boot image will be loaded then executed. Pad of SD1\_CD is used to detect whether card is inserted.

By default, SD/MMC manufacture mode is enabled, blow the fuse of DISABLE\_SDMMC\_MFG to disable it.

**NOTE**

Secondary boot is not supported on SD/MMC manufacture mode.

Figure 6-47. SD/MMC Manufacture boot flow

### 6.6.13 High Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying areas of code or data in programmable memory to make it behave in an incorrect manner. The HAB also prevents attempts to gain access to features which should not be available.

The integration of the HAB feature with the ROM code ensures that Chip does not enter an operational state if the existing hardware security blocks have detected a condition that may be a security threat or areas of memory deemed to be important have been modified. The HAB uses RSA digital signatures to enforce these policies.

**Figure 6-48. Secure Boot Components**

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to ensure the system security state is as expected. The HAB also makes use of CAAM hardware block to accelerate SHA-256 message digest operations performed during signature verifications and AES-128 operations for encrypted boot operations. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The RSA key sizes supported are 1024, 2048 and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by HAB are:

- X.509 Public key certificate support
- CMS signature format support
- Proprietary encrypted boot support. Note that encrypted boot depends on the CAAM HW module. When CAAM is disabled (i.e. when the EXPORT\_CONTROL fuse is blown) then encrypted boot is not available.

#### **NOTE**

Freescale provides a reference Code Signing Tool (CST) for key generation, certificate generation and code signing for use with the HAB library. The CST can be found by searching for "IMX\_CST\_TOOL" at <http://www.freescale.com>.

#### **NOTE**

For further details on making use of the secure boot feature using HAB contact your local Freescale representative.

### 6.6.13.1 HAB API Vector Table Addresses

For devices that perform a secure boot, the HAB library may be called by boot stages that execute after ROM code.

The RVT table contains the pointers to the HAB API functions and is located at 0x00000100.

#### NOTE

For additional information on secure boot including the HAB API, contact your local Freescale representative.

### 6.6.14 Boot Information for Software

To address the requirement that boot image may need to get the basic boot information when getting out the boot process, Boot Software Information (Boot\_SW\_Info) is provisioned by ROM.

The base address of Boot\_SW\_Info, i.e., SW Information Pointer is been recorded at 0x1E8 in ROM. Software should read 0x1E8 to get the base address of Boot\_SW\_Info, and then parse the Boot\_SW\_Info content to get the boot information.

**Table 6-66. Boot\_SW\_Info Structure**

Offset	Byte3	Byte2	Byte1	Byte0
0x0	Reserved	Boot Device Type	Boot Device Instance	Reserved
0x4	ARM core frequency(in Hz)			
0x8	AXI bus frequency(in Hz)			
0xC	DDR frequency(in Hz)			
0x10	GPT1 input clock frequency(in Hz)			
0x14	Reserved			
0x18				
0x1C				

#### NOTE

Boot ROM set GPT1 in free-running mode with 32 kHz input clock.

Boot Device Type Mapping:

- 0x1 - SD Card or eSD chip
- 0x2 - MMC Card or eMMC chip
- 0x3 - NAND chip
- 0x4 - QSPI NOR flash

- 0x5 - Parallel NOR flash
- 0x6 - SPI NOR flash

Boot Device Instance: The instance index of the boot device, start from 0.

# Chapter 7

## Interrupts and DMA Events

### 7.1 Interrupts and DMA Events

#### 7.1.1 Overview

This chapter discusses the assignments of interrupts from the ARM domain in [A7 Interrupts](#), [CM4 interrupts](#), and from DMA events in [SDMA event mapping](#)

#### 7.1.2 A7 Interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all the chip sources and provides an interface to the Cortex A7 CPU.

The first 32 interrupts are used for interrupts that are private to the CPUs interface. These interrupts are not included in the table below. All interrupts besides the private CPU are also hooked up to the GPC in the same order.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The following table describes the A7 interrupt sources. The following table describes the A7 interrupt sources.

**Table 7-1. ARM Domain Interrupt Summary**

IRQ	Module	Interrupt Description
0	GPR IRQ	Used to notify cores on exception condition while boot
1	DAP	DAP Interrupt
2	SDMA	AND of all 48 SDMA interrupts (events) from all the channels
3	DBGMON	DBGMON Sync Interrupt
4	SNVS WRAPPER	ON-OFF button press shorter than 5 seconds (pulse event)
5	LCDIF	LCDIF Sync Interrupt
6	SIM2	SIM Interrupt

*Table continues on the next page...*

**Table 7-1. ARM Domain Interrupt Summary (continued)**

IRQ	Module	Interrupt Description
7	CSI	CSI Interrupt
8	PXP	PXP Interrupt
9	Reserved	Reserved
10	WDOG3	Watchdog Timer reset
11	HS	Hardware Semaphore Interrupt Request
12	APBHDMA	GPMI operation channel 0 description complete interrupt
13	EIM	EIM Interrupt
14	BCH	BCH operation complete interrupt
15	GPMI	GPMI operation TIMEOUT ERROR interrupt
16	UART6	UART-6 ORed interrupt
17	FTM1	Flex Timer1 Fault / Counter / Channel interrupt
18	FTM2	Flex Timer2 Fault / Counter / Channel interrupt
19	SNVS_HP_WRAPPER	SRTC Consolidated Interrupt. Non TZ.
20	SNVS_HP_WRAPPER	SRTC Security Interrupt. TZ.
21	CSU	CSU Interrupt Request. Indicates to the processor that one or more alarm inputs were asserted
22	USDHC1	uSDHC1 Enhanced SDHC Interrupt Request
23	USDHC2	uSDHC2 Enhanced SDHC Interrupt Request
24	USDHC3	uSDHC3 Enhanced SDHC Interrupt Request
25	MIPI_CSI	MIPI CSI interrupt
26	UART1	UART-1 ORed interrupt
27	UART2	UART-2 ORed interrupt
28	UART3	UART-3 ORed interrupt
29	UART4	UART-4 ORed interrupt
30	UART5	UART-5 ORed interrupt
31	eCSPI1	eCSPI1 interrupt request line to the core.
32	eCSPI2	eCSPI2 interrupt request line to the core.
33	eCSPI3	eCSPI3 interrupt request line to the core.
34	eCSPI4	eCSPI4 interrupt request line to the core.
35	I2C1	I2C-1 Interrupt
36	I2C2	I2C-2 Interrupt
37	I2C3	I2C-3 Interrupt
38	I2C4	I2C-4 Interrupt
39	RDC	RDC interrupt

126	UART7	UART-7 ORed interrupt
127	PCIE_CTRL	Channels [63:32] interrupts requests

## 7.1.4 SDMA event mapping

The following table shows the DMA request signals for peripherals in the chip.

**Table 7-3. SDMA event mapping**

SDMA	Module	Description
0	ECSPI1	eCSPI1 Rx request
1	ECSPI1	eCSPI1 Tx request
2	ECSPI2	eCSPI2 Rx request
3	ECSPI2	eCSPI2 Tx request
4	ECSPI3	eCSPI3 Rx request
5	ECSPI3	eCSPI3 Tx request
6	ECSPI4	eCSPI4 Rx request
7	ECSPI4	eCSPI4 Tx request
8	SAI1	SAI-1 receive 1 DMA request
9	SAI1	SAI-1 receive 1 DMA request
10	SAI2	SAI-3 transmit 1 DMA request
11	SAI2	SAI-3 transmit 1 DMA request
12	SAI3	eCSPI3 Rx request
13	SAI3	eCSPI3 Tx request
14	IOMUX	External DMA from pad through IOMUX #1
15	IOMUX	External DMA from pad through IOMUX #2
16	ADC1	ADC DMA request
17	ADC2	ADC DMA request
18	I2C1   SIM1	I2C1 DMA event   SIM1 receive DMA request (IOMUXC GPR0[0])
19	I2C2   SIM1	I2C2 DMA event   SIM1 receive DMA request (IOMUXC GPR0[1])
20	I2C3   SIM2	I2C3 DMA event   SIM2 receive DMA request (IOMUXC GPR0[2])
21	I2C4   SIM2	I2C4 DMA event   SIM2 receive DMA request (IOMUXC GPR0[3])
22	UART1	Rx FIFO
23	UART1	Tx FIFO
24	UART2	Rx FIFO
25	UART2	Tx FIFO
26	UART3	Rx FIFO
27	UART3	Tx FIFO
28	UART4	Rx FIFO
29	UART4	Tx FIFO
30	UART5	Rx FIFO
31	UART5	Tx FIFO

*Table continues on the next page...*

**Table 7-3. SDMA event mapping (continued)**

SDMA	Module	Description
32	UART6	Rx FIFO
33	UART6	Tx FIFO
34	UART7	Rx FIFO
35	UART7	Tx FIFO
36	QSPI1	QSPI DMA Tx request
37	QSPI1	QSPI DMA Rx request
38	GPT1	GPT1 counter event
39	GPT2	GPT2 counter event
40	GPT3   FTM1	GPT3 counter event   Flextimer1 8 channel DMA request (IOMUXC GPR0[5])
41	GPT4   FTM2	GPT4 counter event   Flextimer2 8 channel DMA request (IOMUXC GPR0[6])
42	PXP	PXP DMA Event
43	CSI	CSI DMA Event
44	LCDIF	LCDIF DMA Event
45	ENET1	ENET1 1588 Event0 out
46	ENET2	ENET2 1588 Event0 out
47	ENET1   ENET2	ENET1 1588 Event0 out   ENET2 1588 Event0 out (IOMUXC GPR0[4])

As shown in the table, some of the events are an output of a mux of two signals or triggers. The select of this mux is controlled by the general purpose registers in IOMUXC.

## 7.2 Smart Direct Memory Access Controller (SDMA)

### 7.2.1 Overview

The Smart Direct Memory Access (SDMA) controller offers highly-competitive DMA features combined with software-based virtual-DMA flexibility. It enables data transfers between peripheral I/O devices and internal/external memories.

The SDMA controller helps maximize system performance by off-loading the ARM core in dynamic data routing.

### 7.2.1.1 Block Diagram

The figure below shows a block diagram of the SDMA controller. It includes the custom RISC core along with its RAM, ROM, DMA units, and the scheduler.

The SDMA core executes short routines that perform DMA transfers; these routines are called *scripts*. The SDMA core interfaces to its own memory via the SDMA system bus. The SDMA system bus supports a 32-bit data path and a 16-bit address bus. The system bus datapath is used for both 16-bit instruction (program) memory access and 32-bit data access. DMA units interface to the core via the Functional Unit Bus and use dedicated registers to perform DMA transfers.

The SDMA memory contains a ROM and a RAM. The ROM contains startup scripts (for example, boot code) and other common utilities, which are referenced by the scripts that reside in the RAM. The internal RAM is divided into a context area and a script area (more details about this mapping are available in [Instruction Memory Map](#) and [Data Memory Map](#)).

Every transfer channel requires one context area to keep the contents of all the core and unit registers while inactive. Channel scripts are downloaded into the internal RAM by the SDMA using a dedicated channel that is started during the boot sequence. Downloads are invoked using commands and pointers provided by the ARM platform. Every channel contains a corresponding channel script located in RAM and/or ROM that can be reconfigured independently as-needed. Channel scripts can be stored in an external memory and downloaded when needed. The SDMA can be configured with any mixture of scripts to enable an endless combination of supported services.

The scheduler monitors and detects DMA requests, mapping them to channels, and mapping individual channels to a pre-configured priority. At any given point, the scheduler presents the highest priority channel that requires service to the SDMA core. A special SDMA core instruction is used to "conditionally yield" the current channel being executed to an eligible channel that requires service. If (and only if) there is an eligible channel pending, will the current channel execution be preempted.

There are two yield instructions that differently determine the eligible channels: In the first version, eligible channels are pending channels with a strictly higher priority than the current channel priority. In the second version (yieldge), eligible channels are pending channels with a priority that is greater or equal to the current channel priority. The scheduler detects devices that need service through its 48 DMA request inputs. After a request is detected, the scheduler determines the channel(s) that is (are) triggered by this request and marks it (them) as pending in the "Channel Pending (EP)" register. The priorities of all the pending channels are continuously evaluated in order to update the highest pending priority. The channel pending flag is cleared by the channel script when the transfer has completed.

The ARM platform control block contains the control registers used to configure the 32 individual channels. There are 48 Channel Enable registers, and every register maps one DMA request to any desired combination of channels. The 32 Priority registers are used to assign a programmable 1-of-7 level priority to every possible channel. This block also contains all other control registers that the ARM platform can access.

The 48 DMA requests that are connected to the scheduler come from a variety of sources. The "receive register full" and "transmit register empty" signals found in the UART and USB ports are typical examples of DMA requests that can be connected to the SDMA. These requests can be used to trigger a specific SDMA channel, or several channels.

There is an OnCE compatible debug port for product development. The OnCE includes support for setting breakpoints, single-step and trace, and register dump capability. In addition, all memory locations are accessible from the debug port.

### **7.2.1.2 Features**

The following are the SDMA features:

- Multi-channel DMA supporting up to 32 time-division multiplexed DMA channels
- Hardware or software driven triggers for each channel
- 48 hardware driven triggers that can be mapped to any channel.
- Memory accesses including linear addressing, FIFO addressing and 2D addressing
- Fast context-switching with two-level, priority-based preemptive multi-tasking
- 16-bit instruction-set micro-RISC engine (the SDMA core)
- Two DMA units with some or all the following features:
  - Auto-flush and prefetch capability
  - Flexible address management (increment, decrement, and no address changes on source and destination address)
  - Misaligned data-transfer support
  - Uni-directional and bi-directional flows (copy mode)
  - Up to eight-word buffers for configurable burst transfers
- Support of byte-swapping
- An available API and library of scripts
- Little-Endian and Big-Endian modes
- Hardware handshakes for low-power entry sequence
- Security support to lock contents of the SDMA script RAM.
- 4-Kbyte ROM containing startup scripts (for example, boot code) and other common utilities that can be referenced by RAM-located scripts
- 8-Kbyte RAM area is divided into a processor context area and a code space area used to store channel scripts that are downloaded from the system memory

- Debug support, including a OnCE port, real-time monitors, and embedded cross-trigger events
- Supported clock frequencies in process:
  - Configurable clock options for the SDMA core and the ARM platform DMA units
    - 1:2 ratio with maximum of SDMA core running at ARM platform Peripheral Bus speed and DMA running at max DMA frequency.
    - 1:1 ratio when both SDMA core and ARM platform DMA clocks are set to the ARM platform Peripheral Bus speed.
- Peripheral bus interface for configuration register programming by the ARM platform
- The SDMA RISC engine (arithmetic and logic operations), which is referred to as the "SDMA core."
- An internal peripheral bus connected to the Shared Peripherals Bus Interface (SPBA) that enables access to up to 14 shared peripherals. SDMA supports 32-bit accesses to word peripherals and 16-bit accesses to half-word peripherals.
- The peripheral DMA unit that is hooked-up to the ARM platform Crossbar Switch to service ARM peripherals
- The burst DMA unit is able to perform burst accesses to the external memory
- All the DMA units are 32-bit AHB masters. They are connected to different buses, thus allowing concurrent accesses.

## 7.2.2 External Signals

The table found here describes the external signals of SDMA.

## 7.2.3 Clocks

The following table describes the clock sources for SDMA. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information. For functional information regarding module clocks, see [SDMA Clocks and Low Power Modes](#).

**Table 7-4. SDMA Clocks**

Clock name	Clock Root	Description
events_sync_clk (clk)	ahb_clk_root	ARM peripheral / events clock
ips_hostctrl_clk	ipg_clk_root	Host control clock
ap_ahb_clk	ahb_clk_root	ARM platform bus clock
core_clk	ipg_clk_root	Module / Core clock
tck	-	JTAG access clock

## 7.2.4 Functional Description

The figure below shows the SDMA topology, and is composed of the following components:

- SDMA Core ([SDMA Core](#))
- SDMA Scheduler ([Scheduler](#))
- Functional Units:
  - Burst DMA ([Burst DMA Unit](#))
  - Peripheral DMA ([Peripheral DMA Unit](#))
- ARM platform Control for ARM control register access.
- Internal RAM and ROM Memory ([SDMA Programming Model](#))
- OnCE debug Port ([The OnCE Controller](#))

The functional unit bus provides access by the SDMA core to the DMA units. The system bus provides access to SDMA internal memory and also supports up to 14 peripherals.

### 7.2.4.1 SDMA Core

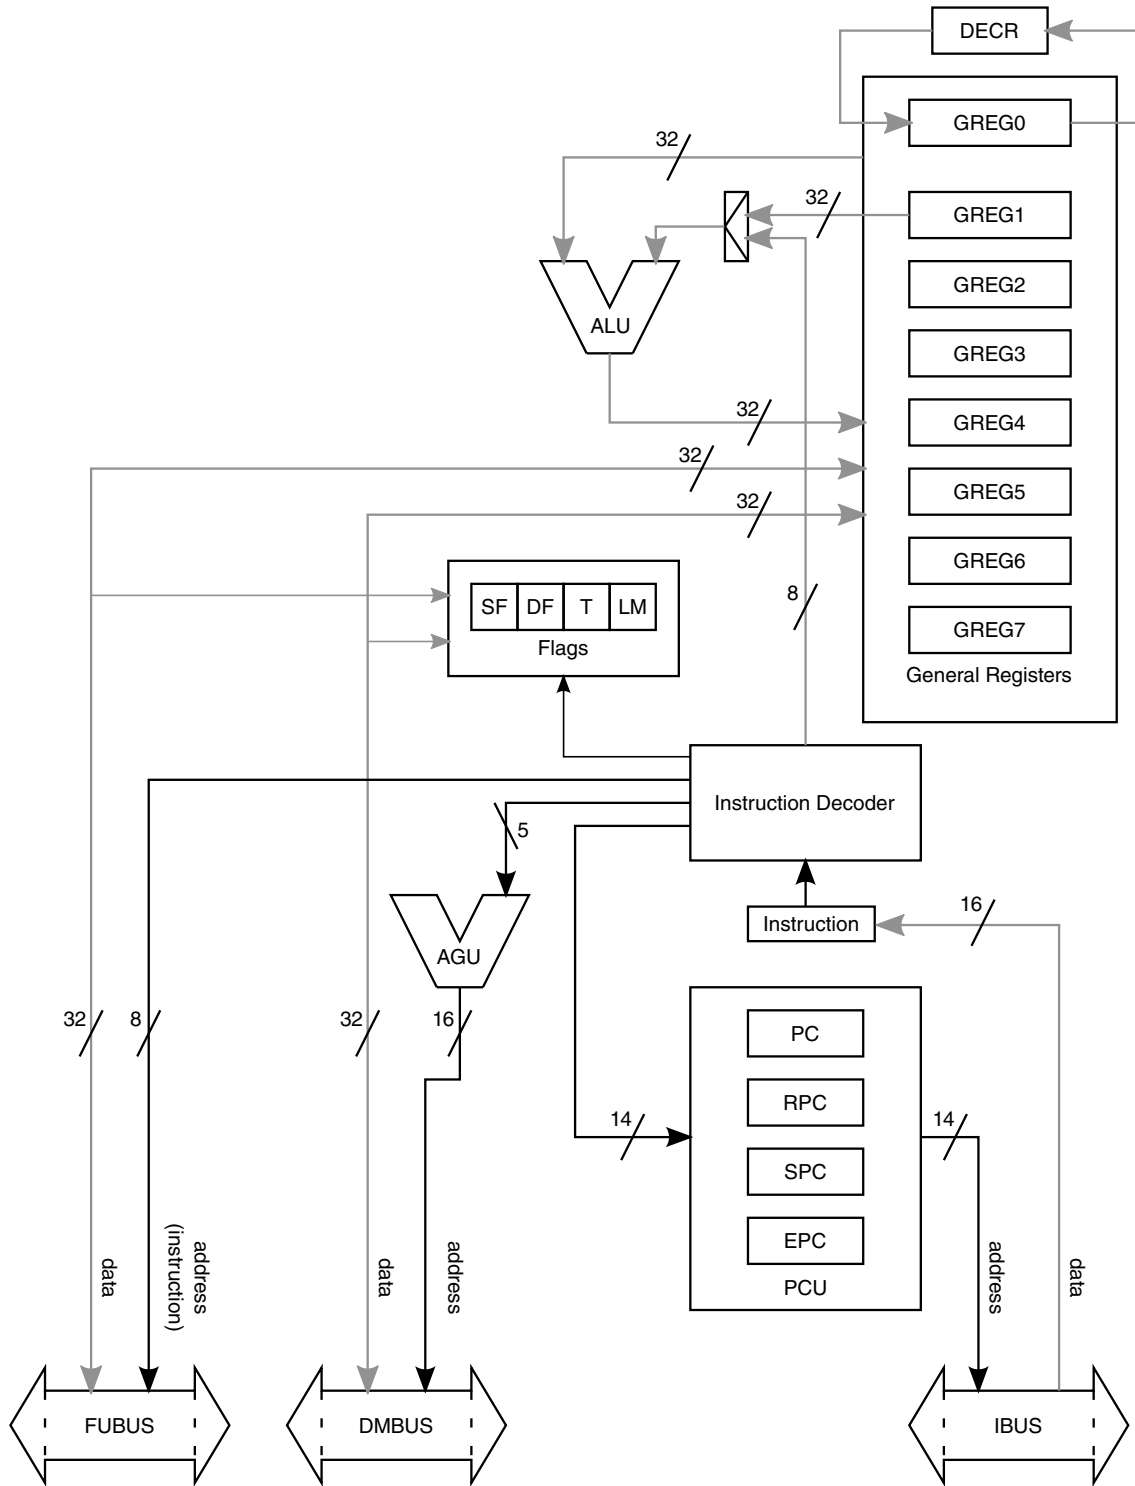

The SDMA core is a customized RISC-like processor that is specifically developed to control DMA units and perform L1 tasks like byte-stuffing or framing.

The SDMA core incorporates on-chip debug capability using the OnCE.

The SDMA core is based on a 32-bit register architecture with 16-bit instructions. There are eight general purpose 32-bit registers, four flags (T, LM, SF, and DF), and four PCU registers (PC, RPC, SPC, and EPC) that can address 16,384 16-bit instructions.

#### 7.2.4.1.1 SDMA Core Structure

The figure found here shows the structure of the SDMA core. It also shows the different registers, calculation resources, and possible data movements.

**Figure 7-1. SDMA Core**

- The Program Control Unit (PCU) is described in [Program Control Unit \(PCU\)](#). It handles the state of the core and generates the instruction fetch addresses. Instructions are retrieved from the Instruction Bus (IBUS) and stored in the SDMA

core instruction register prior to their decoding. The PCU contains the following registers:

- The Program Counter (PC) contains the address of the current instruction.
- The Return Program Counter (RPC) contains the address of the instruction that follows a jump to the subroutine.
- The Start Program Counter (SPC) contains the address of the first instruction of the current hardware loop.
- End Program Counter (EPC) contains the address of the last instruction of the current hardware loop.
- The other core registers are the general purpose registers (GREGn) and the flags.
  - The general purpose registers can be used to hold data and addresses. They can be loaded with immediate values (for example, 8-bit data that are encoded in the instruction), results of calculations that were performed with the ALU, 32-bit data that comes from the memory or peripherals via the Data Memory Bus (DMBUS), 32-bit data that comes from the DMAs via the Functional Units Bus (FUBUS) or another general purpose register. Their content can be the operands of the ALU, the data to send on either bus (DMBUS or FUBUS), or a pointer to memory (DMBUS address).
  - The general register 0 (GREG0) is also the hardware loop counter. In hardware loops, it cannot be used for any other purpose. This register uses a dedicated decrement unit (DECR) shown in [Figure 7-1](#).
  - The flags reflect the status of operations:
    - SF and DF are set when the last load or store on either bus (FUBUS or DMBUS) received an error response.
    - LM is set when the core is executing instructions inside a hardware loop.
    - T is set when the ALU operation result was 0 or the loop counter reaches 0 (the latter is preponderant when an ALU operation is the last instruction of a hardware loop).
- The ALU has two operands: any general register and either a second general register or an immediate value. The result is always stored into the first general register. A NOP function can be utilized by moving a register's contents into itself (For example, the instruction: mov R0,R0).
- The 16-bit instructions are fetched via the instruction bus (IBUS) whose address is driven by the PC. The SDMA RAM and ROM are visible to the core as 16-bit devices through this interface.
- The memory (RAM and ROM), memory mapped registers, and external peripherals are accessed via the DMBUS. The address is always taken from a general register whose content is added to a 5-bit immediate value. This is the only available addressing mode. The DMBUS is a 32-bit data bus. Except for the peripherals that

are external to the SDMA, the address accuracy is the 32-bit word (for example, adding 1 to an address points to the next word, not the next byte).

- The functional units are accessed via the FUBUS connection. The data is exchanged with any general register, but the address (which in fact is the instruction and the selector of the functional unit) comes from an 8-bit field of the corresponding load or store.

### 7.2.4.1.2 Program Control Unit (PCU)

This part of the SDMA core is dedicated to the control of the RISC engine, as implied by the instructions that are executed. Its behavior is determined by the instruction type and the inputs of the SDMA.

It contains the PC, RPC, SPC, and EPC registers that are described in [SDMA Core Structure](#).

#### 7.2.4.1.2.1 Instruction Types

The state sequence and the delay of execution vary according to the type of the instruction. There are six possible categories of instructions, as follows:

1. Standard: Most of the instructions belong to this category, and always last 1 cycle.
2. ldf/stf: These are respectively the load and store instructions that access the functional units. They last  $1+n$  cycles where  $n$  is the number of wait-states of the targeted functional unit.
3. ld/st: These are the load and store instructions that access the memory and peripherals. They last  $1+n$  cycles where  $n$  is the number of wait-states of the targeted device (1 for the ROM, RAM, and memory mapped registers, 1 + the external peripheral wait-states). These instructions always last at least two cycles, but the core is able to handle them in one cycle. The first wait-state is inserted outside the core.
4. Branch: These are all the instructions that cause the Program Counter to point to another instruction other than the following one (for example, one that breaks the sequential flow). There are the absolute jumps, the conditional branches, the jump to the sub-routines, and the return from the sub-routine.
5. Loop, Modified Load or Store: The hardware loop instruction modifies the potential behavior of any load or store inside the loop (for example, when the LM flag is set). A jump may be implied after any such load or store if it received an error. The error causes an early exit of the loop, which means a jump to the instruction that follows the one that is pointed to by EPC. An additional cycle is required by the PCU to perform the jump (+1 to the ld/st/ldf/stf original execution delay). Although there is usually an implicit jump after the last instruction of the loop when the PC goes back to SPC, this is performed at no cycle cost.

6. Done: The done, yield, or yieldge instructions are used to control channel switching. When no channel switching is performed, these instructions last a single cycle. When there is a change of channel or context switch, the delay is variable and depends on many factors (as detailed in [Context Switching](#)).

#### 7.2.4.1.2.2 PCU States

The PCU state is visible through outputs of the SDMA (see [Real-Time Debug Outputs](#)) or the OnCE status register(see [OnCE Status Register \(OSTAT\)](#)).

The PCU state is a four-bit field that can take the values shown in the following table. [Figure 7-2](#) shows the possible state transitions and the corresponding conditions.

**Table 7-5. PCU States**

Value	State	Description
0	Program	This is the usual instruction cycle.
1	Data	This state is inserted when there are wait-states during a load or a store on the data bus (ld/st type).
2	Change of Flow	This is the second cycle of any instruction that breaks the sequence of instructions (branch and done types). This state lasts only a single cycle; it is always followed by the Program state.
3	Error in Loop	This state is used when an error causes a hardware loop exit (loop-modified load or store type). This state only lasts a single cycle; it is always followed by the Program state.
4	Debug	The SDMA is stopped in debug mode.
5	Functional Unit	This state is inserted when there are wait-states during a load or a store on the functional units bus (ldf/stf type).
6	Sleep	No script is running: The core is idle after saving the last channel context.
7	Save	The context switch FSM is saving the current channel.
8	Program in Sleep	Same as Program except there is no associated channel, this state is used when instructions are executed after entering debug mode, whereas the core was in either Sleep mode.
9	Data in Sleep	This is the same as Data except there is no associated channel.
10	Change of Flow in Sleep	This is the same as Change of Flow except there is no associated channel. This state only lasts a single cycle, and is always followed by the Program in Sleep state.
11	Error in Loop in Sleep	This is the same as Error in Loop except there is no associated. channel. This state only lasts a single cycle, and is always followed by the Program in Sleep state.
12	Debug in Sleep	This is the same as Debug except the core was put in debug mode when no channel was active.
13	Functional Unit in Sleep	This is the same as Functional Unit except there is no associated channel.
14	Sleep after Reset	This shows that no script is running, and the core is idle after a reset. When a channel becomes active, no context is restored but the core starts its boot program located at address 0 (or the address available in register in <a href="#">Channel 0 Boot Address (SDMAARM_CHN0ADDR)</a> ).
15	Restore	The context switch FSM is restoring the next channel context.

Figure 7-2. PCU State Diagram

### 7.2.4.1.3 SDMA Core Memory

The SDMA has two memory spaces: one for the instructions and one for the data. As both spaces share the same resources (ROM and RAM devices), the system bus manages possible conflicts when the core accesses the same resource for both an instruction read and a data read or write.

Program and data memory is further described in [Address Space](#).

Instructions of 16-bit width are stored in 32-bit wide devices and can be accessed as data. The mapping is Big Endian: an even instruction address (terminated by 0) accesses the most significant part of the 32-bit data (bits [31:16]), and an odd instruction address (terminated by 1) accesses the least significant part of the 32-bit data (bits [15:0]). Instructions can be fetched out of internal ROM or RAM.

Data can be read from ROM, RAM, memory mapped registers, and external peripherals, and written to the same devices (except the ROM).

The ROM contains bootload scripts, channel scripts, and common subroutines which may be referenced by channel scripts elsewhere in the ROM or RAM.

The RAM is divided into a context area and a code space area which may be used to store channel scripts. The RAM contains undefined values after a hardware reset. Channel scripts and initial context values are downloaded into RAM using channel 0 which is reserved for bootload functions.

### 7.2.4.2 Scheduler

All channel scheduling hardware is included in the Scheduler.

#### 7.2.4.2.1 Primary Functions

The scheduler is a hardware-based design used to coordinate the timely execution of 32 virtual DMA channels by the SDMA core on the basis of channel status and priority.

The scheduler performs the following functions:

- Monitors, detects, and registers the occurrence of any one of the 48 DMA requests
- Links a specific request to a channel or group of channels (channel mapping)
- Ignores requests that are not mapped to a previously configured channel
- Maintains a list of all the channels that are requesting service
- Assigns a pre-programmed priority level (1 of 7) to every channel requesting service
- Detects and flags overrun/underrun conditions

## 7.2.4.2.2 Channels and DMA Requests

### 7.2.4.2.2.1 Channels

A Virtual Channel (hereafter simply called a channel) manages a flow of data through the SDMA. Flows are typically unidirectional.

The SDMA can have up to 32 simultaneously operating channels, numbered from 0 to 31. Channel 0 is usually dedicated to control the SDMA script downloading. All the channels can be assigned by the ARM platform software.

### 7.2.4.2.2.2 DMA Requests

A DMA request is caused by externally (for example, external to the SDMA) controlled conditions (for example, UART receive FIFO reaches a threshold). The SDMA currently supports up to 48 DMA requests.

### 7.2.4.2.2.3 Mapping from DMA Requests to Channels and Priorities

A channel can stall waiting on a single DMA request. A single DMA request can awake more than one channel (in fact, any request can awake any combination of channels).

The mapping between DMA requests and channels is program-controlled. There is a storage element assigned for each of the 48 requests that contains a bitmap table of the channels that are awakened by the event.

Every channel also has a three-bit register that indicates its priority.

### 7.2.4.2.3 Scheduler Functional Description

[Scheduler Overview](#) describes the behavior of the SDMA scheduler—from the channel enabling conditions to the highest priority pending channel selection.

### 7.2.4.2.3.1 Scheduler Overview

The scheduler algorithm is built in hardware. It is provided with possibilities for the ARM platform to control its behavior.

The scheduler processes incoming DMA requests, maps detected requests to 0, one, or several channels, maintains a list of channels that are requesting service (pending channels), identifies the top priority and its associated channel, and selects the next active channel when the current channel yields.

The following figure shows a functional overview.

Figure 7-3. SDMA Hardware Scheduler

### 7.2.4.2.3.2 DMA Requests Scanning

The scheduler contains a 48-bit edge detection device that detects the rising edge of every DMA request and transmits the request number to the next stage.

The DMA requests are assumed to be generated on the same reference clock as the SDMA core clock; they are detected as soon as the signal goes from a 1-to-n-cycles low state to a 1-to-m-cycles high state.

This system is able to detect single-cycle pulses as well as level-based DMA requests such as a FIFO threshold crossing. In this case, the SDMA provides a memory mapped register that can be used by the channel script to monitor the DMA requests lines, and thus determines whether the data transfer is done or not done, and then continues with the transfer or closes the channel.

When several DMA requests are detected at the same time, they are forwarded to the next scheduler stage at the rate of one request per cycle. No request is lost.

**Figure 7-4. Examples of Valid DMA Requests**

The DMA request inputs are connected to various sources that depend on the SoC. The exact list of DMA request inputs and their associated number is available in each respective project-specific chapter.

### 7.2.4.2.3.3 Mapping DMA Requests to Pending Channels

Whenever a DMA request is detected by the first stage, its number is used in the second stage to determine the channels that have to be activated.

This is performed with an array of 48 registers that are 32 bits wide: There are 48 Channel Enable Registers (CHNENBLn), one register per DMA request. The DMA request number selects the Channel Enable Registers, and every bit of this 32-bit register indicates that the corresponding channel must be activated when it is a 1.

This information is passed on the EP register. For every bit of the Channel Enable Register that is set, the corresponding bit of the EP register is also set, and the remaining bits of EP are left unchanged. The transformation of EP is summarized by the following equation:

$$EP = EP \text{ or } CHNENBLn$$

The EP register is used to know which channels require service because they received a DMA request.

Typical contents of the CHNENBLn registers are all 0s, except for a single bit set. For example, a DMA request triggers one channel, but all 0s or several 1s are possible. One DMA request could activate several channels, and the channel execution sequence can be controlled by the channel priorities and numbers, as explained in the next sections. The following table illustrates an example configuration.

**NOTE**

From the table, the DMA request 0 is programmed to simultaneously trigger channels 0, 1, and 31. Also, DMA requests 30-47 are not used in this example. The remaining channels 2 to 30, are configured to be triggered by DMA requests 29 to 1, respectively.

**Table 7-6. Channel Enable RAM Programming Example**

DMA Request Number	Channel																																	
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### 7.2.4.2.3.4 Channel Overflow

A channel overflow occurs when a DMA request requires service from channel  $n$  by setting bit  $n$  of the register EP, but this bit is already set, meaning channel  $n$  is already pending. This can come from an overrun/underrun condition.

This detection is possible only when the DMA requests are pulses, because a level-based DMA request stays high until it is serviced, even though an underrun or overrun condition occurs, thus preventing another edge detection of the DMA request.

The channel overflow information is saved in the 32-bit CHNERR register (1 bit per channel). You can configure the SDMA to trigger an interrupt to the ARM platform when there are 1s in CHNERR. Every bit of CHNERR is masked with the corresponding bit of INTRMASK and if it gives a 1, the corresponding bit of INTR is set, triggering the interrupt.

#### 7.2.4.2.3.5 Runnable Channels Evaluation

The EP register is used in conjunction with several other 32-bit registers to determine the channels that are runnable.

Registers EO, DO, HO and HE, are controlled by the ARM platform. EP is controlled by the DMA requests and their mapping to channels.

Several channels may be runnable at any given time. The  $i^{\text{th}}$  channel is runnable if (and only if) the condition below is true:

$$(HE[i] \text{ or } HO[i]) \text{ and } (DO[i]) \text{ and } (EP[i] \text{ or } EO[i])$$

After reset, the HE[i], HO[i], EP[i], and EO[i] bits are all cleared whereas the DO[i] bits are all set. The functions associated with DO are not available for this device. When DO[i] is set, the scheduler condition becomes:

$$(HE[i] \text{ or } HO[i]) \text{ and } (EP[i] \text{ or } EO[i])$$

The registers in these equations are controlled as follows:

- ARM platform (host) channel enable flag HE[i] may be set or cleared by the ARM platform with the HSTART and STOP\_STAT registers. It can also be cleared by the  $i^{\text{th}}$  channel script.

Typical usage is for the ARM platform to set this flag to activate the channel. The flag is cleared by the SDMA core when the transfer is done.

- Externally triggered channel pending flag EP[i] is set by the scheduler when the channel was activated by a DMA request. It can be cleared by the  $i^{\text{th}}$  channel script.
- The ARM platform channel override flag HO[i] may be set or cleared by the ARM platform. When set, it enables the  $i^{\text{th}}$  channel to run without the involvement of the ARM platform.

Typical usage is for the ARM platform to set this flag for channels that do not need ARM platform supervision such as channels that are controlled by DMA request events (EP).

- DO should always be set to 1 so that the runnable channel evaluation considers only HO, HE, EP, and EO.
- Externally triggered channel override flag EO[i] may be set or cleared by the ARM platform. When set, it prevents the  $i^{\text{th}}$  channel from stopping and stalling on incoming peripheral DMA requests. This is the case when the channel is not handling data transfers with peripherals (for example, a memory to memory transfer).

The SDMA can clear the HE[i], and EP[i] bits by means of a done or notify instruction. The done instruction causes a reschedule; thus, enabling another channel to preempt the current one, while the notify instruction does not. The done and notify instructions can clear either HE[i] or EP[i] (never more than one at a time).

**Table 7-7. Runnable Channel Selection Control**

Register	Set by	Cleared By
HO	Write to HOSTOVR register	Write to HOSTOVR register

*Table continues on the next page...*

**Table 7-7. Runnable Channel Selection Control (continued)**

Register	Set by	Cleared By
HE	Write to HSTART register	Write to STOP_STAT register or by the channel script with the done or notify instructions.
DO	Write to DSPOVR register	Write to DSPOVR register
EO	Write to EVTOVER register	Write to EVTOVER register
EP	Set by external DMA request event input.	By the channel script with the done or notify instructions

### 7.2.4.2.3.6 Next Channel Decision Tree

The next channel number is computed from the runnable channels list, the current channel number, and their respective priorities.

It is re-evaluated every cycle, but is only used when the current channel yields or terminates by executing a yield, yieldge, or done instruction.

The decision tree is based on the selection of the runnable channel that has the highest priority.

The highest priority channel is selected according to the following rules:

- Runnable channels are sorted by priority.
- If one of the channels with the highest priority had been preempted by a channel with a higher priority, but did not want to yield to a channel of the same priority (for example, it executed a yield, not a yieldge), it is elected as the next channel.
- The channels that belong to the highest priority group are sorted by their number and the channel that has the highest number in this group becomes the next channel. For example, if priorities are the same, channel 31 will be selected before channel 30.

When the current channel requires a reschedule with a yield(ge) or a done instruction, the context switch decision is based on the instruction parameter, the current channel number and priority, and the next channel number and priority. The possible cases are all listed in the following table. The grayed cells correspond to unusual cases that should not occur with a typical usage of the SDMA.

**Table 7-8. Channel Switching Decision with a yield, yield(ge), or done**

Instruction	Current Channel	Next Channel	Priorities Comparison	New Running Channel/Comments
yield (done 0)	Runnable	Not runnable	none	Current
	Runnable	Runnable	Current > Next	Current
			Current = Next	Current
			Current < Next	Next <sup>1</sup>

*Table continues on the next page...*

**Table 7-8. Channel Switching Decision with a yield, yield(ge), or done (continued)**

Instruction	Current Channel	Next Channel	Priorities Comparison	New Running Channel/Comments
	Not runnable	Not runnable	none	none <sup>2</sup> (occurs when the channel was disabled by the ARM platform)
	Not runnable	Runnable	none	Next <sup>1</sup> (occurs when the channel was disabled by the ARM platform)
yieldge (done 1)	Runnable	Not runnable	none	Current
	Runnable	Runnable	Current > Next	Current
			Current = Next	Next <sup>1</sup>
			Current < Next	Next <sup>1</sup>
	Not runnable	Not runnable	none	none <sup>2</sup> (occurs when the channel was disabled by the ARM platform)
Not runnable	Runnable	none	Next <sup>1</sup> (occurs when the channel was disabled by the ARM platform)	
done (done>1)	Not runnable	Not runnable	none	none <sup>2</sup>
	Runnable	Not runnable	none	Current <sup>3</sup> (occurs when the done instruction does not disable the channel runnable condition)
	Not runnable	Runnable	none	Next <sup>1</sup>
	Runnable	Runnable	none	Current <sup>3</sup> (occurs when the done instruction does not disable the channel runnable condition)

1. Current channel script execution is stopped, its context is saved; the next channel context is restored and its script execution resumes
2. Current channel context is saved and SDMA enters IDLE mode
3. Current channel context is saved, then restored, and the current channel script resumes execution

Finally, when the SDMA is in IDLE mode and a runnable channel is elected as the next channel, its context is immediately restored and the script execution resumes.

The *combinatorial-decision* tree supports dynamic modifications of the EP, EO, HE, HO, and DO flags as well as dynamic modifications of the channel priorities. The propagation times are detailed in [Scheduler Pipeline Timing Diagram](#).

The decision tree status is available in the PSW register, which is continuously updated. It contains the next channel priority, the next channel number, the current channel priority, and the current channel number. When a priority is read as 0, it means the channel is not runnable.

A few examples of decisions are presented below:

- Channel 31 is running with priority 5, channels 13 and 24 are pending with the same priority 5; channel 24 is eligible as the next channel since  $24 > 13$ .
- Channel 31 is running with priority 7, channels 13 and 24 are pending with priority 5; channel 31 is the next channel because its priority is greater than the other pending channels.
- Channels 7, 23, and 29 are pending with the same priority. Channel 7 is active and runs a yieldge; it is preempted by channel 29. After a period of time, channel 29 runs a yieldge, it is then preempted by channel 23 that is the selected channel since channel 29 is the current channel. Later, channel 23 runs a yieldge and is preempted by channel 29. Channels 23 and 29 will go on switching after every yieldge until one of them terminates. It is only at that point that channel 7 becomes eligible again.
- Channel 11 is running with priority 3, and channel 15 is pending with priority 4. When the channel 31 script executes a yield instruction, it gets preempted by channel 15; then channels 6 and 18 with priority 3 become pending. Because channel 11 was preempted after executing a yield and there is no pending channel with a strictly greater priority, it is eligible as the next channel (although its number  $11 < 18$ ).

#### 7.2.4.2.3.7 Scheduler State Diagram

The [Figure 7-5](#) summarizes the behavior of the SDMA scheduler with details about the exact mechanism of the priority decision tree. It is important to understand the scheduler is a hardwired pipeline, which means all the stages are performed simultaneously every cycle, but a change on any given stage is reflected on the next stage after the delays presented in [Scheduler Pipeline Timing Diagram](#).

Figure 7-5. Scheduler State Diagram

### 7.2.4.2.3.8 Scheduler Pipeline Timing Diagram

The SDMA scheduler process of DMA-request and control-register modifications is not immediate.

The figure below shows the exact delays of all the tasks. The reference clock is the SDMA core clock.

**Figure 7-6. Scheduler Timing Diagram**

Two numbers can be inferred from this timing diagram. First, it takes six SDMA core clock cycles to update the next channel from a DMA request. Second, it takes three SDMA core clock cycles to update the next channel from a direct modification of the condition registers (EP, DO, HE, or HO) by any processor. The processors that can modify these bits include SDMA with a done instruction or the ARM platform with a write access through the corresponding control port on their respective peripheral bus).

### 7.2.4.2.3.9 Channel-DMA Request Mapping

The 48 DMA request inputs to the SDMA scheduler are listed in project-specific chapters. Refer to the respective chapters for this information.

### 7.2.4.2.3.10 Examples: How to Start a Channel

A channel can be started when the following equation is true for channel  $i$ :

$(HE[i] \text{ or } HO[i]) \text{ and } (DO[i]) \text{ and } (EP[i] \text{ or } EO[i])$

Once this equation is true, the scheduler can start this channel according to the priority of all pending channels. Several examples of configuration are listed below:

1. To start a channel triggered by ARM platform software:
  - Initially, configure  $HO[i]=0$ ,  $DO[i]=1$ , and  $EO[i]=1$  using registers indicated in [Table 7-7](#).
  - ARM platform software triggers the channel by writing to the HSTART register to set  $HE[i]=1$ , thereby setting the above equation true.
2. To start a channel triggered by DMA request event.
  - Initially, configure  $HO[i]=1$ ,  $DO[i]=1$ , and  $EO[i]=0$  using registers indicated in [Table 7-7](#).
  - The DMA request is asserted to trigger the channel by setting  $EP[i]=1$ , which makes the above equation true.

### 7.2.4.2.4 Context Switching

On execution of a done or yield(*ge*) instruction, the current channel may be changed either because it has finished (which necessarily happens when the done instruction is executed), or it was preempted by a higher priority channel (which is possible but not systematic when the yield(*ge*) is executed).

Upon a channel change the SDMA goes through a context switch procedure.

When the current channel yields or ends, the context for that channel is saved into the context RAM locations for that channel. When the next channel starts running, its context is first restored from RAM.

Since context RAM is not yet initialized by reset, there will be no context restore at the beginning of the first channel (bootload channel) run after reset. It is expected that the bootload channel will be used to initialize the context for all other channels. When the bootload channel finishes running or yields, SDMA will enter its SAVE state and save that channel's context into RAM. Then, if the bootload channel is called again later, the context will be restored from RAM when the channel starts again.

The context structure for each channel is defined in [Context Switching-Programming](#) and [Table 7-13](#). There will be one context area reserved for each channel. When a channel ends or yields, the SDMA core registers are automatically saved into the context RAM and later restored from the context RAM when the channel is next run. The total RAM

space reserved for 32-channel contexts is either 3K or 4K depending on whether the SMSZ bit is set in the CHN0ADDR register, which enables an additional 8 words of scratch RAM for each context.

#### 7.2.4.2.4.1 Context Switch Modes

The exact procedure to save the context of the old channel, and to restore the context of the new channel depends on the context switch mode selected by the ARM platform in the CONFIG control register.

The following are the context switch modes:

- By default, the "dynamic" context switch is set. This mode provides the most efficient context switch for an average of eight cycles to stop the current channel, save its context, restore the next channel context, and resume its execution. It consists of saving modified registers of the current channel in the background (for example, during the channel execution)-which leaves very few registers to save when the switch is decided-resuming execution of the next channel as soon as possible (for example, when the minimal set of registers is restored), and continuing the restore phase during this execution.
- In "dynamic with no loop" mode, the same principle is followed except the modified registers are only saved in the background when the loop flag is not set. This mode offers almost the same effectiveness as the previous one, but it prevents the system from accessing the RAM during loops to save power. This is the recommended mode for an efficient context-switch when the loop bodies are short.
- In "dynamic power" mode, no background saving is performed, which reduces power consumption to the minimum. The modified registers are only saved when the context switch starts. The restore phase is the same as before. This is the mode that achieves the optimal power consumption at the cost of a slower context-switch.
- In a "static" context switch, all the registers are saved when a context switch is decided, and all the registers are restored before starting the execution of the new channel. This mode enables a predictable behavior of the context switch since all the registers are restored prior to the channel start and all registers are saved after the channel termination.

#### NOTE

Static context mode should be used for the first channel called after reset to ensure that the all context RAM for that channel is initialized during the context SAVE phase when the channel is done or yields. Subsequent calls to the same channel or different channels may use any of the dynamic context modes. This will ensure that all context locations for the bootload

channel are initialized, and prevent undefined values in context RAM from being loaded during the context restore if the channel is re-started later.

#### 7.2.4.2.4.2 Context Switch Procedure

The Program Control Unit goes into the *save* state, the current context is spilled into memory, and the next channel context is restored according to the context-switch mode that was selected by the ARM platform.

The context switch procedure is as follows:

1. Load the current context's spill base address.
2. Spill the modified registers of the current channel to memory according to the selected context switch mode while the channel is running.

On a *done* or *yield(ge)* that causes the channel preemption, the PCU goes into the *save* state. In *static* mode, all the registers are saved; whereas, in either *dynamic* mode, the registers that were modified but not yet saved are then saved, and the PCU registers and flags are finally saved.

3. Put the SDMA core into *sleep* and wait for new channels to be serviced. This step is skipped if there are pending channels when the current channel is saved.

As soon as there is at least one pending channel, the PCU goes into its *restore* state to restore the context of the channel that was elected by the scheduler.

Once a channel is elected, it remains the current channel until its script requests a rescheduling operation with a *done* or *yield(ge)* instruction. That means the current channel cannot be modified by the ARM platform, even if it is no more runnable or if its priority is modified.

The ARM platform can however force a reschedule by writing the corresponding bit in the CONFIG register, which has the same effect as if the script had executed a *done* instruction. That feature should only be used to stop the SDMA in emergency cases.

4. Load the context base-address of the new channel.

In "static" mode, all the registers are restored. In either "dynamic" modes, only the PCU registers are restored.

The new channel is running. In "static" mode, no more activity regarding context restoring or saving is performed. In either "dynamic" modes, the registers are restored in the background every time an access to the context RAM is possible, and

priority is given to restoring the registers that are required by the next instruction to be executed. When a register has not been restored and the next instruction needs it, this instruction gets stalled until the register was restored.

In "dynamic" and "dynamic with no loop" modes, background saving of dirty registers is performed every time an access to the context RAM is possible and allowed by the context switch mode.

#### NOTE

The contents of a channel context space in the context RAM depends on the selected context switch mode. In "dynamic" and "dynamic with no loop" modes, the contents of the context RAM tend to match the contents of the SDMA registers (except for the PCU registers and flags that are never saved in the background). In "dynamic power" and "static" modes, the contents of the context RAM remain unchanged until the channel terminates with a done or gets preempted.

#### 7.2.4.2.4.3 Context Map in Memory

Refer to [Context Switching-Programming](#).

### 7.2.4.3 Functional Units

The functional units are small systems that are used by the SDMA core to handle data transfers between the core and a bus domain external to the SDMA.

The SDMA core is able to control and exchange data with these systems by sending instructions and reading or writing data from/to the functional units' registers via the FUBUS. This is done with the ldf and stf instructions.

The following sections provide introductions to the available functional units. [Functional Units Programming Model](#) provides descriptions the functional units' behaviors.

#### 7.2.4.3.1 Burst DMA Unit

The burst DMA unit enables the SDMA core to perform data transfers to and from the ARM platform memory.

It is optimized for accessing SDRAM-like devices. It does not provide control to assign a privilege level to the DMA access. The burst DMA unit provides the SDMA with means to do the following:

- Perform up to 8-beat read and write bursts to the ARM platform memory, which optimizes throughput when accessing SDRAM-type devices because of an internal, 36-byte FIFO
- Access the ARM platform memory at once or twice the SDMA core frequency
- Copy data from one ARM platform memory location to another ARM platform memory location at the ARM platform bus speed, which provides a very high throughput
- Control the method for addressing the ARM platform memory (automatic increment of addresses or frozen addresses-the former aimed at accessing RAM-like memory and the latter aimed at accessing single-address FIFOs)
- Enable or disable automatic prefetch when reading data from the ARM platform memory. When the prefetch mode is selected, the burst DMA automatically triggers external bursts to fill its FIFO without waiting for the SDMA core to request the corresponding data, greatly improving throughput.
- Rely on the DMA to automatically flush its FIFO content when there is enough data to generate an 8-beat burst to the ARM platform memory. Or, it forces a flush when a data transfer must terminate.
- In the former case, the SDMA core may only be stalled when it tries writing data and there is not enough room left in the FIFO. In the latter case, the core is stalled until the data is effectively written to the ARM platform memory.

In automatic flush mode, the core receives an acknowledge that does not reflect the actual error status when the data is effectively written into the ARM platform memory. This error status is retrieved by a later access to the burst DMA.

Terminating a write data transfer with a forced flush command guarantees that any bus error to the ARM platform memory is caught.

- Handle address alignment issues between the ARM platform memory map and the SDMA core data. This enables the core to read or write 32-bit data from the burst DMA, whereas the corresponding ARM platform address is not 32-bit aligned. This drastically improves the SDMA scripts' efficiency since the same loop that transfers 32 bits at a time can be used regardless of the start and end addresses in the ARM platform memory space.

This unit structure and registers are described in [Burst DMA Structure](#) and [Burst DMA Registers](#).

### 7.2.4.3.1.1 Burst DMA Structure

The burst DMA is essentially made up of a 36-byte FIFO, address registers, and a controlling state-machine. The 36-byte FIFO enables eight-word buffering with address alignment, and the state-machine manages clock adaptation when required.

The burst DMA is depicted in the figure below.

Figure 7-7. Burst DMA Structure

### 7.2.4.3.1.2 Burst DMA Registers

There are four registers, as follows, that may be accessed from the SDMA core:

- **MSA (Memory Source Address)** - Holds the source byte address in the ARM platform memory map for reading data from this location. This register is automatically modified every time the core reads new data from the FIFO.
- **MDA (Memory Destination Address)** - Holds the destination byte address in the ARM platform memory map for writing data to this location. This register is automatically modified every time the core writes new data into the FIFO.
- **MD (Memory Data)** - Labels the 36-byte FIFO access point: Reading a byte, halfword, or word from MD respectively retrieves the first 1, 2, or 4 bytes of the

FIFO (for example, the bytes that were stored first by the DMA state-machine when transferring data from the ARM platform memory).

- When the FIFO does not hold as many bytes as required by the SDMA core, the core is stalled until the missing bytes are read from the ARM platform memory. In the case of prefetch mode, the DMA controller decides when it should start a burst to ARM platform memory in order to reduce the risk to not have the required data for the future accesses of the core. When there is no prefetching, a burst is triggered when the required data is not available in the FIFO.

Writing a byte, halfword, or word to MD stores 1, 2, or 4 bytes, respectively, at the end of the FIFO (for example, these bytes are transmitted to the ARM platform memory after all the other bytes that were previously stored in the FIFO). When the FIFO does not have enough room left to hold the written data, the SDMA core is stalled until a sufficient amount of FIFO contents are flushed out to the ARM platform memory. Flushing is decided by the DMA controller when there are enough bytes in the FIFO to perform the largest allowed burst to ARM platform memory (the exact size depends on the burst start address and the AHB 1 Kbyte boundary rule). However, the SDMA core has the ability to force the flushing operation at any time, for example, when at the end of the data transfer, prior to channel closure.

- MS (Memory Setup) - Contains the state of the burst DMA control, the two flags that define whether each address register is incremented after every access to the external memory, and another flag that is set when a bus error occurred.

#### 7.2.4.3.1.3 Burst DMA Data Transfers

Three typical usages have been identified that involve the burst DMA: the data transfer startpoint, the endpoint, or both.

Every case requires a different procedure, as listed in the following sections:

##### 7.2.4.3.1.3.1 Data Retrieval from the ARM platform Memory

The following steps retrieve data from ARM platform memory using the burst DMA unit:

- Set up the MS flags to reflect the mode for the source address (incremented or frozen according to the type of accessed device: memory or peripheral FIFO), then initialize the source address register itself (MSA).
- Read data from the FIFO using the *ldf MD* instruction as many times as needed. If an error occurred during the fetch from ARM platform memory, the DMA control tags the error status on the data and the SDMA core SF flag is set when reading this data from the FIFO.

### 7.2.4.3.1.3.2 Storing Data Into the ARM platform Memory

The following steps store data from ARM platform memory using the burst DMA unit:

- Set up the MS flags to reflect the mode for the destination address (incremented or frozen according to the type of accessed device: memory or peripheral FIFO), then initialize the destination address register itself (MDA).
- Store data into the FIFO using the *stf MD* instruction as many times as needed.
- When the transfer is finished and if the DMA worked in automatic flush mode, force the flush of the FIFO. This instruction is stalled until all the FIFO data is effectively sent to the ARM platform memory and the error status of the transfer is available in the DF flag.

### 7.2.4.3.1.3.3 Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit

The following steps copy data between two ARM platform memory locations using the burst DMA unit:

- Set up the MS flags to reflect the modes for the source and destination addresses (all the combinations are possible), then initialize the source address register (MSA) and the destination address register (MDA). Both addresses must be word-aligned.
- Use as many *stf MD* instructions with the *COPY* flag as needed. Every instruction triggers a burst read of a given number of words from the source address (this number is provided to the burst DMA via the SDMA core general purpose register, which is referenced in the *stf* instruction). Once all the data is loaded into the FIFO, the DMA empties it with a write burst of the same count to the destination address. The DMA acknowledges prior to instruction completion, which frees the SDMA core for other tasks at no delay cost.
- Once the transfer is done, there should be a final access to the burst DMA to check the error status.

## 7.2.4.3.2 Peripheral DMA Unit

The peripheral DMA unit is the second functional unit that connects the SDMA to the ARM platform memory.

Unlike the burst DMA, it does not support burst transfers and is optimized for accessing peripherals. It does not provide control to assign a privilege level to the DMA access. Its feature list comprises the following:

- Access to the ARM platform peripherals or memory at once or twice the SDMA core frequency

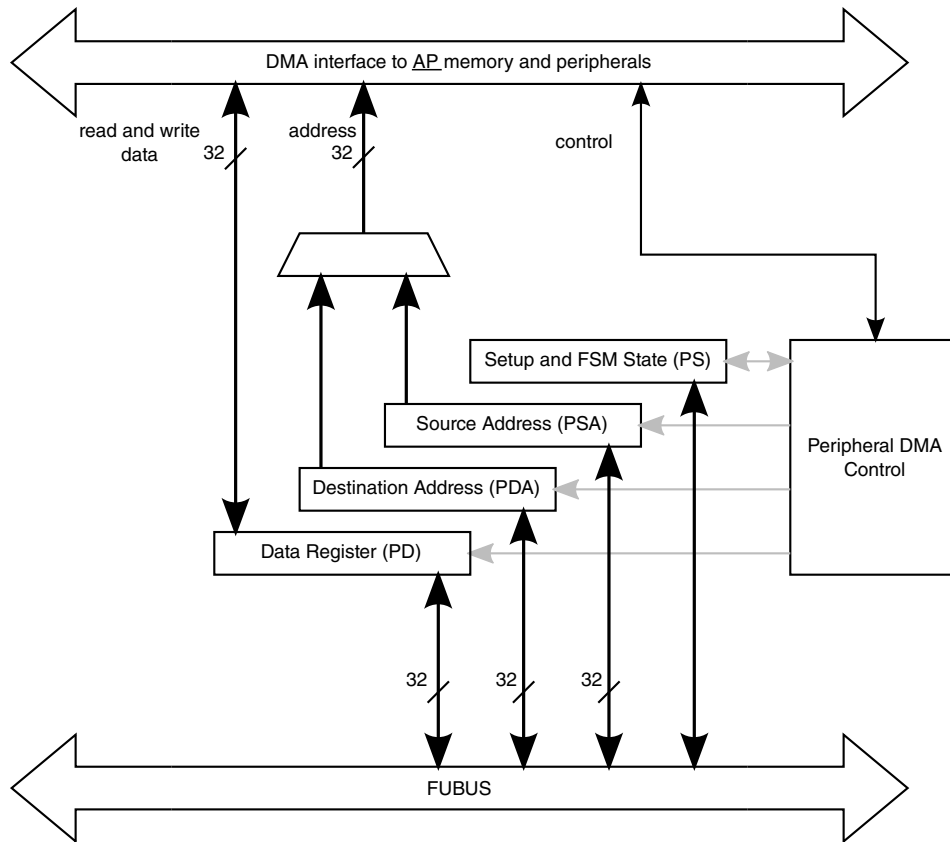

- Data copy from one ARM platform memory location to another ARM platform memory location at memory bus speed, improving throughput
- Control of the method for addressing the ARM platform memory (automatic increment or decrement of addresses or frozen addresses, the first ones aimed at accessing RAM-like memory and the last one aimed at accessing single-address FIFOs)
- Selectable automatic prefetch when reading data from the ARM platform memory. In prefetch mode, the peripheral DMA automatically fetches another data-without waiting for the SDMA core to request it-when its data register is empty, which improves the throughput
- Selectable automatic flush. In this mode, the SDMA core may only be stalled when it tries writing data and the previous write operation is not finished yet; whereas, in forced flush mode, the core is stalled until the data is effectively written to the ARM platform memory.
- In automatic flush mode, the core receives an acknowledge that does not reflect the actual error status when the data is effectively written into the ARM platform memory or the peripheral. This error status is retrieved by a later access to the peripheral DMA. Terminating a write data transfer with a forced flush command guarantees that any bus error to the ARM platform memory has been caught.

This unit structure and registers are described in [Peripheral DMA Structure](#) and [Peripheral DMA Registers](#).

### 7.2.4.3.2.1 Peripheral DMA Structure

The peripheral DMA is made up of a 32-bit data register, two address registers, and a controlling state-machine. The state-machine manages clock adaptation, when required.

It is shown in the following figure.

**Figure 7-8. Peripheral DMA structure**

### 7.2.4.3.2.2 Peripheral DMA Registers

According to [Figure 7-8](#), the peripheral DMA has four registers that may be read or written by the SDMA core:

- *PD (Peripheral Data)* is the DMA 32-bit data register.
- *PSA (Peripheral Source Address)* holds the source byte address in the ARM platform memory map for reading data from this location. This register is automatically modified every time the core reads a new data from PD.

- *PDA (Peripheral Destination Address)* holds the destination byte address in the ARM platform memory map for writing data to this location. This register is automatically modified every time the core writes a new data into PD.
- *PS (Peripheral Setup)* contains the state of the peripheral DMA control, two configuration fields that define the way address registers are modified after every data access, two additional configuration fields that define the data size to access the source and destination devices, and another field that contains the latest transfer error status.

### 7.2.4.3.2.3 Peripheral DMA Data Transfers

There are three typical usages that involve the peripheral DMA, whether it is the data transfer start-point, endpoint, or both.

Every case requires a different procedure, as described in [Data Retrieval from the ARM platform Memory or Peripheral](#), [Storing Data into the ARM platform Memory or Peripheral](#), and [Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit](#).

#### 7.2.4.3.2.3.1 Data Retrieval from the ARM platform Memory or Peripheral

The following steps retrieve data from ARM platform memory using the peripheral DMA unit:

- Set up the PS fields to reflect the mode and data size for the source (incremented, decremented, or frozen address register; 8-bit, 16-bit, or 32-bit data transfers), then initialize the source address register itself (PSA) with an address that is aligned to the programmed data size.
- Read data from PD using the ldf PD instruction as many times as needed. If an error occurs during the fetch from the ARM platform memory or peripheral, the DMA control tags the error status on the data and the SDMA core SF flag is set when reading this data from PD.

#### 7.2.4.3.2.3.2 Storing Data into the ARM platform Memory or Peripheral

The following steps store data to ARM platform memory using the peripheral DMA unit:

- Set up the PS fields to reflect the mode and data size for the destination (incremented, decremented, or frozen address register; 8-bit, 16-bit, or 32-bit data transfers), then initialize the destination address register itself (PDA) with an address that is aligned to the programmed data size.

- Store data into PD using the *stf PD* instruction as many times as needed.
- When the transfer is finished and if the peripheral DMA worked in automatic flush mode, force the flush of PD. This instruction is stalled until PD contents are effectively sent to the ARM platform memory or peripheral, and the error status of the transfer is available in the DF flag.

#### 7.2.4.3.2.3.3 Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit

The following steps copy data between two ARM platform memory locations using the peripheral DMA unit:

- Set up the PS fields to reflect the modes and data size for the source and destination addresses (all the combinations of addressing modes are possible, but both data sizes must be identical), then initialize the source address register (PSA) and the destination address register (PDA). Both addresses must be aligned with the programmed data size.
- Use as many *stf PD* instructions with the *COPY* flag as needed. Every instruction triggers a single read from the source address; a single write of the received data immediately follows. The DMA acknowledges prior to instruction completion, which frees the SDMA core for other tasks at no delay cost.
- Once the transfer is done, there should be a final access to the peripheral DMA to check the error status.

### 7.2.4.4 SDMA Security Support

The SDMA provides support to SDMA software to block unauthorized updates to the scripts in RAM.

SDMA supports the following Security modes:

- Open Mode: has full control to load scripts and context into SDMA RAM. This is the default mode.
- Locked Mode: The ARM platform loads scripts and channel contexts at startup when it is still executing known safe software. When finished, it locks the SDMA to prevent further updates to RAM and selected registers. More details described in [Locked Mode](#).

### 7.2.4.4.1 Locked Mode

The LOCK bit in the SDMA\_LOCK register provides support for SDMA scripts to freeze RAM contents after the initial bootload routine to prevent future unauthorized updates to SDMA RAM.

After initial RAM contents are uploaded, ARM platform software can set the LOCK bit to secure the RAM contents to prevent future updates by an unauthorized. After the LOCK bit is written with a '1', the SDMA is "locked" until reset.

The LOCK bit can be read in the SDMA's internal memory map in the LOCK register (see Section [SDMA LOCK \(SDMAARM\\_SDMA\\_LOCK\)](#)). SDMA scripts which load information into RAM can check the value of the LOCK bit to determine if an upload to RAM is allowed. If not allowed, the script can refuse to allow the request to copy data into the RAM to continue. The exact use of the LOCK bit in SDMA scripts for security control will be described in SDMA software documentation (see [SDMA Scripts](#)).

While SDMA is locked, attempts to write to the SDMA\_LOCK, CHN0ADR, ILLINSTADDR, and ONCE\_ENB registers will be ignored. All registers remain readable. Writes to other registers are still allowed.

Once the SDMA is locked, the LOCK bit can only be cleared by a reset. A hardware reset will always clear the LOCK bit. A software reset initiated by writing to the RESET register will only clear the LOCK bit if the SRESET\_LOCK\_CLR bit in the SDMA\_LOCK register is set. Since SDMA\_LOCK register cannot be updated if SDMA is locked, the SRESET\_LOCK\_CLR bit must be configured before setting the LOCK bit. The SRESET\_LOCK\_CLR bit will also be cleared by resets that clear the LOCK bit.

The SDMA RISC core uses the ILLINST and CHN0ADDR registers as pointers to determine where to jump to after an illegal instruction or upon boot after a reset. The LOCK bit prevents updates to these registers to protect against unauthorized changes to these pointers.

While SDMA is locked, the ONCE\_ENB register cannot be written to prevent the OnCE under ARM platform control from being used to gain access to SDMA internal memory. If ARM platform control of the OnCE is enabled before setting the LOCK bit, the ARM platform can use the ONCE for debug purpose after LOCK is set.

### 7.2.4.5 OnCE and PCU Debug States

The SDMA has two different debug modes in which the OnCE performs debug instructions.

Refer to [Figure 7-2](#) for an example of the PCU states in debug. The following are the two debug states:

- When a channel is running (that is, when CCR and CCPRI are different from 0, which can be read in the PSW register), SDMA can execute a SoftBkpt instruction from the channel script or receive a debug request. When either happens, the SDMA enters its "Classical" *Debug* state, which is described in [OnCE and Real-Time Debug](#).
- When a channel is not running, the SDMA can be in *Sleep* state or in *Sleep after Reset* state. If a debug request is sent to the core, it enters its *Debug in Sleep* state. This debug mode works similarly to the "Classical" *Debug* state, except it returns to the original state (*Sleep* or *Sleep after Reset*) when the debug mode is left via the `exec_core` instruction of the OnCE. From this *Debug in Sleep* state, the SDMA can execute a program whereas no channel is running. If a new debug request is sent to the core or if a SoftBkpt is executed, it comes back to this *Debug in Sleep* state.

The OnCE is provided with several instructions that can be executed when the core is in either debug state. The following table summarizes the behavior of these OnCE debug instructions. There exists other secondary OnCE instructions that are described in [OnCE and Real-Time Debug](#).

**Table 7-9. SDMA in Debug Mode**

Instruction	Debug	Debug in Sleep
<code>exec_once</code>	<p><code>exec_once &lt;instruction&gt;</code></p> <p>SDMA executes the &lt;instruction&gt; and returns to the <i>Debug</i> state. The Program Counter (PC) is not incremented. This command must not be used with an instruction that modifies the PC value.</p>	<p><code>exec_once &lt;instruction&gt;</code></p> <p>SDMA executes the &lt;instruction&gt; and returns to the <i>Debug in Sleep</i> state. The Program Counter (PC) is not incremented. This command must not be used with an instruction that modifies the PC value.</p>
<code>run_core</code>	<p><code>run_core &lt;instruction&gt;</code></p> <p>SDMA executes the &lt;instruction&gt;, leaves the <i>Debug</i> state and continues executing the channel script from the position where it stopped. This command must not be used with an instruction that modifies the PC value.</p>	<p><code>run_core &lt;instruction&gt;</code></p> <p>SDMA executes the &lt;instruction&gt; and returns to its <i>Sleep</i> or <i>Sleep after Reset</i> initial state. This command must not be used with an instruction that modifies the PC value.</p>
<code>exec_core</code>	<p><code>exec_core &lt;instruction&gt;</code></p> <p>It is similar to <code>run_core</code> except it requires an instruction that changes the PC value (jump, branch...): the SDMA jumps to the new PC value, leaves the <i>Debug</i> state and starts executing instructions from this new PC value.</p>	<p><code>exec_core &lt;instruction&gt;</code></p> <p>If the previous state was <i>Sleep after Reset</i>, the SDMA returns to this state, and <code>Chn0Addr</code> value overrides the PC value.</p> <p>Otherwise, the SDMA jumps to the new PC value and starts executing instructions from this new PC.</p>

## NOTE

The feature `exec_core` in *Debug in Sleep* after *Sleep after Reset* was added for the Channel boot (channel 0) to allow the debugger to return to *Sleep after Reset* state with a new PC

value. The SDMA will be ready to boot at the Chn0Addr address.

### 7.2.4.6 SDMA Clocks and Low Power Modes

The SDMA receives several root clocks from the SoC clock controller block and performs adaptive clock gating to optimize its power consumption. From a user standpoint, clock gating and power mode selection are fully automatized inside the SDMA.

Root clock control is available from the SoC clock controller block.

There are numerous clock sources that are used in the SDMA. They belong to one of two possible clock domains listed in the following table, and have frequency constraints within each domain. Clocks are considered asynchronous between domains.

Within the ARM platform/SDMA clock domain, all clocks must come from the same DPLL. The ARM platform DMA interfaces (peripheral DMA and burst DMA) receive their clock from the ARM platform DMA clock source whose frequency can be once or twice the frequency of the SDMA core clock. The DMA interfaces are designed to work at the ARM platform DMA frequency, but the SDMA core is physically limited to a maximum 104 MHz frequency. Since this is lower than the maximum ARM platform DMA frequency, the SDMA core clock is tied to the ARM platform peripheral clock frequency.

The ARM platform Peripheral Bus Clock source must be an exact sub-frequency of the SDMA Core clock source (any integer value greater or equal to 1).

**Table 7-10. Clocking Scheme**

Clock Domain	Source Clock	Comments
ARM platform	SDMA core (SDMA main core)	Source clock for the core and all its operations; this clock is thus used by most of the SDMA sub-blocks.
	ARM platform DMA	DMA interface for the peripheral DMA and the burst DMA. It is balanced with the main clock source, and its frequency is either once or twice the main clock frequency.
	ARM platform peripheral	Connection to the ARM platform peripheral bus. It is a sub-frequency of the main clock frequency.
JTAG	TCK	Clock for JTAG access, limited to maximum of 1/8 of the SDMA core clock frequency.

The JTAG clock is sampled by the SDMA main clock to determine its rising edge. This simplifies design and clock management, but it also adds a ratio constraint between those two clocks. It is guaranteed the JTAG interface works properly when the frequency of TCK is lower than 1/8<sup>th</sup> of the frequency of the SDMA main clock (which is about 8 MHz when the SDMA core clock frequency is 66 MHz).

### 7.2.4.6.1 Clock Gating and Low Power Modes

The SDMA automatically performs power saving without requiring user involvement. It implements two levels of automatic clock gating.

#### 7.2.4.6.1.1 Coarse Clock Gating

Every sub-block clock comes from one of the five available sources, and is gated with the sub-block specific enabling condition.

The following table displays the sub-block clocks and their source. It also indicates the relationships that may exist between different sub-blocks clock enables.

**Table 7-11. Sub-blocks Clocks**

Sub-block	Source Clocks	Enabling Condition and Comments	Related Enabling Conditions
Core	SDMA Main Core	The core sub-block clock is running when the core is not in one of its sleep states (Sleep or Sleep after Reset) or there is a pending channel. Typically, the core sub-block clock is stopped once all the channels are processed and the core enters its sleep state. A new pending channel awakes the core sub-block clock.	None
Memories	SDMA Main Core	The clock activation only occurs during a core access.	Disabled when Core sub-block clock is disabled or no memory access in progress
Scheduler	SDMA Main Core	Its clock only runs when scheduling is needed: for example, when there are pending channels, upon reception of a DMA request, and anytime the ARM platform modifies the channel running conditions.	None
ARM platform Control	SDMA Main Core & ARM platform peripheral	The ARM platform peripheral clock is solely used to determine the frequency ratio with the SDMA main clock. The control registers' clock is based on <i>SDMA main clock</i> ; it is active when the ARM platform or the SDMA modifies the contents of one of these registers.	None
Burst DMA	SDMA Main Core & ARM platform DMA	The burst DMA has two clocks: The first clock is derived from the SDMA main core clock and drives registers that are connected to the FUBUS. The second clock is derived from the ARM platform DMA clock and drives registers that are connected to the ARM platform DMA bus outside the SDMA. Both clocks are enabled	Disabled when Core sub-block clock is disabled

*Table continues on the next page...*

**Table 7-11. Sub-blocks Clocks (continued)**

Sub-block	Source Clocks	Enabling Condition and Comments	Related Enabling Conditions
		during active phases of data transfers (for example, these clocks are turned off when the burst DMA is not used by the running channel script).	
Peripheral DMA	SDMA Main Core & ARM platform DMA	The peripheral DMA has two clocks: The first clock is derived from SDMA main clock and drives registers that are connected to the FUBUS. The second clock is derived from the ARM platform DMA clock and drives registers that are connected to the ARM platform DMA bus outside the SDMA. Both clocks are enabled during active phases of data transfers (for example, these clocks are turned off when the peripheral DMA is not used by the running channel script).	Disabled when Core sub-block clock is disabled
OnCE	SDMA Main Core	The OnCE clock is derived from main source clock. It is disabled by default. In order to use the OnCE, its clock must be explicitly turned on, either by enabling the OnCE access from the ARM platform peripheral bus (register ONCE_ENB), or by driving the clk_gating_off input pin high. This is a SDMA input whose driver depends on the SoC implementation (typically a JTAG controller).  The OnCE also receives the TCK input, which is the JTAG clock. It does not use it as a functional clock; the TCK input is sampled instead. Refer to <a href="#">Synchronization Implementation</a> .	When enabled, all other clocks are systematically on (clock gating is off)

#### 7.2.4.6.1.2 Refined Clock Gating

The SDMA implements a second level of clock gating on a register-per-register basis.

Unlike the first level that covers all the SDMA flip-flops, except the synchronizers (only five flip-flops are always running), the second level is only available for eligible registers, which amounts to about 90% of the SDMA flip-flops.

These gated registers are only clocked when the hardware logic detects a new data loading. This additional gating further reduces dynamic power consumption.

#### 7.2.4.6.1.3 Low Power Modes and User Control

Power savings are automatically managed by the SDMA hardware without any user involvement; however, one can distinguish three different power modes: SLEEP, RUN, and DEBUG.

The following table describes these modes, and shows how to switch from one mode to another.

**Table 7-12. Power Modes**

Power Mode	Sub-blocks							Comments
	Core	Mem ories	Sche duler	ARM platf orm Control	Burs t DMA	Perip heral DMA	OnC E	
SLEEP	off <sup>1</sup>	off	wait <sup>2</sup>	wait	off	off	off	Set when the PCU state is either <i>Sleep</i> or <i>Sleep after Reset</i> and the SDMA is not in DEBUG mode. This is the default mode after reset.
RUN	on <sup>3</sup>	wait	wait	wait	wait	wait	off	Set for the other PCU states that are reachable out of debug: <i>Program, Data, Change of Flow, Error in Loop, Debug, Functional Unit, Save, or Restore</i> .
DEBUG	on	on	on	on	on	on	on	Set regardless of the PCU state when clock gating is turned off to use the OnCE features (either <i>clk_gating_off</i> pin high or ONCE_ENB[0] set).

1. *off*: no clock
2. *wait*: only clocked when accessed or stimulated
3. *on*: clock is always running

It is possible to control the SDMA power mode. The procedures to force the SDMA into either mode are described in [SLEEP Mode](#).

#### 7.2.4.6.1.3.1 SLEEP Mode

This is the default mode after reset; therefore, resetting the SDMA forces this mode.

However, the common procedure is as follows:

- Ensure the *clk\_gating\_off* pin is low and ONCE\_ENB[0] is cleared.
- Disable all channels (via the STOP\_STAT control register, and the HO, DO, EO if necessary).
- Wait for the active channels to complete or force a reschedule via the reschedule bit in the RESET register.
- The SDMA is in SLEEP mode making it possible to completely shut off its clock from the chip level clock controller using the procedure described in [Stop Mode Response](#).

#### 7.2.4.6.1.3.2 RUN Mode

This is the default mode when a channel is running:

- Ensure the *clk\_gating\_off* pin is low and ONCE\_ENB[0] is cleared.
- Activate at least one channel (via the HSTART control registers, a DMA request, and/or the HO, DO, EO register bits).

### 7.2.4.6.1.3.3 *DEBUG Mode*

The DEBUG mode must be set when one needs to use the debugging facilities of the SDMA.

- Ensure the SDMA clocks are running from the CCM.
- Set the *clk\_gating\_off* pin high or use the SDMA to set ONCE\_ENB[0].

### 7.2.4.6.1.4 **Stop Mode Response**

The SDMA receives a stop request from the chip level clock controller. This request may be asserted when the chip enters the stop low power mode.

If the SDMA is running when the request is received, then the SDMA will complete all pending channels before returning to the SLEEP state. The SDMA sends an acknowledgement to the clock controller when the SLEEP state is entered indicating that the SDMA's clocks can be turned off.

### 7.2.4.6.2 **Reset**

After reset (either received from the reset block or a software reset required by the ARM platform), the SDMA is in IDLE mode. It will start its boot code located at address 0 once a channel is activated.

Activating a channel can be done by the ARM platform after programming a positive priority and setting the channel bit in the EVTpend register.

There will not be a context RESTORE for the first channel (bootload channel) called after a reset because the context data in RAM has not been initialized. Static context mode should be used for the first channel called after reset to ensure that the all context RAM for that channel is initialized. Subsequent calls to the same channel or different channels may use any of the dynamic context modes

## 7.2.4.7 **Software Interface**

Appendix A fully describes the SDMA Application Programming Interface (API).

## 7.2.4.8 Initialization Information

This section discusses the following:

- [Hardware Reset](#)
- [Channel Script Execution](#)
- [Initialization and Script Execution Setup Sequence](#)

### 7.2.4.8.1 Hardware Reset

After reset, the program RAM, context RAM, data RAM, and RAM containing the channel enable registers (CHNENBLn) have unpredictable contents.

The active register set is assigned to channel 0 and the PC is initialized to all zeros. However, since the channel enable register is all zeros, there are no active channels and the SDMA is halted waiting for the boot channel to start.

The ARM platform will have to setup the SDMA in order to boot it. The CONFIG register must be initialized to determine the DMA/core clock ratio (1 or 2). Channel Enable Registers must also be initialized.

To start up the SDMA, the ARM platform first creates some channel control blocks (CCB) and buffer descriptors (BD) in ARM platform memory for the boot channel (channel 0) and then initializes the channel 0 pointer register (SDMA\_MC0PTR) to the address of the first control block. [Data Structures for Boot Code and Channel Scripts](#) provides an overview of the data structure for the CCB and BD's. The SDMA\_HSTART, SDMA\_HOSTOVR and SDMA\_EVT OVR registers are then configured according to [Runnable Channels Evaluation](#) to allow channel 0 to run.

Upon being enabled, the SDMA begins executing the script located at the address indicated by the Channel 0 Boot Address register (SDMA\_CHN0ADDR) in the program memory. The reset value of SDMA\_CHN0ADDR points to the default bootload script in ROM. This ROM script will read the channel 0 pointer register (SDMA\_MC0PTR) to determine the location of the Channel Control Block (SDMA\_CCB) in ARM platform memory. The script will then begin fetching by DMA the first channel control block which contains a pointer to the location channel 0 Buffer Descriptor chain which is also fetched via DMA. If the buffer descriptor contains a valid command, the script interprets the command in each buffer descriptor and proceeds to implement the command and move on to the next buffer descriptor control block. The buffer descriptor commands for channel zero are typically set up to load SDMA's program RAM, Data RAM, and initial values for the channel contexts. Some channel scripts expect particular parameters to be passed

There are two ways to make the SDMA boot on a user-defined script. The OnCE (either via its JTAG interface or its ARM platform Control interface) can be used to download any code in the SDMA RAM and force the SDMA to boot on that code. Also, the SDMA\_CHN0ADDR register in the ARM platform programming model can be modified to point to user code in RAM which would need to either have been loaded via the ONCE or default bootload routine (ex before a S/W reset).

### **7.2.4.8.2 Channel Script Execution**

The execution of an SDMA script depends on both the instructions that make up the script, the data context upon which it operates, and commands or parameters allowed to the buffer. All these items must be initialized before the script is allowed to execute.

Each of the 32 channels has a separate context, but may share scripts and locations in data RAM.

Channels are initialized by the ARM platform by using channel 0 to download any required scripts and data values and the channels initial context. The context contains all the initial values of the SDMA core registers. This includes the Program Counter (PC) which is set to the start of the desired script in SDMA program memory.

The ARM platform selects which trigger conditions that must occur for the channel to start by configuring the SDMA\_CHNENBL, SDMA\_HOSTOVR and SDMA\_EVTOVR registers. The trigger events include ARM platform setting HE (SDMA\_HSTART) or a hardware DMA request asserts an event input to SDMA. The channel can become active according to its priority compared with other runnable channels when the selected trigger(s) cause the condition described in [Runnable Channels Evaluation](#) to evaluate as true.

The specific parameters to be passed to each script in the buffer descriptor or context are documented in the software documentation for each script. Please refer to [SDMA Scripts](#) for complete script documentation. [Buffer Descriptor Format](#) provides an overview of the buffer descriptor format.

### **7.2.4.8.3 Initialization and Script Execution Setup Sequence**

To summarize, the following steps are minimally required to setup SDMA and run channel scripts.

- Perform Hardware Reset. The program RAM, context RAM, data RAM and SDMA\_CHNENBLn registers have unpredictable contents after this reset.
- Initialize SDMA\_CHNENBLn registers to map DMA request events to desired channels.

- Configure SDMA\_CHNPRIn registers to select priority for runnable channels. A non-zero priority is required for the channel to run.
- Configure the SDMA\_CONFIG register to select DMA to SDMA core clock ratio .
- Set up channel control blocks and buffer descriptors in ARM platform to specify the loading of SDMA program RAM and channel contexts for each SDMA channel to be used. Reference [Data Structures for Boot Code and Channel Scripts](#).
- Configure SDMA\_MC0PTR register with base address of ARM platform Channel Control Block base address.
- Initialize SDMA\_CHNENBLn registers to map DMA request events to associated channel. Reference [Mapping DMA Requests to Pending Channels](#).
- Configure SDMA\_CHNPRIn registers to set priority for each channel to be run.
- For each channel to be run, configure SDMA\_HOSTOVR (HO) and SDMA\_EVTOVR (EO) registers to select which events (hardware and/or software trigger events) must occur for the channel to be runnable. Reference [Runnable Channels Evaluation](#).
- Set bit 0 of the SDMA\_HSTART register to set HE[0] and allow Channel 0 to run (assumes EO[0] and DO[0] were both set in previous step). This will cause SDMA to load the program RAM and channel contexts configured previously.
- Wait for Channel 0 to finish running. This is indicated by HI[0]=1 in the SDMA\_SDMA\_INTR register, or by optional interrupt to the ARM platform.
- Set the LOCK bit in the SDMA\_SDMA\_LOCK register to prevent un-authorized uploads of data to SDMA RAM.
- Additional channel scripts can now be run by enabling the selected software or hardware trigger event according to [Runnable Channels Evaluation](#).

### 7.2.4.9 SDMA Programming Model

This section describes the programming model for the SDMA RISC engine, including its processor, memory, and internal control registers.

All addresses are related to the internal SDMA memory map, which is completely different from the ARM platform memory maps. The ARM platform processor has no access to any hardware resource described, except when those resources are described in ARM Platform Memory Map and Control Register Summary. .

#### 7.2.4.9.1 State and Registers Per Channel

The SDMA can be seen as a set of 32 identical devices that are able to perform one data transfer channel each. Only one channel can work at a time, but every channel state is available at any time.

This chapter lists the components of every channel state.

### 7.2.4.9.2 General Purpose Registers

Each channel has eight general purpose registers of 32 bits for use by scripts. General register 0 has a dedicated function for the loop instruction, but otherwise can be used for any purpose.

### 7.2.4.9.3 Functional Unit State

Each channel context has some state that is part of the functional units.

The specific allocation of this state is part of the functional unit definition that is described in [Burst DMA Unit Programming](#), [Peripheral DMA Unit Programming](#) .

This state must be saved/restored on context switches.

#### 7.2.4.9.3.1 Program Counter Register (PC)

The PC is 14 bits. Since instructions are 16 bits in width and all memory in the SDMA is 32 bits in width, the low order bit of the PC selects which half of the 32-bit word contains the current instruction.

A low order bit of zero selects the most significant half of the word.<sup>1</sup>

#### 7.2.4.9.3.2 Flags

Each channel has the following four flags:

- The T bit reflects the status of some arithmetic and test instructions. It is set when the result of an addition or a subtraction is zero and cleared otherwise. It is also the copy of the tested bits. Finally, it can also be set when the loop counter (GReg0) reaches zero. When the last instruction of the hardware loop is an operation that can modify the T flag, its effect on T is discarded and replaced by the GReg0 status.
- Two additional bits, SF and DF, are used to indicate error conditions resulting from loading data sources and storing to destinations, respectively. Access errors set these bits, and successful transactions clear them. They can also be cleared by specific instructions (CLRF and loop). The source fault (SF) is updated by the loads LD and LDF; the destination fault (DF) is updated by the stores ST and STF.

---

1. For example, big-Endian.

- Access errors are caused by several conditions including writing to the ROM, writing to a read-only memory mapped register, accessing an unmapped address, or any transfer error received by a peripheral when it is accessed.

The SF and DF flags have a major impact on the behavior of the hardware loop: If SF or DF is set when starting a hardware loop and it is not masked by the loop instruction, the loop body will not be executed. Inside the loop body, if a load or store sets the corresponding SF or DF flag, the loop exits immediately. Testing the status of the T flag at the end of the loop (as well as testing both SF and DF) tells if the loop exited abnormally as any anticipated exit prevents GReg0 from reaching the zero value and thus setting the T flag. This is also valid if the fault occurs at the last instruction of the last loop.

- The last flag is the loop mode flag, LM, which is composed of two bits. The most significant bit indicates when the processor is currently operating in loop mode. It is set by the loop instruction and is cleared after execution of the last instruction of the last loop. The least significant bit is set when the program counter points to the last instruction of a loop on the last path. It is used for a channel that is restored with this configuration to know that the next program counter is EPC. As with the dynamic context switch GReg0, which indicates when the program must get out of the loop, it can be restored only on the last instruction of the loop. This, however, is too late to fetch the next instruction after the loop.

#### **7.2.4.9.3.3 Return Program Counter (RPC)**

The RPC is 14 bits. It is set by the jump to the subroutine instructions and used by the return from the subroutine instructions.

Instructions are available to transfer its contents to and from a general register.

#### **7.2.4.9.3.4 Loop Mode Start Program Counter (SPC)**

The SPC is 14 bits. It is set by the loop instruction to the location immediately following it.

#### **7.2.4.9.3.5 Loop Mode End Program Counter (EPC)**

The EPC is 14 bits. It is set by the loop instruction to the location of the next instruction after the loop.

### 7.2.4.9.4 Context Switching-Programming

Each channel has a separate context consisting of the eight general purpose registers and additional registers representing the state of the functional units.

The active registers and functional units contain the context of the active channel. The context of inactive channels is stored in SDMA RAM, which is part of the SDMA address space.

In a function of the selected context switching mode ([Context Switching](#)), modified registers by the program can be saved in the channel RAM space while the program is going on. In every cycle, a write access to the RAM is possible.

On a done or yield(ge) instruction, SDMA goes into "real" context switching. In one of the dynamic modes, modified registers not previously saved, as well as the PC-Loop registers, are stored into the context area of the channel that will be closed. The new PC-Loop registers are loaded from the context area of the new channel. All other registers are restored while the program is executed, giving priority to registers used by the decoded instruction. Therefore, in the best case, only the PC and Loop registers should be saved and restored during this context-switching phase, which only requires five SDMA cycles.

In static mode, the context switch stores all registers in the old channel RAM space, and restores all registers from the new channel RAM space. It requires 26 SDMA cycles.

The address of the context memory for channel  $i$  is  $CONTEXT\_BASE + 24*i$  or  $CONTEXT\_BASE + 32*i$  where  $CONTEXT\_BASE$  equals 0x0800. The table below presents the layout of a channel context in memory:

**Table 7-13. Layout of a Channel Context in Memory for SDMA**

### 7.2.4.9.5 Address Space

The SDMA has four internal buses which are listed here.

- The Instruction bus reads instructions from the memory. Its address map is described in [Instruction Memory Map](#).
- The Data bus (DMBUS) accesses the same memories as those visible on the Instruction bus, some memory-mapped registers (scheduler status and OnCE registers), and up to 14 peripherals. Its address map is described in [Data Memory Map](#).
- The Functional Units bus (FUBUS) accesses the , Burst DMA, Peripheral DMA . The addressing mechanism is further detailed in [Functional Units Programming Model](#).
- The Context Switch bus reads/writes registers into context-switch RAM space. It is a 64-bit bus dedicated for accessing this RAM space for updating the context of the running channel. While the program is going on, this bus has the lowest priority compared to the Instruction and Data buses, except for restoring a register needed for the decoded instruction to be executed. On the save part of a context switch (when the PCU is in its slave state), this is the only one used. On the restore part, the Instruction bus has the priority to read the next instruction at the restored PC and

otherwise the Context Switch bus is used. It is not possible to control the actual data transfers that occur on this bus.

### 7.2.4.9.5.1 Instruction Memory Map

The instruction memory map is based on a 14-bit address bus and a 16-bit data (instruction) bus. Each address corresponds to a 16-bit data location.

Instructions are fetched from either program ROM or program RAM. An SDMA script is able to change the contents of the program RAM, which is also visible from the data bus.

The first two instruction locations (at 0 and 1) are special. Location 0 is where the PC is set on reset. Location 1 is where the PC is set upon the execution of an illegal instruction. It is expected that both of these locations will contain a jmp to handle routines.

**Table 7-14. SDMA Instruction Memory Space**

Device	SDMA Address (Hex)	Base Address Label	Block Name	WS	Description
ROM	0x0000 ↓ 0x07FF	SDMA_IBUS_ROM_ADDR	-	0	4 Kbyte internal ROM with boot code and standard routines.
RAM	0x1000 ↓ 0x1FFF	SDMA_IBUS_RAM_ADDR	-	0	8 Kbyte internal RAM with channels context and user data/routines.

### 7.2.4.9.5.2 Data Memory Map

All of the data accessible to SDMA scripts make up the data memory space of the SDMA.

This address space has several components:

- ROM (also visible on the Instruction bus)
- RAM (also visible on the Instruction bus)
- Shared Peripherals Registers
- SDMA Internal Registers (scheduler, OnCE, and registers that are also accessible by the ARM platform)

SDMA scripts can read and write to the context RAM, data RAM, shared peripheral registers, and internal registers.

The address range is 16 bits and the data width is 32 bits. When accessing peripheral registers (USB and so on), the data width may be different. The exact address map for the peripherals depends on the project (as presented in each respective chapter).

Data access is performed with *ld* and *st* instructions that take the address from a general purpose register in the core (GRegn). The mapping between the general purpose register contents and the address bus is given in the following table:

**Table 7-15. GRegn to DMBUS Address Mapping**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
sz	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
address															

Grayed bits are simply discarded but they must be cleared to ensure forward-script compatibility.

- sz (bit 31) indicates the peripheral data width: 0 is used for a 32-bit peripheral and 1 is used for a 16-bit peripheral.
- address (bits 15 down to 0) is the address of the accessed resource (internal memory, internal register, or shared peripheral).

**Table 7-16. SDMA Data Memory Space**

Device	SDMA Address (Hex)	Size	Description
ROM	0x0000 → 0x03FF	4 Kbyte	4 Kbyte internal ROM with boot code and standard routines
Reserved	0x0400 → 0x07FF	4 Kbyte	4 Kbyte Reserved
RAM	0x0800 → 0x0FFF	8 Kbyte	8 Kbyte internal RAM with channels contexts and user data/routines
per1	0x1000 → 0x1FFF	16 Kbyte	<i>peripheral 1</i> memory space (4 Kbyte peripheral's address space)
per2	0x2000 → 0x2FFF	16 Kbyte	<i>peripheral 2</i> memory space (4 Kbyte peripheral's address space)
per3	0x3000 → 0x3FFF	16 Kbyte	<i>peripheral 3</i> memory space (4 Kbyte peripheral's address space)
per4	0x4000 → 0x4FFF	16 Kbyte	<i>peripheral 4</i> memory space (4 Kbyte peripheral's address space)
per5	0x5000 → 0x5FFF	16 Kbyte	<i>peripheral 5</i> memory space (4 Kbyte peripheral's address space)
per6	0x6000 → 0x6FFF	16 Kbyte	<i>peripheral 6</i> memory space (4 Kbyte peripheral's address space)
Registers	0x7000 → 0x7FFF	16 Kbyte	Memory mapped registers
per7	0x8000 → 0x8FFF	16 Kbyte	<i>peripheral 7</i> memory space (4 Kbyte peripheral's address space)
per8	0x9000 → 0x9FFF	16 Kbyte	<i>peripheral 8</i> memory space (4 Kbyte peripheral's address space)
per9	0xA000 → 0xAFFF	16 Kbyte	<i>peripheral 9</i> memory space (4 Kbyte peripheral's address space)
per10	0xB000 → 0xBFFF	16 Kbyte	<i>peripheral 10</i> memory space (4 Kbyte peripheral's address space)
per11	0xC000 → 0xCFFF	16 Kbyte	<i>peripheral 11</i> memory space (4 Kbyte peripheral's address space)
per12	0xD000 → 0xDFFF	16 Kbyte	<i>peripheral 12</i> memory space (4 Kbyte peripheral's address space)
per13	0xE000 → 0xEFFF	16 Kbyte	<i>peripheral 13</i> memory space (4 Kbyte peripheral's address space)
per14	0xF000 → 0xFFFF	16 Kbyte	<i>peripheral 14</i> memory space (4 Kbyte peripheral's address space)

### 7.2.4.10 SDMA Initialization

Appendix A describes the setup of the SDMA . This section provides a quick description of several initialization procedures.

#### NOTE

There may be differences with the actual implementation in the API.

#### 7.2.4.10.1 Hardware Reset-SDMA

After reset, the RAM that holds contexts, data, scripts, and the DMA request-channels matrix has unpredictable content.

The core registers are all reset to 0, including the PC; the PCU state is *Sleep after Reset*. No channel can be activated because all of the priorities are also reset to 0.

#### 7.2.4.10.2 Standard Boot Sequence

The following is the standard boot sequence:

1. Initialize the CONFIG register-detailed in [Configuration Register \(SDMAARM\\_CONFIG\)](#)-to determine the ARM platform DMA/core clock ratio (1 or 2)
2. Initialize the DMA request-channels matrix (see [Channel Enable RAM \(SDMAARM\\_CHNENBL<sub>n</sub>\)](#) ).
3. Program the channel control registers-[Channel Event Override \(SDMAARM\\_EVTOVR\)](#), [Channel BP Override \(SDMAARM\\_DSPOVR\)](#), [Channel BP Override \(SDMA\\_HOSTOVR\)](#), and [Channel Event Pending \(SDMAARM\\_EVTPEND\)](#)-according to the channel allocation.
4. Perform any necessary setup as required by the standard boot script in ROM (this is described in Appendix A).
5. Trigger channel 0 with the [Channel Start \(SDMAARM\\_HSTART\)](#) register, which starts the execution of the ROM script starting at address 0. This boot downloads channel scripts and contexts in RAM.

#### 7.2.4.10.3 User-Defined Boot Sequence

The following is a user-defined boot sequence:

1. Initialize the [Configuration Register \(SDMAARM\\_CONFIG\)](#)[Channel Enable RAM \(SDMAARM\\_CHNENBL<sub>n</sub>\)](#), [Channel Event Override \(SDMAARM\\_EVTOVR\)](#), [Channel BP Override \(SDMAARM\\_DSPOVR\)](#), [Channel ARM platform Override \(SDMAARM\\_HOSTOVR\)](#), and [Channel Event Pending \(SDMAARM\\_EVTPEND\)](#).

2. Use the OnCE (either via its JTAG interface or its ARM platform control registers) to download any code in the SDMA RAM. [Accessing the Memory](#) describes how to write data to the RAM via the OnCE.
3. Use the OnCE instructions to make the PC default value point to the new boot script start address, or rely on the ROM startup script, which first jumps to the address in [Channel 0 Boot Address \(SDMAARM\\_CHN0ADDR\)](#). (This register default address points to the standard boot script.)

#### 7.2.4.10.4 Script Loading and Context Initialization

The execution of an SDMA script depends on both the instructions that make up the script and the data context upon which it operates. Both must be initialized before the script is allowed to execute.

Each of the 32 channels has a separate data context, but may share scripts and locations in the data RAM.

The ARM platform manages the space in program RAM and data RAM. It also manages the assignment of SDMA channels to the device drivers that need them. Channels are initialized by the ARM platform via the channel 0 boot script. The boot channel downloads any required scripts with their data and the channels' initial contexts. Every context contains all the initial values of the registers, including the PC. Then the ARM platform can enable any channel that becomes active and begins fetching and executing instructions from its script.

#### 7.2.4.11 Instruction Description

The following sections introduce the instruction of the SDMA.

Instruction set details are available in [Instruction Set](#).

##### 7.2.4.11.1 Scheduling Instructions

The following are scheduling instructions:

- done-The instruction causes certain scheduling or interrupt bits to be set or cleared, which may cause a change in the schedule-ability of the running channel. Then the instruction causes the SDMA to evaluate the current scheduling priorities and to choose the highest priority ready channel. If this channel is not the current channel, a context switch will take place. If there are no runnable channels, the SDMA will enter the stopped mode. The done 5 has a special usage reserved for debug, as explained in [Debug Instructions](#).

- **yield**-These instructions are special cases of the done instruction. They do not modify the scheduling bits, but allow the highest pending channel (if it exists) to preempt the current channel if the pending channel priority is strictly greater than the current channel priority.
- **yieldge**-These instructions are special cases of the done instruction. They do not modify the scheduling bits, but allow the highest pending channel (if it exists) to preempt the current channel if the pending channel priority is strictly greater or equal to the current channel priority.
- **notify**-The notify instruction affects the scheduling bits, but does not cause rescheduling.

### 7.2.4.11.2 Conditional Branch Instructions

The conditional branch instructions of an 8-bit displacement, which is sign-extended and added to the current PC (which points to the next instruction) if the condition is satisfied.

Otherwise, control passes to the next sequential instruction.

- **BF**-Branch if False. The branch is taken if the T bit in the processor status is zero (false).
- **BT**-Branch if True. The branch is taken if the T bit in the processor status is one (true).
- **BSF**-Branch if Source Fault. The branch is taken if the SF bit in the processor status is one.
- **BDF**-Branch if Destination Fault. The branch is taken if the DF bit in the processor status is one.

### 7.2.4.11.3 Unconditional Jump Instructions

There are two varieties of unconditional control transfers: an absolute transfer and a through-register transfer.

Absolute transfers have a 14-bit address field that replaces the current PC.

- **JMP**-Jump. Causes the processor to jump to an absolute address encoded in the instruction itself.
- **JSR**-Jump to Subroutine. Causes the processor to jump to a subroutine, the address of which is encoded in the instruction itself.

- **JMPR**-Jump through Register. Causes the processor to jump to an absolute address contained in a General register. This instruction is meant to be used when more than one level of subroutines are required.
- **JSRR**-Jump to Subroutine through Register. Causes the processor to jump to a subroutine, the address of which is contained in a General register. This instruction is meant to be used when more than one level of subroutines are required.

#### 7.2.4.11.4 Subroutine Return Instructions

The following are subroutine return instructions:

- **RET**-Return from Subroutine. The RET restores the contents of RPC to PC.
- **LDRPC**-Load from RPC to Register. THE LDRPC instruction is meant to be used when more than one level of subroutines are required. It stores the contents of RPC in any General register.

#### 7.2.4.11.5 Loop Instruction

The following is a loop instruction:
